Type 1 DIABETES in 6 year old boy was cured with only a Gluten-Free diet, insulin was never needed ► BMJCR 2012. Dr Vikki Petersen explains more about this study in this 3 min clip. Type 2 DIABETES gone in 2 weeks after raw veganism ► 5 min clip. San Francisco people reversing DIABETES with raw foods in this 7 min video. Colon cancer, DIABETES cured, 230 pound lost with raw *vegan* diet ► 3 min video. 80 year old man reversed DIABETES and hypertension with raw *vegan* foods ► 3 min clip. Cured DIABETES with Raw Vegan diet in 30 days, A1C dropped from 9.2 to 7, LDL from 146 to 99, lost 27 pounds, stopped taking meds ► 4 min clip. Gina was diagnosed with type 1 diabetes since 9 taking insulin ever since; after years of suffering, she received an islet cell transfer as part of a clinical trial at City of Hope and became insulin-free ► 4 min clip. Type 1 DIABETIC went off insulin after 4 months of mostly raw veganism (mostly veggies and nuts, but some fruits and cooked foods) ► 8 min clip. Type 1 DIABETES was reversed in mice via gamma-aminobutyric acid and via encapsulated β cells made from stem cells, showing promise for humans who don't respond to a raw *vegan* diet. The Gabriel Cousens book on curing diabetes with raw foods is great. Informative are also: 8 min video of Dr. Neal Barnard about reversing diabetes, 35 min video by a Canadian MD about using intermittent fasting to cure type 2 diabetes, 1 min video of Dr. Neal Barnard about curing diabetes with a *vegan* diet, newspaper testimonial of a man reversing diabetes with a *vegan* diet, 7 min video about reversing diabetes with a vegan diet since the 1930s. The American Heart Association, American College of Cardiology, Academy of Nutrition & Dietetics, American Academy of Family Physicians, Endocrine Society concluded veganism reverses type 2 diabetes.

11.15.2. ►►► CURING CANCER: ◄◄◄

5 min video on prostate CANCER healed by raw veganism. Cancer removed in 2 months by a raw vegan diet in 2010 and then a new 2023 prostate cancer was removed by 13 lb of juice/day that took PSA (prostate specific antigen, a marker for cancer) from 520 to 0.9. Brain CANCER cured with raw foods ► 8 min clip. Colon CANCER cured with raw *vegan* diet ► 5 min clip. Blood CANCER (leukemia) cured with 80% raw vegetarian diet ► 2 min clip. Excessive intake of copper, iron, β-carotene, synthetic B9 or folic acid, selenium, glutamine, methionine, leucine can cause cancer. Raise thermostat in winter and summer, as warm temps are known to boost immunity via better blood circulation, and to reduce cancer. Warmth also prevents arthritis which can mean wheelchair. Joints feel more painful during cold weather, even indoors, due to drops in barometric pressure that cause tissues around joints to expand, putting pressure on nerves. Cold

weather causes the synovial fluid that lubricates joints to thicken, reducing mobility, while cold weather causes decreased physical activity, causing stiffness and reduced blood circulation.

11.15.3. ►►► CURING HEART DISEASE, ATHEROSCLEROSIS, the #1 killer worldwide: ◄◄◄

Your heart dies in 20 minutes (all muscle dead) if there is a clot blocking oxygen uptake by the heart muscle. Likewise, if your bed area has the CO_2 meter showing 900+ ppm (like for most Americans who live in the most toxic homes designed by rat IQ "contractors"), due to fan blowing no more or etc, you're low on oxygen and high on stale air that kills your heart slowly, causing heart ache when you wake up. This can happen when weather shifts drastically from very cold to very warm and the temperature difference between the bed area and room/window is no longer high, meaning CO_2 rises without 2-3 small USB 1 watt fans. Our houses are designed by aristocratic gnat IQ gangsters, so no CO_2 by the bed, no humidity meters, all essentials for good heart health. Ensure your bed area is well ventilated, buy a good $40 CO2 meter to keep it < 550 ppm (outside it's 400). 11.5.4. explains why atherosclerosis, heart disease is quite often an autoimmune disease caused by high meat low fiber diets that cause leaky gut. Once you understood that, you can look at more normal causes of atherosclerosis below. Here is a video on what to do (open door 1-4 inches, turn on all lights, call 911, take aspirin if no blood thinning medications, because every minute counts) if you ever have a heart attack so you survive, besides the 325 mg HealthA2Z aspirin, with 1 inactive ingredient only, natural corn starch, instead of 5-10 toxic ones for the other lethal brands (or four 80 mg tiny pills, or 300 mg per NHS crushed aspirin you chew into a powder before swallowing (not whole, but made into a paste to absorb 3x faster, since heart muscle dies in 20 minutes, so you need aspirin to dissolve the clot in 5 minutes). Sit on the floor resting on a wall, bent knees, W position to prevent falls and to reduce blood returning to the heart to make heart survive until paramedics come. Use marker to write on wrist time on pain onset, so the paramedics can know if clot dissolving injection thrombolytic can be given without killing you. "aspirin within 4 hours of severe chest pain onset… (can) save 13 000 lives per year in the US" ► JAHA 2024;13(11):e032778. The normal vegan diet of many (mine too for 10 years) has about 30-90 mg aspirin in it in salicylate form (not salicylic acid, so it may work differently or be milder), in blueberries, prunes, spices, produce, so if you remove these, without replacing aspirin, your blood becomes thicker, increasing the risk of clots and death. Thus, half of an 80 mg aspirin tablet daily (40 mg) may help if you're at high risk of clotting (A+ blood type, etc). However, if you eat a lot of LDL lowering foods or supplements (garlic, bromelain, ω3, nattokinase, ginger, vitamin E) that happen to also thin the blood (google "Does X thin the blood?" for everything you ingest), taking aspirin can cause bleeding, obvious to you if you try pick your nose in the shower (red mixed with beige snot instead of beige) or blood in the stool. Strokes can be due to bleeding, not a clot, so taking an aspirin while "having a stroke" would kill you if it is actually a bleeding stroke

(15% of strokes are not ischemic, only a brain scan at the ER can tell if bleeding or ischemic), the 320 mg aspirin advice only applies to heart attacks. For strokes, write onset time too so MD knows if to use the anti clot drug, and open door, do all above as every minute 2 million neurons die and you need visit ER immediately. Though in general, if you're the sticky clotting blood type, your chance of a bleeding stoke is lower than average. But we have 100s of silent ischemic strokes monthly, our MRI can't even detect and see them, they occur in capillaries, that's how brains age too, it's not just dementia, etc. The simple clots that starve brain areas of nutrients and oxygen. If you have a peculiar heart/brain pain, do an MRI, they see a narrowing, and link that stroke or clot to the sticky blood, then it's likely that any such future pain may be related to a clot that diminishes blood flow, to an area, even if it's not a full stroke, but partial one. That would be a sign, a small 80 mg aspirin will help prevent small ischemic clots from causing partial blocks. Today, millions take 80 mg aspirins daily (325mg HealthA2Z can be used if you split it in 4, as it has the safest inactive ingredients, chew it with biggest meal to avoid stomach bleeding) to prevent sudden death, especially as they get older, though new studies show a risk of cancer. Drink plenty of water, to keep the blood fluid and prevent stickiness. When waking up, or before even rising from bed, drink water from a container, and walk slowly, as most strokes occur in the morning and you can prevent them by eating breakfast right away, as opposed to waiting.

Strokes are the #1 cause of disability and # 2 cause of death: 90% of people lose brain cells due to lack of knowledge, see what to do during a stroke to prevent brain damage. Heart disease is the # 1 killer on Earth. Zero oil 5% fat high fiber vegan diet (2 min video) made a fat lady's coronary artery blockage of 85% vanish in 5 months and made LDL of an MD drop from 186 to 84, carotid blockage from 50 to 0%. 15% of 22 year old US Korean war soldiers (autopsies) had 50+% coronary blockage, 77% had some blockage, 99.5% had no clue they're sick, Table 3 ► JAMA 2012;308(24):2577-83. Atherosclerosis causes heart disease, fatal aneurysms, vascular dementia, brain (cerebellum, the 10% of brain that holds 80% of neurons) shrinking and needs to be stopped at all costs. The hair loss reversal section explains the power of phystosterols, other DHT blocker nutrients in reversing arterial plaque, preventing cardiac events. The seed oils ω3:6 ratio 1:2 for CRP below 0.3, avocado, walnut, olives, coconut sections explain the dangers of high fat (raises LDL, the main driver of plaque, heart disease) and fake industry paid science. It's very important to move every 20 minutes or so, as Harvard/Stanford top of class MD explains in this 45 min primer into atherosclerosis, to prevent blood pooling which makes it easier for blood clots to form, since clots to the bifurcation of blood vessel far wall are the start of arterial plaque. In one study, those eating plenty of garlic daily for 5 years had 80% of their plaque gone, vs no change for the other group: this is because garlic thins the blood and prevents the "accumulation of platelets to form a clot like inflammation on the artery", which then turns into soft plaque. Thick blood (A blood types) tends to clot more, and fat thickens the blood. Garlic

kills plaque forming cells, removes blood heavy metals (via sulfur and selenium). Without garlic, metals cause plaque by attacking the sulfur/selenium of the endothelial proteins and forming an inflammation site that attracts platelets and clot-plaque formation cells. Garlic prevents LDL oxidation and lipid accumulation in preliminary soft plaque. Garlic and 100s of other blood thinning foods prevent soft plaque formation, but garlic may cause infertility in some. Contrary to nutritionfacts.org idea that we must eat nuts daily to be healthy, the USDA nutrition data shows only walnuts have a healthy (if used with chia/flaxseeds) ω6:3 ratio among nuts. Plaque rises with hs-CRP, so you need high ω3:6 ratio of 1:1 or 1:2 max to reduce plaque if Lp(a) is high. Even with walnut, that in junk food eaters improves biomarkers the most vs other nuts and especially vs the lethal fat they eat, in Ornish research it is clear all nuts need to be avoided to reverse all arterial plaque in some folks (see pic), with fat being 2% of calories until plaque vanishes. Many vegan MDs say limit to 1-2 walnuts/day, 5% fat cal. Research on PWV shows in healthy people with no plaque, nuts ruin arterial health, increasing risk of stroke, death. The more sedentary one is, the lower the fat % needed to avoid this horrific cIMT carotid pic. Most people eat such bad fat, that for them nuts are a good food relatively speaking, but you can't extrapolate study conclusions in sick people with high plaque to healthy vegans with 0 plaque. Some *mice* get 114 more plaque from the same diet, so some people live to 120 only on 4% fat diets. We got different DNA/dietary needs. Check out this amazing video on CT scan with AI that is more useful than all other tests: MD with 30 years of CT scan experience shows how perfect LDL/HDL can still mean plaque if sticky Lp(a) (the worst type lipoprotein that is 6 times stickier than LDL, see seed oil discussion) is high and inflammation is high, while those with Teflon like arteries can get no plaque even with sky high LDL, as long as they're younger (when very old, all will get plaque with high LDL, hence the MDs advise AGAINST carnivore and ketogenic diets, since sooner or later plaque will kill us).

1 yr of pomegranate juice lowered cIMT 30% vs 9% rise in placebo: CN 2004;23(3):423-33. 440 mg MgO 3x/week for 6 mo shrank cIMT 0.84 ⍰ 0.76 mm … vs placebo 0.73 ⍰ 0.79 ► EN 2013;69(5):309-16. cIMT 1.0 = 3.5x more infarcts vs 0.48 ► AJPC 2025;22:101011. Other studies showed improvements. Vegan diets have much more magnesium, fiber, K, see 4 *vegan* cases:

1). CRC 2015:978906 ► 60 yr old went *vegan*: TC 234 ➡ 138, BMI 26 ➡ 21, BP 140/80 ➡ 124/72, LDL 158 ➡ 69, walk 0.3 miles ➡ jog 4 miles.
2). FN 201911;6:82 ► 54 yr old went *vegan* for 0.5 yr: A1C 8.1 ➡ 5.7 (diabetes gone), left ventricular ejection of blood fraction 25 ➡ 55% (heart failure gone), BMI 45 ➡ 35 (50 lb gone).
3). JJC 2016;13(4):364-6 ► 77 yr old went *vegan*: angina gone, TC & LDL halved.
4). PJ 2013;17(2):61-6 ► diabetic went *vegan* for 16 weeks: TC 283 ➡ 138, BP 132/66 ➡ 125/60, A1C 11 ⍰ 6.3 (taken off 4 pills, as glucose wasn't 524 anymore).

CM 2015;22(3):427-36 explains if we eat a low carb diet, we lose more weight in a few days (hence the popular myth of high fat diets are best for fat loss), as we lose protein, glycogen and water (lean mass), but on a low fat diet, we lose 80% more body fat (463g vs 245, after 6 days in the study) than on a low carb diet and no glycogen/water; our muscles won't shrink, but body fat will shrink faster, see video for more studies. Gas 2017;152(7):1718-27.e3 says "32 controlled feeding studies with isocaloric substitution of carbohydrate for fat found that both energy expenditure and fat loss were greater with lower fat diets." What kills us faster is not the glycogen and water in the muscles, but the body fat. PO 2013;8(1):e55030 found low carb diets meant 31% higher all cause mortality, see more in this video. This makes sense, as high fat or high protein diets lead to higher AGE intake and AGEs speed up aging. 2 min video shows reversing heart disease and heart blockages in 5 months with a low-fat high fruit high veggies *vegan* diet recommended by her cardiologist Baxter Montgomery, no dairy, bread, sugar, meat. One of her arterial blockages was 85% blockage of blood flow. Her doctor sees this reversal of heart disease via veganism routinely. She also lost 30 pounds in 5 months. PJ 2015;19(1):62-7 explains "compared with a control group, the plant-based diet group had a 73% decrease in coronary events and a 70% decrease in all-cause mortality."☺☺☺ Cutting fat from 40% to 10% of the total calories led to a 50% drop in the bad cholesterol, LDL ► PBUMC 2000;13(2):139-43. Low-fat *vegan* diet reversed angina, man who could barely walk a few feet can now climb mountains. Heart disease was reversed within 1 year of going *vegan* via low fat (5-10% of calories) diet. CRP being lower meant 16 times lower cardiac mortality. One way to reverse heart disease risk is to lower CRP 4 times as shown in "what I eat" ω3:6 section, or to go *vegan*, since as ABC 2007;88(1):35-9 shows, TC/LDL/TG (Triglycerides) are for *vegan* 141/69/82, *omnivore* 208/123/156, egg-eating vegetarian 175/101/94 & vegetarian 165/88/95. Egg-eating vegetarians get 15% higher LDL☺☺☺, as eggs are loaded with oxidized cholesterol. High TC/LDL/TG are strong predictors of heart disease, with the optimal LDL being 50-70 mg/dL, "Atherosclerosis *is* endemic in our population in part because the average *person's* LDL level is approximately twice *the normal physiologic level*" ► JACC 2004;43(11):2142-6.

RR 2007;10(2):225-34 analyzed 3 groups: 21 sedentary raw *vegans* (BMI 21), 21 omnivore endurance runners (48 miles/week) of the same age, sex, BMI as *vegans*, 21 sedentary omnivores (BMI 26). Total Cholesterol/LDL/Triglycerides were: *vegans* 143/76/56 (healthiest), *runners 161/84/62*, overweight *omnivores 187/112/120*. Systolic/Diastolic Pressures were *vegan* 104/62 (healthiest), *omnivore runners 122/72*, overweight 132/79. HsCRP (high sensitivity C-reactive protein, marker of inflammation, lowest is best) was: *vegans* 0.52 (best), runners 0.75, overweight 2.61. Fasting glucose: 85 *vegans*, 88 runners, 95 overweight; *vegans* got the best glucose. Carotid artery intima-media thickness (IMT) *vegans* 0.56 runners 0.63 overweight 0.74, meaning *vegans had* the least atherosclerosis. This is an amazing & beautiful piece of evidence

that *veganism is the best diet for preventing heart disease* for many. Raw *vegans* ate less saturated fat, more polyunsaturated fats, double the monounsaturated *fats,☺☺☺ more fat (43% of energy) than omnivores.* Table 2 has the exact percentages. Many raw *vegans* eat only 5-10% of calories from fat though. *Imidazole propionate is produced in the intestine of omnivores more than vegans* and this compound causes atherosclerosis, *so going vegan will help* you lower plaque. Just because you're vegan it doesn't mean you didn't get plaque in pre-vegan years or that inflammation, poor sleep, air pollution, pesticides, heavy metals have not destroyed your arteries, so for only 500$ you can do dyeless MRA even without health insurance, so you know where you stand. Homocysteine has to be < 7, hs-CRP < 0.2 ideally, CAC = 0 for lowest risk, LDL < 75, TG < 55, HDL > 50, etc. Arterial clogging in toes, calves, ankles, toes, etc, or any other body area can also cause odd pains, cramps, etc, so it's not always magnesium deficiency, it could be you eat too much fat that blocks arteries (see pic). 80% of those under 35 who died in a car crash, has a huge arterial blockage of the main coronary artery, with 20% having a 50% blockage, so don't imagine being 25 means "it can't be plaque" or it's just some low electrolyte: K, Na, Ca or Mg. It can be neuropathy too, not plaque. A carotid Doppler, leg Doppler, abdominal aorta Doppler helps us see via ultrasound, if any blocks exist to the brain or other areas. CIMT (carotid) ultrasound testing of 10,000 people 35-65 predicted 98.6% of heart attacks/deaths within 10 years based on neck/leg artery thickness. However, MRA (next paragraph) offers much more info for 300$ extra: lipid-rich necrotic core, fibrous cap, and intraplaque hemorrhage, which are direct indicators of plaque instability and high stroke risk. CIMT only measures the thickness of the inner layers of the carotid artery, tells you nothing about coronary arteries blockage % (stenosis) MRA sees or total body plaque volume calculated with AI MRA. The CTA (computer tomography angiogram (800$ the cheapest CTA) uses x-rays that damage DNA via radiation and looks at all vessels in the body and can show calcium Ca around the joints/bones, so that you can use Mg to dissolve Ca like in this clip. You don't need an MD letter to do a 50$ CAC score, 0 means no hard plaque, see a youtuber CAC=0 report: checks your lungs too. You don't need MD letter for ULTRASOUND Doppler if using a clinic where you pay yourself in US, UK. Watch this video on CTA where John Osborn explains the incredible corruption of the US medical system. The RF section explains that RF causes brain cancer in the shape of the antenna held to the head. MRI uses cancer causing RF, and body oxidative stress, not just the classic cancer causing CT scan. Thus, 10 days before and 10 days after any ultrasound (a stressor too), MRI, CT we need to rest more than usual, eat much better, stress much less, build antioxidant defenses, to prevent cancer or other diseases. The cancer is small first, but in 4-15 years, it may be stage 4 and we won't know MRI, CT caused it. Full body MRI in Korea led to finding 10 times more thyroid cancers, 10 times more surgeries, but mortality from thyroid cancer remained the same: people died or lost speech ability as a side effect. 90% of humans have tiny cancers all the time, they're so small they can't be seen on MRI and most cancers don't

kill us, they go into remission, and we die of other causes. So, unless the cancer is stage 3-4, with a big tumor, surgery makes no sense. Each biopsy, etc can kill. Overdiagnosing, overtreating can kill, since each human has 90 health issues at any time. Eat well, sleep better, see how any issue evolves over time, don't overtreat.

Plaque is deadly, since it blocks blood flow to legs, liver, pancreas (see in full body CTA) seen in full body or abdomen MRA (no radiation of CTA), leading to useless pills for "liver issues" (caused by low glycine and/or narrow artery to liver, etc). Dyeless Magnetic Resonance Angiography (MRA) can provide a clear picture of soft plaque (specifically vulnerable plaque, the most deadly plaque that can kill with a 1 hour notice) and is generally considered superior to CTA for soft-tissue characterization, even without the use of gadolinium dye (part of which remains stuck in the body for decades, causing harm). Fatal reactions to gadolinium dye have happened: "fatal allergic reaction to GBCA in a 35-year-old" lady ► Cur 2023;15(7):e42455, "fatal anaphylactic reaction to gadobutrol (GadoButrol Contrast Agent GBCA), in a 42-year-old man... Adverse drug reactions in gadobutrol have a very low prevalence of 0.32%-3.5% (3.5% is huge, 1 in 29 people), with serious adverse drug reactions in <0.1%" ► RCR 2017;13(1):299-301. Dyeless means die less. There is no reason to do CTA, CAC score or to use dye unless there are serious issues that can't be seen with dyeless MRA. AI-enabled MRA offers a much better, accurate estimate of total soft plaque in the body without using dye (non-contrast) compared to plain MRA, so go for AI MRA if you waste time doing MRA, and opt for full body MRA to see plaque in legs, and all brain, trunk areas that could kill you or lead to damage to knees, feet, amputation, etc. Since 2010 there are low-dose CCTA protocols that use 1 mSv of radiation (CAC score is 1-3 mSv), the only ones worth going to if you're a real immortalist, which is low vs 3-20 mSv of typical CTA scans (around 10). However, a CCTA actual scan time is 10 seconds and we humans get about 3 mSv a year, so 10^{-6} per 10 sec, so we divide the lowest CCTA 1 mSv by that, we get about million higher radiation in that 10 second period than ever in our life, which overwhelms the cellular antioxidant systems that prevent the emergence of cancer causing molecules in the next minutes. Nobody wants to experience 75 million °F in the fusion reactor unprotected. Also, CCTA scans are interpreted by AI or people, and you can get differences of 1000% in plaque, showing CCTA measurement of plaque is not as "perfect" as 99% of youtube videos claim. For CAC, the actual scan time varies between 10 seconds to 3 minutes, so it can be less deadly, but also tells us nothing about soft plaque and its location. Thus, the myth that CT scans are harmless is simply a lie pushed by the CT scan makers, the cancer from one scan, can lead to cancer in 30 years, and nobody would have guessed it was a dental X-ray even due to the lowest antioxidant state of the person that day of dental x-ray, even digital x-ray with 10 times less mSv. An MRI doctor explains the advantage of a yearly AI MRI to catch cancer: he believes in 2035 he might convince insurance companies to do an MRI as part of the yearly physical exam,

since the usual exam catches nothing and if a cancer is advanced, you may lose 30 years of life. That's why even for dental, once a year scan is more than enough. Try AI CCTA or AI CTA scans, in the best 50 US hospitals, because that calculates exactly how much soft plaque exists. Humans get 2.3 mSv/year from background radiation, thus 7 mSv in 1 minute is bad. The amount of radiation from 1 mSv vs 0.03 mSv for Los Angeles to NYC airplane flight, 0.1 mSv for chest X-ray and 0.005 mSv for all 4 pictures of the mouth at the dentist that has digital (not film) x-rays. To avoid damage the immortalists may require all CAC, CTA etc scans to be done over 2 hours, while patient takes breaks to eat high vitamins (and even receive one injection of blood antioxidants) to reduce cancer risk and cellular damage from the radiation, plus eating in the days before, after, far more antioxidants, vitamins, polyphenols to save all. Eat good vitamins, etc before and after any radiation scan, because cancer starts 10,000 times smaller first. Don't play the Invincible One, humans are so fragile. One soft plaque clot is enough to kill anyone, without warning, even if LDL, HDL, every marker is perfect, as they didn't see the soft plaque or feel any angina before. Sugars, extreme exercise, anything that raises HR/BP damage the arteries, creating injuries that years later can trigger an event ending life with no angina warning before. 58% of heart attacks are fatal. Knowledge of soft plaque risk via dyeless MRA is better than belief, so immortalists will require 100$ dyeless AI 15 min MRAs be available at Immortality Centers to anyone without referral, to evaluate the vascular health of any body area, especially chest and brain. Avoid contrast for ultrasound, if you do ultrasound, because besides the cavitation induced damages to chest area tissues, you can get anaphilactic shock. The combination of ultrasound and contrast-enhancing microbubbles (UEAs) can induce cavitation, which in turn can lead to vascular damage. "The FDA is currently aware of 11 cases of anaphylaxis and two deaths, related to an immediate hypersensitivity reaction after the administration of Definity or Lumason (PEG 4000 is its main component) among patients with reported allergy to PEG" ► JCHIMP 2023;13(4):74-8.

Leg cramps can mean you're 3 weeks from a heart attack/stroke that kills you. Plaque is number one killer worldwide, so checking everything each 15 years is good idea after age 25. Many spend 900$ on evil concerts whose sound waves create biological entropy and shorter lifespan, but with that $ they can do 4 scans to help them realize they may die at 45 with no real dietary or sleep habits change. Want half of your body paralyzed after 35? Living in a wheelchair or amputating legs due to plaque at 31? Others spend 5K for extra car features, but with 5K they could do so many tests, take so many supplements they desperately need to cure 20 deficiencies, and know 500x more about what they need to do to live to 100 in a healthy state of mind and body. Mg prevents further calcification of soft plaque, which is unwanted, as hard plaque renders vessels inflexible, stiff, prone to clots and ruptures, which can become fatal events when aged 50+. Magnesium intake is inversely associated with coronary artery calcium

CAC, abdominal artery calcium AAC scores. It's possible with the right combo, Mg could remove Ca in arterial hard plaque, but we don't yet know how to do that, you need a chemical signaling cascade for each layer of cells that is above the Ca, maybe spermidine autophagy. You need to use lasers via teleportation to trigger the apoptosis of hard plaque cells, but we don't have those lasers yet, so the best thing now is a chemical signaling by eating something. CIMT 200$ is another ultrasound test to monitor plaque evolution over time. MRA (magnetic resonance angiography, 1000-4000$, using much lower energy radio waves, meaning 90,000+ times less molecular effects) is the equivalent of CTA (300-3000$), just using full body MRI, without the deadly X-rays, used in preventive care to see soft tissues, lungs, brain, brain ischemic damage and much finer details not seen in CTA (MRI machines are pricier too). Full body MRI is wholly superior use of 1000$ vs endless ultrasounds on this or that area or CTA. Advanced MRI techniques can identify and quantify plaque components, including calcium, in coronary, carotid, and leg arteries, so you don't really need CTA, unless you have high Calcium as seen on MRI. MRI vs CTA differences are soft tissues appear best on MRI, vessels and bones best on CTA.

Since JN 2016;146(2):460S-3S found apoE gene knockout mice form in 24 weeks 114 times more atherosclerotic plaque given the *same amount of* fat, it seems smart to be very careful when eating any fatty foods to watch for cholesterol or triglycerides going up or signs of angina (caused by plaque) which might indicate one eats too much fat for one's own DNA. "Mice lacking apoE have plasma *cholesterol levels that are 4 to 5 times normal* and develop atherosclerotic lesions spontaneously, even when fed a normal chow diet, which is low in fat and cholesterol… lesion development can be accelerated by a high-fat, high-cholesterol diet… in response to a high-fat, high-cholesterol diet, LDLR-deficient mice exhibit massive elevations in plasma cholesterol and rapidly develop atherosclerotic lesions throughout the aorta" ► ATVB 2000;20(11):2336-45. The apoe4 allele can cause a 12 fold increase in Alzheimer risk in humans. Likewise, *certain genes might cause pathological levels of plaque (since everyone has some plaque) at 2-10 times lower fat levels*.☺☺☺ That's why, since we don't have enough human data, a low fat diet seems the safest bet. Vegans eat no cholesterol. The *#1 killer worldwide is heart disease*, usually initiated by *atherosclerosis*. Flaxseeds, chia seeds contain lignans that reduce the formation of atherosclerotic plaque by 46% in rabbits. *Flaxseed oil had no effect, but* flax lignans reduced it by 73%. Flaxseeds may reduce it by 20+% in humans in certain low fat low oxidative stress diet conditions. To really reach 150 year lifespans we have to understand how to best (by reducing oxidative stress and systemic inflammation) prevent atherosclerotic fatty streaks which can form even while in the womb. "Fatty streak formation occurs in human fetal aortas and is greatly enhanced by maternal hypercholesterolemia (high cholesterol)". Infants whose moms had high cholesterol, had 12.3 times the arterial plaque in the fetal aorta (aorta = main artery of the body supplying oxygenated blood) of normal cholesterol moms' infants,

758,651 μm² (0.759 mm²) vs 61,862 μm² (0.062 mm²) per section. ► JCI 1997;100(11):2680-90.

"The development of coronary atherosclerosis begins in childhood. A clear relation between diet and cardiovascular disease risk has been demonstrated.. most children still exceed national recommendations for intake of total and saturated fat" ► AJC 1998;82(10B):22T-9. This 6 min video explains one study *found* fatty streaks (the beginning of fibrous plaque) *of plaque in* 100% of 10 year olds and that all adults have some plaque, especially brain capillaries MRI misses, which explains why memory weakens with age. High LDL was the strongest predictor of plaque, so being low fat high fiber low AGE *vegan* can reverse a lot of existing plaque and prevent new plaque. Some youngsters in KCJ 2010;40(1):1-9 had *some* heart *vessels 90% blocked* ► "Their average age was 22 years, and over 70% of them (77%) had evidence of atherosclerosis in their coronary arteries… The prevalence of fatty streaks in the coronary arteries increased with age from approximately 50% at 2-15-years-of-age to 85% at 21-39-years-of-age, and the prevalence of raised fibrous-plaque lesions increased with age from 8% at 2-15-years-of-age to 69% at 26-39-years-of-age. The prevalence and the extent of atherosclerosis was greater with increasing age, *body mass index (BMI),* blood pressure, and levels of serum total cholesterol (TC) and low-density lipoprotein cholesterol (LDL-C) " This means that *vegans*, who have much lower BMI (weight in kg/(height in meter)^{2,} for example 60/(1.92)^2=60/3.7=16.2), blood pressure, TC and LDL have much less atherosclerosis. Table 1 shows that having non-*HDL* cholesterol (TC minus HDL) < 130 means PDAY risk score of advanced atherosclerosis of 0, while > 220 got a risk score of 8, non-HDL cholesterol 130-159 score of 2. Figure 2 shows probability of advanced atherosclerosis depending on the PDAY risk score and age. PDAY stands for the PDAY study also explained at ► ATVB 2000;20(8):1998-2004, which has more useful tables and info on plaque. ☺

Atherosclerosis can cause even Alzheimer and all kinds of "unrelated diseases" by diminishing blood supply to the brain or organs. FASEB 1998;12(6):433-7 found Italian centenarians had lower TC/HDL *190/49* vs *228/55* for 65+ year olds. NRIZ 1997;34(3):202-8 found Tokyo centenarians HDL/TC/TG were *42/161/82* vs *58/211/126* for controls (see Table 2 on page 204); they were very thin (BMI 16-18 common). Among centenarians, those with higher HDL were healthier. *Nobody who lived past 110 was overweight. Loma Linda* vegan centenarian heart surgeon has TC 117. As you can see, the lower the TC, the lower the HDL, LDL, TG, etc. Eastern Sicily centenarians had lower TC than 80-87 year olds ► AGG 1996;22 Su 1:403-6. LDL/HDL were 93/66 in centenarians and 143/39 in controls ► JAGS 1997;45(12):1504-9. Centenarians had about the same HDL as other younger people, 51. HDL2b was higher (16.5 vs 12.1), HDL3a lower (13.4 vs 17.4) in centenarians. *Several studies suggest that the protective role of* HDL comes from HDL_2 mainly, so it is no wonder that centenarians have higher HDL_2 ► Ger 1998;44(2):106-10. Each paper studies different diets, lifestyles, DNA for centenarians and the results are very different as a result. 75 Tokyo centenarians had lower HDL compared to 73 people aged 53-73;

among centenarians, those with lower HDL had lower albumin, higher cognitive impairment, IL-6, CRP ► JAGS 2001;49(11):1434-41. Italian omnivore centenarians had TC/HDL/glucose *189/57/84* vs *216/61/96* for 65-85 year olds ► EG 2008;43(2):119-22. *HDL-lacking mice can transport* cholesterol *to bile*, so in humans there may also exist alternate cholesterol removal mechanisms, explaining perhaps why some make it to 105 even if their HDL is 35, while others have HDL 75 ► PNAS 2008;105(35):13045-50. ☺☺☺

1% of Australian centenarians had blood pressure above 140/90, 8% had high cholesterol ► AJH 2011;24(3):299-303. The mean pressure was 130/70, good for age 100. The average pulse was 72 for Bama centenarians ► CJPS 1996;8(4):385-94. "Individuals with exceptional longevity (98 years) and their offspring have significantly larger HDL and LDL particle sizes" ► JAMA 2003;290(15):2030-40. The HDL/TC/LDL/TG for Sardinia omnivore centenarians were 49/184/108/105 vs 55/218/139/123 for 80-89 year olds, see Table 2 ► PO 2015;10(6):e0128029. Belfast omnivore centenarians (BMI 25.7, the fattest of any study I've seen) had TC/LDL/HDL values of 204/101/42 ► CPD 2010;16(7):789-95 with a shocking TC/HDL ratio of 4.9, somewhat high and not thought to be healthy. Bama *vegan* centenarians (BMI 20.0) had TC 111 compared to *239* for omnivore controls ► Ntr 2016;8(9):564. Male offspring of Ashkenazi centenarians had higher HDL (56 vs 44) and lower LDL (95 vs 127) compared to the spouses of centenarians' offspring used as controls ► JAGS 2001;49(1):76-9; female offspring has higher HDL too: 70 vs 59. Aging 2012;4(9):580-9 found that centenarians have HDL/TC/IGF1 *47/185/9.3* vs 50/203/14.4 for offspring vs *56/196/17* for controls (control=offspring of shorter lived parents); *their IGF1 was 9.3 vs 17*. Many studies found that *vegans* have lower IGF1 than vegetarians and omnivores, dairy and meat raise IGF1 ► CEBP 2002;11(11):1441-8; *this may be one reason why vegan live longer than vegetarians and omnivores in several studies*. JGBSMS 2002;57(11):M712-5 study of 139 people aged 95+ found "Plasma HDL levels correlated significantly with MMSE (cognitive function test). Each decrease in plasma HDL tertile (75, 51, and 37) was associated with a significant decrease in MMSE (23.4 +/- 1.5, 17.7 +/- 1.8, and 12.4 +/- 1.8; p <.04 for each plasma HDL tertile). As expected, increased plasma apolipoprotein A-I and decreased plasma triglyceride levels were also correlated with a significantly superior cognitive function". HDL increases as a result of anthocyanin, flaxseed intake. However, pills raising HDL can increase mortality: torcetrapib therapy led to a 58% increase in all-cause mortality, even if it raised HDL 72%, decreased LDL 25% ► NEJM 2007;357(21):2109-22. ☺☺☺

The more anthocyanins people ate, the more polyphenols, the less heart events, since the polyphenols prevent LDL cholesterol oxidation, which is the first step of arterial plaque formation; "*low-density lipoprotein (LDL), especially in its modified form, serves as a primary source of lipid accumulation in atherosclerotic lesions*" ► BRI 2016:9582430. Flaxseeds polyphenols (lignans found in 99+ foods) prevent atherosclerosis in rabbits. Pineapple bromelain

dissolves arterial cholesterol plaque in rabbits as explained in the pineapple section which details some human studies on the benefits of pineapple for the heart. Hydroxytyrosol in some (not all) less processed olives and sulforaphane in broccoli also attenuate the formation of arterial plaque in rabbits. Whether similar arterial plaque dissolution effects apply to humans is not clear. Bromelain is an enzyme, so its mechanism is different than polyphenols preventing LDL oxidation and thus plaque formation; bromelain may be one of the few phytonutrients that can actually dissolve existing plaque (formed 1-500 months ago) instead of simply preventing new plaque from forming. Plaque is made of LDL cholesterol, oxidized LDL, fat, cellular waste, some protein (fibrin) and/or macrophage foam cells (circulating monocytes attracted to oxidized LDL are transformed into macrophage foam cells, so younger softer plaque has no monocytes or macrophages, just LDL or oxidized LDL), smooth muscle cells, etc. Pineapple bromelain (buy as powder) comes and destroys fibrous proteins, by chopping them *into amino acids and* peptides. Fibrin is one thing that helps the plaque to become fibrous and hard. Bromelain is a protease, an enzyme that breaks down proteins and enhances protein digestion. To avoid bromelain being used to break proteins, one would need eat pineapple without protein rich foods, so bromelain goes into the blood and dissolves the plaque. Bromelain is mostly in the stem, so eat the stem. JTU 2015;3:3 shows how ultrasound was used to remove 2 mm plaque in 25 minutes in the carotid (easy to do ultrasound on to measure plaque) artery of rabbits. They fed rabbits high cholesterol (absent from *vegan* diet) to build plaque and then dissolve it via ultrasound, and as seen in Figure 3, the plaque blocked 50% *of blood flow* after just 3 months. Talking about why go *vegan*? Well, *vegans* eat no cholesterol, so no wonder they got less heart disease, since their LDL is much lower as shown above. All plaque starts from LDL cholesterol oxidation. The body makes cholesterol, but when you eat it from eggs, dairy, meat, fish also, you increase your risk. Polyphenols diminish oxidative stress from AGEs rich food, from junk food, etc and thus diminish LDL oxidation, that's why centenarians often eat more polyphenols. ☺☺☺

The dramatic pictures in Fig. 1 of AD 2011;7(4):436-44 show what happens to trans fat eating omnivores many times, as atherosclerosis blocks sometimes 90-97% of brain *arteries* flow and *starves the brain cells from the nutrients* needed to remove amyloid plaque (done at night). 200 types of proteins (not just a-beta and tau amyloids) get misfolded in a brain starved of nutrients and oxygen, inability to remove toxins. Some people still use (without knowing, like cave men in the Neolithic) stoves, ovens, grills to fry or dry heat cook foods and cook in the presence of high oxygen to oxidize cholesterol, poison the foods and their lungs, brains, arteries with fumes (90x lower with pressure cookers since they use water), fumes that contain 500 times more carcinogenic PAHs and other poisons than cooking all in water in a pressure cooker with minimal oxygen. Electric pressure cookers also emit no CO, etc from gas that also damages your brain and body; electricity is clean renewable, natural gas poisons ground water and kills people with

explosions. Go electric, save your life and that of billions of people. It can happen to junk food *vegans* too, who eat dry heat cooked, high AGEs foods. NE 1993;12(1):28-36 found long-term *vegans* had *3 times* less *Alzheimer* than omnivores. They didn't look at the length of being meat-free. Perhaps if they looked at 25 year *vegans* vs omnivores, they would see a difference of 5 times at least in Alzheimer. This is not surprising at all, since *vegan* food has no cholesterol. Wikipedia and this video explain *that the first case of Alzheimer, reported by* Alois Alzheimer *in 1901, had a lot of* atherosclerosis. Men with coronary heart disease and ferritin above 200 had 4.5 times risk of atherosclerosis compared to healthy men ► ARYAA 2014;10(1):32-6. ☺☺☺

Too much iron is bad, so it is perhaps better to take iron free multivitamins if one eats already plenty of iron and serum ferritin is somewhat high. One study found those who ate garlic for 5 years dissolved 80% of their plaque. However, garlic thins the blood, so too much garlic taken with blood thinning medications can cause hemorrhagic strokes. Aged garlic or *garlic* powder, or raw garlic are good choices for lowering plaque formation. Just like olives can lose all polyphenols during canning, some garlic powders may lose most beneficial compounds during processing; this may be why some studies show raw garlic *alone*, not "cooked or odorless *powder* garlic" (Garlique brand with 5 mg allicin raised LDL☺☺☺ by *8%*) achieves certain biomarker improvements. Fermenting it by adding water, (maybe vinegar if you wish), salt and sauerkraut juice to raw garlic, letting it ferment 3 weeks (before storing the jar in the fridge) at room temperature eliminates smell too; can add a bit of onion and ginger too for flavor. Ath 1999;144(1):237-49 shows *garlic* powder (Amazon sells 1 lb organic), *which smells less than raw garlic,* reduced arterial plaque build up *(due to aging) and dissolved some existing plaque over the 4 year period.* After 3 months, the garlic powder group improved brachial flow mediated dilation (endothelial function marker) by 51% versus placebo ► AJC 2017;18(2):116-21. ☺☺☺

Amazon testimonials claim lower TC/LDL, higher HDL for this Kyolic garlic brand with soy lecithin in it. Soy lecithin lowered LDL by 56% after 2 months (in those with high LDL) and promotes HDL liver synthesis ► Cho 2010:824813. Kyolic odorless aged garlic (the brand linked above, 25 times more expensive than garlic powder) slowed down yearly calcium score increase to 7.5% vs 22.2% for placebo ► PM 2004;39(5):985-91. Aged Garlic Extract combined with CoQ10 slowed down calcification (plaque buildup) 4 fold compared to placebo; CRP fell slightly in garlic group, increasing for placebo ► JCDR 2012;3(3):185-90. Aged garlic S1PC crosses the blood brain barrier, reduces brain oxidative stress, prevents heart muscle aging, lowers blood pressure (this lowers plaque formation) ► CM 2026;38(6):1218-28.e10. S1PC is an isomer of SAC, which itself prevents Alzheimer ► SR 2025;16:486, lowers hippocampus (memory) lipid peroxidation, brain MnSOD (enzyme that kills O_2^- radicals) activity (see chart), brain O_2^- radicals. Since SAC kills O_2^-, MnSOD is less active. S1PC/SAC are present in raw garlic and you don't have to spend 25 times for fermented aged garlic, since storage and shipping can be hot and cause the growth of lethal

bacteria, as shown in the sauerkraut section. Poor people who want less plaque will buy garlic powder or garlic, or better yet, nattokinase/bromelain. "CAC (coronary artery calcification) progression was significantly lower in the (garlic) treatment group than in the placebo group (6.8% vs 26.5%)" per year ► JN 2016;146(2):416S-21S. LAP (low attenuation plaque (soft uncalcified plaque) decreased by 1.5% in the 2.4 g/day aged garlic group, and increased 0.2% in placebo group after 1 year ► JN 2016;146(2):427S-32S. Some people dislike having to peel garlic, but garlic peel is edible and healthy so garlic can be made into a puree smoothie with a food processor after removing only the hard center piece and some of the peel of the clove (not individual pieces) that comes off in fast vs every peel piece. A smoothie with garlic and lentils removes all temporary pungent taste or 3 second pain on the tongue that occasionally develops when eating raw garlic; the smoothie also leads to far less odor too (which goes away after using mouthwash if a lot of garlic was eaten in the smoothie). JSFA 1972;23(7):871-7 found that garlic peel has 27% pectin, 11.4% rhamnose, 5.6% galactose and the rest other lipids, proteins, polysaccharides, mannitol, lignin. JAFC 2003;51(25):7313-7 found 6 powerful antioxidant phenyl propanoids (common in many plants) in garlic. Citrus peel white pith also has 30-45% pectin, a powerful chelator of heavy metals. The peel of apples etc contains 10 times the phytonutrients, pesticides, antioxidants of the fruit itself. Unlike apples, garlic has almost no pesticides, so garlic peel may be OK. People use garlic/onion peel for therapeutic teas.

FDA regulation of oxidized cholesterol (present only in animal foods), oxidation byproducts, AGEs in foods is not there yet. To prevent *atherosclerosis, the # 1 killer worldwide*, oils are best never used or used very little (basic processing introduces oxidation products, beside light during storage) and added to foods AFTER COOKING, since they have 200-1,000 times more AGEs than bananas and cooked rice (AGEs form free radicals that oxidize LDL and build plaque). Alzheimer deaths are up 89% since 2000. Perhaps 10 year olds who eat a lot of oxidized fats get silent white matter strokes leading to autism via a less common route: inflammation plus silent stroke. Oxidized fats don't mean just oxysterols from the oxidation of animal foods, but oxysterols generated endogenously (inside the body) as a result of an increase in oxidative stress from eating aluminum, mercury from amalgams, AGEs (Big Mac has 115 times more AGEs than Amy's vegan burger), heat oxidized *vegan* sugars, heat oxidized *vegan* unsaturated fat from junk potato chips and fried foods, so inflammation of body and brain swells leading to autism, Alzheimer; *oxidized cholesterol can cross the blood-brain barrier while cholesterol can't*. 27-hydroxy cholesterol (27HC) is an oxysterol (from diet or from cholesterol metabolism) that is found in higher amounts in the Alzheimer's brain, and it can get there from the oxidation of internal cholesterol or from the diet ► JLR 2004;45(1):186-93. "27HC also acts as an endogenous selective estrogen receptor (ER) modulator capable of increasing breast cancer growth and metastasis" ► ERC 2017;24(7):339-49; more details on 27HC causing breast cancer is in this 7

min video summary of 27 papers. These oxysterols generated inside or from cooked meats, fish, dairy, cheese, pizza, etc might also form atherosclerotic plaque leading to angina after eating a fatty meal due to increase in blood viscosity after a fatty meal. ☺☺☺

AB 312(2):217-23 found that arterial plaque contains 20 times *more cholesterol and* 45 times *more oxidized cholesterol* than normal arteries. "*COPs* (cholesterol oxidation products, oxysterols) compared to unoxidized cholesterol have demonstrated stronger pathological and toxic effects by *at least* one to two orders of magnitude" (*10 to* 100 times) ► FCT 2010;48 (12):3289-303. As the 2004 paper above explains, *oxidized cholesterol can cross the blood-brain barrier while* cholesterol *can't. Oxidized cholesterol, not* present in *vegan* foods, but abundant in fast foods with meat, eggs, fish, ghee, cooked butter, milk powders, *pizzas* (cheese) may be one of the reasons for the sharp rise in autism, Alzheimer (brain inflammation) since 2000. See this 5 min oxysterol video. Fast foods is a misnomer, since you wait 5-10 minutes in the drive-thru at dinner and lunch; and spend 5-10 minutes in traffic to get to your favorite fast food place; total is 15-40 minutes daily; at home, you can make a smoothie in 5-10 minutes in the morning, place it in a food box and eat it at lunch, dinner, since you can add cooked lentils to the smoothie for protein, that you cook weekly (together with any other sources of protein) in a pressure cooker under water to avoid AGE formation, takes 3 minutes to press a button and load them. Hey that's 5-10 minutes at home/day since you got to shop for lentils, *fruits and veggies once a week, not 15-40 minutes/day for "fast" food*; at home: 100 times less AGEs, no vitamin K lost (opaque container), no cholesterol if *vegan*, *100 times less oxidized cholesterol maybe if not vegan yet*, healthier and cheaper. If you go out to eat fast foods, choose the ones that are *vegan*, or if not vegan yet, the ones that use the least dry heat (even if *vegan*), as dry heat is forming 100s of times more oxidized cholesterol (animal foods only) and AGEs. ☺☺☺

For example, Jersey Mike or Subway take the water cooked meat and place it there on a sandwich, but pizza spreads the cheese and meat in ultra thin slices that get high dry heat. This heat can basically destroy your brain, a typical pizza got 758 times more AGEs than cooked rice. ☺☺☺ Oxydized cholesterol is found ONLY in animal products, especially barbecue, fried foods and dry heat cooked stuff like pizza, burgers, etc; dry heat cooked (oven, etc) foods with calcium rich dairy, and cholesterol rich meat-dairy have vitamin K destroyed (very light sensitive) and cholesterol oxidized, leading to a dead and rapidly shrinking brain, literally, as blood flow is blocked by plaque. It's important to think twice before eating pizza, or choose *vegan* pizza at least, because unlike water cooked meat or a sandwich, the tiny slices of meat increase contact with oxygen, and the spread dairy increases contact with oxygen leading to formation of oxidized cholesterol than other forms of cheese or meat consumption; light exposure also increases due to dramatic surface area increase of meat and dairy in pizzas, and this destroys vitamin K too. Teeth/bone problems appear when calcium goes in the arteries and pineal

instead of the teeth and bones, due to low vitamin K in dry heat cooked foods, also loaded with lethal oxidized cholesterol. Everyone wants strong bones and teeth, but without brains, we're dead. The obsession with calcium/dairy without vitamin K can thus be deadly. ☺☺☺

Without vitamin K from greens, natto or vitamin pills, processed light exposed dairy is deadly, as calcium goes to arteries and pineal, not teeth or bones. Vitamin K section explains it can take hours for milk jugs to lose all vitamin K. This is why many are shocked that people with highest dairy intake often have highest osteoporosis, the dairy had no K, diet no K, it only increased body acidification. In a Civilization of Immortals the sale of foods cooked with dry heat would be illegal, just as FDA banned trans fats, since dry heat destroys vitamin K, oxidizes cholesterol faster and makes anything with meat and dairy a lethal poison that makes living to 120 even, let alone 200, impossible. But how can that be? You would need to reform all food industry to cook all meat in water to prevent AGE and oxydized cholesterol formation, ban all cookbooks with frying (even French fries), barbecue and dry heat, hard to do in the cultures of "freedom is everything, longevity is nothing". Basically, to achieve results in engineering, you have strict parameters for every component, not much freedom to choose. The same applies for engineering extreme longevity, you need some restrictions, otherwise chaos and aging are natural. It's not that hard, just replace fire grills and all junk food burger flipping plates with pressure cookers using water for cooking and you get longer healthier lives for all people. Incidentally we're made of 70% water, not fire; cooking with water seems more human friendly? People need to choose: tasty food and 80 year lifespan or healthy food and 120 year lifespan. Tasty is subjective: due to cultural brainwashing, people link taste of toxic burnt compounds to happiness, as the first instance happens in a happy childhood moment and brain recreates that illusion. In a society where cooking is different, tasty has a different meaning. Oxidized cholesterol doesn't just destroy the brain, but every organ which gets diminished blood nutrient flow. You don't believe me? Watch what cholesterol (in animal foods only) and calcium do here. Our body makes all cholesterol it needs. ☺☺☺

There is some hope though for pizza lovers: *vegan* pizzas are not healthy if they use fatty *vegan* cheese and vegan meats; dry heat creates AGEs too, even if no oxydized cholesterol; *vegan* pizza is healthy if made in a special way, with low fat, humus (chickpeas puree) not *vegan* cheese, more veggies, moist heat, low temp by a person knowing how to reduce AGE formation 50-100 fold; no such pizza was ever made by a company; lentil puree and spices and steamed veggies, onion, garlic on top and minimal processing of the bread; choose low 10-70 AGE units foods (always lowest values in any category, only few items with AGE 70-250) from Table 1 to make your home made low AGE☺☺☺ pizza more often and to prevent living 1-25 years shorter (1 if rare junk food eaten, 25 if tons of daily junk eaten and body doesn't adapt); the "nutrition education and biochemistry IQ" of restaurant owners is so low, so with some papers you can

outdo them 50 fold AGE wise. 5 minute healthy pizza: take some pita bread with minimal brown spots (avoid brands with burnt spots as those contain carcinogens; put on top of it cooked lentils, slices of carrots, butternut squash, onion, garlic, some mustard, red cabbage, kale, place in a pressure cooker for 2 minutes until pressure builds up to soften the veggies and steam them. Eat it, it's way healthier; best is to get a gluten free pizza bread, they sell those or can make it at home, to avoid issues in some allergic people. ☺☺☺

Another atherosclerosis cause is TMAO, trimethylamineoxide, a metabolite of carnitine (found in meat only), choline (found in meat/eggs mostly, but also in legume, veggie, pollen lecithin). Intestinal microbial metabolites are linked to severity of *myocardial infarction* in rats ► PO 2016;11(8):e0160840. "Intestinal microbiota metabolism of L-*carnitine*, a nutrient in red meat, promotes *atherosclerosis*" only in *OMNIVORES* ► NM 2013;19(5):576-85; as Fig 2 shows, *vegans lack the microbes to produce toxic TMAO once given L-carnitine*. "a striking increase in d_3-TMAO generation was *observed in omnivores over vegans/vegetarians* (>20-fold; P = 0.001) following oral d_3-l-carnitine (deuterated) ingestion" ► JCI 2019;129(1):373-87. *These 2 studies defined vegans as vegans for more than a year, while other studies may call any omnivores eating plants for 5 weeks a vegan, which is wrong and will lead to more TMAO generation* of course; for example, a tiny study of only 2 pages (most papers are 7-30 pages), Circ 2017;135(17):1671-3, gave 450 mg choline/day to 8 "vegans" and 10 omnivores and both had TMAO increase 10+ fold, but there is no data on the study design and "*vegan*" verification; *that's probably why some studies get a tiny (still lower than omnivore) TMAO production after carnitine/choline/lecithin [lecithin is diacylglycerolphosphocholine or* R_1-C(=O)-O-CH_2-CH(O-C(=O)-R_2)-CH_2-O-P(=O)(O^-)-O-CH_2-CH_2-N^+(CH_3)$_3$*] intake by vegans, some vegans were short-term (not long-term) vegans who skewed results to higher levels from 0; this is a real issue in vegan studies, many fail to make sure the vegans were vegan at least 5 consecutive years prior to the study, or* did not take animal origin probiotic pills that changed microbiome to omnivore partially, *vegan for 10 years in the last 20 (*since most people don't become *vegan* suddenly, they first go vegetarian, then vegan for 4 weeks, then go back to vegetarian and oscillate on-off dairy 5 years, until finally moving to vegan only for 5+ years*); plus, people often lie about their eating dairy at times, or forget; pay attention when* reading study design how long the *vegans* were vegan for, how they *verified* it; otherwise, you can't really know what vegan diet is like, with the 3 month "vegans". ☺☺☺

An ever bigger issue with "vegans not being vegans*" in studies is that many vegans are not very careful reading labels of the enormous amount of junk or processed foods they eat (I eat 0 of that), so sometimes a company, just like Pharma ones say "no preservatives" on eyedrops, sneak in a chemical under a different name that those who don't know chemistry don't recognize is the same BAK preservative. The food industry is not required to list EVERY ingredient, so processed*

foods can be marketed vegan or deceptively "plant-based" (which can mean 80-90% *vegan*, it's mostly "plant-based" indeed) to increase profits when they're not, since it's too costly at times to remove some contaminant. *The supplement industry (GNC, Target, Walgreens, Walmart items) was caught* selling fake herb supplements, where 79% didn't have what's on the label*, or had cheap substitutes.* So they put some ingredient that is contaminated with animal microbes (or vegans swallow or chew animal gelatin of vitamin pills, which can have animal microbes); if vegans eat that "vegan processed food" a lot, their microbiome can shift towards omnivore a little and they produce TMAO a little, ruining the study. The more vegans eat out at "vegan/vegetarian" restaurants (FDA doesn't inspect restaurants to verify *vegan* meals are vegan, unethical owners can make "fake vegan entries" to increase sales) or normal ones offering "fake vegan" entries (not really *vegan* always), the more vegans eat processed foods and not read labels (40 ingredients there, a little dairy sneaked in and he didn't read that, or fish extract in the natto (*people wrongly assume it's vegan always*), etc), the higher the chance they're getting animal microbes. Fecal transplant from vegans doesn't change TMAO production much, since the vegan microbes are immediately outnumberred by omnivores ones, so one needs to change the diet to *vegan* ► JAHA 2018;7(7):e008342. TMAO doesn't just destroy all organs via atherosclerosis and thrombosis (blood clot creation), *but plasma* TMAO *jumps 12 fold* ☺☺☺ (3.5 µM to *43 µM*) *after 3 months of giving 1 g of carnitine to omnivores*; "plasma levels of carnitine are dose dependently associated with incident risk for ...myocardial infarction (MI), stroke and death... the adverse risk associated with plasma carnitine levels is only observed amongst those who concomitantly have elevated TMAO levels" ☺☺☺ ► MGMR 2018;15:130-3. This is why red meat (which contains 3 times more carnitine) is far more deadly than chicken/fish (people may lose 9 years of maximum lifespan too, not just being sicker in old age). If *vegan* this would not occur. We hear about "supplementing with carnitine, choline, lecithin" sometimes, but we can ask, at what cost? Is the cure worse than the problem? Having 12 times more blot clots and atherosclerotic plaque generated by TMAO, who knows what % of total clots and plaque is caused by TMAO? TMAO also attacks the kidneys possibly causing renal fibrosis ► "TMAO is cleared by the kidney... Within *CKD* (*c*hronic *k*idney *d*isease) subjects (average TMAO *7.9* µM *vs 3.4* non-CKD subjects), higher (fourth (≥ *12.4* µM) versus first, (< *5.2* µM) quartile) plasma TMAO level was associated with a 2.8-fold (*1.93 after adjustments*) increased mortality risk" ► CR2015;116(3):448-55; even the non-CKD cohorts had 47% higher mortality (after adjustments) if TMAO was > *5.3* instead of < *2.3*. "High plasma TMAO levels (average *5 µM vs 3.5 µM* in normal subjects) are observed in patients with HF (heart failure) and elevated TMAO levels portend higher (*double*) long-term mortality risk independent of traditional risk factors (and renal function)"; TMAO ≥ *8.51* µM meant *3.4 times* the risk of death vs TMAO < *3.03* (*2.2 after adjusting for confounding factors; in studies, the confounding factors are not always confounding, the lower GFR is often caused by the same TMAO*) ► JACC 2014;64(18):1908-14.

Among heart failure patients, "TMAO levels were significantly higher in patients with diabetes mellitus (9.4 vs 4.8)" ► JCF 2015;21(2):91-6. TMAO destroys the pancreas/brain too, the blood vessels there, via atherosclerosis, so insulin production, memory, glucose management weaken. All diseases are worsened by TMAO atherosclerosis, since all organs are nutrient starved by the 2 to 10 times lower blood flow, so mortality goes up. We keep track of sports scores, not TMAO. It helps, if not 100.% *vegan*, to monitor TMAO if taking carnitine/choline pills.☺☺☺

11.15.4. ► Curing Crohn's disease, asthma, multiple sclerosis, Hashimoto, lupus, arthritis, proctitis, psoriasis, epilepsy, eczema, fibromyalgia, celiac disease, depression, chronic fatigue ◄

16.3 explains why going vegan cures autoimmune diseases: omnivores have leaky gut often, so animal proteins leak inside the blood (normally only amino acids, or 3 amino acid peptides can), T cells create antibodies for them and attack them in the entire body, so atherosclerosis is often an autoimmune disease caused by the eating of animal arteries proteins that leak and then the body attack proteins of the arteries, causing plaque, since they're almost identical to human. Asthma (lung), brain diseases (multiple sclerosis, meat has nerves (myelin is 30% protein dry weight (MPZ, MBP & MPP) and body then attacks the myelin sheath), thyroid, liver, kidney, heart valve etc diseases can be caused by eating the animal organ proteins that then get attacked. Dairy also has proteins similar to human ones (even men can produce milk, especially women) and can cause lupus. So if you eat anything non-vegan, eat something furthest from humans, like tiny krill fish (smallest fish you can buy, 1 cm), etc. A Lupus reversal specialist Dr Goldner veganmedicaldoctor.com with lupus from 16 to 28, got rid of LUPUS in months by going *vegan* (lots of greens), besides losing a lot of weight and returning her cholesterol to normal, becoming a doctor and giving birth to a son later without any problems, which is not possible usually for people with lupus. ► 20 min video. She has a curing lupus website too goodbyelupus.com. A lady got relapsing polychondritis (similar to lupus, autoimmune disease), which vanished after 3 weeks of going vegan from vegetarian, as dairy caused the autoimmune attacks. Curing *multiple* sclerosis (not able to walk properly, now she can run) and *Hashimoto hypothyroidism*, losing 80 lb with a no salt low fat raw *vegan* diet within 18 months (5 years of *vegan* diet prior did not do this, only raw *vegan*) ► 6 min clip. Dr. Sam drsampt.com cured *chronic fatigue and proctitis* via raw veganism ► 4 min clip. *Autism* cured by mostly raw vegan diet ► 3 min clip. Audrey Voss had *rheumatoid* arthritis, couldn't put shoes on, move her fingers well, or even walk; she did a 5 day juice fast, then went raw *vegan*; 1 year later she completed a triathlon ► 2 min clip. *Epileptic seizures*, low energy (could not help his mom carry things up the stairs), *suicidal tendencies* (tried it many times) healed by 6 months of raw veganism ► 6 min clip. *Eczema* disappeared via raw veganism ► dehappy5.com, Ullenka story, Laura story and Sarah story. Fibromyalgia, arthritis, *depression*, extra weight gone via raw veganism ► 4 min clip. ☺☺ Multiple sclerosis and losing 135 pounds via raw veganism ► 3 min clip. See also this 12

min one about multiple sclerosis and veganism. Rebecca cured MS ► 13 min clip. *Depression* cured via raw veganism ► 5 min one. Lupus cured with 3 months of raw veganism, after 90 days her blood looked like that of a 16 year old ► 8 min clip and she was so changed, that she started a raw vegan restaurant in 2008. Lupus caused *psoriasis, dialysis* gone ► 4 min clip; high insulin ► 5 min. *Asthma* cured with a *vegan* diet ► 3 min clip. Vegan lost 125 lb in 5 months via raw veganism ► 3 min clip and raw2therescue.com. Meat eater *lost 215 lb via* raw *veganism* ► 10 min clip. Heather *lost* 300 *lb* by *going vegan* ► 50 min clip. *Crohn's* disease cured via 9 months of raw veganism ► 2 min clip. Lose 240 lb in 9 months ► 9 min clip. *Celiac* disease gone via raw veganism ► 1 min clip. *Candida* gone plus amazing energy on raw *vegan* diet ► 1 min clip. Raw *vegan* athlete eating 90% fruits, 10% veggies runs 150 miles ► 3 min clip. 74+ year old raw *vegans* look decades younger ► 34 min clip (ann..ns.com) & 26 min clip (youngonrawfood.com)

11.16. Avoiding nutrient depletion thru meditation

The meditation is a million times more ecstatic than sex section explains in detail that the human reproductive liquids contain *substances* that, if lost frequently, as in daily sex, can deplete body reserves of *nutrients* (essential fats like DHA-EPA☺☺☺, amino acids, enzymes, cofactors used in body repair) used to make those *substances*. This *can lead to the body's inability to replenish* those *nutrients*, if *mild deficiency exists,* shortening the lifespan. See 13 reasons for abstinence. Not all vitamins, cofactors essential to living to 400 are known; some may be lost by *frequent* sex. Animals (turtles live to 400) don't have sex daily. Plus, it's more selfless to help 1 billion people live to 200 or 7,000 live to 99 in health than just help 1-2 people have fun while living short lives. Avoid erotic media or touching erogenous zones too much if you massage frequently feet, hands, body to lower cortisol as it can cause sperm build up/night emissions.☺

11.17. Eye health, nutrition thru the 100s of natural tear nutrients (how to prevent floaters, dry/red eyes, eventually stop using eyedrops)

This 390 page subchapter is for the digital era of saline eyedrops and "blinking less by staring at devices, atrophying the lacrimal and tear oil glands, increasing eye inflammation as dust/dirt aren't cleaned/drained in the nasal duct". People go to dental office to clean/check teeth, they spend a lot of time to learn how to maintain their house, car, garden, flowers, computer, phone, gadgets, everything, but nothing about learning how to maintain eye health, prevent eye dryness, redness, eye gland atroghy, they never go to check/unclog Meibomian Glands MGs or do home cleaning, the key glands that, together with lacrimal glands and others secrete 2100 chemicals to maintain eye health, keep them moist, lubricated. Without eyes, we can't do anything. Same thing for other areas of health. 0.5-2 billion people got (more when all live to 120) mild or serious dry/red eyes, leading to faster eye aging. Check the 10 page humidifier,

humid climate section to relieve eye stress. A study found 72% of adults, 42% of kids have meibomian gland dysfunction, MGD, i.e. eye malnutrition. ☺☺☺ The sections below show how we can fix it without artificial tears (with side effects), while developing discernment (7 page paragraph) about fake news and partially fake public realm papers and ingredients, while the real studies without disinformation, obfuscation, fakery, etc are obviously not public, since there is no peace on Earth, and tech has dual use: any info about eyes can be used to design bioweapons that infect millions with viruses that damage health or lower IQ, so companies use 'it's a trade secret' to hide info. So when reading papers linked in this book, it helps to know all Internet/Journal papers are a mix of omission (up to 99.9% of knowledge), obfuscation, fakery, disinformation to protect intellectual property, real ingredients (not listed?). We can read between the lines, use 20x mirror before and after every eye product use, and get a feel of how many centuries we have yet to develop tech to make decent natural like eyedrops:

11.17.1. Urgent actions when eyes are dry/red: humidifier, regular 8 hr sleep, 20x mirror, $ 0.50 moisture retaining eye night mask, $19 daytime wrap around foam seal safety glasses to reduce use of 80-100% nonsaline tears in 3 days for all (even the 1% with fully dead lacrimal gland). ☺☺

11.17.2. The 3 layers (with 2100+ nutrients) in tears; how to yawn to generate tears (minimize artificial tears or use saline only) containin 2100+ nutrients, versus 4-10 in artificial tears: keep all artificial tears/saline vials in the fridge, since microplastics leach far less in colder temps.

11.17.3. How preservatives ruin the eye + 15 dry eye ointments, 19 eyedrops with lipids for 86% of dry eye patients with lipid deficiency, 63 eyedrops without lipids & 9 salines (NaCl+H2O only)

11.17.4. Which buffers match your natural pH (citrate, Tris, borate, phosphate, lactate, etc)?

11.17.5. How redness relievers cause rebound redness, dryness, ocular damage long-term; alternative to redness relievers like cold compress, cold compress + eye ointment + tear combo; mildly cold compress reduces inflammation, brings water on ocular area & silicone seal can evaporate it to hydrate eyes without saline, drops, gels, just water vapor; *by training lacrimal nerves to release tears when cold compress comes*, via simulated yawns, etc we can create lacrimal tear release reflexes that ensure hydration of endogenous and exogenous (vapor) type.

11.17.6. How to put eyedrops easier than ever before (never miss) with a $5 bottle/vial guide

11.17.7. How to take pics of eye nourishing eyelid Meibomian Glands (MGs), how to do warm compress, MGs expression at home to unblock, regenerate them; how to cure MGs Dysfunction or MGD, with NuLids, TearCare, Keratograph, MiBoFlo/MiBoCam, LipiFlow/LipiView, iLux, IPL

11.17.8. How to protect eyes from oxidative damage done by UV, blue light, wind, air pollution

11.17.9. How to require moisture glasses, info on dry eye prevention to be in every drug store

11.17.10. Punctal plugs, treating styes/dry eye with light, antibiotics for MGD, stye, pink eye

11.17.11. How photons, vitamin A, electrons help us to see and how to prevent eyelid swelling.

11.17.1. Urgent measures besides humidifier, yawn tears, saline drops, 20x mirror, meibograph pic, warm & cold compress, sleep=eye repair, bad sleep = 70% fall in T cells, 20+ other actions

►►► 11.17.1.2.1. Use daily: *Moisture retaining night eye mask*

►►► 11.17.1.2.2. Use daily: *Moisture retaining daytime glasses*

Since all artificial tears are in plastic containers, the microplastics leach into the drops and eyes and can cloud your cornea, leading to the need for glasses or eye cancer. Moisture retaining glasses can distort vision slightly too, if cheap and not high quality glass. Therefore, it is eye saving to build a cubicle around your bed and desk, using foam boards and tape ($1.25 foam boards from $ stores or pack of 50 google search or eclipsusa.com 65$/50 pack can use even aluminum on one side to block RF if too high, 3.2 mil 8"x150ft aluminum tape covered with 8”x435ft clear tape) in order to create an artificial 80-90% humidity inside as found by the ocean in California summer, with a simple humidifier, that is not ultrasonic, as ultrasonic ones bring microplastics and scale particles (white dust that ruins lungs) into the air, causing eye, lung damage, infertility, cancer and possibly death 30 years sooner. The safest humidifiers may be the ones without ultrasound, but only boiling, use alcohol prep pads (100/1$ at $ tree) to wipe parts clean, and without the ozone and oxidized air chemicals from UV humidifiers that ruin the eyes and lungs too, poisoning the blood. For 30+ pages on humidifiers, click here. ☺☺☺

11.17.1.1. First urgent action: keep eyes moist always during the day: happily, kindly, gently *yawn* to induce tears as the yawning section explains, to provide immediate relief NOW, don’t let eyes be dry and deprived of the 2,000 unknown or known tear chemicals. Repeat when dry. Sleep if few tears come, since being tired prevents copious tears; watch in a mirror how eyes became less red (typical of dry eyes). Buy a $10 20x mirror which is worth trillions, because it helps us test every new *drop* and *bottle* we buy, prevent damage that costs trillions to fix at our current tech level; it seems far safer and ☺☺*lovingly gently* kinder☺☺ to not sit too close to the 2700K lightbulb, to avoid too much ocular stress from the light. A future device could allow us to see things even better and safer. I also bought 30x, 40x, 30x/60x, 100x, 200x mirrors on Amazon to hold to a phone camera and then look at the pic on the phone screen in a mirror to get the 40-100x image of the eyelash roots, to check for blepharitis, Demodex infestation, take pic to send teladoc.com for instant prescription or consultation (or your insurance offers telemedicine

in the search option, choose the best MDs, not ODs, from USA on the network to ask who receives samples you took of your eyelid oils, styes etc or whatever, since teladoc uses few doctors), etc and pic the eye in general; you can do the same; I bought a lot more magnifiers, but these were the most useful ones that I did not return. This is harder to do, the 40-100x, as it requires you to hold the phone and tiny magnifier attached to the phone, and then move until resolution is good. The 20x is instant, as it's fixed and you need nothing else. This also tells us how good our sleep is each day: bad sleep means damage to every cell of the body, some of it irreversible; look at the eyes each morning, and evening at least, for 1 second, *eyes mirror our entire body: how healthy is the white of the eye?* Many drops (Refresh Optive, Hylo Gel/Care, etc) are gel-like or thick, so they *can block the nasolacrimal tear drainage ducts at night, make the eyelids sticky with thick lubricants, form cornea ridges of lubricant (HA, CMC), even during daytime if using cold compress or taking a nap, ridges that cause 'foreign body sensation' inflammatory response, leading to red eyes in the morning similar to having an eyelash inside*.

Only use any drop, gel, ointment *@ night* after testing it 10+ times *during* 10 *days* by 20x mirror checking eyes *20+ times/day*, and then during *5 daytime naps* to *check effects* during 1 hour of no blinking *(since* this increases contact time 100 fold *and allows to see if that drop reddens eyes or not after 1 hour; if 1 hour test passes with no redness, also test it twice for 2-3 hour naps (or weekends after waking up early to drink water or pee and going back to bed) to* make sure eyes are not red *or uncomfortable; if red, don't ever use at night, since 8 h is longer than 1 h or 3; it simply means your eyes can't tolerate that much exposure);* if you use thick drops at night, first times of testing, always blink 30 times at least before going to bed and squeeze eyelids so only 10% remains to test the effect of 10%, *so you don't damage eye if allergic to it during sleep; if you use thick drops at night without squeezing a little,* each morning clean eyelid MG orifices of sticky *dried* drops if any, to get lipids flowing. Let eyes blink for 2 hours before daytime testing again to avoid irritation or damage with weirder thicker drops that take longer to wash out; *at night, we* don't blink *and* exposure *time to chemicals by ocular* cells *increases* 900 times; test all drops 1. *morning*, then 2. *afternoon*, then 3. *evenings* (less time to blink, generate tears to wash); if OK, move on to testing for 4. 1 hour *naps*, 5. *2 hour* naps, 6. 3-4 hour naps or late morning oversleep, then 7. finally short night: *6-8 hour* max first 8. long sleep 12 hour. *The* drops *that* cause *no* redness *or* discomfort *after* night *use,* are *the* ones *that are* safest *to use* during *the* day *too, it* means *that* they *cause the* least *unseen* damage *that is so small it takes* years *to notice its* effects *and you will blame it on 'bad sleep' or* else. When I say night I mean a night when you sleep well, relaxed and don't blink, not a hectic night of anxiety and blinking that pushes all drop or ointment out fast. ☺☺☺

Blinking a lot is leading to wrong conclusions about the safety of products, hence companies could be required by INA or FDA *to write* "We are in the stone age in the Pharma industry.

Centuries away from making a drop with the 2000 chemicals in natural tears that expires in 3 days not 3 years or months. As such, we suggest you read the INA PDF on how to use other methods than toxic poisonous drops we sell, which in future centuries are called poisons. *But if you tried everything else, please see side effects and potential toxicities in the attached 100 page PDF at this website, and do a test before using this eye drop or gel, ointment with eyes closed for more than 5 minutes (especially at night or naps): sit with eyes closed 5 minutes first (then 10, 20, 30 minutes), relaxing or napping or listening to relaxing music and then see redness with a 20x mirror (since 1x shows almost nothing clearly) and comfort level. Other drops with polar lipids may increase cornea permeability to these toxic ingredients, so wait 2 hrs between drops ideally after you have been blinking a lot and washed out the other drop well. If no discomfort or redness, these poisons may not be as damaging as other drops for your eye biochemistry. But try use saline when possible.*"; just like cosmetic companies write on some products instructions "do an allergy test first, to see if your skin tolerates this", cornea is like the skin. ☺☺☺

***In studies they don't account for the confounding factors of 1. nasolacrimal duct partial blockage, 2. blinking during sleep 50x more, 3. sleeping on one side (causes the eye opposite to the side to have the stuff fall out of the eye more into the nasal corner outer area) for some people, so they lead to studies with different conclusions.* Alkaline drops are better used 2nd half of day when our pH is more alkaline. Since today you would not use eyedrops manufactured in the 15th century by clueless 'alchemists', which would be full of toxic compounds in plants and nonsterile, you would never put the 'poisons by 25th century standards' that we call 'artificial tears' in your eyes and if you had no choice due to inability to generate tears by yawns, etc, you would use 20x mirror to see 5 seconds BEFORE and 1, 3 and 10, 30, 90, 500 minutes AFTER eye redness, floaters, comfort and log it in into an Excel or other table you/NIH makes, to make it easy to test 10 times every new bottle, since human Quality Control is not that good (did temp during warehouse storage (Amazon?), shipping affect hot/cold weather degrading compounds?). Even for regular use of drops that seem OK, you would check BEFORE and AFTER with 20x mirror always☺☺☺, to enable you to see eye condition 10 times a day at least. ☺☺☺**

We want to compare apples with apples, not oranges, so to ensure that we're always looking at right and left eye with the same brightness of lumens, same angle, etc, we need dedicate a portable lamp, tape it to the table or counter or etc, fix some object nearby to support the 20x mirror in a fixed position and make a label for upper and lower lip that you bring your lip or other face feature to, to always look at it form the exact same angle and light level, to avoid illusions of 'it seems redder', which may be due to holding mirror further away, or using less light due to a different angle, etc. This taped to a frame mirror *(use a 2700K soft white bulb, to avoid too much blue light when so close)* enabled me to go from checking eyes once a day, and perceiving it as a hassle, to happily checking eyes 20-40 times daily sometimes when *testing new*

drops and effects of sticky hyaluronate *drops (watch the temporal eye corner when you blink and see if hyaluronate gel like sticky stuff is there after 5, 10, 40, 300 minutes to evaluate optimal hyaluronate drop viscosity and whether foreign body sensation, 'eyelash in eye' feeling exists for some drops due to extreme viscosity causing needless inflammation and cytokine storm, the effect of cold compresses and procedures, etc (like how cold compress solidifies o*r makes hyaluronate more sticky, etc). *Besides the* 1. redness test*, 5 minutes after eyes closed with a new drop (use phone timer, so all drops get the same exact 5 minutes, to have scientific comparison not subjective), we have the* 2. comfort test *(sandy, itchy, stings, burning, too thick?) and the* 3. floaters test: thicker drops form a 'contact lens' like film, which changes the neuroadaptation of the eye (*neuroadaptation is the process of eyes no longer seeing floaters; floaters disappear with good sleep; a vitamin blend Vitreous Health that reduces floaters has stuff in fruits and multivitamins: 40 mg C, 5 mg zinc, 26 mg* grape seed extract *(25 mg are* proanthocyanidins *(same* stuff in plum, blueberry)), *100 mg orange* flavonoids *60%* Hesperidin), which can make floaters more visible for 20 minutes: ***look at the white sink or a white surface and move eyeball left and right, before placing a drop and 5 minutes after eyes closed with that drop, to see if floaters are more visible; this will tell if the refractive index of the drop is similar to that of natural tears or if anything unusual happens***.

For the sake of your own eyes having a simple to use 20x mirror fixed workstation (5% the lamp, 1$ a frame or object support, 9$ mirror) that you can use quickly while sitting is important: it helps you do many things related to eyes, remove eyelashes, express glands, trim eyelashes, etc very fast and safer, to evaluate which drops are most compatible with your eyes the most, etc much better. It's very important to check eyes 10 times when using new drops, 1, 2, 5, 10, 20, 30, 45, 90, 300, 500 minutes after a drop, gel, ointment and repeat tests many times to get objective data not weak conclusions based on spare data. Fixed 20x mirror also helped me to discover 9-16-21 how most redness of the eye, the tiny arterioles are on the conjunctiva (33 µm, vs 70 µm for human hair), while the big thick vessels are on the cornea; you can see that yourself by using 20x mirror and moving eyelid up and down to see which arterioles are moving. This shows us the conjunctiva gets irritated fast and you can see how easily the redness relievers or any drop can shrink both cornea and conjunctiva cells. You go to doctor, he recommends a drop, then you use more care before the 1-2 month check-up that reveals an improvement in some parameters like tear duration, etc - but this is superficial, since it hides the long-term effects only you can see with your meticulous records before and after each drop use, in a normal stressful day, not tear break up time increasing 50% before appointment due to using drop right before it, etc and treating eyes nicely last 2 days; long-term effects are often hidden by one test of ocular status.☺

Why be naive and believe the info or lies Pharma marketing departments deliver (they don't tell people to use 20x mirror to see what drops do to their eyes.), why not do your own research too

and 'quality control'? They don't know everything and they often hide more than 98% of what they know, publish what they wish, never tell us much about what is inside, what properties it has, MW of polymers, concentration, *etc. We're left in the dark, easy to manipulate and deceive, victims of the state of eternal war where everybody hides and obfuscates info*, afraid others will use it to create lethal viruses, weapons via eyedrops or any medical tech. Pharma hides info not much because they want profits or don't care, but often because any knowledge of eyedrops or anything medical has dual use: it can be used by foreigners to slowly exterminate others. They don't want people to know how bad some drops could be, since nobody would buy them. *I even put a mirror near my computer to check my eyes at 1x every half hour or so and a 20x mirror with suction cups stuck to this mirror to check eyes at 20x easily by moving head slightly, and take computer breaks, use cold compress when they get red.* ☺☺☺

$ stores have 10x mirrors that you can place in more places to remind yourself to check eyes at 10x at least and if redness, then check 20x to see; eyes can get red before you feel any dryness or discomfort, so mirrors can help you a lot to keep eyes healthy. After you use it a little, the light from the bulb can cause the transparent light reflecting edge of mirror (if your mirror edge is transparent) to appear as a reflection of a circle around your pupil, which may scare the hell out of you when you first notice it, it's nothing wrong with your yes, just a reflection that moves as you move the mirror. It may thus be better to get a mirror with a solid color edge. *It's ultra critical to check eyes with 20x mirror when waking up*, to see which vessels are red and know if it's degree 1, 2, 3, 4, 5 of redness (each degree has specific arterioles red that you know get red only at that level) instead of somewhat red (more scientific, you can also do it at 5 am when you go pee or drink some water in the middle of the night to evaluate how well some ointment or drop combination or night moisture mask worked). This also helps because 1x doesn't allow you to see small mucus bits, because if you placed any somewhat new drop (*sticky hyaluronate*) or ointment and the eye doesn't like some ingredients, it will secrete protective mucus that merges with the ointment or gel, transforms it and is coming out of the nasal corner of the eye; the mirror allows you to see if any mucus is still left in the nasal corner and remove it with some saline solution. You don't want that mucus to be there for hours of the day as it will cause unnecessary redness and inflammation that prevents the healing of cornea due to dryness caused damage during night dryness. ☺☺☺

We can see redness at 20x, tiny unhealthy blood vessels appearing and beginning of dry eyes 20 years before dry eye symptoms (*or endless diseases caused by bad sleep that makes eyes visibly redder only on 20x mirror*)☺☺☺ appear, you can't do that with 1x; *this $2* mass produced mirror saves society *$2 million* in healthcare costs (to keep someone alive to 90 or 100 in decent condition, *delaying aging diseases by 25 years*) *per person if done from age 5, teaching good sleep, eating, exercising, digital screen habits from toddler stage*; for 100 million people this is

$200 trillion saved; the mirror tells you when it's time to practice universal loving kindness towards yourself and get some rest and/or stop any activity that made eyes red: eyes reflect cardiovascular health thruout the body and it's atherosclerosis, inflammation that kills most humans. Our health is worth 2 seconds/day. 2 seconds a day for 75 years can mean just 15 hours, but can add 40% extra to our lifespan, so we live to 105. If we can't be *gentle tender soft* with self, we can't be so with anyone else; if that's not enough, the burden to society from preventable diseases and short lifespan is worse than world wars.☺ The mirror helps us to reverse aging, to go back to how eyes/body looked like, to restore the Lepton-Quark-Boson-Immortalion Chart: future tech takes a 'mirror' pic of us to bring a younger state. Letters in *mirror* are first of Immortality.☺☺☺

11.17.1.2. Second urgent action: keep eyes moist always using the night moisture mask (2.1) and day moisture glasses or 'mask' (2.2): these masks need to be sterilized or cleaned as much as possible daily, to avoid bacteria contamination of the eyes. Until they make something easier to use with something that is peeled off daily and discarded or easier to wash, be careful with this, to avoid eye infections. The reasons medical companies don't make these masks (only tears) may be, besides making 30,000 times less profit by simulating a more tropical weather around our eyes, 1. it's hard to motivate people to place the future 3D printed custom fit masks into a sterilization solution or to do what we're supposed to do with existing masks sold out there: wipe them with 65+% alcohol moistened STERILE, q-tips (2000/40$ or sterile alcohol pads (buy online, free ship if 10 packs) even better (use only for 2 swipes, as more swipes will get fiber inside eyes), since no q-tip cotton fibers get stuck on lenses to fall into eye and make it red) daily or at least tap water wash (if rubber or silicone) to remove nightly eyelash, hair, dirt, buildup and make them shiny and clear again, dry them with a clean towel or let them dry a few minutes before putting them on; 2. due to water vapor bringing bacteria from eyelid to the eye causing eye infection. However, if one would properly wash face and wear such goggles all the time, the contamination issue would not be there (millions of construction workers wear dual pane tight fit safety goggles that are worn 8 hrs daily (large version of dual pane here) under high humidity of the enclosed ocular area, maybe use a similar brand that works for your face, ***far easier to disinfect daily with q-tips than the home made masks below which are proof of concept***).☺☺☺

We see how hard would be to motivate people to clean the ocular area covered by such glasses daily properly and maybe even use a disinfecting eye drop to make sure no bacteria grows. On the other hand, imagine you live in a state with 2-3 times higher humidity than presently, then, the issue of moist air bringing bacteria exists too; even dry air brings bacteria and these glasses protect eyes from dry air bacteria that would otherwise soak our eyes in 100s of time more bacteria. Maybe it's too much work or too expensive to create masks that solve the issues, but at the level of tech today, it is easy to make something, it's just a lack of CEO motivation? Scleral

contact lenses (2013 released Daily Total 1, 2020 Infuse, 2015 AcuVision Oasys daily 'contacts for dry eye') for dry eyes don't have this issue, are tiny, easy to clean and sterilize daily, (or disposable, no cleaning needed, but cover only iris and a little extra, so dryness drops only 50-70%; most contact lens wearers discontinue soft contacts (not scleral) due to dry eye they cause, so they designed larger diameter scleral ones, filled with fluid, not for vision, but for dry eye; even those however don't cover the driest area of the temples, where MGs atrophy first), but bring another whole set of issues related to bacteria growth, protein allergy, restricting the flow of 100s of tear nutrients to part of the eye, causing faster ocular aging. Today we have no 0 effort/issue tech: all dry eye management techs require daily cleaning. ☺☺☺

11.17.1.2.1. ►►► $0.5 *moisture retaining eye mask* during the night ◄◄◄, is a cheap alternative to a more expensive modified tranquil eyes XL, which itself is useless on warm nights, even if moist, as it dries the eyes. Blinkjoy has 2 night masks too. You can also sleep on the back, with a plastic lens glass (sunglass version) of 20$ from the daytime section, that come swith its foam and you fill in the holes with earplug silicone to create a tight seal. This 20 pages below explain various possibilities for those who don't want to sleep with foam gasket plastic glasses on. Perhaps, for some people, the most effective mask at night can be the plastic sunglass Bollé Cobra with foam and some silicone, basically a day mask, dark to not wake up mornings, which works better than anything (*especially at preventing eye press via pillow which* may have led to *millions* of people going blind, since *300 BC when* soft *pillow* (hard ones came in 7000 BC reportedly) *was* invented, *thru crushing the* optic *nerve* 8 hours a day for the 70% of humans, who don't sleep on the back, *which causes* glaucoma) in the next 20 pages on warm and hot nights when all other masks dry the eye due to overheating it. When room humidity is low, yet you or room is not warm-hot, etc, the *moist* tranquil XL or the *moist* 50 cents mask is better, since it creates a ***microclimate of humidity without heat, so you can keep all by bedside and switch depending on heat/humidity***: *see* front and back pics of my September 2020 50 cents mask version, and the front of April 2021 thick version (thick *lasts 15x longer, how I wear it now, used a trimmed 3/8 inch wide foam roll, thick so it doesn't fall off at night when moving and compresses less)*, or front of untrimmed 3/4" wide roll May 2021 version, the longest lasting version (you need trim the upper 3mm in some areas at an angle as picture shows, more or less, depending, not the bottom, to avoid touching the eyelash when eyes closed; leave bottom so it gets a good grip and lasts 20x longer than 3/8" wide roll mask that keeps breaking and having gaps every 3 days), or the July 2021 version. ☺☺

You can also buy tranquil eyes XL, though you need trim foam inserts 50% (double the lifespan), to avoid eyelash bending (so you can make 4-5 inserts out of one). *For dry eyes,* sleeping on the back seems the best choice, *as you* don't squash/misalign the trigeminal nerve which controls tears, meibum expressions, mucin expressions (the 3 layers of tears). Sleeping on the back is also

the safest position for preventing strokes as it prevents turbulence in circulation (turbulent flow causes clots), because it doesn't block any artery, which can be fatal or leave you paralyzed or unable to speak for 40 years. *Eyelids stay closed (*especially if you try to smile, which I do to train myself to close fully, they close tightly*) easier due to gravity*. With back sleeping, you can wear the XL sleep mask, moisture mask without gaps, meaning you need no toxic eye ointment and drops at night, except some saline; a tiny gap of air forming at night while tossing on sides makes eyes dry, inflamed, red next day; to keep eyelids shut, only back sleeping allows a safe foam pad that can't touch eyeball; side sleeping makes that foam press on the eyeball, though foam needs not touch eyeball at all (my foam pad on XL never touches the eyeball). ☺☺☺

Back sleeping prevents thru not only crushing your optic nerve and going blind as a result, but also dryness, 100s of diseases born of dryness, infections, etc, wearing glasses due to pillow pressure changing eyeball shape. Many people sleep *with pillow under knees to relieve back pain.* Sleeping on stomach is not recommended by most MDs since it causes strokes, and crushes both eyes as you switch sides. For finding the best back sleeping mattress, etc you could try 1 or a combo of these toppers: inflatable air bed with built in pump (20$ only if you got a pump already) plus a 3" Sinweek mattress on top (less heating in warm summer, we forget how much environmental damage foam and spring mattresses do, as they use up so much material and landfill space (inflatables are recycled, just cut the pump if built in if they puncture, immortalists will make 100% recyclable mattresses), inflatable + topper better than everything I tried, works if you are low BMI), a very soft memory foam mattress topper like 2" fast 3 sec rebound greenish blue Linenspa (7 lb for 2", 11 lb for 3") or 3" Choshome green white 6.5 sec slow rebound (13.37 lb, 1.1 lb cover, 14.47 lb total) or rough foam (support to place under the soft one) 3" instant 0.5 sec rebound sky blue Secret foam (it's 10x tougher than Choshome, even if description says 'extra soft' 13.42 lb) or some firm 5-8 inch mattress (with only 1: of memory foam glued to 4-7" hard foam); instant rebound foams reach full size in 1 hr vs 12 for the soft foams (slow rebound).

If, due to a medical condition, you need side sleep, place the mask in a way that prevents pillow from pushing so hard that it makes the foam touch your eyelid, as that causes blindness over time, via retina damage. For more sleep ideas see video. 67% of people sleep on the side, so we need avoid tossing so that mask won't move and mask won't create air gaps that lead to dry eyes *in the* morning. Back sleeping can cause chronic back pain if spine is tensed, so do research pillow use etc. Back sleeping *prevents sinus congestion (*which diminishes oxygen, shortens lifespan*), neck pain,* teeth shifts (due to upper half pressing on the other, so center teeth get pushed in or out, or due to resting on the jaw while sleeping), wrinkles, face swelling, irregular heart beat (left side) and more heart work (it's pressed if left side), poor circulation/dizziness (right side, if (not in everyone) pressing vena cava, can shorten lifespan as oxygenation via blood flow is impaired, we need medical imaging to check vena cava). Back sleeping can cause low

oxygen due to lifting belly less due to belly fat; lose belly fat and lower dry eye inflammation caused by that fat. In 2022-6 I slept on the back again, as when a kid. AI will determine from imaging, etc the best (for each person) sleeping position to maximize lifespan at the 5 year sleep position exam. Change pillow every 18 months, due to microbe accumulation. Sleeping with high pillow on the back is the most protective for the eyes from all points of view: dry eye, glaucoma, farsightedness. However, pregnant women need sleep on the left ideally (or without a choice, as headache is huge) to prevent dizziness/'low blood to fetus' due to uterus pressing on vena cava last 5-7 months when fetus is larger (low blood can mean birth defects, low IQ, poor health, 20 year shorter life expectancy; this all depends on how much uterus restricts fetus blood flow – needs medical imaging while lady sleeps). Trim moisture mask well so at night the foam *never* presses on eyelashes, otherwise, it will change the direction eyelashes point towards and this could irritate/redden *cornea* or need eyelash curling or trim explained in the cold compress section. *Use neck pillow on top of pillow corner if a side sleeper to surround the mask, to avoid ever pressing with neck pillow or pillow on the mask and bending eyelashes*.

This mask costs $0.5 to make, but save you in the long run $90,000 in eyedrops, ointments, gels, visits, and $0.5 million in time wasted due to lost productivity and preventable ocular damage: night dryness is in many cases the 80% where all damage is done, so, while this is extremely boring to read, these pages are the most important in this eye chapter: *it's in engineering a good night mask that dry eye can be completely eliminated for many*. Mask takes 10 minutes to make and remake, and you need place those 4-5 foam pieces tight against each other, since as each day goes by the foam compresses and shrinks creating air leaks if not too tight. But if air leaks develop, just recreate one in 10 minutes for $0.5 worth of foam or less. The July 3rd was my last version (before using the adapted, trimmed by 70% inner foam XL) and used the Amazon Wahah dry eye mask on the back and disconnects the two eyes (so this is the old $0.5 mask, except the 4 mm long plastic nose bridge was removed and replaced with Wahah nose bridge, while moist white foam was placed inside to provide moisture; but you don't need Wahah to connect the two pieces, you can just use some 1 cm long or so 4 cents elastic cord with a hole made in each piece and wrap it in foam so it's smooth on the nose, or just use some silicone piece from another swim goggle, etc), to avoid *1.* damaging the nose skin (see Amazon reviews of Eyeeco 51$ Quartz and 56$ Eyeseals 4.0 about complaints of nose scratches;☺☺☺ I tried those too and returned them, too harsh on skin), *2.* the huge air leaks that develop when you have to go over the nose with thick foam due to the incessant shift of left eye foam fit when you sleep on right cheek and vice versa; 90% of people sleep some of the night on the left or right cheek when sleeping on left, right or stomach side, so when we do that, the right or left cheek side shifts if the two pieces are rigidly connected via hard plastic instead of flexible silicone from the Amazon mask tapes to the back of the $0.5 mask; *the back of the mask has aluminum tape, then clear*

tape, then the Wahah mask secured with a lot of tape if you want more than I used; make a knot at the center to prevent the length of the cord to shift at night 3. the incessant snapping of the elastic band from the two holes I made in the plastic 4. the need to always remake the elastic since it shifts its holding strength with time, while Wahah is easy to adjust, unknot it and adjust every 1-2 weeks if needed for a better fit *(if Wahah cord gives out or is hard to wash, buy Amazon (lighter color is better to see dirt, replace it often, protect eye from infection) strong but thin* (not the one for face masks, that's too weak to hold the mask tightly*) elastic cord 327 ft/8$, (too thick perhaps) use the Wahah fastener or* a smaller flatter one if you find one*; though normal thin elastic is not ideal for Wahah fastener (can get better comfier flatter smaller cord locks* maybe from Amazon, 25 for 2$) since round cord is way more comfortable on the ears), 5. the inevitable breakage of the 4 mm plastic bridge between the two pieces which can happen before you notice it creating air leaks and dry-red eyes without you knowing why air leaked (like mine did partially after 6 months, fully by 8.7 months, until not even the tape on the outside broke by month 9). 6. Nose pimples due to incessant foam rubbing of nose; unlike other masks, this allows the nose bridge to go ultra high and above nose bridge due to the foam that rests on the nose, with silicone bridge never touching the nose something I have never seen in any mask; plus, Quartz, tranquil eyes, tranquil eyes XL, etc use plastic as nose bridge with plastic pins that damage nose (unless you use door foam to wrap it around), so if you like tranquil eyes, you can tape the nose bridge with door foam to make it soft or you can remove the nose bridge and tape on top Wahah to have a high nose bridge or create a better nose bridge yourself with soft silicone; for the $0.5 mask, make sure that your two plastic pieces for each eye have foam extending past the plastic, and that the plastic is very round, especially around nasal area, covered in tape or foam on edges, so that if you move a lot or the foam falls or something and the plastic gets close to nose, it won't ever exert pressure on the nose via the foam or directly, because then you get the same issue with Quartz, swim goggle type of night dry eye masks (Wahah other model, etc), etc that leave marks that takes hours to disappear, etc; plus it's no hygienic to have so much foam rubbing on the top of nose bridge, not the sides, when not needed, high friction on any skin would create bacteria buildup. 7. Excessive pressure on temples; this design is much better than tranquil eyes where the eye cup is centered and bulky, it prevents comfortable side sleeping without pressing heavily on temporal ocular vessels or skin or even the eye itself with tranquil eyes due to being quite small (hence you need tranquil eye XL); it even relieves temporal pressure vs former designs (2020, 2021) of the $0.5 mask without that Wahah attached. *For back sleepers, tranquil eyes XL is fine with trimmed inserts by 80%* 8. can make it more concave by using some $ store huge sunglass plastic lens and placing the other plastic with the foam on top of the lens, taping it to it, depending on the concavity you want.☺

These $0.5 masks are simply the most ignored (and effective, just use the 1$ plastic of COVID19

face shields at 1$ stores to make 3 masks) method that almost nobody knows, because regular eye masks don't retain moisture (most decrease it even), so you can make one for $0.5 in 10 minutes as explained below. If you're worried about chemicals in the foam, just use clear tape to tape the inside of the mask side of the foam. [If foam is not your thing, and you always sleep on the back 100% of the night, you could try use silicone earplugs (turn half of one into a 4 inch snake if needed) around like in the Bollé antifog pic, *sleep with these plastic glasses,* or try Cobra sunglass or Cobra HD as night mask *(if the clear HD, you can wear a removable clear taped on both sides aluminum foil piece (attach some tape pieces (double tape so no glue ever exposed) that go behind the temples when you want to put on the aluminum 'mask') to create darkness and remove when you need walk to bath, etc without breaking moisture seal).* MDs suggest that you replace sunglasses every 2 years (because the UV coating degrades over time, scratches allow UV *in), and that all UV blocking* glasses, like Cobra, are never be left in a hot car where UV, IR will destroy that UV coat.

Cobra is by far the most comfortable *pair* of glasses for silicone seal night sleep in any position *(protects eyes from pressure of pillow or mask better actually than having no mask or any mask)* due to adjustable temples and bigger size; however, the pair you use for night sleep is best designated for that, to avoid using chemical antifog at night and have it fall on eyelids by gravity. For side sleepers, buy a 5$ *memory* foam *neck pillow from $ store* or Amazon, rest the side of the head you sleep on on the neck or your normal pillow in a way that avoids pressing on the plastic frame or ear too much *(use normal pillow in an unusual position where it avoids the temple area completely so if you move slightly the glasses don't move at all; this will take some time to get used to if you're tossing all night in various positions, you will toss 10x less; i.e. pillow is always below the upper cheek and behind the ear at the temple level – to avoid shifting the silicone seal),* or use some towel to support head, avoiding the frame. Neck pillow is useful for 0.5$ mask;☺☺☺ a neck *pillow* can *help* the *0.5*$ *mask* to *shift* less *and* create *fewer* air *gaps; neck* pillow can be used to rest cheek while side sleeping on one part of the pillow, so that the normal pillow applies no pressure on temporal ocular area of the mask (plastic glasses) causing its distortion and the restriction of blood flow to the temporal area of that eye. We don't want to unintentionally block the lacrimal or other reflexes pathways by pressing on the temples, nerves or eye areas when side sleeping: zygomatic branch of the facial nerve activates the trigeminal ganglion which activates the trigeminal nucleus caudalis, then the superior salivatory nucleus, then geniculate ganglion, then pterygopalatine or nasal ganglion, then lacrimal and MGs, since it may cause 1 eye to tear less after years of side sleeping. Use soft neck pillows to prevent damage to blood flow to orbital area you sleep on.

Most *Amazon dry eye masks are smaller and made of tough materials and they would press hard on very fine skin and vessels around eye corner, creating air gap; that's why I use foam, but*

even foam gets pressed hard and becomes harder if you sleep on pillow after a while, so replace foam or use neck pillow to ☺☺*lovingly tenderly gently kindly*☺☺ avoid obstructing *any* blood flow to *any* ocular area*;* the ideal is to be sleeping without touching with your pillow the eye or anything within 1 inch of it, touching only the cheek, *by placing neck pillow on top of pillow, can really help prevent all kinds of issues long term coming from using any mask at night while side sleeping*; the best is to sleep on the back, so these issues don't exist; *silicone can be less allergenic than rubber foam, rubber, touching skin; it's made to be in contact with skin 10 hours, like in sleep*]. You can use 2-3 layers of 3/16" white (not grey or black, white is best to see dirt and replace when dirty) door foam or 1 layer of 7/16" (see pic) (cut in 2 if too wide) so it contains less glue (on the back of the foam) and takes less time to make if you use 7/16" instead of 3 3/16" or a 3/16" + a 5/16", so easier to replace to prevent dirt build up). 1 layer of 7/16 is better, as it's less tall and will be higher humidity, due to less air, unless you use it on top of a rubber one below. 70 mm is the width (maximum) and 171 mm is the length (maximum from eye corner to eye corner), odd how it is like that, I realized only 11-2-2020 morning, 35.5 days after I made it in a few minutes 9-27-2020 evening; elastic from $ store (just cut it to be thinner); make sure the mask is smooth on the dermal contact, so it doesn't leave marks due to any tape placed on top of the foam when you wake up. Marks due to rubber or irregular tape can damage collagen. Use a flashlight in darkness to go around the mask to see if these are any areas where you can see the flashlight (make plastic opaque by using $ store aluminum tape and then clear tape on top of it; opacity enables you to have darkness, RF protection and to see gaps easier with the flashlight test that you may miss). ☺☺

This is a temporary solution, and while the foam+plastic costs only $0.3, labor 0.2, the foam needs frequent (every 2 weeks) replacing for perfect fit and hygiene, daily cleaning of plastic and foam with 70% alcohol pad. *If you use foam for naps alone, one 7/16" is fine, but for using foam on top of* Quartz/Eyeseals 4.0 *(see below), 7/16+3/16" foam works better, to avoid pressing on rubber mask; the temple areas of the* mask may need two extra 2" long 3/16" thick foam pieces, so 13/16" (see picture) total thick to p*rotect air leaks from the edge.* You can also use silicone from earplugs, like in this picture too, but silicone is placed on the plastic, not the sunglasses, if you sleep on the back, silicone would work as you don't change shape much, silicone is safer than foam for eye allergy; however, if you allow the foam to degas for a few days after opening it from the box, it won't smell and emit allergenic gases. Try medical grade foam, even if pic shows door foam. My $0.5 mask is 30% bigger *than* the similar doctor made $21 foam mask, (plus 2 layers of much softer foam than the ultra harsh on the skin Amazon 21$ mask one, or even 3 in some areas, making it way more comfortable), mine going above the eyebrow and around eye corner more, so it avoids any eye area much better, making it safer as there is no pressing of fine tissue; these $0.5 ones can be disinfected daily with alcohol pad or a UV lamp,

remade every 2 months). Foam can be home depot, door trim without Prop 65 label on them in California if you can't afford anything else now. The 2100 chemicals of tears fogging *are the best face moisturizers that makes your orbital area much healthier looking, saving billions of dollars in toxic eye creams that often do more damage*. Make 2 masks, 1 opaque for naps and meditation, 1 clear/tinted for sleep that you can leave on when walking around the house; these moisture droplets on the mask plastic are *natural, because tears you generated initially tried to evaporate, depending on how air tight it is, etc.* ☺☺☺

There is a variation of the $0.5 mask you can try, which is using a big piece of foam (trim the yellow foam, from those 3.5" by 5" sponges, 5 for $1 @ $ stores), bigger than each plastic half to surround the whole plastic and tape the foam to the back of the plastic to secure it, all one piece, that is then carved inside to make space for the eyeball. I haven't tried it, but others may find this works easier, as it's all one piece and they can insert wet piece of foam in the carving they create there. A similar idea can be used to create a semicircular or circular band of foam that is placed inside the classic $0.5 mask or tranquil eyes XL below, very thin one, to prevent eyes from opening as the inner foam compresses, losing ability to prevent eye opening. *Besides the 50c or* 21$ Amazon foam mask *there are other options, ideal for back sleepers or those who don't move much during* sleeping, like $10 swim goggle or the special dry eye masks (the tougher masks below need memory foam soft pillow under a small travel pillow for side sleepers to avoid touching temporal area and pressing the harder silicone against the skin & using a silicone mask under the 50c or tranquil eyes XL for perfect seal a the XL fails to give, as long as the mask doesn't bend your eyelashes): ☺☺☺

2.1.1. The $20 Wahah clear mask can be used alone if a back sleeper, or even side one if you get used to it and place pillow edge before temple area and below upper cheek bone, since this mask is too small for many eye sockets (fine for smaller faces in terms of maximum safety) and risks applying pressure on eyes if you make a mistake at night, so you may want to give Speedo a try, since side sleeping can never applying pressure on eyes with Speedo for bigger faces, if Wahah doesn't fit well. I think Wahah is not a good idea, because it is too close to eyelashes and will make eyelashes point towards cornea sometimes, so choose bigger masks like tranquil eyes XL. I can sleep with Wahah with wet foam (see below) inside it well (though if width would be 2 mm bigger, i.e. more round, for Caucasian eyes, not Chinese, it would be better since it wouldn't press on soft tissue, just ocular bone), and it fits me OK, they or others making similar masks need to have at least 3 sizes for smaller, medium and big face and eye sockets to prevent even the slightest 1% push of soft tissue when people move a lot, so it pushes on orbital bone only, not on that softer too close to eyeball tissue. One has to think about round eyes and more elongated when designing these masks. There are so many width to length ratios in the 8 billion people, even within the Chinese population these masks may be sold to also. Speedo swim

goggle has 3 nose pieces, one very high that sits much higher than Wahah, but has the nose area poorly designed, it applies too much pressure; recall to clean Wahah daily. A*lways prevent suction from forming by placing one 1 by 2 inches, 9 mm thick foam between the two eyecups, between near nose Speedo rubber and the nose skin, like nose area where nose bone gets all pressure during side sleep, and if you place foam inside the eyecups with water or gauze, read below on how to avoid eye pressure and adjust foam shape by making it thinner centrally since Speedo shape is different than Wahah.* You can also use Wahah placed under .5$ one to avoid door foam (or some better foam you buy from a medical supply store) glue & foam chemicals from irritating the eye, if allergic, though it's too tough to be placed under, so I place it on top of the $0.5 mask after I separate the two pieces as in the 50c picture. You can also use foam pieces under the nose bridge or on the sides if you plan to use it alone and it's too rough on the nose or temple skin when you sleep on the sides (if you sleep on the back, you don't need wear it tight, so foam is not needed, but nobody almost sleeps 100% of the time on the back only). ☺☺☺

However, this Wahah works alone also if you sleep on the side and place pillow short, so that there is no pillow under your temple area where the mask makes contact with the skin, to avoid shifting the mask. Likewise, all other masks here can be used like that, except the Quartz and Eyeseals 4.0 require far more care (stress during sleep, for a better word) due to the nose bridge touching the nose and being more dangerous for the skin (tough plastic bridge with sharp areas, not soft silicone on Quartz and high friction silicone around nose and orbital area on Eyeseals 4.0, see below). A problem with the Quartz and Eyeseals 4.0 is that they make far more skin contact to achieve a seal, and this can lead to skin damage, by tearing skin layers if you move more and sleep with pillow the usual way, not folded, so that it doesn't touch the mask at all when side sleeping. Wahah, if you can side sleep without pillow touching the mask, an impossible task I know when you sleep and are not aware, presents advantages over my $0.5 or $0.5 + Wahah mask too, since it will be easier to clean daily and has less foam contact, hence I tried for 3 days to see if I could actually sleep on the side with Wahah plus some white foam from those now 3 cents (at $ stores, from 3$ initially) face shields; the result is that it's too many marks Wahah leaves on the face, especially right eye and it's not worth taking the risk to press on right eye much (I sleep on right side). But I did discover that wrapping Wahah in door foam on the left side (opposite to the side I sleep on) made it a better thing to hold my $0.5 mask since it relieves pressure on the right side by lifting the right side a little and disallowing the right Wahah side to exert such a direct shock on left side moving it further, with the foam relieving that impact of every move of the right face on the pillow; each time you try something different with new masks you will discover something to perfect your most used mask. The face shields, 4 for 1$ in June 2021, in August 4 for 10 cents, at $ stores, have tons of foam (and plastic to use to make 150 masks if you buy 30 face shields like I did, due to cheap price, 2.5 cents each, instead

of $7 on Amazon, 300 times more expensive.) and if you trim that off and get a 5 mm thick layer of about 5 inches long, 1 inch wide, you can cover with that one band the nose bridge, placing foam under it to softer the contact, and also place that same band in the eye cups, band being wet with distilled or osmosis water, in a way that removes any discomfort from tough silicone touching soft tissue (Wahah silicone is tough, so this foam really improves comfort as it eliminates any skin pressure and eliminates even the tiniest marks when waking up), any air leaks due to unique face shape and also prevents 100% the eye from opening. The middle 40% or 2 inches of this goes to protect nose and can be 5 mm, but the stuff going into eyecups need to be slimmer, especially the stuff around the central and upper areas (since 5 inches means that there won't be foam near temporal areas on purpose, to avoid extra pressure during sleep if not careful when side sleeping, so to someone else it will seem as if only 70% of eye cup has foam in it), since we only need some thickness on lower central and nasal eyelid to keep eye closed, so maybe 4 mm lower eyelid area and 2-3 mm elsewhere, except the middle nose bridge 5 mm. That varies by individual eye shape and the silicone mask you use and how you place it. I found adding this foam dramatically improves Wahah performance, as it seals air leaks and keeps moisture higher. It only costs 4 cents worth of foam and you get amazing results vs Wahah alone. It's possible many people may achieve similar results as a modified Wahah (foam) as with a brand new $0.5 mask made at home, but without having to remake mask all the time, and having a hard time to clean it. Each person may need a different placement of the foam, some may need the stuff in eye cups to be mostly inside, while others may be fine with it being between the nasal part and the skin too, yet others may find 3 pieces (nose and 2 eye cups) work better (one piece is much easier to handle though and safer for nose skin). For some faces, the foam band needs be 3 mm, others 5 mm, etc, or thinner for upper eyelid to avid any pressure on eyeball during sleep. ☺☺☺

0 pressure on eyeball needs be # 1 priority to avoid glaucoma (**glaucoma is due to *increased* eye *pressure* that leads to nerve damage, as foam pushes the *nerve* at the back of the eye and in some cases, to *blindness*), *keep eye closed, but without any pressure*, by trimming the band, making it round on central-temporal border area where band ends about 12 mm before eyecup ends (eyelids have 3 parts: nasal, central and temporal), thinner 2 mm or 3, etc to only have bulk mostly on lower eyelid, 4 mm *(nasal, not so much the central eyelid area, the lower 20% of the band I mean)*, where we prevent eye opening, thicker for lower eyelid to hold eye shut. You may think that this is a waste of time, but on Amazon we see people complaining that the black (to keep darkness during sleep so people don't wake up at 5 am on summer days) foam of tranquil eyee XL pushes against eyeball; well, they need to trim it to fit their eye shape, and more so after a while, 4 days or 16 days, depends on each person, if the foam between tranquil eyes and skin gets compressed (measure it) and brings the inner foam closer to eyeball increasing eye**

pressure. *All $0.5 masks also compress a lot for side sleepers with each 5-20 day period until they reach their maximum compression stage.*

All these masks need careful maintenance and trimming if there is foam in between silicone and skin and that foam compresses for side sleepers *(recall $0.5 plastic is not tough and neither is the even softer and more bendable tranquil eyes XL blue rubber cap, so you need account for that bending too if you side sleep)*, etc, it's only one pair of eyes we got and we can't replace them. We got 3d printing for a lot of useless stuff, except for eye masks and eye glasses to prevent worsening of dry eyes. So ultra care is needed, since it's not like a toe or anything you can function easily without. You may need to put mask on 20 times for many min hrs at a time to figure out the perfect shape of the foam band and then use that knowledge, that is custom fit to benefit from Wahah or other mask you like, be it Quartz, Eyeseals 4.0, etc. Quartz mask would be great or perhaps better than Wahah if they made the silicone bridge one piece like Wahah, just very high above nose and perhaps all round, cylinder like, but you can get around that with some foam under it to protect your nose skin, since you need foam on Wahah too, since the nose bridge does touch the skin and leaves marks without the foam under.

You can wear some removable aluminum foil taped in clear tape on top of the mask to make it dark if you wish, so you still see a little if you go to bath etc without having to break the moisture seal at night. Quartz would be better if the mask skin contact was round, minimal like Wahah, not flat to avoid such hard pulling on collagen fibers during sleep. ☺☺☺ But you can place foam under Quartz flat skin contact area. The 0.5$ can help the rubber one from shifting much if the rubber clear one is worn looser to avoid rubber marks after 8+ hrs. They can be worn separately alone or together; in my experience, the foam one works well for a short time, but then starts to have pieces of foam misalign or fall off (since the glue is very weak, being just a tiny bit); because of that, it's very bad if during the night we have a huge air gap emerge, since if we put drops the gap can get bigger and we can even forget to put the mask on the eyes, being without it for a few hours, leading to dry eyes in the morning. Daytime we know when eyes are dry, night time we don't, so it's far more critical to wear the rubber one under, which prevents dryness in case a small foam piece comes off from the foam one, and prevents forgetting putting mask on, since it's 2 masks and it's far harder to forget that. The foam one can keep rubber one in place better so no leaks develop as with wearing it alone, making a more robust moisture trap. Wahah also has a $32 dry eye goggle pair with *plastic lens that may work for some during the night or even day* (rubber, like swim goggles, can create tiny hole if it fogs and plug in warmer weather when fogging is less; vision is poor for computer reading due to the weird distortion when you move your head and some distortion when being still too; doesn't fit my face, so I returned it; it only fits smaller faces with eyes closer). The other Wahah is made of too hard plastic that will pressure the fine blood vessels, soft tissues around the eyes when moving.

2.1.2. *Eyeeco.com* tranquil eyes $42 (incl ship, with tax it's 51), free returns if bought via Amazon and you select "item defective or doesn't work" instead of "no longer needed", is the 2nd softest and most comfortable of the eyeeco night sleeping masks after $65 tranquil eyes XL, which is the best on Amazon. Tranquil Eyes works if you have tiny eyes (*otherwise it presses on eyelashes a little sometimes as you shift at night and will cause eyelashes to point towards cornea making eyes very red over time*) and if worn with the inner moist foam pads inverted (foam side touching eye, not cloth side) and trimmed so that they're not so tall and so pressing on the eyeball center. I think for normal eyes XL works better, but ONLY if you trim by 80% the lower third of the foam area *height and upper two thirds by 70%, temporal areas maybe even 90%* if side sleeper *(70% of lower third and 15% upper two thirds if back sleeper, since you don't press on the mask, so it won't touch eyelashes easily; upper third doesn't need trim for the entire area, the very top edge can be left alone as there is no eyelash when eye is closed, nor eyeball there that would be pressed), so when you sleep on the side, it won't bend eyelashes;* otherwise, your *eyelashes* will point towards *cornea* after 1 month and make your eye(s) *ultra* red; eyeeco tries to survive, $ making too, like iTear100 30$/month subscription, so sometimes the nose bridge will come off ultra easily or the ultra thin rubber will break, since it's designed to break easily so you buy new ones all the time; a solution to that is to create your own holes 3 mm below or above the factory hole (both 3 mm above for example, for symmetry and best fit) on a thick portion of the rubber that is 3 times thicker, to hold it in place much more securely; to 'drill' the hole, you could use that $ store kit (sterilize it first) dental pick (or buy new one or just use any thin aluminum or copper sterilized wire) and pull away to enable the plastic end of the nose bridge to fit into the hole; *same thing for any mask or safety glasses silicone, make sure the foam is well below or above the eyelashes, so they don't bend eyelashes.* ☺☺☺

The Tranquil Eyes design is not ideal, it ruins eyelashes fast, since the silk cloth padding on top of the foam prevent you from trimming it to create a concave cup to embrace the eye so it doesn't press on eyeball center; you need to turn it around and trim it from the bottom if you still use their foam, not the custom concave shaped foam of your choice, white foam as explained in 2.1.1. and 2.1.5. in more detail. The eyecup is made of rubber, not plastic, the black foam is medium soft foam covered in a satin like cloth to make it softer on skin and less dirt accumulating. The $0.5 mask allows you to make it as big as you want, with a surface area 1.5 times bigger than tranquil eyes. You'll probably love $94 tranquil eyes XL a lot more, it's 30% bigger than tranquil eyes: the outer/inner cup is 2.8"/2.1" vs 2.1" & 1.3" for Tranquil Eyes.

XL was made for warm compress but can be used for night sleeping too; *trim the lower half of the inner foam to avoid the foam pressing on eyelashes and having eyelashes bend and point towards your cornea and causing endless cornea irritation and red eye*, inflammation, depleting ocular resources from fighting dryness. I bought *tranquil eyes XL* and used it enxclusively for

many years (easier than the ones I described for those who can't afford eyeeco) and it's way better than Quartz, Eyeseals 4.0, tranquil eyes, Wahah; their head wrap is very comfortable compared to elastic cord of 50 cents mask and most masks out there; it's same size as the mask I used for 10 months for $0.5 and avoids sensitive eye areas. Their foam is maybe 900x more water absorbing than the door foam, and the face shield foam (factor of 10 to 1). Not having the cloth of tranquil eyes foam, makes the tranquil eyes XL *inner foam far more flexible and less glaucoma causing* by pressing less on the eyeball; especially after you make an oval cavity in the inner foam to 'embrace the eyeball'; using a squirt bottle allows you to wet the foam inserts easily in 5 seconds. *You can tighten the strap then make 2 knots on the left side, since 1 knot doesn't prevent sliding, so only 2 cm of free elastic was left on the left and 1 cm on the right* to be able to create a tighter air seal *if you side sleep on the right.* When mask is new, meaning it didn't yet compress, due to side sleeping, the nose bridge of tranquil eyes doesn't touch nose, but if it does, you can put sticky door foam or face shield foam around it, as with Wahah; for tranquil eyes XL the nose piece is too high to touch nose anyway for most people. You need cut the inner foam it came with in half, to avoid pressing on eyeball so as to make a cavity to embrace the eyeball perhaps, instead of damaging the central part of eyeball or temporal one when side sleeping. Those who always blink at night, can place some *white foam on the lower part of the inner removable black foam, after trimming the black one, on the nontrimmed side mostly to prevent eyelid opening.* If you sleep on the back tranquil eyes or tranquil eyes XL will last many years as it won't compress the side you sleep on to damage that foam. Tranquil eyes is ideal for people small heads, XL for most people.

Companies can design similar masks and design a shiny ultra sliding smooth surface sticker to place on eyecups for people who want a sliding less bending mask: this way they don't have mask shift so much and create so many air leaks when tossing on pillow; make stickers of various colors and let people choose and include smiley faces on them to cheer people up; less glaucoma/eyeball damage. And fewer complaints on Amazon that the mask is shifting and causing the strap to come off, of course, if friction is 10-30 times higher when pillow shifting, it will loosen the strap hold. But meanwhile, you can make a knot after you tighten it, at the ideal level you found to work, so the elastic is no longer getting loose and causes air leaks to form; this is very shifty, even after you make a knot it can loosen a little, so before going to bed, turn light on, place mask on and ☺☺*lovingly gently*☺☺ verify you see no light, since light is where air will get inside and dry the eye and mask fast. Again, like with any bigger mask (or even small ones to a lesser degree), the key thing is nightly seal check, before sleep. Make sure some extra small foam touching the lower eyelid only (much safer) inside prevents eye opening, if you made a valley on inner foam to protect eyeball center; this way you make sure the eyelid remains sealed, hence seal check applies to eyelid & outer foam. Until a high tech future where a 3D

printed foam is made after testing your actual bed position, with 300 sensors placed on eyelids to measure pressure from the foam, etc, we do it the stone age way.

$ stores sell neck pillows of memory or normal foam *that is white and makes it easy to see* hairs and eyelashes*, so you can remove them daily. So, you can buy that for* $3-5 *and use it to make 60 foam sets* instead of paying $450 *to buy 60 sets from eyeeco.* Saves you 450$*, since they sell 3 sets for 25 and 6 for $45. Eyeeco says a set can last at least 2 months, so* 60 sets can last for 10 years. Eyelashes can cause huge redness, *if you happen to blink a little between putting mask on and off, and it's worth having white foam,* on the inner inserts at least, since outer ones can last a huge time, *if washed or you buy adhesive to make outer white also to see hair/lashes.* It's hard to see lashes on black foam. I trimmed the round convex end of a neck pillow memory foam and it gave me nice white inserts convex on both sides; I trimmed it so it's convex only on one side slightly *(flat in the center for the 'convex' side to allow for room to bend if needed or pressure develops, as a safety mechanism*), flat on side facing eye, with the lower half 6 mm below upper, to allow for eyelash to not bend; one can also use a 10 pack/1$ set of yellow sponges for cleaning, to peel/trim the yellow part into ovoid, or some soft pillow foam if it sucks water better, in combo with soft memory foam, for a hybrid one with 2 inserts. Or buy eyeeco if you don't want to spend some time trimming some foam and worry it may not be equally hypoallergenic for your skin etc. 6 sets may last even 5 years, your eyes are worth $45/5 years. Doing this helped me improve my design trim of the eyeeco black set too, making more eyelash room. However, I prefer eyeeco foam as it's softer, sucks water better, easier, possibly releases water vapor better, keeping eyes wetter. Normal eye masks we buy are sold without a warning label that, if side or stomach sleeping or if pressing on eyelids, can cause *glaucoma* (a leading cause of *blindness*) or *dry eyes* long term by heating the eye and making it dry.

2.1.3. *Eyeeco medical grade silicone* $51.5 *(incl. Ship), free returns if bought via Amazon* and you select "item defective or doesn't work" instead of "no longer needed", medium mask, Quartz Shield *is way softer than the Wahah alone above with hard rigid rubber. Only use for tiny eyes,* because if it bends eyelashes we need curl or trim them which can be a hassle. In the first months (all these masks get dirtier with time and heavy use with oily skin and ointments etc will give it a yellow tint), Quartz is much easier to see thru, while Wahah is impossible to see thru without huge blur/distortion, headache after 7 sec. There is a distinct disadvantage to this ultra softness of Quartz and, to a lesser degree, tranquil eyes, Eyeseals 4.0: that is when people sleep in (stomach usually) positions that make the pillow press on one side of the whole eyecup a lot, they can press on the eyeball, while Wahah won't allow that, pressing on the orbital bone instead and bending the pillow, not the eyeball. *Eyeeco was* designed by 4 MDs (see the 1 hour video); read critical reviews before wearing it, since the nose bridge comes off at times and too much tightening will damage skin due to plastic they use near temple area and nose bridge, little

eyelets with a black pin. I bought this and returned it since you have to tighten it quite a bit at night, to prevent it from slipping if side sleeping and then pressing on the eye at night when you shift position and are not very careful; this makes it 20x less comfy than 50c foam masks that go around orbital area; *however, if you wear a piece of foam or back sleep, as explained in the 2.1.1. section, under the nose* bridge, *maybe 7 mm thick, you can get this to work and not need return it,* and in this Quartz case, you don't need place foam under the eye cup nasal part since it's very soft, unlike the tougher Wahah, just under the nose bridge itself only and any foam inside eyecups are better off separate perhaps for Quartz, unlike Wahah. Quartz with no nasal bridge foam will work if you toss little during sleep and sleep on back only, it's easy to see thru, can work as daytime mask too for short periods, if you want to read something without taking off 'sleep mask', arrived in 2 days, not 7 as Amazon said, great product for 100% back sleepers who don't need tighten at all, and have very mild dry eye; daytime I wore it just under eyebrows, partially or fully under, and got a great seal, so many with similar face will get this seal, way more comfy than any swim goggles, no suction like swim goggles so can use during small day naps and then go to bath, kitchen, computer, type something and go back to your nap or meditation if you forgot something, keeping eyes ultra hydrated as well as or better than the most leak proof taped blue light glasses (so you use less tears, tighter fit wrap around got less air volume, women's are smaller, tighter, better for dry eye, higher % humidity if silicone sealed or taped) which is key until you figure out a long-term solution, the best moisture retaining glasses for day/night, best artificial tears, meibomian expression. This Quartz mask helped me move away from taped glasses to silicone method and discover the wrap around Bollé, due to realizing how poor my daytime seal was due to huge air volume with non-wrap around blue light glasses.

2.1.4. *Eyeeco medical grade thermal plastic* $59 (incl ship) big mask, Eyeseals 4.0; free returns if bought via Amazon and you select "item defective or doesn't work" instead of "no longer needed"; *clearer than the Quartz, much more fixed, much more protective of eyeballs (may not be safe for eyelashes being too small and bending them, requiring daily curl of eyelashes), since the* eyecup os far sturdier and resistant to bending, good for back sleepers, but can't read letters on computer thru the upper part, due to headache; around the house though, you can see stuff, going to bath, etc very clearly; bigger means less air and longer to reach humidity saturation, so try Quartz one first. This touches the skin a lot more, so it may irritate you more then Quartz and way more than foam $0.5 mask; a future product would need to have some ultra soft foam on the edge of the flat plastic that can be replaced easily, so as to enable soft sliding, not pulling on eyelid when moving from one side to the other, as this pulling on eyelid can cause partial open eye and dry eye; if Quartz is too small for your face, then eye seal 4.0 may work; only good for people with mild dry eye (same for quartz, *quartz* is good for very mild dry eye, this may work for moderate if moist thin pads, foam, liner inserted), since there is not enough space to place

moist pads, foam inside, plus irritates skin, so you need wear it loose, which creates air leaks (same issue with the quartz, quartz being more dangerous, since it can shift and press on ultra sensitive skin near eyeball or eyeball itself); I bought this and returned it since it damages collagen fibers of skin, due to pulling at them all the time when tossing around. **Foam is far safer if you're ever tossing or not sleeping 100% on the back** like a rock (hard sleeper who sits on back all night). Masks with rubber, plastic, silicone against skin will damage skin, even if you're one in 2,000 people who sleeps on the back and falls asleep in 5 minutes and remains in 1 position all night, on the back, needing minimal tightening of these masks. If you get acne around there these things touch skin, it's a sign the damage is there.☺☺☺

2.1.5. ***BIGGER MASKS for severe-moderate dry eye*** (or people who don't close eyes fully every night, waking up with dry-red eyes as a result) ***WITH*** **MOIST** ***foam***, absorbent pads, liners inside, 50c disconnected with silicone bridge above (using Wahah, or other method) home made with something wet inside or the $49 eyeeco tranquil eye ***night goggle*** (ideal for people with severe dry eye who need ultra high moisture if they don't want to make a $0.5 mask and place moist foam inside; read Amazon critical reviews first, you need replace those foams often and the strap doesn't hold, so you need buy $ store elastic or cord to replace the strap they got and get a fixed tension level ideal for you; *the strap design is poor on all eyeeco masks (***Quartz** ***and*** **Eyeseals** ***4.0 too,*** the plastic there rubs too much on temple skin – better is to replace it with your own elastic). The eyeeco night mask got a foam that is soaked in water and inserted there, but I don't find their black color safe, since that inner foam cloth padding at least (if not the outer area of the foam (inside can be black, but the outer could be white) needs be white to properly see any dirt and if it needs be washed daily; the website says "does not need be washed daily because it's glued to the plastic (well, it's rubber) eyecup with adhesive and it will come off easier than expected with daily washing". Well, after years, I wash it far less, once a month, just wipe it with alcohol pads, you will get used to it, too often wash means it comes off and you will go bankrupt buying a new one all the time. You can buy other types of medical foam on Amazon maybe; the glue on the back of the fixed foam is quite far away from the eye, separated by so much foam; but the fixed foam traps bacteria from moist foam placed on top, you can't properly wash that and it's too close to the eye to not be washed often. An Eyeeco doctor said they suggest washing all foam in the eyecup daily, if we use eyedrops, ointments, gels, etc; perhaps using drops alone doesn't need daily wash; eyeeco sells 100 white cotton liners for 15$ for tranquil eyes XL warm compress. If you have a home made mask, you can add moisture: Amazon sells 5.3$ for 44 panty liners *the* back is water repelling plastic with adhesive which can be removed or used to stick to the plastic of the $0.5 foam mask, but these smell and I don't recommend them for night mask, even if sterile, due to odd chemicals and adhesive. They got hypoallergenic 100% cotton cover $4/40 liners too; towels have tiny microfibers come off, so

not really ideal, even though they're only $9 sterile towels, use tiny piece daily, lasting months; I found gauze to be superior to towels though and thin cloth wrapped around the head, under the foam $0.5 mask dry too fast. The liner has water repelling back that prevents the foam from getting wet, preventing eyes from interacting with the foam chemicals, but the gauze does the same thing without the odd chemicals (wood pulp, polyacrylic acid $[-CH_2CH(COOH)-]_n$ derived glue, etc) in the liner; *I found the gauze is much better than using the liners;* liners are made to hold water, not let it evaporate; gauze evaporates residual water in hours, becoming dry, while these liners stay wet for 10 times longer at least, they don't let water escape and moisturize the eye; so in choosing a material, you need to take these evaporation rates into account.☺☺☺

FOAM or gauze seem the better choices? My mask now is the $0.5 one with silicone flexible nose bridge (no longer hard plastic) with moist foam (from face shields they sell at $ stores) inside or, in the past, sterile *gauze* (gauze works less ideally than foam, foam has stable shape and loses water less, traps the water better). No gauze at all allows eye to open too much. Gauze (or extra foam, cloth or liner, etc inside the mask) causes another issue: the gauze bends the eyelashes and when you wake up you think you got an eyelash stuck into your eyes, but there is none, it's just an eyelash that got bent inwards, so you need to realign it, just put your finger there to make it point away from the eye as before; your 'foreign object' sensation will then cease, just use some 0.9% saline and/or favorite drop (Hylo Gel has highest MW HA for healing) to relieve the eye afterwards if needed. We lose 3-4 eyelashes a day, but never notice it as they fall on the carpet, etc, face, etc. With these glasses and masks, we notice it and become alarmed, but there is nothing to be worried about, we're shedding eyelashes daily before too, without ever noticing. You may notice that the half of the mask you sleep more on at night is thinner due to compression, so add more thin foam to increase its thickness so eyelashes are not under such stress due to moist gauze. $ store sells gauze, just get 3-5 inches for each eye (less or even half the gauze for the right eye, depending om how big your gauze thickness is and your mask, if you sleep more on the right to relieve the heart for example, since that right mask half will be closer to the eye and then you would pressure the eye leading to glaucoma) and fold in 4, squirt distilled or purified water on it, then place on the lower part on top of closed eyelid to prevent eye opening. I tried moist cotton rounds but they're too absorbent. ☺☺☺

Never use semi-moist or dry cotton rounds, since they absorb water and will dry eye more, plus the cotton fiber gets around eyelids when not very wet and you don't want cotton fibers into your eyes if you open eyes at night a little*;* fold them in half and trim them, use 1-2 folded (and some extra halves from one that had the center taken out, so that you can prevent eye opening at night, WITHOUT pressing on eyeball, you want some 2 extra pieces with a big hole inside to prevent eyelid from lifting 4% during REM sleep, especially the lower half of the eye, since if that eyelid can't lift, it's fine; eye opening *5-20% at* night *is often the* only *reason eyes* become *dry*

over 10 years, night dryness slowly destroying homeostasis and MGs thru inflammation (*this is why probably* 2 billion people develop red arterioles in the eye by age 30, that are more visible, night dryness *spikes inflammation which thickens arterioles due to cytokine storm*); add white foam (like in the pic of $0.5 mask) of a lower height (to save on disposable cotton round use) or whatever cotton round trimmed or extra softer foam on top (if you don't use cotton rounds, I like them because they're shapeshiftable, moldable after watering, while foam gets very rigid after a few days, if not super soft super memory foam (that all these masks would ideally be made of, futuristic foam that doesn't push back at all on the eye if eye or mask position changes), so it comes back right at you after pressing to adjust a little, while cotton round doesn't do that it remains compressed or shifted; cotton rounds are bad even if ultra wet, since little fibers can get inside your eyes over time from the eyelashes; problem is that if masks shift, you won't know and it will mess with your eyelashes and cause them to maybe point inwards and irritate cornea, so it's not really working well; you don't have time at night, as mask shifts, to trim foam to perfectly match, but you can use finger to move a little cotton and remains moved as you did), for the lower periphery (lower center-nasal area of eyelid that first detaches; don't put rounds or foam near temples, since if you side sleep you will damage eyes by pressuring that area during sleep; test it well by sitting as in sleep while fully awake to see if any pressure exists and adjust so no pressure on any area of the eye exists) of eye until eye doesn't open at night.

Wet FOAM inside the $0.5 foam mask? The $ store packs of 5 kitchen 3.5" by 5" sponges (yellow foam with hard blue back) that are 1 cm thick enable us to remove the blue hard backing and use the yellow foam only, after trimming to fit the eyeball shape perfectly to prevent eye opening at night, since this foam is not absorbent like cotton and may enable water evaporation better; or just buy a Walmart foam pillow or memory foam neck pillow from $ store and use that foam to make your foams; avoid the 2" by 3" thicker sponges (set of 10 for $1) or the ones with tough big holes cellulose 'foam', as those are too hard on the eyes and less bendable, risking damaging the eye when you toss on pillow*;* technically you can take 2 such sponges, to see dirt, eyelashes, hair better (since black foam of tranquil eyes prevents that seeing and eyelash and hair are a major eye irritant, with 99.9% of people having dark eyelashes) and make a mask out of them by turning the rectangle into a huge ovoid and then creating 2 pieces like tranquil eyes XL, one the circle inside and one the outer edge; 1 sponge for one eye cup sort of, using a plastic backing like in the $0.5 mask or the tranquil eyes XL rubbery plastic as explained above in section 2.1.2 – just make sure the back or 'eye cup' is a shiny smooth surface that glides easily with 0 friction on pillow to minimize bending as explained in 2.1.2.); the face shields for COVID19 foam is much softer and works way better for this purpose, they sell 4 shields for 1$, so you can make about 50 masks to last 2 years or more; you only need a tiny 3-5 mm thick 7-12

cm^2 foam square; black foam in tranquil eyes and the black silky cloth is not allowing us to see hair, eyelash, dirt; they could design one with a gradient, thicker on bottom and softer on skin contact, with the contact cloth being white or *very light color, even if the foam is still black to block light;* other masks use rough foam on the edge so it can adhere to the plastic and last more, but the door foam is ultra soft when new, being no match for this tiny mask that gets too close to eyes; that's the nice thing about making your own, you can make it much larger and more comfy than tranquil eyes or Amazon ones; plus, it's white foam, easy to see head/eyebrow hair, eyelash, dirt which are critical to remove because they cause eye redness if entering or touching the eye. It's good to trim hair within 2 inches of forehead/temples around eyes if longer than what it takes to reach eyes, to avoid hair entering or touching eyes (remove from your white silicone glasses and white foam night mask); this is an issue only for guys with curly or longer hair or for girls; when it loses extreme softness, you know it's time to replace it, it acts as a good reminder to do so in 2-6 weeks; it contracts, so it creates leaks, so you do need to replace it often, $0.5; the other ones are more rough, you may forget to change foam for way longer; the gauze *(not liners which retain water well, instead of allowing it to evaporate and moisturize the eye and air under the mask)* prevents foam chemicals from coming close to eye; likewise, the face shield foam prevents door foam chemicals/adhesive from getting close. ☺☺☺

***If possible, avoid distilled water, since it's not as virus free as reverse osmosis (RO). The ideal is to* use RO water, not sterile saline solution, because saline evaporates slowly due to water binding to ions; "Evaporation rate from the diluted plume was occasionally 3 times larger than that of the main salty lake" ► WRR 2018;54(3):1460-75. I tried saline sterile on gauze but eyes became drier, since less water vapor is available to hydrate them; if you wake up mid sleep and your gauze has lost much water, compliance to rewetting is key to saving your eyes and compliance is 10-50x less likely if you need to stand up and take a gallon jug to pour 0.5-1 mL water on a gauze; you simply are too tired and want to go back to sleep; to maximize compliance, get some distilled or RO water from the store in small bottles or big 1 gallon one to save plastic, and pour some on the eye mask; or you can get a set of 3 capped squirt bottles and have one by the bed; Amazon got 4 oz (4 not 8 or 16 so we get less air to contaminate, to discard left over, shake, clean bottle, replace water often) capped bottles (they got same type in 8 and 16 oz size) you can use to rinse moisture day/night mask too after you wash them with tap water (to remove calcium traces), and after you squeeze them to remove calcium rich tap water. Sterilize the Amazon bottles before using them with UV, 70% alcohol, rinse well with DI water. To minimize risks of infection, clean bottles often or just use directly the RO water bottle, recap it. Recall to disinfect the cap where the hand touches it often with alcohol pads (400/4$).☺☺☺**

A piece of foam or gauze can be placed inside the $0.5 mask, Quartz or Eyeseals 4.0 masks or daytime goggles from eyeeco, to cover whole area of goggle even so only cotton touches the

skin, not plastic (to avoid zits or irritation), after wetting with DI or osmosis water or sterile saline solution (first, cleaning with 65% alcohol wipes the clear masks or at least 50% isopropyl or rubbing alcohol when needed, let alcohol fully evaporate, 2nd add water); wash the gauze often, or store them in a container once dry to wash them all at once, to avoid contaminating it so much with washing; people with severe dryness or incomplete eye closure due to being harassed, do need moist gauze since they provide higher humidity and if folded they can be effective in preventing eyelid opening. Since plastic *and silicone provide perfect seal vs tranquil* eye foam mask, they need less sponge/wetness, so using wet sterile gauze piece may work safer than tranquil eyes foam, being less allergenic (they say foam inserts are to be washed daily; but bacteria could grow if the plastic inner foam (which you're not supposed to remove daily, then how can you wash it, you would remove the adhesive) is not washed and dried daily, without the risk of bacteria growth, since you can wash cloth often well and no foam exists; you can place additional a long cotton/towel piece cloth (20 cm by 3-5 cm) on top of the silicone mask, moist one, hold it in place via the straps or knot, not only tiny ones inside to help eye stay closed in case it tries to open. Quartz/Eyeseals 4.0 leave strong orbital area eye marks for 20-50 min, so you need sleep on back to use them. We forget *the eyes become dry first at night, years before they ever get dry during the day*. Dryness it starts before MGs atrophy on meibograph. *Night mask prevents dry eye from becoming far drier/redder in 1-5 years.* ☺☺☺

11.17.1.2.2. ►►► $5.0 *moisture retaining eye mask* during the day ◄◄◄, *if you* want no artificial tears in the eyes and yawn tears are not enough. The only types are those with foam gasket (like foam-padded motorcycle glass list of frame width site (so you can buy frames with 145mm for adult men, as Amazon doens't share the size on all and Amazon list (free returns)) where you can plug the holes with earplug silicone to get a better seal for higher moisture (fill any other temple or below gaps with silicone attached to frame/foam if too dry). Using any sunglasses will require earplug silicone and make glasses too heavy (crush your nose, leave nose marks, fall off easily), look very strange and be too close to eyes, causing eyelash to touch the lens. For those who need prescription *(or those who want to protect vision by wearing high quality glass with no* prescription *that removes glare and increases visibility at night, since it blocks no blue light)* driving or reading glasses *(buy frame, go to optician store to get lenses, photochromic = tints and becomes sunglass outdoors, avoid bifocals if possible, to prevent headaches)* you need wrap around glasses with the biggest (145-155mm width), tallest (47-55), widest (69-75mm) lenses possible *(so you can't see the frames of the glass from inside or the eyebrows as outside of the frame in the mirror)* to prevent atrophy of retina cells that perceive peripheral vision *(curve 8, not the flat type, otherwise, there is too much air and relative humidity is too high or the field of vision too small)* glasses with all around rims like the first 4 for

Most adults: $30 Wynd 334 (soft foam nose tips, unlike the rest; if you trim the foam a little, you

get the widest field of view with this pair, if you trim the plastic gasket too, the field of vision becomes gigantic, the healthiest of all: lens width 75, frame height 52, glass width 145, with trimmed gasket on the lens height is 41 mm (37 if no trim), trim top of nose bridge + lower foam so it fits tighter and offers the biggest field of view of any foam glass, you no longer see the lower frame edge, as it's closer to the face; the foam of these is much tougher, long lasting than Bolle glass Foam that peels off), $25 WDP (146mm frame width, 51mm frame height, 38mm lens height you actually see thru), $15 Birdz (has strap too for dusty job, no free return, 146 mm width, 52 frame height per Target, small vs Wynd 334, Wynd lens height is tall thruout, Birdz shrinks above nose, blocking vision), $27 Solpro (146mm width, 47mm frame height, 38 mm lens height/61 mm lens width on a straight line, with gasket on, fits closer to eyes if you trim the *foam on the top of nose bridge, lower nose areas, so you don't see the lower frame edge*)

Adults/kids with narrow heads or small/deep eye sockets, where eyelashes can't reach the lens if lens is close *(the rest need frame to rest on eyebrow, not below, as eyelashes otherwise touch the lens)*: $14 Radians 2724AF Radians bought Crossfire in 2013 (field of view tiny, pic deceiving, makes it look so huge; above and below blocks field of vision; frame width 150 mm, with gasket lens (what you can actually see thru) height 33mm (very low), frame height 45, lens width 60), $12/3 pairs Surpass (145mm width, small per reviews, 41x65mm lens), $8 Radians XT 1-11 (lens height 40mm, lens width 5.3"/135mm), for tiniest heads only, soft rubber nose pads, 20% of 1 star reviews complain they cause pain near ears due to being tight, foam blocks view), $30 Wynd Blocker 327 (glass height 1.7"/42mm, lens view height 29mm, lens view width 47mm, sits so close, eyelashes touch the lower lens when you blink, good for kids or people with deep eye sockets, lens width 65mm, 1 star reviews say it's too small, glass width 5.5"/140mm), $20 Klein Tools 60538 (glass height 1.7"/43mm, lens height you see thru 32mm, lens width you see thru only 51 mm (foam trim won't change the 51), glass width 5.7"/145mm, rubber nose tip is tough; field of vision tiny blocked left, right, down a lot), $23 Bolle 40085 Tracker (lens height 40mm, lens width 70mm, glass width 5.1"/130mm, tight on ears due to 5.1" vs 5.7" normal, small field of vision as you look down and sideways, due to 5.1"), $20 Baxter (lens height 36mm, lens width 62mm, frame width 140 mm, tiny field of vision below), $35 Purple Gem (small head), $28/2 pairs Purple Sly (41mm lens height, 137 frame width), $4 White (140mm frame width, 40mm frame height), $13/4 pairs Jee (147mm lens width, 41mm height), $7/3 pair Pink Owl (147mm frame width, 37mm lens height), $38 Bolle Ultim8 googles for toxic air areas and 100% protection (lens height 39mm, lens width 70mm). You can always use a razor blade to trim the foam to get a more perfect closer to face fit, so you use less silicone to plug the holes or obtain a higher relative humidity. Likewise, you can use a razor to create vents in the foam, if the vents the glass foam comes with are not enough, causing too much fogging when you use antifog solution. People forget 42% of kids (Cornea 2018;37(4):426-30) and most adults already have

eyelid gland atrophy, which will become dry eye soon if they don't wear their prescription lenses with a wrap around padded foam frame to protect eyes from the immense oxidative stress the wind brings with dust, microbes, etc. Even people with no prescription would benefit if gland atrophy is seen at the optometrist. The $26 Ergodyne (glass height 48mm, lens height 39 mm, frame width 144, lens width 60mm with gasket) is terrible, the nose tips are plastic (not rubber/flexible) and, unless your nose bridge fits perfectly, they leave red marks in 1 hr, plus gasket is not tight at all, needs silicone between frame and gasket, website is pathetic, no glass dimensions, lens etc, mom and dad garage company founded in 1983 vs 1857 Klein. ☺☺☺

For non prescription wrap around style (good for night sleeping, but not ideal for daytime due to plastic distorting vision) you also have 20 times more options of "one piece" types (the 2 lens merged as one, no rims), with foam gasket, that you will find on Amazon (at least 20), one good *brand is Bolle as field of vision is huge*: 14$ Bolle Cobra HD (glass width 150 mm so much wider field of vision below and sides, lens height 50 mm, 96% visible light goes thru) + 6$ Cobra Foam Gasket, $14 Bollé Rush+ HD *(glass width 130 mm, lens height 40 mm, so due to lens height 10 mm smaller and lens width 20 mm smaller, restricted field of vision for big heads, Rush is for small heads)* (10$ at safetyglassesUSA) + matching 7$ Rush+ Foam Gasket, sunglasses (better clarity, more contrast, less glare than $ store and Walmart sunglasses, which are almost identical, except Walmart charges more), $10 Glass+Foam Purple (small), or Bollé Rush+ CSP (52% blue light blocker for sunrise, sunset driving maybe) for minimal air, max humidity, and use tape or earplug silicone to create a seal. Amazon is great, it allows you to test a glass for 12 hours to see if it causes temple pain or not, in stores you can't do that, Amazon returns are easy. Both these seals are on safety glasses with ear grip and antifog paste applied, with tape or silicone going about 1 cm behind the hinge (see picture here) for max comfort and seal stability (before hinge only for ultra high humidity for people with very dry eye or in air conditioned area). You can also wear a hat close to eyes and a COVID mask close to eyes, and in cold weather the warm air you breathe out will condense and provide a lot of moisture for short periods.

For easier finding of sealing methods, antifog sprays and other topics, the next 15 pages are split in 7 parts: 2.2.1. ear grip if glasses slip 2.2.2. antifog spray/paste/gel 2.2.3. silicone seal (20x faster) 2.2.4. tape seal 2.2.5. other Bollé, etc glasses 2.2.6. hydrophilic coated glasses (why they often don't work) 2.2.7. future tech & glasses at RiteAid, standard dry eye treatment

2.2.1. *Ear grip*, temple retainer, ear hook & other methods to prevent glasses falling or moving

It's extremely important to avoid breaking the moisture seal. When we look down, at keyboard, at the floor during house chores, while shopping or doing other physical activities, glasses fall and break the moisture seal and then we have to bring them back in, pushing the silicone too hard, changing the mold of the silicone or damaging the tape seal. Not to mention, not having

ear grips introduces extreme eye stress, since it goes from constant humidity to wild variations of humid to dry. Before going into the 7 ear grip methods, I wanted to mention t*he smiley faces I placed on temple area (pic) are there to prevent UVA, UVB from destroying eyes from the side, since clear plastic only blocks UVC and some UVB, while the lens of Bollé HD protects against all UV. This is a good idea for either tape or silicone seals.* The 7 ear grip methods are*:

1. Molderp *soft silicone* colorful fully behind ear hooks ► 12 sets/6$ (this type is best for high movement like gardening, bending, tub cleaning, running, etc; you can also trim it and leave only 1 or 2 mm outside of the hole (so trim most of the hook), so it creates the least ear bending 'hook' of all on this list, least ear stress, least ear inflammation, just like having glasses with thicker frame – save some for high up down moving and trim the rest for in house PC work); normal hooks heat ear too much. I bought 12 of this type, the clear ones below:☺☺☺

2. Multicolored, *clear (easy to spot dirt), lavender, etc* fully behind ear grips ► 12 sets/7$

3. 3 inch long temple tip retainer ► 12 sets/9$ (these only work for very tight pairs, not loose) – this bent my ear too much, creates too much heat, so I returned it, but others may like it.

4. behind ear grip + ear circular grip ► 12 sets/3$*, 3$ and get to see how circle/hook work (circular ones bend ear too much vs trimmed ear grip, but some may love them)*

5. Molderp circular silicone ear grip 15 sets/7$ (these are smallest and most invisible, but they don't work well like the ear hooks grips do for the glasses that slide a little; clear is most 'invisible' behind ear hair, since it gets the color of skin, plus clear or lighter color is easier to see when dirty for washing – depends if you want others to see it or not, and on your skin or hair color, length, etc; clear ones tend to get yellowish after years, due to skin oils; all these types come in many colors, so if you want it to look newer longer, opaque color is better: appearance vs hygiene, 12 will last 20 years, though older ones worn longer may become more skin friendly due to absorbed oils, while changing it often may irritate skin due to chemical exposure and do more damage than wearing the same 'dirty' one for longer)

6. *Use the end of a glass strap you got (or the one that comes with Bollé HD, pic), trim it and place it on temple tips to create strong friction. Don't use if it creates discomfort around ears. You could create even 7 sets of ear grips from the Bollé strap. This is flimsy though, Molderp circular or ear grip is way better for a really stable grip.*

7. *Use rubber wrapped to the temple via electrical tape or high friction material in a shape that goes behind the ear preventing the glass from falling; I did that and it doesn't move, see pic; Bollé* HD comes with a hole at the end of the temple, so you can even use some elastic cord to place under hair for max discretion if the methods above are not what you like.☺☺☺

Another reason ear grip is useful is this: when face around eyes is wet (after shower, cold compress, etc) we need wear the backup 2nd HD Bollé pair very loosely to avoid water blur due to the fact all antifog coatings distort vision with excessive moisture; we wear it loose so air can enter and escape, then after 5 minutes, when drier, move it 2-3 mm back to normal fit or 1 mm for another 5 min to test if it fogs too fast or not. If you have money to spend, you can also wear a loosely silicone or tape sealed non ear griped Bollé HD: this would be our 3rd pair for this purpose alone, to provide some moisture but allow fast evaporation, 2nd or 3rd HD Bollé is ideal for this, to avoid stressing the eye by using all kinds of lenses, glasses, just one lens; if using a 3rd Bollé HD there is no need to ear grip this 3rd pair, though that can be useful, since it's easier to put on and take off and you don't need perfect seal for this (since wearing ear grip loose bypasses the taking off of a pair with no ear grip (used for that purpose alone), wearing 2nd pair loose can be favored by many); try see what works easier for you; some may like grip, so they adjust the tape 'height' instead of how loose to wear it. If you have some blue light glass lying around the house, we can also use a taped $10 blue light glass (see my pic) from Amazon like 9$ Kenzhou (Kenzhou and blue light glasses are not as good as Bollé HD for generating moisture and for seeing well; which have 5x times more air volume than taped Bollé HD) for 5 minutes to evaporate that eye area water before it ruins our coating by water overload). The advantage of ear grip is that over time we learn how much to wear it loose depending on water on ocular area and it will remain there even if you move a little.☺☺☺

2.2.2. *Antifog paste/spray/gel* on taped sided HD or silicone seal HD (see below) is needed, since HD has no antifog coating; but it only takes 1 minute a day to apply it and thus also clean our glasses. It's better to apply spray types on a microfiber first, then wipe the lens with the wet microfiber (1 by 0.5 inch) to avoid spraying chemicals in the little grooves of the foam-plastic-silicone-glass setup, so we only get those chemicals on the lens and it evaporates fast in 10 minutes; we don't want leftover volatiles irritating the eye, creating biofilms that trap bacteria, etc. If you created too high moisture by mistake or not using the tips in the prior paragraph, you may need reapply paste that day, when dry. If it blurs or fogs, you probably applied too much pressure when wiping the greasy gel, only wipe with the minimal force to make lens clear. *All other glasses have coatings that wash off in days after cleaning with water or wiping them when wet, so you need this gel.* I tried 4 Amazon antifog sprays and none worked like Bollé spray, so paste works a lot better in general, but not perfectly; paste has much more soap, so it prevents fog much better; spread paste or spray using a microfiber piece (*1 inch by half inch, I made 100 such pieces that I wash once used*), wait 5 min for stuff to evaporate/stick, then use dry microfiber (20, 6x6", 9$) to clear the lens of paste/liquid leftovers; paste can be safer since it has way less volatile stuff, so if you rush, you won't get toxic volatiles into your eyes. Overall, the best option seems the 500 ml Bollé anti fog spray; the website and bottle describe it as alcohol

free, but the bottle lists an ether alcohol as main ingredient, so definitely let it dry 10 min before using the glasses, it even says wait 2 minutes. *Don't spray; instead, use a microfiber that was moistened with the solution to wipe the lenses, as spraying leaves some of it stuck in the foam gasket grooves and won't evaporate in 5 min*. This got no ammonia, no silicone, bottle says it has 25-50% methoxy propanol (volatile, an alcohol and ether at once), 1-10% sodium docusate, 0-0.1% glutaral); letting it dry first 5 min after the first wet wipe is important, you don't want to wipe it dry with dry microfiber while it's still wet since it removes all the nonvolatile stuff and will fog badly; is way easier to wipe it off, being super-easy like z-clear and offering better antifog than z-clear. 4 Amazon antifog products I tried that work are:☺☺☺

1. Gamer by Gamer Advantage, *best* one *so* far, it's a spray, US made, spray it on microfiber piece, then wipe lens, let it dry 10 min and then wipe again once dry to thin out layer 5 times; to avoid chemical film in foam/plastic holes and incomplete evaporation of the 2 volatile ethers. Bottle lists contents as: fluoroaliphaticoxyethylene adduct, x=3,4 or 5, n>1 (*$CF_3(CF_2)_x$-$S(=O)_2$-$N(CH_2CH_3)(CH_2CH_2O)_nH$*, propylene glycol butyl ether $H_3C(CH_2)_3$-O-$(CH_2)_3$-OH, 2(2butoxyethoxy) ethanol $CH_3(CH_2)_3O(CH_2)_2O(CH_2)_2OH$. Due to electronegative inductive effect from F, SO_2 group, the C-F bonds in CF_2, CF_3 are very strong versus C-F bond in CH_3F, which is already strong; this makes this compound safer. Safety is not 100% known for partially sealed safety glasses like Bollé Cobra with or without silicone, though 3M and other companies use these types of antifog. Use with caution, return if irritating. Little is known on how much of the toxic adduct enters the body via vapor pressure, but you may need wear glasses 12 hours daily 40 years to get 1 mg into the body. Never spray on glasses, always spray on a tiny cloth piece in a ventilated area, while wearing another safety glasses pair, and only wipe a little on the glasses. Spray at a distance of 5 mm from cloth ideally so you don't inhale anything. UVEX Fog eliminator and many other brands contain this adduct, so it may be less toxic than other chemicals in anti-fog. Walgreens Nano Magic Anti Fog that has this adduct says "safe to use on any goggle".

2. z-clear.com *2nd best* one *so* far, safer maybe *(company sends email spam, with people without teeth in the ads, and guy has weird music on website, may be bad),* founded *1985*, makes $9/12g thick paste, easy to apply, a coat lasts about 20 *times* < Gamer Advantage so it is useless for moderate or severe dry eye - only useful for low humidity ultra mild dry eye needs unless you want to waste 3 min to apply it every hour, in high moisture it makes streaks and vision becomes terrible, ultra foggy. Utah *small company, no SDS, pH 8.5 when diluted 10x with water, pH 9 at 2x (same for ekusa, the next soap based gel below); they emailed that main ingredients are optical soap (see more in the drop section) and water, and that they use it on their swim and snorkel goggles*. In low-medium humidity z-clear outperforms Hilco, which is extremely hard to apply and becomes very milky if a tiny silicone gets mixed in from edge of glasses. Then you have to spend 10 minutes extra at least, if not 20 to clean the whole glasses all over with soap

and alcohol to remove the silicone. Si and F like each other and they make one big mess. Since usually we're in moderate humidity and we need reapply coating often, z-clear wins over Hilco:

3. hilcovision.com Hilco, founded 1956, acquired in 2015 the Hilco Germany subsidiary Breitfeld & Schliekert b-s.de (founded 1927) *makes* gel $9/5g that lists 3 ingredients: perfluoroalkylether (extremely stable) $(-C_nF_{2n+1}-O-)_x$, tetrafluoro-1-propanol $CF_2HCF_2CH_2-OH$ (the fluorinated alcohol, the volatile component,), perfluoropolymethylisopropylether (extremely stable) $F_3C-O-(-F_2C-O-)_x(-CF(CF_3)CF_2-O-)_y-CF_3$ if curious what companies list as ingredients. This is the only company that lists ingredients on the tube (bottle) that I came across so far, being oldest (*1956*) biggest antifog gel firm selling on Amazon, 8 subsidiaries on 4 continents. The Hilco Part # 1082743 and website link for the Amazon product is here. It's worth pointing out that the vapor pressure of perfluoropolyalkylether (PFPE) is $6x10^{-8}$ Torr, vs 33 Torr for isopropyl alcohol, 17.5 Torr for water (20C/68F), 380 for diethylether (the smelly one). PFPE is used as lubricant in aerospace, due to stability at 200°C. 1 Torr is 1 mm Hg, or more exactly 0.9999998575337 mm Hg. So, no PFPE is not volatile by any definition. Like all gels below, Hilco, of pH 6.5, also needs to be reapplied daily. Hilco is best on initial uses on a lens, hard to apply vs z-clear, it takes a lot more rubbing to make the lens clear, but once you did it, it will last 30x longer than z-clear; the drop that comes out is huge, so you need to place your finger or a designated (for this purpose only, not meibum expression) silicone q-tip near the tip of the tube to get the top of a droplet stick, or something to get less and get your tube last 10x longer. Returned it.☺☺☺

4. ekusa.com founded *1986*, leaves a lot of streaks and is harder to apply than z-clear due to being less paste like; makes scope dope $8/14g same product as 9$/14g cat cap $/14g (just different bottles), more expensive than c-clear, but it's more watery than z-clear so it is about same price/g of stuff (not water) as z-clear, so you need apply more; no SDS, Utah, professional email reply, told me it contains only 3 things: ***water, glycerin and coconut tallow soaps***, no alcohol, no silicone. That's the company that shared all ingredients when asked. Pretty big company, Utah governor visited them, see their website video of the visit. Seems the safest of all, since there is no ingredient that could pose any safety hazard if not fully dried, etc. Returned.

Other 4 products on Amazon (US made) that are entirely useless are: 5. Don & Jon's (doesn't list ingredients, doesn't last long under heavy moisture conditions, but is better than any of the ones below); 6. GearAid Gel (no ingredients, this thick gel doesn't work well, it clouds whitens the view after moisture, since the rainbow streaks cause a blur); 7. GearAid Spray (no ingredients, fogs fast, 10 times quicker than the gel); 8. Koala spray (water, partially fluorinated alcohol substituted glycol, isopropyl alcohol, isopropylidene glycerol, sorbitan caprylate): lasts longer, but it creates cloudy streaks in high moisture, just like the equally useless Vapor Shield coating safety glasses. The last 8 products are a waste of $, they fog instantly in high moisture:☺

9. Cressi spray – says on website all is made in Genova, Italy, bottle says made in Spain. Uses toxic preservatives, like others may do too (without listing them): has <5% anionic surfactants, benzisothiazolinone (similar to next compound, banned in cosmetics in EU, all isothiazolinones are *preserv*atives used in cleaning products etc – due to their ability to kill microbes), methylisothiazolinone (biocide, cytotoxic, the EU explains on page 28 "Methylisothiazolinone, at 100 ppm (0.01%) in cosmetic products is causing contact allergy and allergic contact dermatitis... Benzisothiazolinone ...has induced sensitization at circa 20 ppm in gloves", avoid Cressi; they have some voluntary bans on this stuff in EU, $S(CH)_2C(O)NCH_3$). 10. Zeiss spray – made in Taiwan, designed in Germany by Zeiss, a company started in 1846, ingredients listed as "water, proprietary surfactants and *preserv*atives" 11. c-clearantifog.com C-clear, fogs immediately, very hard to apply since the stuff is so liquid and uses so much wiping, pH 8.0, founded *1977*, *makes* 8$ for 33 g *very liquid paste, a real gel, more gel than ekusa, and far more water than z-clear*, started by chemists, answered the (877) 750-7927 phone questions I had, most affordable and professional website info for our dry eye application (shows good website doesn't mean good product), sells to big commercial accounts mostly *(Amazon listing is mainly to find new commercial accounts, since individual sales are not big, they do sell to fortune 100 companies, military, 53+ countries, anywhere the delivery works worldwide),* contains 20% nontoxic soap, 400 ppm isopropyl alcohol, < 0.5% glycerin and about 80% water in it, the other 1.5% is antistatic that is naturally made in the manufacturing process (*antistatic is also in the spray, spray is weaker for all these Amazon antifog products, that's why youtube optometrists, Amazon reviewers rate gel higher than spray, it's more of that soap on the lens after use*) and other proprietary stuff, see Safety Data Sheets). Seems odd when used. I returned it. 12. Optix 55 Anti-Fog – fogs instantly, the worst, no ingredients listed. 13. Spit spray – fogs fast, no ingredients 14. Fog-stopper – fogs quite fast, even if not as bad as Optix, no ingredients. 15. Zooke paste (hard as a rock, have to dilute with water to apply, and then it fogs fast), no ingredients. 16. Cat spray fogs fast, try their paste above instead. Be wary of products with no ingredients listed as they might be very irritating for the eyes, so call company, etc.☺☺☺

Swimming is not recommended while wearing antifog coatings specifically stating 'they are safe for swim goggles', due to water getting into the glasses, washing off the coating into swimmer eyes and causing damage (cornea pH 12) as with this guy using $7/1oz Spit Gel (that 2005 founded company says on Amazon is not for swimming, no way to contact company via email or phone, odd, I would not buy this gel, plus c-clear is cheaper, being paste, not gel) ► Cornea 2016;35(2):289-91, *so try (hard task, as manufacturers never reveal the exact contents of their coating)* find the safest antifog solution that has no volatile or semivolatile compounds after drying (*many have isopropyl alcohol, some 400 ppm, which needs to dry out after application, so wait 3-8 minutes before using it and make sure it's odor free*) that may cause issues, usually,

they're surfactants, or soapy compounds that are not volatile). *When swimming, 90x more water can get on the lens than when wearing sealed safety glasses, so much so it can even get into the eye. With moist safety glass lens, water is too scarce to even reach the skin below eyes.*

Why not wear sealed nonHD Bollé? Because HD Bollé even with antifog paste is far higher quality vision for computer to any antifog wrap around glasses and a paste allow you to recoat yourself and remove the coat instantly as needed with alcohol or soap, but Bollé nonHD (meaning with antifog coating) you need buy new pair each time to get fresh antifog coating; *it only takes 3 wipings with microfiber when wet to ruin the coating on all antifog coated glasses*. The antifog paste you apply fades in 10 minutes if you wipe it, to dry it, with microfiber when really wet, so have 2 pairs of sealed Bollé ear griped HD (*you need a 2nd pair, definitely, because you need clean your other glasses and apply antifog and fix the tape sometimes, replace it, etc*) and let the wet pair dry naturally, after you put the dry pair on; otherwise, you will apply gel 5x daily which is more $ in the long run than buying an extra Bollé HD. ☺☺☺

2.2.3. *The SILICONE seal day mask (described on the next page, some may prefer this, being higher moisture, way more comfortable, I prefer this day mask when I wear one, since* COVID19 can cause pink eye or conjunctivitis so these glasses shield eyes from it*) is essential to prevent dry eyes* (even for healthy people, in extremely *windy* or *cold*/hot *dry* winter/summer weather) *without scleral lenses, overuse of drops or* punctal plugs that give infections. Castor oil, used in Refresh, Rohto, Systane, etc eyedrops, has pour point 2.7°C/37°F; meibum oils, that keep eyes wet, have way higher pour point in some people, hence they solidify and block the meibomian *glands (*MGs) orifice, so you can wear the sealed safety goggles below if outside for long periods in freezing weather, to raise eyelid temp by 10°, as otherwise you may get dry eyes from *gland blockage*; this is why these glasses are way better than scleral lenses, punctal plugs, they keep the orifice of MGs 10-20° warmer in cold conditions (especially *wind* that cools MGs orifice way faster, wind blocked by glasses), preventing the solidification of the oil in the orifice area exposed to freezing temps that will ruin eyes in the long run. Hence, 42% of kids have MGD. Parents can give foam kit Bollé Cobra or Rush (see below, protects against UV too) to kids when playing outside in cold weather or walking to school 30 min/day in super cold winter weather (*-16°C (3°F) to -26.9°C (-16.4°F), way colder than Anchorage, Alaska, typical January temp at 7 am in many nations where parents never drop kids to school*), if you want to save their eyes and prevent dry eye at age 25-45, sunglasses in sunny weather, as sun destroys the MGs orifice.

If you do studies of kids, those born in the coldest month of the year to the same parents, January for example is far colder than Nov or July, may develop MGD (all adults develop it when old enough) sooner, as their sensitive orifices are wiped out by cold wind vs those born in the summer (by 5 months old our eyes are far stronger, immune system far stronger, under 6

months, our immune systems are ultra weak, unable to deal with the stress caused by the orifice dryness of winter wind. Likewise, those playing for hours daily in *freezing* or *dry/windy* weather the most, without foam kit/wrap around safety eyewear, will develop MGD, dry eye decades sooner. Oddly, parents, allow their barely born kid, to spend too much time in toxic super cold weather, damaging their eyes and facial trigeminal nerve that controls MGs; no wonder Russians got 72 year lifespan, it's so cold, if parents make one mistake, the kid can't say 'mommy I'm cold, he can't speak before 6 months', so his immune system, undeveloped, will be unable to heal the body damage done, recall immunity only becomes barely functional at 6-8 months; likewise, super hot weather, can damage small kids and babies too, via dryness causing MGD and we see Africans live to 50 in some areas; so it's not just about eyes, but also the whole body, avoid extreme temps for kids. In future eras, all cities will have 75°F weather, 24/7, 365/year, to maximize lifespan, diminish heat/cold stress, but that tech is not real this age.

Adults who go from 75 to -10°F daily a lot will also destroy their eyes, so to live to 500 and not have dry eyes, MGD, everyone will need to adopt the 100% wrap around, 90% seal glasses and make them stylish, better and allow email and phone chats, etc, to make them ubiquitous, like clothing is today; this removes the need for punctal plugs and contacts. This is precisely why ointments are so deadly, they have hydrocarbon oils that are solid even at room temp, so in freezing weather, they will completely destroy our eyes, or even cold 50-60°F weather typical of evenings globally for a part of the year, since they diffuse into the MGs causing meibum (especially around orifice) to *melt at an ever higher temperature, the more you use it; this will lead to chalazions, styes,* infections, swollen eyelids, etc in 1 or 7 years. Likewise, if you do cold compress, only use 58+°F 'cold' water bags, don't use 30-50°F cold compress. So avoid ointments and sticky thick eyedrops/gels at all costs *(since sticky Refresh Celluvisc, etc or HA drops block meibum orifice when drying at night, unless you clean it every morning when waking up, which nobody does with* 20x mirror *to see it)*, use lipid drops instead with natural oils with low pour point (20-30° lower) and saline and night mask (biophysical method, not sticky solid almost chemical pouring to ruin meibum orifice/gland in 1-5 years). ☺☺☺

To *make* the *dry eye 'mask'* use earplug silicone like in the Bollé Rush+ Clear pic (need 2x the silicone in this pic to prevent shifting, so foam kit is best, *you can trim, like the pic* side trim 1 & 2, the foam kit (plastic and foam) *to remove the sides so you can place silicone on the edge, to give yourself 6 mm extra on each side, the 1 inch on the sides removed with scissor to allow you to have real life* peripheral vision *for driving and daily activities to prevent atrophy of peripheral vision cells,* since the foam kit restricts lateral view slightly; due to not placing silicone all around, your glasses are closer to the eyes and the foam is seen much less, leading to less atrophy of periphery perception (Bollé made a mistake, the glasses needed to be bigger so the up and down vision has 0 blockage and you don't notice glasses are on. You can still use 1 single

earplug split in 2 for the 2 side areas, for better seal, you will need another half earplug to seal the top gap between the clean glass and the plastic that lets too much air in) or Bollé with foam kit Rush+ sunglass (Rush foam kit 5$) or Bollé Cobra HD with foam kit pic (plastic-foam kit on the glasses is 20x better, it makes silicone far less shifty, to avoid silicone on the lens, *uses 8x less silicone (1 earplug)*, explained below, Cobra foam kit is only $5.8 when in stock, or 8$ on main site when other sites are out of stock, it saves 700$ in silicone cost over many years: *to install foam kit*: *insert right side 2 pins on the frame (it snaps), then pull the upper center piece away from the glass, then pull the left foam kit end towards right to insert the 2 left pins on the frame; to remove foam kit: pull upper plastic near 3rd eye away from the glass, then pull left lower side away from the glass, then pull left side towards center gently to remove, then get right one out; if left handed the other replace left with right above for fastest outcome;* this takes 50x less time/effort than other methods), sunglass Rush+ seal pic to seal them. *The major drawback* of Bollé is cheap lens that makes long distance view blurry, while looking up close on computer, reading is easier as it eliminates glare from blue light. So, long-term, Bollé *damages long distance vision and aids near vision*, so clean glasses a lot to avoid damage and use higher quality glass instead of Bollé if using more than a few hours. So, use pure glass always and rim frames, not cheap frameless plastic safety glasses. Don't use it if 20+% of your work involves medium or long-distance view (garden, house chores), for computer use it's fine, these are 12$, so can't expect the same outside performance as a $70 quality glass lens pair. However, Bollé makes any text on computers higher resolution, much easier to read (no glare). You can also sleep with Cobra with foam kit, and add extra taped aluminum as this pic shows.

Take off any silicone seal safety glasses you wear (to protect eyes from wind or to see better) and wear the Bollé without the foam kit, using the tape seal perhaps or no seal if possible sometimes (only outside to protect from dust and wind, since water condensation will create blur and headaches), so that you don't atrophy the peripheral vision cells. *Bollé Cobra has adjustable temples, so it allows you to see down much more when walking very well without head tilting, being much safer than 99% of safety glasses with foam gaskets out there*. Bollé sunglass (smoke lens) types may not be ideal, since they block only up to 380 nm, allowing 14% of 380-400 nm light thru; but they do block more blue (86%) than other types and 400-500 nm blue can do mode damage than a little 380-400 nm, so it's a very complex issue. Most sunglasses are not wrap around and are not worn with foam kit or silicone on top of that, so they allow 100 times more 100-800 nm UV, blue, red, yellow light to completely destroy the eye from above, below, the sides, etc – while sealed foam kit Cobra allows virtually none from the sides, above, below; so the 14% of 380-400 nm that Cobra doesn't block is far outmatched in destructive power by the 400-500 nm that other glasses allow (few block 86% of that destructive 400-500 blue light) and especially the above, sides, under 100-380 nm UV light and 380-500 nm blue light

that comes and reaches eyes without any filter, in amounts 900 times greater than the sealed Cobra allows from sides and above, below.☺☺☺

***When we comparing glasses, we need to measure the actual total UV AND 400-500 nm blue light (super intense outside at noon, 100 times more than some inside places) that reaches the eye, not get so worried about 380 nm-400 nm only;* however, for extended outside works, you can try find a foam gasket wrap around that blocks 86% of blue light (like Cobra) and 100% of 200-400 nm if that's your concern. The labels on the Cobra pairs indicate all these percentages, while other brands never even state how much visible, blue or 200-380 nm UV they block, so you would need to figure that out first to compare, besides finding a wrap around with the Cobra perfect fit and gasket. However, most people get way more UV-blue due to using poor seal glasses and non-wrap around and not wearing glasses often, so 380-400 won't make a big difference at all. We're talking about using these ultra wrap around Cobras with foam kit and silicone to offer unmatched protection versus typical non wrap around sunglasses, especially, since windshield and car windows block 99% of UV if windows are tinted slightly with UV coat. If you use them mostly for driving, and have tinted windows that block 99.9% of UV, like windshield also blocks too (99% or so), then it's not a big concern; few people work outside hours daily, or drive in the sun much. Cobra Clear, Cobra HD only block 10% of blue light, so if you want to block 30% of blue light, buy $11 Cobra Contrast to use at night; I drive with Cobra Contrast at night, to ease ocular stress from blue light.**

If driving in well light areas with high level of car lights shining into your eyes, you can swap the Cobra with the Tracker and block 47% of blue light for a much more comfortable view, placing silicone around the $20 Bollé Yellow Tracker, which has built in 'foam kit', and very nice green plastic, grey foam; however, Tracker is smaller and has no Platinum antifog, just regular antifog, so you need to remove factory antifog with alcohol wipe and then use antifog coating; tracker will remove traffic, pole and car lights glare, lines, etc and give your eyes way less stress. You can set it on the table, or any surface with lenses facing the surface, since the rim is taller than lenses and won't scratch the lenses (you can't do that with Cobra or you scratch lenses); however, Tracker reduces visible light 18% vs 4% for Cobra HD, so ☺☺*lovingly gently* use HD at night in low light conditions; it can be used before going to bed to read computer stuff to avoid too much blue light exposure and still see colors well; *most people use these yellow lenses for sunset, sunrise, overcast days, night driving to reduce glare from lights, etc, though HD is safer for driving since it allows 96% of visible light thru, vs 82% for Tracker.*

Bollé Cobra Clear antifog coating called Platinum is the best antifog coating of any glass I tried, so overall Bollé Cobra is the best, allows you to see down when walking far more than most glasses, like Tracker/Rush and 99% of Amazon ones. *Evenings eyes get drier and we need to*

bring the silicone seal glasses closer to eyes (straight eyelashes would touch the lower silicone) to produce higher moisture or have an evening designated silicone seal closer to eyes than the morning pair, so curled eyelashes (see cold compress section) help avoid toxic eyedrops (that's the nice thing about silicone, it's flexible, so we adjust it 1-3 times daily if we need to, with rubber-like materials we can't do that, and rubber restricts circulation, leaves marks, etc). You can buy some white (allows maximum visibility of hair/lashes, same for pillowcase and bed sheet) food containers to be able to hold (some near bed, some by your second pair storage area during the day) these ultra heavy glasses during sleep or using the other pair to see eyelashes/hairs, in order to remove them with tweezers when they get on the silicone; can sterilize containers with 70% alcohol often and to keep glasses hair free, cornea free from eyelash/hair scratches. I once (not anymore, so I can see eyelashes better) even wrote "seal ✓" on the outside of silicone for one lens, "lash ✓" on the other, (both contain las) to remind myself to remove eyelashes that fell on the inner silicone and to use a q-tip (thin on top, cotton removed) to check for big gaps that create less moisture and make you turn to toxic eyedrops; to gain this new habit of seal ✓, I placed 2 q-tips in front of PC & mirror, with purple marker dotted design, to recall seal ✓, I removed clutter on the desk, made the q-tips central on the table, mirror. The official site explains it's non-irritating moldable silicone rubber, i.e. polydimethylsiloxane, $(CH_3)_3Si\text{-}[\text{-}O\text{-}Si(CH_3)_2\text{-}]_n\text{-}O\text{-}Si(CH_3)_3$ used in medicine and cosmetics, or dimethicone found in endless hand, facial creams as the 2nd most used moisturizer, no wonder they use it for ears to repel water. It's also used in most fast foods, condom lubes, breast implants, etc. If a mg get into our eyes over 50 years of use, all it will do is what dimethicone does: create a strong hydrophobic layer (maybe prevent aqueous layer evaporation, prevent dry eyes, just as it prevents water loss in skin). However, avoid getting it into the eyes, since there are impurities in it too; personally, I believe trace levels of siloxane are safer than some dubious ingredients in some of the eyedrops.☺☺☺

The HD glasses are amazing: $12 Bollé Rush HD, and $14 Bollé Cobra HD. The Amazon pic is tinted, but all HD glasses are clear, Amazon pair is lower quality, 40040 item 05-16, HD with antiscratch AS, it's not 40040 item 07-18 that has hydrophobic and AF/AS antifog coating, so I suggest paying 5$ shipping to get the 11$ Bollé HD with hydrophobic and antifog from Michigan, since it is cheaper if you order also other Bollé that are cheaper than Amazon prices *(sunglass 10 vs 14), as this version of HD fogs far less when using any spray. The Amazon seller incorrectly describes item as having hydrophobic coating; the hydrophobic coating version is an older or alternate type of 40040; Amazon often sells stuff where description is a little off.* The temples adjust well/equally, unlike the Amazon ones where one temple moves slightly differently.

Both HD Cobra and Rush have 100% transparent clear lenses and *offer better clarity on computer screens than any safety glass I tried with silicone* (Rush silicone HD pic and Cobra HD pic) or tape,

without darkening the screen like Bollé CSP (52% blue block) or Bollé ESP (extra sensory perception, 64% visible block, 70% blue block) blue light glasses do, screen blue light can be adjusted with flux software; Rush HD (specs here) & Cobra HD (specs here) allow *96% of visible light thru, while the regular clear only 90%*. *We get better results if we first wash HD when brand new with soap and alcohol, scrubbing it really well with a cotton q-tip, to remove the factory coatings that interfere with the working of the antifog gel applied to HD lenses (which don't have antifog coating).* ☺☺☺ Wash with alcohol or soap if you change antifog gel brand, so you don't mix them and achieve poor results. Most pics in the book refer to Rush HD, clear, smoke (sunglass); Cobra is bigger *(the edge of lens is about 1 cm longer than Rush on the sides and near nose, so it is equivalent to placing silicone 1 cm past the Rush HD hinge)*, having more air if you place silicone on the very edge, which works if seal is perfect. To avoid eyelash touch for me Cobra needs 2 mm higher silicone above the eyes (covers eyebrows more than Rush), while Rush needs 1.5 mm higher silicone below eyes. Cobra allows a wider view down, while Rush blocks the view down slightly, due to silicone, being a thinner frame for higher moisture; Cobra temples are adjustable (5 positions, no other Amazon safety glass can do that, and not for $11 as Cobra Clear does elsewhere), for fitting almost any face and easier avoiding of eyelash touching silicone, so that's a plus since Rush temples are not adjustable;"bHD" letters on glasses are under the silicone, so they're not visible to us, but visible to others, Cobra less visible, away from field of view if no silicone. Try both Rush HD and Cobra HD and see which one works better for you, I have both. Cobra allows you to make it as air tight as Rush, since the upper frame goes way above eyebrow, so you can place silicone close to eyes. On Rush however, you can't go much closer and Cobra is comfier on the under eye area, has pivoting temples, etc – so Cobra will fit way more faces. Cobra also comes with more area to build skin moisture on, meaning healthier skin, less acne, less inflammation and easier moisture reserves to recreate moisture when you swap glasses, as skin releases it; Cobra Clear creates water blur less than Rush Clear due to more air volume, so it really helps, since you swap glasses 3-5 times less often and you don't need to apply daily gels that last only half day; this is a life saver, since you will become very frustrated with Rush if it blurs too much and need swap glasses with identical pair every 30 seconds; but hey, every person is different, you can make a vent in Rush if you like Rush more and see if it fogs less; but Cobra has huge advantage on swaps vs Rush due to moisture in skin rebuilding interior humidity faster. This helps you avoid pouring too many chemicals into the eye that have side effects, so that way you just use mostly saline and tear generation (except at night when you may use thick drops) when you got some dryness due to a mistake or etc. ☺☺☺

Cobra HD has antireflective coating that can fog a little more, so you can remove that via many methods (google it), or simply some $ store isopropyl alcohol and soap removed mine (since all the lightbulb reflections reappeared after many applications of antifog gel). Cobra Clear has

Platinum antifog gel baked by Bollé into the lens, but lasts for a few days if not careful *(weeks if careful, I.e. if you use another pair for high moisture situations to avoid damaging it and if you avoid microfiber, alcohol, soap washes)* before you need to buy a new pair, whereas a gel or Bolle spray we buy and apply to Cobra HD (that has no antifog or basic antifog) only lasts 0.5-1 day. The Platinum antifog coating produced on day 3 of use more fog (well, 100s of droplets that are like fog really) than Hilco gel after a cold compress (when face is saturated with moisture), so it's a far cry from 'platinum', but it's best for some, since you don't need reapply it often.☺☺☺ Under normal wet eye conditions, *Hilco produces less water blur than Bollé Platinum coating.* They all create streaks in high moisture, so HD only works if you apply coating often or find a better antifog gel/spray than I did. Cobra HD is best for computer work (but Cobra Clear works too, just not as amazingly as HD and Cobra Clear needs 0 application of gels, since cleaning would remove the Platinum coating – rinse with DI water only to clean) and driving (especially at night, to see better text on road signs, etc). It may not be good to use Cobra Clear only (which is ideal when high moisture situations demand it, after instilling drops, cold compress, etc) since it can't be cleaned well without ruining the coating, so you need return it every few weeks; plus vision is poor vs HD on computers, HD is better than without glasses.☺☺☺

Cobra Smoke is OK for sunglass (sunny day driving, etc). Cobra Clear can be bought 2 at once used until coating is done and then returned, *until Bollé Platinum antifog coating is available for sale on Amazon some future year. On 9-22-21 I got Bollé* anti-fog spray for free*, but it's not as good as Platinum coating on their glasses, but it does work without fogging on the smoke versions of their glasses (sunglass makes blur far less visible)*. You will want to get the foam kit for $5.8 for all your Cobras (Grainger has the kit too) because it allows you to use far less silicone (see pic), to remove foam and leave the plastic only, like I did for Rush clear (side view) and for Rush sunglass (inside view), foam removed if you need a tighter fit; the plastic or plastic+foam prevents silicone from shifting and ruining the Platinum coating 5x faster than without the plastic; the Cobra with foam-plastic kit and silicone picture shows less silicone; we use 8x less silicone with plastic only or plastic+foam and the silicone no longer touches the falling eyelashes that much or when you blink, since it's very fixed. The foam needs to be removed as it makes it too tall and it obstructs viewing objects in your peripheral vision and down, so Cobra is the best as this issue is not there for plastic only obstructing down view so much, because Cobra has 5 positions, so you can adjust temples to remove obstruction and it's wider, further away from the eye; because walls, carpets, bath tile, street concrete are light color, the dark plastic/foam may be distracting initially so some silicone on the black lower visible area could help, though most people (due to face shape) don't see the lower plastic in front of the computer if you move down the adjustable temples to the max position; *it's useful to move temples down to the max, as this moves the center of the lens further from iris and will fog that center area less for the*

same overall water load in the trapped air inside. We want to see dark eyelashes and clean them every few hours; we don't have to put silicone on the lower foam, since eyelashes don't stick to plastic and foam like they stick to silicone, but we need to inspect the glasses and shake them so eyelashes will fall; due to slight reflective quality of foam and plastic and smooth finish, it's way easier to see them than on the porous foam of the night XL mask. ☺☺☺ We want to also clean the foam well (impossible), so placing replaceable silicone on top of foam is a more sanitary option (but makes glasses heavier and more likely to shift) since foam and silicone can only be cleaned with alcohol wipes only a few times. Silicone the inner lower part (the only one that's visible as you look) of the black plastic distracts less than high contrast black-grey, makes eyelashes visible. If you want, you can even trim the foam-plastic on the lower side or third eye area plastic even and use silicone there or even some transparent soft round edge thing to see down very well, if you work in a job where looking down is important when you can't bend head too much and black foam is in the way. There are many alternatives. Bollé sells Platinum antifog Baxter glasses that have blue-grey frame, and may use even less silicone, may work for smaller faces that need super high moisture (this one would create it easier than Cobra), so the contrast issue (of black frames) is not there, but Baxter has no HD version that Cobra/Rush offer. We touch the plastic far less, as we no longer need adjust it as with all silicone mask, using 4 times less silicone, protecting eyes from microbes that can't be removed by a simple DI water from squirt bottle cleaning (all cleaning that can be done, any microfiber removes the coating).

The Bolle foam kit is 5.8$, so in the 20 years☺☺☺ it saves you $700 of earplug material trashed, not to mention the environmental cost for society, *but most people would replace the foam more often than once 20 years; with the foam kit you do use 3-5 less earplugs per pair if you don't cover lower part with silicone (I didn't yet)*. The foam kit saves you tons of time, since water won't make silicone slide anymore, since it drains outside of the glass and you won't deal with the incessant need of cleaning silicone off the glass when it shifted up (lower one) or down (upper one) due to soap of the antifog coating mixing with water and making silicone bond break. It has little vent holes on the bottom, so it allows you to drain water better if needed if too foggy etc if it doesn't get outside the glass easily, or just plug them with silicone if eyes are too dry; the custom ability to make precise location holes in the silicone is huge, as it will allow you to optimize moisture level easily; you can also use a needle or something thicker to make small holes in this silicone you use to plug the huge holes, this way, you can make the hole smaller depending on whether you got punctal plugs, etc, more moisture some days etc. Winter we need more water, summer less, etc. The foam supports the silicone on top of the inner lower part better, so I leave the foam on on all my Cobras. I only bought one foam kit for Rush, and removed the foam, since that was in the first 2 weeks of Bollé and didn't know any better, plus with foam it got dry; I didn't realize that the silicone would shift a lot without the plastic then

and gave up on plastic as I created tighter fits without the plastic; with the plastic (it arrived in California in 2.5 days from Michigan from the order placement online) eyes will be much happier, since leaks will develop 10 times less since silicone doesn't shift (it doesn't shift on very thick silicone much either, but thick silicone allows water to run backwards towards lens center when you put glasses on the table and create soap streaks, contaminate the lens with silicone dirt, etc, the water that accumulates at the silicone edge simply gets out of the glass with the plastic kit) but you will still need to adjust it closer and plug all holes on driest days or have 2 pairs, one close to eyes and one further away (foam not trimmed or removed) for wet days or times of the day (morning). You can plug partially the bottom holes and pour distilled water there to provide moisture for the eyes, but those tiny earplug silicone pieces need be replaced daily if you do that for ultra dry days.☺☺☺

You may need remove or trim 20-80% the foam (and cover the left over with silicone for a smooth face touch) if your eyes are too dry and need a tighter fit, it will still allow this amazing water drain that prevents silicone sliding. 6 months after buying first Bollé, I realized these foam-plastic kits are the ideal thing to use to allow water to drain so that silicone doesn't start to slide due to water. The nice thing about these plastic attachments is they hat they got little holes that remain always the same and allow you to create exact vents of an exact constant size when you want less moisture or fog; this would be impossible to do with silicone earplug only. Platinum often only lasts 3-4 weeks and only 1 at original strength if you used it and created very high moisture (basically loses 50% of strength and created a blur of 100s of droplets that is almost as annoying as fog) due to not taking it off a long time or using drops before or cold compress; since this is not feasible, people just buy a gel to apply daily (or less if their seal or moisture are lower) to Cobra HD or Clear once coating is suboptimal. All *Cobras block 99.99% <380 nm UV and 10-86% blue light;* to maximize Cobra or Rush Platinum antifog longevity present on Clear & Smoke (not HD), never use alcohol, or any other gel or lens cleaner, never microfiber after it's been wet for hours, and never use microfiber to barely touch lens to absorb the tap water in the hope of "removing calcium that could build up as on a shower door etc"; instead, use only a sink water jet to clean and finally (or entirely, though squirt bottle has little pressure to remove some dirt), have capped squirt bottle 2 bottles/6$ with DI water or RO water to do final rinse to get rid of hardness buildup that happens with tap water alone; these bottles can also be used to wet a room temp 'cold compress' to touch eyes and let that water evaporate to generate water vapor on low moisture days, besides using saline drops; only 1 microfiber drying by just touching to absorb calcium in water will ruin the coating and annoy you to no end as the pair fogs 10x quicker; you want to leave it alone after wearing to dry on its own and clean only after it's been dry a while. Otherwise, you will need return 10 pairs/month.

Bollé Rush/Cobra HD are far superior for computer or any detail work to any safety glass on

Amazon or anywhere I tried, since it requires no frequent antifog gel if you make a loose fit (mild dry eye) or daily antifog gel/paste (paste is better usually, dries in 2 seconds, then can rub it off) for a tight fit and high moisture (moderate-severe dry eye). HD has no antifog coating that wears out, so you don't need buy a new pair every 3 weeks. HD makes all letters darker than the background, allowing you to read 20% more papers before eyes need a break. after 2 months of silicone like in the pic above, on 7-7-21 I decided to extend the silicone 1 cm behind the Rush HD hinge (pic), to prevent bending the silicone irreversibly and creating a leak with each laugh or big smile, and forgetting to adjust silicone mold; this was done also to prevent the incessant water blur that occurs due to extremely high moisture created by a seal very close to the eye (so extended seal has the silicone very straight and even slightly bent away from eye, to further increase air volume and diminish water blur; for people with drier eyes than mine, they need the tight version though); the skin near hinge rises 7x more than the one just 1 cm behind when we smile; this extension (only needed for Rush, not Cobra) also lowers eye temp, decreases water blur, increases oxygen and air amount and makes silicone better than tape seal, since it eliminates the most annoying issue: *mold always changing every smile/laugh/huge yawn*. *If eyes are mildly dry only and you don't like the fact that the extended silicone mold can't be folded (placed in a pocket, etc), you can make the hinge area height much lower, so when skin rises 2mm during smile☺☺ and laugh it won't reduce mold height by 2 mm creating a huge leak.*

When you get a pair you like (see options here) measure the length of the silicone snake (very dry eye: 137 mm for Bollé Rush HD for tight fit for very dry eye, moderate dry eye: 185 mm for behind hinge Rush fit, 170 mm for normal Cobra fit), like in this picture, make the snake in 1 minute from 1 earplug and then place it around the glass (see pic), finally mold it and press it as in final pic. 137 is for one half of the glass, so to make it thick and prevent bending and shifting nonstop (which would make silicone streaks on coating and make it blurry) we need *4.5 earplugs* for Rush, and *7 earplugs for extended Rush or Cobra*; if you use the foam kit, you *only need 0.7 earplugs for Rush and 1 for Cobra (this means leaving the foam on the plastic and topping the plastic-foam)*, about 8 times less; if you cover the foam and plastic of the foam-plastic kit entirely (I never do) with silicone to see eyelashes better (maybe use beige plastic under if very thin), you will need 1.5 for Rush and 2 for Cobra. Use more and it will shift less, so you touch it less to readjust it, if you don't use plastic and it lasts 20x longer in a clean state; using too much will move glasses away from eye too much and obstruct your peripheral vision, atrophying your cells, so 1 is better than 2. Saving earplugs in the short run leads to more waste in the long run, since you touch it 20x times daily to adjust it as it falls by gravity. Make little grooves on the lower silicone layer if no 5$ Bolle foam-plastic kit used, for water to fall outside of the glass by gravity so it doesn't start shifting. If using plastic (with or without foam) let water get out easily don't plug everything with the silicone and clean the plastic too as you do clean the silicone.

Remove the plastic, wipe it well with soap, alcohol, etc, let it dry then put back. Silicone can be cleaned with alcohol pads, disinfected with UV lamp and also the outer layer that gets dirty can be trashed every few days/weeks, so no need to use 5 earplugs a day. Knowing the length allows us to remake it ultra fast every 1-8 weeks when it gets dirty (we only need to replace the top layer first, as that one gets dirty only), depending on whether you use that pair 2 or 16 hours/day (be gentle around the nose bridge pieces when pushing silicone against the glasses to fix it, as they can snap). It seems easier if the silicone snake going above the brow is 20% thinner than the one under eye, the temples one 30% thicker. Make silicone point away from the eye, to avoid touching eyelash if it does *and* create less water blur.☺☺☺

***When it 'blurs' (water condensation, not really fog when you just applied antifog paste and coating is intact)*, just loosen its tight air seal slightly or take it off and wave 3 seconds; a slight air leak will create a wonderful balance of no fog but high moisture; with time you'll get the exact knowledge of how much to loosen it, where to place your ear grips to prevent shifting and moving, without having to mess with the silicone, just pull it slightly forward, but not too much, because then you get dry eye, so you need to do it in tiny steps, until you reach that sweet spot of perfection, which varies by day and time of day. If it blurs too much, widen the area of the silicone, moving away from eye at temples, increase silicone height; if that doesn't prevent water blur, you can buy the 5$ plastic-foam set to place on any Bollé Rush+, cap with silicone all gaps as in this Bollé Rush+ with foam pic (or remove the black foam that is hard to clean, and just place silicone over the black plastic, since this will enable a higher moisture being reached faster, due to less air volume and tighter face fit, plus higher hygiene, since plastic can be cleaned very well, silicone replaced, while foam can allow bacteria to penetrate and thrive, *and spraying new foam always from a can is not easy, needs a lot of trim afterwards, and foam has to be hypoallergenic, for eyes not construction*) and then you get a little lower humidity, but no more blurring nonstop every 3 minutes which can become ultra annoying and redden eyes due to trying to go around the blur to see; I tried it and wow, the blur takes 5 times longer to appear vs without the foam when eyes are very wet initially, but we don't need foam if we move silicone way towards the edge of the glass and increase height of silicone. ☺☺☺**

However eyes become pretty dry first 10 minutes due to time it takes for moisture to build up if you start with normal level of eye wetness, so the plastic (see pic) fit on Bollé without foam is the better of the two, since it fogs slower and eyes are still wet, when I say fog I mean that water condensation, not real fog, since with fog you can't see anything. *Move your head back and forth when not sure if a gap exists, the little cold air entering in one place, will alert you your silicone has shifted and needs adjusting again; no adjusting is needed once you figured your average and set ear grip at that level; just move glasses 1 mm away if too much blur on very wet times of the week.* These are cheap, so having 2-3 pairs is useful to avoid issues and also to have

a pair when you fix or clean the other, etc. I had 1 Rush HD, 3 Cobra HD, (better for night time driving, reading road signs from distance, and bigger, since blur at night is bad; actually 3 HD are needed at times, since the other 2 pairs dry the water blur) 1 sunglass Rush+ Smoke (the antifog coating is gone, so I use antifog gel) from Bollé. I also used rarely (no more, too small) a yellow polarized wrap around night driving glass – see silicone polarized seal pic, and 99.9% blue blocking glasses (silicone seal pic – blocks way more than Bollé Cobra ESP 70%, so when driving you may often see purple auras of green trees etc). We got the challenge of maintaining equal humidity, which is hard, since if you take them off to dry them, humidity changes, so slight pull 1 mm or far less would maintain a much more constant humidity and allow a more fine tuning of blur. Taking glasses off brings stress for the eye due to ever changing humidity, so you need 2 identical pairs to avoid the stress of new lens type; plus you also need to often readjust silicone if you take them off, and then it may not align properly next time if you're rushed to type, leading to dryness; find a pair that once sealed to a level provides maximum constancy of optimal humidity the eyes need, based on your average dryness, without need of drying it so often, the right amount of venting, etc. Recall to wash or clean with antifog paste (that acts as a cleaner too) your Bollé pair often, maybe daily, to clear debris, dust that clings to the water droplets; you can use the naturally present chlorine in tap water to disinfect it too; this way glasses are cleaner; you need reapply antifog gel after a good wash or after use of microfiber on a wet lens. These sealed glasses raise our eyelid temp slightly, so many need no warm compress either, because the meibomian oils melt easier. If too much water, not fog, condenses on lens, if you use the antifog non-HD ones with silicone seal for ultra severe dry eye, *just take them off 10 sec,* wave them and water is gone; or if you like a non-HD Bollé pair with antifog coating, have 2 of them to swap to avoid having to take them out for seconds to dry the lens, to avoid having your eyes stress out by always adjusting to a new type of lens. ☺☺☺

I would not clean it with 1 square half inch (small so you don't touch the silicone) tiny microfiber cloth unless it's dirty and dry, since the antifog coating on Bollé goes away with excessive wiping out of moist lens and also, you risk mixing silicone (that touches the microfiber) with the coating further deteriorating it. We use sealed glasses to avoid putting toxic lubes, drops, buffers, preservatives, etc into our eyes in excessive amounts; if instead you just swap it with the backup clear pair, let it dry and then wash it if dirty with tap water and quickly dry it, you will have the coat last longer.☺☺☺ We need eye breaks, so after taking off Bollé just close eyes and wave for 10 seconds; our eyes need those 10 second breaks every 10 minutes anyway. $ store sunglass picture shows how I created in 5 minutes on 4-25-21 a good air tight seal (nobody can see silicone from outside, very discreet, my $ store glass got foggy in 5 minutes of wearing it, so if you got a sunglass, you need antifog paste applied to it of course; I found Bollé only on 4-29-21 and HD on 5-8-21, on a low tear production day (bad sleep before) so the silicone method works

for severe dry eye or really dry days (10 of the year); we can make 1$ sunglasses with moisture retaining ability and COVID19 protection; replace silicone when it gets dirty, disinfect it with UV light (2$ @ $ store); make it less tight to avoid fogging until it works without fogging. I don't suggest using $ store glasses, if poor quality vision, since eyes are worth more than $10. If one eye lens fogs more, create a tiny gap in the silicone seal for that eye to equalize. ☺☺☺

For COVID or vacuum of house, wear KN95, N95 or KF94, store in slightly open plastic container, handle via the loops, don't touch it, and clean disinfect container often, trash mask after 20-40 hours of use; KF94 fit perfectly, are cheaper (40 cents/mask vs 240 cents 3M US made N95) and way comfier than most N95. China made fake KF94 have a strong bleach smell that takes weeks (after mask is ready to trash) to vent out, all bags have holes to air out in them allowing contamination of masks, the Chinese KF94 are harder to breathe thru since they use a cheaper tech, and anyone can open the ziploc bags that have 10 masks each, so buy Korea made, Amazon got many, as these are individually sealed; South Koreans live to 83, Chinese to 78; KF94 is a South Korean government standard and only Korean made ones pass this standard for sure; the difference between a cloth mask or the blue 3 layer mask and KF94 is like between day and night, KF94 creates instant seal, has plastic nose clip to create perfect seal, such a strong seal that when you breathe in the mask is drawn in, you get so little air, it takes a while to get used to, when you breathe out it inflates, it's ideal for painting, gardening (see insects on mask, dirt to decide when to replace), smog, dusty areas; cloth masks have so many gaps on the sides that they offer very weak protection; KF94 one removes smells 5 times more; KF94 vs cloth mask is like a Tesla Model Y versus a 1920 car. If KF94 is too little air for you, try a cloth mask + a 2.5 filter or the best deal:☺☺☺ 2 big masks + 30 filters. (manufacturer says to wash daily; maybe get 4 masks to wash all 4 after using all 4 for 1 day, to avoid inhaling viruses, place in a semi-sealed (to avoid mold) plastic box in the car after shopping to avoid inhaling junk from stuffy dirty highways, stores, etc). $ stores sell 3-ply masks, 50/pack, for those who want more air, comfort, ease of use, vs the cloth plus 2.5 filter masks used for smog too; however, 3-ply masks filter 60+% of 2.5 pm smog too, if worn tightly around face. KF94/N95 are not for long-term use due to too much lung/heart strain; "a PM2.5 filter (*lasts 12 hrs, if used multiple times, always have it face the same way, e.g. 2.5 pm writing facing mouth, to avoid getting junk on your mouth*) and cloth mask combination imposes only 25% of inhalation resistance compared to a properly fitted N95 mask"; 4x easier to breathe than N95.

2.2.4. *The TAPE seal day mask*: how to do it, and its pros and cons. *For those 1 in a ?million? with allergy to silicone, tape can be a saver, but* it's extremely time consuming for tight seals. I used silicone for decades as earplugs, so I'm used to it. Tape has its issues, like being very hard to make it smooth (roll it at the end where it comes in contact with skin, don't flatten it; tape also reflects sunlight and allows a lot of damaging UV in, while silicone repels all of that, preventing

sunspots, while tape can create sunspots or reflect some UV/blue light back into the eye, light coming from above, under, sides. I tried silicone seal for almost 2 months, but on 7-3-21 I discovered the taped sided HD (sided means with something on the temple tips to increase friction) is as good as earplug (not plastic) silicone sealed HD at generating high moisture, so I gave tape for tight seal a try (even if I use silicone) for 7 days (some were half days using silicone too). Loose tape seal is easier to make and lasts longer, since there is little contact with skin: I used tape for 6 months on blue light glasses before discovering Bollé and silicone seal in April 2021; it was very dry with it, so it's rather useless as a loose seal, but better than nothing. ☺☺☺

Tape tight seal takes 20x longer than silicone seal to create, as you need tape the inner areas that expose glue to air, to prevent evaporation of semivolatile chemicals from glue; the advantage of tape over silicone is eyes become slightly cooler, you no longer expose eye area to the silicone (though tape glue is 900x more toxic, even if exposure is 100x smaller by area due to double taping); however, silicone reduces need of drops, due to more perfect seal vs tape, so it reduces chemical overload on eyes by gram levels even if rarely, you get a nanogram of silicone sneak into the eye (we are talking about a billion to 1 ratio and silicone is in foods, cosmetics, face creams, tape glue is not); with tape, you no longer have to adjust the mold every few days, but the tape is very unstable itself, so it needs a lot of readjusting that takes 20x longer than silicone readjusting. If you don't use a tiny microfiber (trim a big one), you can get silicone on the lens, and this is one issue tape solves; on the other hand, silicone on the lens may be a good way to clean the lens of nanoparticles, per some papers. If pressed, silicone changes shape irreversibly unlike tape, though that can be a disadvantage of the tape, since when smiling, laughing, etc the tape will scratch if not in a concave roll shape around temple, under eye, etc while silicone will change shape and you will feel nothing when smiling, laughing; silicone is more expensive, but the time it takes to fix, maintain and create the tape seal may be way pricier than using silicone; tape is invisible if you don't use comfy rolls to touch skin and nobody will notice it from a distance of 5+ ft; tape can be cleaned perfectly with alcohol, since it's double tape on each side, though silicone can be cleaned too the same way; tape seal has more air, thus more oxygen if you use tape on the very edge of the glass (though you can adjust silicone to achieve same warmth and air volume as tape); tape is cooler than silicone, so you may need use cold compress less, since warm eyes get redder, less oxygenated cornea gets redder due to hypoxia. Try to extend the tape behind the hinge, to avoid scratching the skin while laughing or smiling; the ideal tape method is to create rolls of tape at the end for high friction areas at least (like temples, etc), so nothing is abrasive against the skin and can adjust its shape while chewing, yawning, smiling, laughing, without discomfort; this makes tape as visible as silicone from 15 ft or so, since you tape it also 2 mm on the exterior to prevent instant detaching that happens when moving face; this is why few bother with the tape method if they got very dry eye

and are tempted to try some sealed safety glasses (with that soft Bollé Ultim8 40299 red rubber touching their skin, but leaving marks and being too sealed and moist, with too much water blur, though you can make holes in that red rubber and plug them with silicone if too dry or wear it loose without the strap) or earplug silicone sealed glasses. I tried Ultim8, but didn't fit my face in the glasses version (not the elastic holding it tight and making huge marks on face) so around temples huge gaps exist that need to be filled with silicone. Ultim8 frame and the rubber attachment need to be 2 times thinner, so that the lower edge of the glass is far less visible and blocks the field of vision far less by being 2 times closer to the face. When safety glasses are worn 8 hours we need something that is much closer to eyes, like the Cobra without any foam kit, to prevent atrophy of cells that deal with peripheral vision. For people with less dry eyes, they can use tape (as long as it's blocking UV it's safe) & loose seal and leave a big space around hinge of 2 mm, since skin rises when you laugh/smile around the hinge area and gets irritated by tape. If you smile a lot, silicone may be the only choice, if eyes are very dry, as tape is not comfy unless you spend 2 hours to make it with rolling tape pieces all around, if you can even find UV blocking tape. You can't fold the taped or silicone sealed extended (behind hinge) HD.☺☺☺

2.2.5. Other glasses I tried that may work for those with similar or different face shapes: Bollé got many glass types, Rush+ HD or regular being ones I found to work best for my face, they remind me to breathe softly, to never rush, to filter our walking tone, thought + emotion + vocal tone so we go into fight-flight mode less and make better decisions in a tranquil state not one of confusion, so we dial down inflammation that destroys our eyes when we go into high stress over nothing. I found way better than swim goggle lens quality, wrap around glasses that could be used to create high humidity, all use polycarbonate (PC) lens even if Amazon may incorrectly say glass in description. The following safety glasses are good; most are so good, you can use them for computer work (can use fitover sunglasses ($2 @ $ store) to avoid breaking the moisture when going out or have 2 pairs, one for inside and one for outside). Safety plastic glasses clarity is almost the same as glass snorkeling goggles 5 times heavier and harder to use. The amazing safety glasses are in decreasing order of image clarity, from best to worst (place silicone or tape closer to eye socket for more moisture):

Bollé Safety founded in 1888, making glasses since 1936, with 100s of models on Amazon: 12$ HD Rush clear (96% of visible light comes thru for inspection work and detail, vs 92% in standard clear frames like Rush+; HD Rush+ is the best, letters appear darker, easier to read, just apply antifog gel/paste like you have to apply after a few days on all Bollé since factory coating wears of if you use silicone, for ultra air tight, otherwise, leave it alone without antifog if using tape for milk-moderate dry eye) >> (far greater clarity than all the rest) >> $10 Rush small black-gold 40254 tight fit, superior antifog (platinum coating, see Bollé vs others in fog, company fog demo, see fog explained), very adjustable soft nose bridge, great for dry eye with or without silicone,

especially for small-medium heads or 15$ white-pink (lens clear, not pink, Amazon pic wrong), or smoke version for outside (I use this for outside with tape), inside/outside CSP 52% blue light filter, twilight 70% blue light filtering outside (twilight is pretty dark for outside or computer work, so it will be pretty useless unless you work outside around sunrise or sunset a lot and the smoke version is too dark then. The coating on it smells the strongest, disappearing only after a week) the tinted versions have a chemical coating the clear doesn't have, and these are made in Taiwan, come in a sealed bag, right off assembly line and may need to be aired out for 2-4 days (near a window where there is draft between windows, etc), to make sure all chemical traces or smells are out – just like with the foam you buy/use for moisture mask; all tinted glasses smell once freshly made, some forget to let them air out before packing in air proof bags) = $14 40208 Rush clear superior antifog,☺☺☺ identical to Rush small, just larger, less temple pressure, no eyelash touching, got CSP 52% blue light blocking, twilight (more blue block), smoke sunglass version for outside, ideal for making a dry eye day moisture mask with silicone☺☺☺, only 2 Mack's or Equate earplugs needed) = $10 Silium 40073 (nose bridge uncomfortable) antifog = $13 Silium 40237 superior antifog (too high, nose bridge fixed not comfortable, as it raises glass, so silicone can't be placed under eye, avoid buy) = $21 Nesspsi huge lenses, high glare, mirroring, superior antifog ≥ Bollé Ultim8 with rubber (100% seal for fast humidity without silicone) or foam types Tracker clear or twilight, Rush, Baxter (can order foam-plastic kit for $5, to put on any Rush pair you use more often to see if you like it, video about it here) = Bollé Iris (fits 100s of face types) ≥ $18 Venture Semtex (best anti-glare of all clear glasses, more glare than blue light CSP or twilight from Bollé, the difference in glare is only noticeable with normal lightbulb, not with my low blue light NASA lightbulb, tighter fit below eyes and above, so higher humidity if you put foam, silicone or tape, but temples a bit too tight giving headache after a while, nose bridge too close to eye corner, not safe for moisture glass due to dirt from rubber getting into eyes, hard to clean nose bridge, so only buy if small-medium head or if you think it bends, nose bridge is too tight and hard, uncomfortable compared to Bollé, especially if you place extra weight with the silicone) = $22 Venture (hinge inflexible, too tight temple, headache, too big for best moisture too, small head OK) ≥$8 DeWalt (temples too tight giving headache, hinge inflexible, sits too high, low glare though, good for small heads) ≥ $15 white-pink NoCry (temples reach behind ears and pressure slightly, for small head only) > $12 anti-fog metal shiny silver frame 3M safety glasses, got a little mirror effect, like NoCry, and frame is too rigid and tight on temples, OK for small head, but nose bridge is too close to eye corner, sitting too high, not ideal for dry eye moisture > $10 Solid (these fit me perfectly, but they fog fast) > $14 Safeyear (too big for me) > $17 Safeyear with removable foam gasket (too high due to very narrow nose piece, but foam is easy to remove and put back, way easier than Bollé, so a good pair maybe for some face types who want flexibility, may work perfectly for some) > $6.9 Uvex (don't buy, the most uncomfortable, tightest temples, tiniest heads only) > $7.3 Pyramex Goliath

(temples way too tight, give headache, hinge inflexible, plastic fixed nose bridge, don't buy) > $7.4 Encon (don't buy, huge distortion the upper 70 mm of lens, gives headache if you move head a lot at computer, get what you pay for) > $7 Highlander XP Pyramex (huge distortion upper 70 mm, NOT for computer work, just for dust outside) >> $5 Highlander (don't buy for computer work) >> Pyramex i-Force dual pane antifog (OK for outside, double pane distorts far worse than any above removing contrast, increasing glare; not worth buying, too much distortion). With Pyramex last 3 glasses on this list, you can take off the band and they become regular glasses, but don't fit perfectly, so you need silicone to plug holes and gaps, plus their foam is hard to clean vs gasket of many others or silicone you replace on others. Other cheap safety or swim glasses (except the clear glass of snorkeling goggles which are too big, heavy) are extremely distorting, headache causing cheap PC lens. For suboptimal lacrimal glands, one can add some daily washed sponges (or gauze) or wet cloth to provide extra moisture like moisture releasing glasses from eyeeco.com; Bollé tinted safety that fit tighter are better at generating humidity fast due to less air volume. ☺☺☺

2.2.6. Antifog *coatings* that are hydrophilic: these coatings don't help always (unless the 3M type hydrophilic coating, that doesn't remove moisture to the edge of the lens like HexArmor does) those with dry eye (unless they're not sealed with tape or silicone 100% and used in ultra high humidity workplaces, so people can see), but I include some info on this tech if you're curious or have tried Bollé worn loose (with air leaks in silicone seal, with silicone pointing away from the eye to create a greater volume and avoid touching eyelashes) and even then it didn't stop fogging (due to lack of patience in finding the ideal air leak or due to *using alcohol to clean them*, which removes the antifog coating; *never use anything except water to clean antifog coated glasses; use a microfiber cloth designed for glasses to clean Bollé daily, to diminish eye stress and 'fog'*). The temptation is to try hydrophilic lenses that absorb water and releases it out at the edge of the lens, but hydrophilic only work when eyes or eyelids are wet due to using cold compress, sleeping with moist pad, showering, using drops before, *jobs in foggy places or going from cold to hot air environments,* and *even then, they work only for 5-10* minutes, after which they dry the eye due to the silicone seal. *So if you see a glass saying hydrophilic lens, then you know it's not ideal, but you can buy one to use 5 minutes at a time when eye is super wet, to evaporate "eyelid, under eye" water faster without using a cloth or Bollé, since bacteria contamination is an issue and Bollé fogs or condenses water.*

HexArmor hexarmor.com, Michigan, USA makes lenses that are 5x better than Bollé and all hydrophobic (water repelling, what we need for dry eye) lenses at preventing water (and fog) droplets; this is because Hex (like 3M) are hydrophilic, while Bollé and most safety glasses are hydrophobic causing water condensation (with a tight silicone seal) that blurs vision in 2-50 minutes depending on how wet your eyes are, how tight the silicone seal is. 3M and Hex

hydrophilic coatings are washable too, so they suffer from the same issue as hydrophobic, you need that hydrophilic paste or gel to reapply every day (like with hydrophobic). 3M $10 Solus (like souls) 1000 Scotchgard hydrophilic coating glasses absorb water far slower than HexArmor, so they can work much better for dry eye applications than HexArmor, i.e. they dry the eye less, but they also blur/fog in 3 minutes, very disappointing for 3M to make such a product, but the frame is very good (but not as good as Bollé if you want instant moisture, Bollé fits tighter so more moisture faster, but good for people who have different facial shape), so you can use the frame and some other antifog paste; maybe work when Bollé gets too foggy as a backup; however, vision quality thru 3M is way lower than HexArmor and lower than Bollé, way way lower than 12$ Bollé HD. See this article on the chemical composition of hydrophilic coatings, they all wash, a pair I got from Amazon had the right lens 90+% washed when I got it, it absorbed no water. However, *after a while Hex glasses make your eyes dry if somewhat tight seal, and eyes get dry before we notice dryness,* so hydrophilic coated glasses are usually bad for this purpose, *being useful only for using them during foggy weather (without silicone to avoid drying the eye) or 3 minute periods.* Their glasses don't create the perfect tight seal around my eyes like Bollé, (VS250 is too high, even if small) so even if I wipe with alcohol their hydrophilic coating and put hydrophobic from Amazon, it'll be an issue (Hex has better lens, but the nose is not comfy; plus you have to find a hydrophobic antifog solution and doesn't blur your vision). ☺

It's to risky to wear hydrophilic lenses more than 3 minutes*, as they will dry and thus damage eye without you even noticing.* Hex lens quality is better than most Bollé glasses, except the HD Bollé which is better than Hex, but has no antifog so you need put antifog gel/paste yourself (you need do that for most glasses after a while anyway, it fades). Hex got 4 coatings explained in this pdf: F (TruShield), S (TruShieldS), 2F (TruShield2F), 2SF (TruShield2SF). F stands for antifog coating, S for antiscratch coating; F has basic (that only absorbs moisture) inner F (fog) and hard outer S (scratch) coating; 2F has basic *inner and outer (hence the number 2)* F and basic (not hard) inner and outer S coating; S has on the inside lens *dual-action F coat* (that spreads, and then absorbs moisture, to minimize fog) and hard coat S on the outside; 2SF has *dual action F coat* (spread + absorb) coating and basic scratch on both *inner and outer lens, hence the number 2*. S and 2SF have S in them since their fog coating SPREADS moisture before it absorbs it. These 4 coatings come in various shapes, some shapes being available in 2-3 coating styles and even as sunglass (VS250) or blue light (only 2 are blue light blocking, I tried them both). I only tried *five* Hex glasses from Amazon, before returning them 3 weeks later: *two* 2SF ($11.5 MX200S, which dries eyes fast and prevents fog fastest being useless for most dry eye people & lightweight 15.5$ VS250), *two* F ($10.5 MX200S, *which dries the eyes less than* 2SF & $14 MX300 blue light which has rubber on top requiring less silicone), *one* S ($15 VS250 blue light, has the same inner lens coating as 2SF). *I only used VS250 2SF for 5 min, MX200S 2SF 1 hour, the others 2 hrs, since*

the 2SF ones were bad smell even after 3 weeks and the rest were drying eye fast after 5-10 min.

The 2SF coating smells the strongest, all the other coatings have the smell of the package disappear after exposing to window air 2-5 days; 2SF (discovered it 5-4-21) dries the eye 100x faster than Bollé if you make a perfect seal, so it will be useless 99% of the time; the other coatings, F, 2F, are better than 2SF,☺☺☺ *not drying the eye so much that it cancels the effect of silicone seal in 3-5 minutes, but need to be worn short periods and with gaps to allow air moisture in coming inside thru the temperature gradient to replenish water absorbed by the lens. VS250 absorbs* less water than MX200S for the same coating 2SF, having smaller lens and being lighter weight; 2SF is S on both inner and outer lens, not sure if this affects water draw from inside if the exterior coating draws water coming from inside at the edge slightly to speed evaporation, since customer service was incapable of answering the question; for dry eyes, S and 2SF may be the same, *since we don't care about the outer lens antifog coating presence, the vision would be clearer without the outer coating for certain eyes, reducing ocular stress and thus dryness*. Mornings we need Bollé worn loose, if eye is wetter or we got water blur, or pulling in and out is too distracting or dangerous for what we do. Platinum Bollé antifog coat is said, by Hex, to wear out fast in their video and that's what I found too, so don't wipe with microfiber much; my Bollé coat was worse after 3 weeks, mainly due to my using alcohol once to clean, so avoid non-water cleaning, use antifog gel/paste if Bollé coat is gone. Try taped sided HD, 2 pairs, one to wear when I clean the other or as backup when it creates too much water blur due to moisture. You can use alcohol/soap to remove antifog coating on any glass.☺☺☺

2.2.7. *Future tech*: In the future, they may have a pair that opens a vent automatically when it detects ocular dryness diminishes, so as to retain inside the lens an optical humidity for the ocular surface dryness and not overcondense water which them brings dryness via the stress condensed water creates via blur; that vent opening is calculated by ocular surface monitoring by the AI. However, that's requiring some good solar battery and other techs, making it heavier, though vent and motor can be tiny for the 3d printed glass matching your face perfectly without silicone, without strap, without pressure, future soft materials we only dream of. They got many types of safety glasses, each fitting better one of the main 10 types of faces. *This HD Bollé with* silicone or tape is still, *even if not this vent-AI-etc dream tech, mind blowing because it enables now, 0.4-1 billion people with mild lacrimal deficiency and lipid layer weakness, to become free from the need to yawn to generate tears, to use any artificial drops, except at night if foam mask had a gap or lacked moisture pad*. *Imagine* no longer spending 10K on *drops*, *ointments* and *gels* next 10 years, and completely or partially damaging or destroying your eyes (or other organs due to side effects of swallowed tears, inhaled drops, gels, ointment lipids, etc) with some of the drops, gels, lubes out there. Bollé is, for many dry eye types, the *best brand for this purpose, the most comfortable, the closest to eyes,* the highest diversity of frames for 52-70% blue light

blocking, 52% is CSP, twilight 70%, clear, sunglass, *tried 40+ glasses, safety, swim, way better than foam or tape glasses, far less harsh or allergic on skin;* silicone or taped Bollé method is 10 times better than *taped 'normal non wrap around' glasses*, due to perfect seal, higher humidity, less air volume to saturate, so you use way less tears; unlike fixed tape, silicone allows you to mold its shape every 4 hours to regulate the moisture level in your glasses, for optimal eye function, depending on tear production (we produce more tears in the mornings and days with ideal sleep), which helps those with severe dry eye. Bollé could make 10 billion in sales, improve the lives of half billion people with 3D printed Bollé glasses for dry eye, that use the comfortable or even softer nose bridge material around the edge of the glass for air seal, this material barely touching the skin, allow for higher moisture, with a special coating that drains water faster than existing one, removing the need to wave much, to use silicone at home, by calculating the optimal air gap based on the moisture/humidity optimal for dry eye prevention for each patient.

Eyewear companies that offer 3D frames, could in the near future offer gaskets (*or tight fitting frames that would create an almost air tight seal;*☺☺☺ maybe use Bollé nose piece transparent silicone) to fit over the frame for people with dry eyes for better humidity, so we can adjust the air intake with some silicone or something that clips on and off to prevent over fogging, or simply pushing the frame closer to our face. What people with minimal or no dry eyes don't understand is that these wrap around clear glasses or their tinted versions when going out, even worn without silicone (used to create humidity) or without 3d printed gasket or tape, will protect eyes from enormous oxidative stress caused by wind blowing into the eyes (even indoor wind from walking, from central heat/cooling, drafts, windows), wind with dust, dirt, dust mites, viruses, bacteria that drain ocular immune system and regeneration and speed up eye aging, MGD – all in the name of vanity and looking good "who am I to wear wrap around blue light blocking or clear glasses to protect the most valuable organ in today's digital age? After all, I might look a lot smarter, more of a geek, higher IQ too sometimes." These glasses would, in a longevity civilization, be available at RiteAid (be standard of care for the mildest dry eye too, before drops are recommended even), CVS or any pharmacy right near eyedrops to reduce 50-90% eye drop use (we don't want side effects of present primitive eyedrops) for mild cases, most cases being mild when people walk to RiteAid to get some drops 1st time; *they sell 50 types of eyedrops and not even 1 or ideally 10 types of clear nonprescription dry eye wrap around glasses fitting 10 types of face sizes and shapes.* Well, Pharma wouldn't make more than 10-20$, vs *10k from many LipiFlow dry eye* treatments or dry eyedrops for life. Why cure disease or eradicate 80% of its incidence with preventive glasses, education, when they can make 100x more profit with managing disease and never curing or preventing it?

How can we dream to live to 130☺☺☺ and have perfect eyes of a 50 year old then if we don't change the way we think about protecting this organ? 3 billion people without prescription

glasses would have their eyes look and be 10-40 years younger 30-60 years from now if they would wear this, even without silicone/gasket/etc to make them moist, but they don't, due to social pressure, vanity or *lack of information on the eye aging processes*"; *we protect very thick skin areas with clothing, but the most delicate skin, the thinnest skin, the wettest skin that can get viruses in, etc we don't protect; isn't that odd*? Kids who wear UV wrap around glasses indoor, outdoor, partial blue blockers, etc will have better vision, higher happiness, better capacity to read more papers and know how to take care of themselves and parents better, live to 150 easier, due to more knowledge from papers read, healthier eyes, etc; they will look smart, since when asked why wearing wrap around each time, he will refer to a huge pdf or website or start explaining hi tech stuff no other kid around knows about eye aging, explaining some day all humans will wear glasses enabling them to look up emails, computers, websites via holograms projected, etc. The government can encourage wearing these glasses always,☺☺☺ even in overcast days, when UV is present even if not sunny; models wear the most beautiful *frames* with 30 colors and flowers, patterns *(purple or lavender outside tint, even if they see it almost clear, for ladies wanting to hide dark circles and replace toxic makeup with redness preventing glasses, eye aging preventing glasses, look good in older age too, not just at 25)* and no longer use makeup that usually damages their eyes; everyone focuses on living to 200, less on toxic makeup. *Cigarettes have warning on packets that they may cause cancer*; *imagine if makeup would say that it may cause* eye cancer, dryness, redness, complications *leading to blindness, etc*. These colorful wrap around glasses, just 20$, 3D printed, will prevent dry eye 50 years before it happens, since glasses will be all wrap around (like in Australia all sunglasses by law have to be), for prescription *and* sunglasses, and improve on design to create higher humidity by creating upper protection and a better side, lower protection to prevent dry eyes 70 years before they happen, reducing MGD incidence 5 fold from the current levels in 50 year olds.

2.3. *For the severely lacrimal deficient only (1% of people) ►►:* In October 2020, I found eyeeco glasses; black matte absorbs more light, prevents odd reflections that stress eyes; these glasses are for those with huge lacrimal deficiency; they block 15% of blue light (UV for the tinted grey or copper versions); I bought them, they don't create air tight seal for 95% of people without silicone added; when I sealed them without gasket with silicone, without sponge soaked in water, just silicone going around it, *the lens* became blurry due to water condensation *(can still see, since they got antifog coating)* within 1-3 minutes, *vs* 10-20 minutes for Bollé. So, need take them off, wave in the air for water to evaporate every 3-10 minutes depending on moisture production that day/hour. Lens quality is lower than some really good safety glasses (just to make a point, I mean we pay 99$ and we get this?), which cost 10-15$. Even those without big deficiency can use them (if they remove the gasket it's easier, more humidity faster), without needing to moisten the sponges, since the sponges are optional to wet and are ideally sealed

away from to avoid bacteria contamination; however, I believe the sponges not being wet will cause drier eyes as they will suck moisture; glasses are so heavy and temples don't bend at a strong angle at the end, so you can only use the adjustable temples locked to prevent them from falling off easily a tiny bit, breaking the air tight seal; have to use so much silicone, to get the gasket to fit around perfectly *(not 3d printed gasket and/or frame for every face yet, frame could be 3D printed to create an almost air tight seal if pressed, so no need of gasket)* so we're better off get wrap around Bollé safety. ☺☺☺

I review this here so people don't waste 99$ on something that performs less than a 10$ Bollé, and obstructs side vision a lot, which is dangerous when driving, etc. It's a glass that may only help the severely lacrimal deficient, so I include it here. The eyeeco are clear lenses of decent quality versus the low quality or headache giving lenses in other Amazon 'dry eye goggles' and 'any swim goggles 10-40$ from anywhere', but about same clarity as Bollé CSP or some high quality lens of 5-10$ computer reading blue light glasses; even if no perfect fit for most faces, you can use earplugs silicone to create a perfect seal, I needed only half an earplug for each lens with gasket, 1 earplug without gasket for better fit, so it will work (can even remove the gasket and place silicone all around to make it less air, way more comfy (gasket is really harsh on the skin below eyes) higher humidity, but you need replace silicone more often); I only see 2 small reflections when bending the head too much downwards, so it motivates me to not hunch.

2.4. *For those with* very *mild dryness, for computer reading,* the normal glasses that are not wrap around, would work to create optimal moisture using the tape method or hybrid-thick tape-clear-tape-silicone. The silicone section Bollé HD glasses are *WAY* better than any blue light glasses for contrast and screen clarity, because they make letters appear darker, while the screen remains bright, while blue light darkens the screen too. *Since lightbulb and screen level of blue light is easy to change, it's logical to try HD to see if it works better than current blue light glasses you got.* Examples of 'normal shape' blue block glasses (which you would return after trying *Bollé HD which is better than* without *any glasses.*) are: *[$5, no flexible hinges, good for small head only (big head gets headache),* 14$/2 pairs Kenzhou *(or* $9 for 1 pair*, a good cheap blue glass, flexible, good for any head size, 3x better clarity, resolution than* my first $10 pair *from 2020, these glasses make your eyes less tired, red, dry* since they take out LED glare, even if you don't put tape/silicone around them, are the highest quality vision for cheap *non wrap around* style I tested), (can use glitter tape thread or paint to change outside frame for unique color/rainbow) purple with flexible spring hinges but came defective one hinge *and allowed too much glare i*n, $13 with plastic around but small, too tight for big heads, a little too much glare, i*nflexible, $5* safety with foam around *(plug foam holes with silicone earplugs for less air leaking)] and do the ►►►TAPE* METHOD ►►► place *double* tape, *sticky* part *inwards,* around as in this pic; can buy $4 side shields from Amazon to make it more professional looking, discreet

and thus use less tape, giving yourself a lot less work long-term, saving 4000$ in time wasted.

You need more taping of *air* gaps if too dry, less taping if too foggy, just tell people you put tape due to COVID19 (because papers show eyes can be affected by COVID19 or even transmitted via eyes), if you're worried what to say *and don't want to let all know you got dry eyes, if you're self-conscious,* since eyes are the main route *of* COVID19 *transmission after mask is on, since they're wet and catch dirt; besides COVID shields make the clear tape far less visible*, face shields are an alternative to masks and, if you still want mask+shield, shields help you place masks lower so air blows far less into the eyes and prevent wind (formed due to walking) from drying your eyes, since many masks give you drier eyes ► Ophthal Ther 2020;9(3):397-400); see more day mask details and ideas below; *1$ stores got prescription reading (for farsighted only, not nearsighted) glasses that you can use for this "daytime moisture mask" too, if you wear glasses; since most don't wear glasses, blue light blockers will work well for digital screens, protecting from glare & blue light*. Please use silicone method with tighter *fitting* wrap around *glasses* if you want *instant* humidity for *drier* eyes, the tape HD method is for mild-moderate dry eye (can use tape on the Bollé blue light glass, but it's easier to adjust computer brightness). Foam is fine at night, eyes are closed, but daytime exposure to foam is too much.☺☺☺

2.5. *Why do we need moisture masks?* The *2 types* of *eye protection masks described* above, *night and day,* increase the temperature of the MGs, making oils flow all that much easier, removing the need of any or most warm compresses, which are usually too dry and eye damaging, this being a gentler way to keep oils liquid, as if we live in a tropical climate. Due to various forms of stress or even harassment we may think too much at night and this may cause us to open eyes slightly and leave them open, waking up with dry eyes and causing long-term chronic redness or dryness, and later dependency on more and more drops. Some people may get dry eyes only because when sleeping on the side or stomach, because of the nose position, when exhaling, the air hits an obstacle (bed, blanket, pillow) and *returns back into the eye*, (I noticed this 9-23-2020), creating *a draft that evaporates the tear* fast even if eye is closed; this is made worse, if when resting the cheek on the pillow, and lying on stomach, *sometimes* the *nostril* (on the side of the cheek on the pillow) gets *plugged*; same issue exists to a far worse degree with CPAP users whose machine is drying their eyes, due to a draft far more powerful. Window drafts cause it too. People who close eyes only 94-98% or so dry eyes faster too, even if no CPAP; relax before going to bed, sleep comfortably, so less wild dreams occur that can open eyes 2-10%, though sometimes dreams are messed up with via gadgets.

So, eliminate the drafts, adjust sleep position, or buy draft blocking goggles or "air blocking, moisture retaining" mask to sleep with; this may solve 20-100% of the cause. You wonder, perhaps, *why one eye (not always the same, but usually the same, since we tend to sleep on one*

side of the cheek on pillow more when stomach sleeping) gets so dry once every 20 days, it could be opposite cheek got resting on the pillow that night and/or the opposite nostril got most plugged that night and the draft was thus strongest in 20 days that night. Sometimes, depending on the angle of air hitting the bed, pillow, blanket, the eye opposite to the unclogged nostril can get more draft, but it's highly unlikely. Normal eye masks heat the eye slightly, evaporate the eye water, the water gets on the mask and the nose blowing air dries the mask and continues drying eyes, more the half of the mask near the unclogged nostril; *because of the normal eye mask you can't notice the draft for years*, but you can notice it if you generate tears first, warm the eyes with a "moisture retaining eye mask of swimming goggles" and then plug a nostril, remove plastic/rubber mask/goggles, breathe and see how the moist warm right eye gets cold and dry due to the draft created by the high double usual flow from right nostril (left is clogged due to gravity or you placing hand on it to see how fast the eye gets dry). This issue is not solved with normal eye mask, which often worsens dry eyes via the mechanism explained above. This draft over time gets eye very irritated, so we get dry-red eye during the day too. You can sleep tonight without a cheap Walmart eye mask and be amazed how much the exhale blows into the eye opposite to the cheek resting on pillow; more so if the pillow nostril is plugged partially or fully. This extreme drying/wind/cooling of the eyes will solidify the oils on the MGs eyelid exits and clog the orifices, increase eye wide oxidative stress/inflammatory cytokines which inflame the gland orifices on the inner eyelid, causing MGD and later on atrophy, which will cause ultra severe permanent dry eye without generating tears or artificial tears. You can also try sleep on the back, so no more blowing air in the eyes to dry them faster. You will be *totally shocked* what a *difference* a mask makes, *to put it mildly*. Plus, you won't put the toxic eyedrops with redness relievers. Even regular eyedrops without redness reliever can cause allergy and thus gland dysfunction. It's VITAL to avoid *dryness at all costs, day and night* (yawn when dry and *copiously* before going to bed or use unpreserved tears or gels if you can't generate tears that night), since night dryness damages ocular surface, *increasing eye oxidative stress and delaying the full regeneration and* unclogging of the MGs. ☺

2.6. The 50 cent night mask and swim goggle extra details: *tiny traces of bacteria killing* lysozymes *may spill over* MGs *orifices and disinfect your eyelids, from the* tears you generate *before going to bed and they may spread over your entire ocular area disinfecting it, due to the foggy humid environment; these* lysozymes *are so powerful, they can be used and spread all over your face to kill P.* acnes *bacteria that causes* acne in some*;* ☺☺☺ *I noticed after 2 weeks of* using the $0.5 moisture mask (or other masks I tried but didn't like since mine was the most comfortable and biggest, keeping largest area wet or hydrated), my acne has stopped for 2 weeks for the first time in 4.5 years (I never had acne until 30, and even then it was very little, a few pimples a year, only in 2016 after my right big toe got very swollen (twist) acne became an

almost daily thing – due to immune system overload (we always get acne after injuries with much higher probability, as white blood cells run to injury site away from face, leaving face vulnerable to P. acnes overgrowth); yawn (or laughter, in my case yawn is easier as it's on demand, hard to laugh so loud at any hour to generate tears, without disturbing others) tears also downregulate TNF, IL-1 and other inflammatory cytokines, since they induce the sleep related body/eye repair chemical cascade (repair of damage done by P acnes during daytime, restarted via short naps), relaxation and catecholamine lowering response of the brain, thereby assisting the immune system in eliminating inflammation caused by P. acnes before it becomes a pimple and also in destroying P. acnes quicker;☺☺☺ when we fake smile, we induce endorphins release in brain, when we laugh we do the same, likewise, when we yawn 5-10 times more than usual, we start a whole chemical cascade that affects the entire organism.

Yawn tears may actually have system wide effects of preventing atherosclerosis (everyone gets it since fetus stage, far more after 25), diabetes, Alzheimer, that literally bury us 30 years earlier, it may be a mechanism to delay aging related diseases by 30 years; due to epigenetic shifts in sperm/egg system (not the egg, but nearby renewed components affecting traits), it may even cause offspring to become a mutant who ages slower; because we yawn a lot, offspring is informed of the need for sleep, for higher efficiency of body repair during sleep; this creates genetic shifts that slow aging by enhancing night or sleep body repair speed and efficiency; if repeated, 3rd generation may age 2 times slower (body repair during sleep 2 times more effective) and live much longer than any ancestor. If we breathe deeply, with eyes closed while also "inhaling"/"exhaling" God's energy or the infinite bliss of "All that is" ("the "entirety of all that exists" alone exists, sat-chit-ananda, existence (sat) is conscious (chit) of its existence and is infinitely blissful, ananda, in its infinite eternal existence. No fear exists, there is nothing to fear, it alone exists), the infinitely blissful light thru the eyes (to stimulate oxygen-blood flow, so stem cells repair eyes), or breathe fast like Yogis in the fast type pranayama when moving belly fast (removes belly fat that causes inflammation and aging) for 5 minutes, see chapter 10 on various breathing ideas, increasing oxygen, before tear generation, then yawn a lot 2 minutes (or just simply breathe normally), *we exhale a lot, so we lower oxygen;* this gradient of oxygen is hypothesized to produce stem cells, *stimulating body renewal, delaying aging; is this why some Yogis reportedly lived to 120?* ☺☺☺

It's vital to sit or relax in bed, eyes closed so eyes don't use energy, oxygen to generate tears, but to produce stem cells and repair eyes, so body oxygen is not depleted by using it to stand, let oxygen saturate the eyes and brain and increase eye stem cells. *So, not only you get a tear 1 million times better, like from year 3000 when we can create eyedrops imitating our natural ones 100% for 1$/bottle, but you can also learn* how to be happy, breathe better *and produce stem cells, stimulating immune system and producing longer lived* offspring*. You also cause more*

frequent bowel movement, decreasing toxic build up on the blood *and aging slower because of that; so tons of positive feedback loops.* The moisture vapor will also moisten the area under your eyes, allowing you to get rid of dark circles which usually are caused by dehydration; so ladies can stop using toxic chemicals perhaps and moisturize dark circles the natural way, for 5 min or hours on demand with yawn tears, to look sexy without eye destroying makeup or "dark circle cream"; people don't believe me, but take a shower and notice how dark circles disappear; this is the same principle: hydration, circulation (eye masks provide it, due to higher temp).☺☺

Most swim goggle straps are too uncomfortable for sleeping, *so one can replace* the tight rubber straps coming with the goggles with a $ store (party section) ribbon (9 m roll) (see a ribbon pic), mold resistant twine (home depot), elastic band/cord (cord doesn't have to be elastic, just make a knot at the end to adjust how tight), so you *don't ever create suction as during swimming, but barely touch the skin on your eyebrow, etc still letting air come in (you are not swimming), avoid suction as that would damage the eye if sleeping or reading with it*. Some amazon swim or safety rubber glass may be fine for back sleepers. ☺☺☺

2.7. A few other choices, for daytime masks: glasses for $180 (that won't match your face shape to create 98+% seal and thus be useless) that use rubber, but the tape ones you make at home retain far more moisture for only 3 cents. Lenses on the snorkeling amazon glasses are clearer than any swim goggles at Big 5 store, but low quality compared to the 12$ Bollé HD plastic lenses (no antifog coating though, so need use antifog gel/paste). Outside you wear some sunglasses as shown with Bollé.

Imagine if people would make a mask for $0.5 for naps and sleep and generate yawn tears as I explain, not spend 2k in artificial tears in 5 years, Pharma would have to discover more amazing & beautiful ☺☺☺ things in medicine than what they're doing, less profits maybe, but *people would have far better eye health in Immortality Capitalism, as ingredients would not damage eyes.* Ask FDA why we don't have "0 pressure on eyeball" warm compresses and *moisture retaining eye* masks in every CVS? With mass production, they can sell a moisture retaining mask for 10 cents, that you replace monthly, so buy a pack of 10 sterile ones for $1. They can even take a pic of your face with your phone, then the app mails via Amazon a custom 3d printed foam or new material mask that fits your face perfectly for night moisture retaining and has some removable pieces that can let air in when too much moisture is generated and even fancier versions that beep when humidity is below or above ideal range, so you make it more air tight or less. They can also, for 5-10$, have Amazon ship a custom 3D printed rubber attachment system for your glasses (you send pictures of glasses via an app and dimensions), or for 5$ blue light blocking or clear glasses for those without prescription glasses, so they can have a moisture retaining mask during daytime that fits perfectly until they unblock MGs *or figure out the best*

healing method for MGD *or whatever issue they got (if lacrimal, etc).* With a $10 20x mirror and $6 40x magnifier (no light on to avoid eye damage) or $22 100x glass (no flash used, not plugged in) placed on the phone camera (back) you can take via mirror amazing eye pics to see issues 10 years before we can see at 1x what a mess is inside there; if people would see how the blood vessels appear and the aging that is there, how tear break up time (TBUT) is shrinking 10 years before people think they got dry eyes, they would save so much of their eye health; the app records TBUT in its history (linked to our Immortality account), beeps when TBUT falls, suggests taking a face pic to get a 3D printed moisture retaining mask (or one of the 25 premade shapes they made to fit the main 25 types of face, which would fit WAY better than 1 for all faces even if no custom one for every face) and use an optimized Q device to heal Mgs. We *need at home apps, phone tools to enable everyone to be a doctor*☺☺☺*, like* solar panels *allow* everyone to be an energy producer. At home, you can monitor eyes or any area of interest every week, not once a year, with 100 times more care *and interest than a tired doctor who has no way of knowing your sensations in that area of your* body as you know it, can't see thru our eyes.

The masks can also be washable ones, not disposable as with 1000 q tips for a bag at the 1$ store. ☺☺☺ Disposable ones allow higher hygiene, so bacteria not removable by washing and alcohol soaking would be done with. We have endless things and gadgets, sex shops etc, (meditation > orgasm) but not the most basic ways to extend eye lifespan and perfect function to age 150. The foam around the edge can be a disposable foam that is replaced, while the foam uses an airtight velcro to adhere to the plastic (safe for eyes) velcro, eliminating the need for foam glue as foam velcro is bound to the foam, one piece, not glued to the foam, although velcro can be eliminated if a very safe hydrophobic glue is found. Foam can be replaced every 1-3 month here and there, velcro once a year, so when you buy 10 masks, you get 1 plastic piece, 2 velcros and 10 foams for 1$. This offers instant relief to people having to sleep in a hotel with dry air AC. Can make even 1$ sunglasses that are almost totally air tight, for such people, blue light, prescription wrap around glasses, to aid them with tear break up time doubling or tripling, until MGs are healed, etc. They could exist at $ store too, since living to 150 means we need to take care of our eyes early on, prevent dust and crap entering our eyes, wrap around glasses could be the only legal ones for sunglasses like in Australia, all dirt hitting eyes is so bad. ☺☺☺

11.17.1.3. Third urgent action*:* Setup meibograph *(*either LipiScan, LipiView, Keratograph 5, MiBoCam, etc*)* appointment *within 18* hours ► 86*% of dry eye patients have some* MGD*.* These glands produce the *holy grail of eye health*: the 600 lipids and 100 proteins of the outer layer of tears, *the* 3rd *(*C_3 lipid mnemonic*) or lipid layer (after aqueous and mucin layers, more than just* ω3*) that prevents aqueous layer evaporation and keeps eyes wet. Because these glands are so key to seeing well at 150 or 900, within 18 hours, setup an appointment to actually check your* MGs *with a free or $30-40 consultation (call many offices, some charge 30 others 200 for taking*

a pic, see meibograph section *on how to take clear gland pictures), because if they're clogged, you need to do warm compresses and express the glands, otherwise, dry eyes will remain dry for years and all tears, self-generated or bought, will be a vain effort and* all *glands will atrophy with time, which is bad. You* definitely need to unclog the glands and reverse atrophy if possible, or at least prevent it, *so don't postpone this, as you may have nothing left in 1-2 years, and may never get them back. So, please address the cause of dry eyes, not the symptom, otherwise, you will suffer for decades if your* MGs *atrophy 100%, becoming 100% dependent on using 1-10 times daily artificial lipid rich drops, having poorer eye health than otherwise.* ☺☺☺

11.17.1.4. Fourth urgent action: Warm compress (if needed), MGs massage to thicken the lipid layer, unclog glands that are now clogging even if they seemed normal on LipiView. Compresses stimulate healing, circulation, help produce longer lasting natural tears. If the doctor said tears are not due to MGD (14% of people), then you decide if urgent. ☺☺☺

11.17.1.5. Fifth urgent action: Go to bed/wake up at a regular hour to aid eye repair, lower inflammation of body/eyes, keep MGs and ocular surface healthier. Insufficient sleep destroys neurons & causes *a 70% drop in immune T cells next day in the blood.* ☺☺☺

11.17.1.6. Other urgent actions:

11.17.1.6.1. Please reread the page on conserving lipids/nutrients first, via avoiding sex outside of procreation, as dry eyes need all out mobilization of all body resources; dry eyes can lead to catastrophic damage to eyes within years if left untreated, so it's like a war for the *survival of your eyes*, drop all you're doing if possible, read this entire chapter carefully since gland atrophy is irreversible sometimes, can't get it back years later: *all else can wait, not our eyes*. Avoid any birth control "lacrimal gland deficiency has been observed in women after menopause or ovariectomy and during oral contraceptive use" CEO 2014;97(4):324-36. Have sex at ovulation and only if you want a kid. Meditate or use natural birth control (zero sex if you want no kids, since meditation achieves happier states). "Bee pollen induced 25% of anti-estrogenic properties while no estrogenic activity was found" FCT 2009;47(3):547-54. Estrogen causes dry eyes if too high or low, birth control pills contain about 20 µg, while bee pollen suppresses estrogen. "RJ diet induced higher testosterone (T)" in animals NJ 2012;11:77; maybe that's why in some human and rat studies RJ lead to improved tear production, since, usually, androgens (T) make eyes wet, while estrogens can dry eyes if either low or high. Eyelid topical USP (hexane free processing, cold-pressed, dark glass bottle to prevent oxidation, since plastic leeches estrogens like BPA) castor oil may help with dry eye, see Amazon brands. In Matur 2001;37(3) :209-12 topical testosterone cream on eyelids for 90 days restored (lipid layer thickness) LLT and TBUT (tear break up time), since androgens cause meibum glands to secrete more lipids, see also EJ 2020;67(9):893-902. After 4 weeks, OSDI (ocular surface disease index) fell 15 (rose 0.1 in

controls), TBUT rose by 7.4s (fell 1.1s in controls), the Schirmer's mm rose 6.84 mm (fell 0.5 in controls) in the AndroGel (1.6% gel) testosterone group ► AJO 2019;197:136-44, testosterone remained constant in males, and rose in females. Watch the testosterone for dry eyes video. IOVS 2003;44(13):2450 had success with 3% testosterone transdermal cream.. OS 2025;38:56-63 found 4.5% testosterone eyelid gel applied twice daily, 12 hours apart for 4 weeks almost doubled TBUT, reducing dry eye. A 2015 Ophthalmology Times article explains testosterone eyedrops. Like female menopause, andropause is when men 40+ have lower testosterone leading to dry eyes. When I became vegetarian, then *vegan*, my eyes no longer had mucus dried up in the eye corner each morning (due to dairy/meat), because a *vegan* diet is much less mucus forming, much less inflammatory, so eye inflammation drops once you go vegan. Iron deficiency and vitamin D deficiency both can cause low testosterone and dry eyes as a result. ☺☺☺

11.17.1.6.2. Avoid using alcohol prep pads on glasses, as the lint can fall into your eye, especially for sealed glasses. Maybe buy a lint roller or electric lint remover (13$ 6600 rpm lavender, 25$ Philips, pet hair too, or 10$ 7600 rpm, or 16$ 9000 RPM, 5 extra blades) to remove lint/pet hair from all bedding, clothing etc once a week if you got pet, etc... and buy small *lint* free tiny, 7" by 8" or so, towels ($ store got some kitchen ones with 20x less lint than normal Walmart towels), used for eyes only, to prevent P. acnes bacteria from pimple areas to get to your orbital area and causing dry eyes via lipases as explained in antibiotics section; can use one tiny towel per eye; if you can't find a body towel with 0 *lint*, just get a big t-shirt with *lint* of 4 times lower height and trim it in rectangular and use that; lint is deadly, it can cause infections, inflammation, dry eyes, etc; inspect items before buying in bright light, since with dry eyes the most important thing is minimal lint; use items that don't get pulled over the eyes, for all clothing items, except a few t-shirts and when placing clothing on, widen the neck so it doesn't touch eyelashes, or glasses; and wear more rain coats, polyester t-shirts and cotton shirts, instead of cotton t-shirts with 3 times taller lint than cotton shirts, rain jacket has 90 times shorter lint than a cotton-polyester blend hoodie (so all my clothes are now short lint shirts and rain jackets, plus a few t-shirts), shirts have far less lint than sweatshirts and also make you look like a pro, instead of casual; lint can get into eyes, and cause foreign body sensation like eyelashes, easy to see at 20x, but sometimes harder than lashes due to their white color that is masked by mucus, etc; always use moist q-tips, otherwise, cotton lint will get stuck into eyes; lint can cause red eyes, *irritation*, infection, so gently avoid sweatshirts, pullovers, cotton hoodies *(that have a soft inside with 50 times more* lint *than other night clothing or pajamas, especially hoodies without zipper, or buttons, meaning you pull them over your eyes and hair and get all that inside hyper linty section rub on your face and eyelashes and give you infections)* and things that have 'tall' thick *lint*, inspect in bright light to see the clothing, pillowcase, sheets, fluffy winter socks, hats, scarves, blankets and towels with shortest rarest lint and use those for sleep, or even normal

activities when you hang out in bed: vacuum room weekly, clean glasses daily).

Stop using *makeup (especially eyeliners, mascara), eye creams* until dryness is gone as they can cause dry eyes, anything around eyelids could cause it; *women* use creams/makeup more, *women* got more dry eyes (CO 2018;10:33-40: BAK tear/makeup preservative causes MGD too) via MGD blocking, especially if not removed at night via shower (makeup removal products cause MGD*), etc,* causing blockage and inflamed eyelids/eyes*, as makeup bacteria get trapped in the glands.* Most makeup uses iron oxides for that beige skin like color, so iron increases eye oxidative stress causing dry-red eyes in the long run sometimes; the toxic chemicals in cosmetics section has some studies on parabens, phenoxyethanol, etc *which kill MGs cells within 24 hours.* Avoid dimethicone and silicones in shampoo or conditioner, since this is very hard to wash off and sticks to the eyelash and normal hair, depositing itself at the base of the eyelash and obstructing natural processes of regeneration and causing eyelash loss, leading to styes and infections; it also leads to hair loss on your scalp and can get easily into eyes causing MG orifice blockage, cornea staining, blurred vision, etc. See dangers of cosmetics section. Many women improved eye wetness by eating fenugreek seeds, these are 6$/lb on Amazon, give it a try. Basically, *several studies show* men, women (EJ 2020;67(9):893-902) who're low in testosterone *develop dry eyes,* so definitely try *FENUGREEK* seeds, known to boost testosterone. Some studies showed DRAMATIC RESULTS. *Fenugreek seeds are so healthy, so powerful against viruses,* Covid19*, flu, cold, etc,* that they have benefits beside dry eyes common in all 70+ year olds, who don't realize their ocular redness is due to low level dryness. *To live to 175, you need wet eyes, so we need to discover how to keep eyes wet as we age. Try buy* produce with fewer pesticides, the clean 15 (avoid the dirty 12), since pesticides can disrupt hormones, drying eyes. "Men with the lowest vitamin D levels exhibited notably lower concentrations of testosterone compared to those with the highest vitamin D levels" ► Cur 2023;15(9):e45856, so if you got ultra low vitamin D, like me in August 2017, you may be low in testosterone and this may lead to low water, oils, mucins, the 3 layers of tears, meaning to dry eyes. Taking 267 mg zinc/day for 6 weeks rose testosterone from 493 to 852, enabling guy to have kids ► Lancet 1977;2(8048):1125-6. Check testosterone and then if ultra low, try 0.05% testosterone eyedrops from your eye doctor as it cures dry eye for some. However, even Bryan Johnson with $2 million/year on 91 supplements and testing has dry eyes (4th comment on the youtube video about him).☺☺☺

11.17.1.6.3. Eat powders for more tears, lower glaucoma/AMD risks (top causes of blindness):

1). maqui (highest ORAC of all fruits, 50% more tears in some people, ORAC 3-15x > blueberries, smells like blueberries/blackberries mix, aids the brain/body, has way more fiber than blueberries/g sugar so it improves stool softness and bowel movement 10x better than blueberries, avoid Bulk Supplements maqui, it smells of acetone/asphalt from extraction/bag

(hot transport/storage?), 20% maltodextrin stabilizer, lavender instead of dark purple due to maltodextrin or oxidation, Brazil origin, buy always freeze dried (not powders mixed with maltodextrin) from Walmart as they ship/store at low temp to avoid oxidation that creates eye toxins), 2). avoid goji powder with 20% maltodextrin buy pure goji berries instead (far less toxins generated during drying these, than the powder extract) (30% more tears in some people, 138 mg oxalic (kidney stones, bladder urination issues if overeaten) vs 8 mg maqui and most berries, so eat 0.5g only, smells of caramel + raisins, orange powder, used in China for dry eyes for eons), 3). organic freeze dried bilberry powder (bag or bottle must be 100% opaque, not white; never buy nonorganic, since in China this means industrial levels of pesticides; avoid maltodextrin containing extracts like this bilberry (better antioxidant for dry eyes than even blueberry, smells like blueberry, more pungent), Bulk Supplements one is lavender (China) due to 10% (possibly more) maltodextrin added. Bilberry extract standardized to 30% anthocyanins is dark purple-red-brown, but that dark becomes syrup at the slightest moisture, so they add 10-50% maltodextrin to many powders to prevent syrup formation, extend shelf life to years, it is best to avoid maltodextrin, as it damages the gut ► CMGH 2018;7(2):475-6. The lavender color is because this is not a concentrated extract, but dried bilberries: Bulk Suppl. provided chart shows China crushed berries, extracted with warm water, spray dried them, so a lot of oxidation happened in this drying making colors fade. The best bilberry or any powder is freeze dried, no chemical solvents, no oxidation, so buy those.

4). apigenin pills (taken with fat) since eyedrops (in development stage) cured dry eye "*effectively* reversed DED" ► IJP 2024;658:124222. Don't eat chamomile as it has anticholinergic compounds (less tears) and allergens that can cancel out the apigenin in chamomile effects, releasing histamine, etc. Only use pure apigenin pills, since commercial eyedrops don't exist. Try find quality pure bulk powder, as that will be 2-3 times cheaper than capsules.

Warning on ginger TRPV1 and cayenne TRPV1: capsaicin in all chili peppers stimulates tear production in the short term, promotes ocular circulation for MGs, but high (or even moderate for some) intake can cause long-term dryness just as Indians noticed in Ayurveda that some foods lead to dry eyes. Garlic, hot peppers, onion are heating the body (eye needs cooling Pita foods), being non-sattvic foods, they stir up animal passions, waste body resources to produce sperm, etc, only useful if trying to conceive. Chili pepper capsaicin may cause infarct in some, be careful, start very slow and only hot peppers only if all 200 other foods fail, as you may cause long-term dryness via the "rebound redness" effect: stimulates tears temporarily, but then suppresses them, like redness reliever drops reduce redness temporarily, but cause bigger redness long term; capsaicin causes night sperm emissions, which makes the eyes dry, so don't use if night emissions occur). Avoid fermented foods as they're high in histamine, which is high in many dry eye patients, who get swollen eyelids when eating fermented or probiotics.

Fermented foods (tamasic) are again not recommended in Ayurveda for dry eyes, these guys knew something: salt in fermented foods draws water away from eyes. Curcumin aids dry eyes.

***Avoid* chlorinated *shower water in your eyes, since it can cause redness or even dryness*: when taking a shower, first wash your hands with soap; then use the left hand (the cleanest one) to wash with soap your ocular area, and then dry the eyes with a special (for eyes only) towel and use this drying time to gently massage the upper eyelids downwards, to stimulate the meibomian glands. Avoid blinking while in shower of eyes are wet, to cause nearby upper eyelid or eye corner droplets from going into the eye and causing extra inflammation, so dry eyes first and then reopen them if you need to (basic washing doesn't need eyes open always, recall those water droplets can be infinitely small and that steam also has chlorine, etc, unless you use 100% warm water and the tank has a newer magnesium rod that reacts with most chlorine before it gets to you. Avoid swimming, as pools are full of chlorine, feces from swimmer's asses, urine, bacteria and viruses, like the blindness causing herpes virus. Get a shower filter if you can't do the above, but recall that many science papers advice against it, since bacteria can grow in our stone age filters and then damage our eyes and/or lungs too as much as not having the filter at all. Chlorine is good as it keeps the shower head truly much more sterile. Recall how it takes 200 years for science to notice when a tech (bad filters) is doing a lot of damage. Stop using redness reliever eyedrops, try *preservative* free tears. Lower eye inflammation by keeping nasolacrimal ducts open, sinuses free from chronic inflammation (stuffed nostrils, which would spill over to the eyes, such as cayenne powder to open sinuses), while providing some warm moisture to eyes a warm mist humidifier to inhale warm *vapors that* loosen mucus, *wet eyes and make them less red, irritated* if you wear dry eye glasses since vapors are cooler than a hot shower and you save water; this avoids antihistamine OTC cold/allergy pills that cause dry eyes.**

11.17.1.6.4. ☺☺☺ Stop strenuous exercise, but do exercise gently; sudden exercise raises body and eye inflammation, depletes body of vital nutrients; avoid LASIK, as it causes far worse dry eye many times, than you already have; try instead PRK of farsighted or astigmatic or, if nearsighted or astigmatic, the very best for dry eye is SMILE. SMILE uses 1 femtosecond laser only, not 2, to create 2 layers of bubbles in the middle of the cornea, which form a lenticule, a piece of stroma that is later removed thru a 3-4 mm cornea incision. LASIK however, makes a 20 mm cornea incision with femtosecond laser and removes using the 2nd laser (excimer) to reshape (remove) some of the underlying stroma; in LASIK, MD lifts temporarily the outer layer of the cornea in order to remove some of the middle layer, so because of that, dry eye is far more common and LASIK destroys a lot more cornea nerves that take 1 year to regrow, *so dry, burning, itchy eyes can last 1 year or more, and dislocation of this cornea flap is possible if you rub your eyes a lot, or experience some eye injury*. PRK also causes dry eye (not as much dry eye as SMILE though, LASIK being the worst), since, unlike SMILE, it's very invasive and removes the

outer layer of the cornea for a circle of 4 mm radius or 25 mm circumference; *PRK has the longest recovery time and is only used for people with thin or* irregular shaped corneas who can't undergo LASIK. All surgeries have possible side effects like double vision, blurred vision, halo around lights at night, etc, so it's safer to just wear glasses if you want 0 dry eye. SMILE is the least invasive laser surgery today available (approved in 2016 only in USA, 3 million surgeries done by 2021 in US; approved in 2011 elsewhere, used in 70 countries) and causes the least dry eye (since they damage cornea far less) and strongest cornea post-surgery (47% stronger than LASIK), as a SMILE surgeon video explains; some view is as safest long-term, but it has its own drawbacks; can just wear glasses or contacts, though contacts also cause dry eye (like SMILE can, besides glare, halos, double vision, etc from laser surgeries), so glasses or SMILE are the better choices for nearsighted who need to see while driving better. ☺☺☺

11.17.1.6.5. Hydrate with *water*, juices, smoothies, *veggies*, especially before sleep to avoid night dryness. While 14% of dry eye patients only have aqueous deficiency and no MGD, most of those with MGD (86%) have a little bit of aqueous deficiency and dehydration too, which is very bad, since dryness results in bacteria proliferation which invade MGs and clog them making MGD worse or returning after treatment. Avoid constipating foods.

Keep your kitchen/bath clean, *replace kitchen, bath sponges often* (they are only 10 cents each, $ stores sell 10 for $1), you touch the sponge with your hand and then touch face, near eyes, so read the USDA findings: "37 to 87% of bacteria were killed on sponges soaked in the 10% bleach solution (10 min), lemon juice or deionized water (1 min) and those left untreated. *That still left enough bacteria to potentially cause disease*. Microwaving (1 min) sponges killed 99.99999% of bacteria..., while dishwashing (with a drying cycle) killed 99.9998%... microwave oven (1 min) or dishwasher (2 h) [killed 99.99999% of yeasts and molds]. Between 6.7 and 63 % of yeasts and molds survived on sponges soaked in bleach 10 min, lemon juice/deionized water (1 min) or left untreated." So stay away from normal cleaning, microwave instead, but make sure the sponge is very wet, otherwise it can catch fire, and move away from microwave, that RF will damage you. Wear gloves. Wash hands before putting your gloves on too, to prevent bacteria buildup inside and replace them every 100 uses. At least, place 5 drops of liquid detergent or soap and squeeze it 20 times if no microwaving, but a dishwasher cycle above takes 2 hrs, it dries the sponge. Thus, hand washing *sponges is a* joke *or a waste of time vs microwaving.*☺☺☺ Keep the bath clean too, pee while sitting down (at home where toilet seat is clean, flush with toilet cover down, but clean that cover often too, don't rub it on your back clothing), since it empties the balder faster and better, prevents prostate issues, and prevents pee particles from getting to your eyedrops, bottles, devices, etc near the bath. 62% of Germans pee while sitting usually, I found this out in 2023, 7 years after I started peeing sitting down. Pee particles can jump 3 meters away, so better keep eye stuff away from shared baths; sitting makes bath cleaning so

much easier, baths so much less smellier. ☺☺☺ The 30$ Purrfect Zone bidet 1 star reviews (like other bidets on Amazon) explain the leaking, water damage (5000$ etc) and thus emanating in the air, from the leaking bidet that is never really that clean, MRSA bacteria that develop in the bidet within months or years; bidets are common in some areas, so they buy this quick without realizing the inherent dangers of these cheap attachments that can cause ocular infections and even dry eyes: when using public restrooms, we try avoid touching anything except the toilet paper, some even avoid sitting on the toilet *(in some nations the toilet is very low, so they squat, as feces come out a lot easier and they don't sit to cross-contaminate)* as there is no paper to place on the toilet; cholera and other diseases can be transmitted by contact with feces in public bidets, by touching the handle, etc. Water deposits algae that form a biofilm, which then acts as a perfect place for mutant bacteria to hide and remain as water is used; most don't clean their 30$ bidets every week, to sterilize them properly, so cross-infection is high. Many don't turn off the backflow preventing knob after each use and this contaminates sometimes the entire house plumbing system, drinking water fixtures with bacteria, the water you use to wash ocular things, eyes, etc; as people wash the anus, small feces particles get stuck in the nozzle and can transmit diseases; on top of that, women are far more likely to develop vagina infections (JOGR 2010;36(5):1071-4: bidet users were found to be more infected, due to the toilet being always new and clean, while the nozzle not so clean (JHI 2017;97(3):296-300) and women not using bidet properly) since the vagina is so close; when washing, feces can get into vagina, while for men, that never happens, as penis top is so far away, just pointing it the other way prevents any water getting on the penis. Thus, risk of urinary tract infections for men are far lower.

Females also have the issue of vagina, an extra orifice that men don't have, so perhaps for them, with having to clean after menstruation, etc and tampons causing TSS, a bidet may be more useful, but many risks exist, since bacteria films develop within weeks; municipal water is not what they say, just see 1 star Amazon reviews on humidifiers scale build up; you don't need to see it at 1x for it to exist and cleaning and sanitizing bidets is not as easy as they say, they're designed by low IQ people, these cheap 30$ attachments, and cleaning them properly is impossible.. While at home bidet cleaned well are fine, in public settings it's risky, unless there is a super strong cleaning routine. The issues with backflow, whole house or condo complex contamination are explained more here. On top of that, some people turn it on and off a lot during use, and this can cause pressure building in the system, leading over 3 weeks to shower leaking in that bathroom (for stem faucets where slight pressure causes it to leak when not tightened more than usual), or for toilet valves to not work as usual (contamination or even scale, sediment in city water can block the holes, see video on how to clean toilet valves that don't refill), and over 10 years to pipe leaks, etc. When toilet is flushed, the water pressure causes some air to build up in the plumbing system as water dislocates air in the hose; over

time, this air causes rattling noises in all pipes that will make living in that house or condo a nightmare, even with earplugs sometimes; so, besides diseases, one could get into some plumbing issues too; only install these if you know what you're doing, have backflow prevention, as UK laws require, for example and also clean it religiously weekly (most are too lazy to do that). ☺☺☺

You know how EPA says to clean a humidifier every 3 days, even a simple bidet nozzle is something that needs a lot of cleaning, and even with the best cleaning, bacteria can crawl on the nozzle towards the hose, and get stuck there, so nozzles and the hose need to be replaced far more often than currently done, since nobody will take the hose from the attachment to the toilet valve and flush it with disinfectant often that doesn't corrode the metal (bleach can) and thus forms new biofilm easy to stick prone scratched places; water from the toilet bowl will spread air bacteria from everyone who defecated there into your hose and anus eventually, so it's not really as sanitary as it seems; clean it well, so you don't get reinfected with MRSA or whatever over and over, if you love bidets; if male, bidets are not as useful, since you can wet a toilet paper after cleaning with dry paper first for a final cleanse; we have no periods, nothing to clean much; honestly, I would never use a public bidet, like they do in 10 countries, since there is no way to make sure it was cleaned properly, the toilet paper is always clean; even at home, it's a lot of work to clean everything well, due to water bowl infecting the hose with the regular cheap thing and even with stand alone bidets, the feces can gradually crawl via biofilm scale streaks into the inner faucet and reinfect you with MRSA, SA, etc, giving girls TSS, etc. It's not like a sink, it's like a sink you defecate on daily, is that sanitary? Not to mention, the skin around anus is so sensitive and all that chlorine and F is destroying collagen, skin and bacteria microbiome, since it's not shower filter water (if you got a shower filter), it's pure corrosion. It may be a ☺☺*loving gentle* kind☺☺ move to place lid down during toilet flushing and leave it down if no window, no sunlight entering (UV kills microbes, so lid down always after each urination won't disinfect it naturally), to prevent germs from going into the air or eyes during the flushing (clean the inside of the lid periodically, of those contaminated droplets). It's unclear what is really better, to have UV kill microbes in the air in the toilet with lid open after flushing it with lid closed or let the aerosol to fall slowly by gravity on the toilet with lid closed and then be flushed next time, more studies need be done: strong sunlight kills 99.9% of microbes in bottled water, so indirect sunlight that may not hit the toilet itself, may do a good job too. It seems safer to avoid metal trash cans in the bath, even if many low IQ companies make them, since they rust and then bacteria are impossible to clean, while a plastic one never rusts, especially if you paint the tiny foot paddle if that one is metallic. All plastic is ideal, it's quieter too. ☺☺☺

11.17.1.6.6. Use less AC (dries eyes), no central heat (electric heater in a room dries air far less), window screen to get humid fresh air (mosquito zapper 8”x19”, AA 1.5V battery, not recharge

types requiring 4hr recharge/day). Use evaporative cooler (not AC) if hot, a humidifier when dry.

HUMIDIFIERS (31 pages on *humidifiers*, humid climates & 0.0 imports of lethal products)

If in a rush, you can ☺*lovingly tenderly gently kindly*☺☺ scroll down 3 pages to reach the ►►►5). ►► ways aristocrats destroy nations and planets with their palaces and 400 acre ranches, leading to the 10 second end of humanity. Most humidifiers got plastic that spews microplastics, causing 7 g of microplastics to enter the brain and shorten life by 9 years in some cases, even if you use distilled water. To prevent brain damage via plastic, use a good air purifier that catches microplastics. USA needs to develop humidifiers with glass or stainless steel container/lid that spew no microplastics, like the Korean Carepod & Chinese Livatro, with all their issues detailed 26 pages below. If humidifiers fail to bring humidity to 70% fast, scroll down 8 pages to read the ways to *create a small cubicle to place humidifier in, to boost* humidity to 70% *with* 10 times less *distilled water daily*. 4 US impossible to clean properly (thus deadly) steam humidifiers are:

1). Vicks V745A 1.0 gallon most known type at all pharmacies, least safe, 2nd loudest, tank opening is 2" not 6-10" like others, some tank areas can't be scrubbed easily at all, unless you use special brushes, but even then, can't clean well to remove biofilm formed after 3 months.

2). Honeywell HWM440 1.5 gallon (only $54@Walmart.com), noisiest, so you can use aluminum tape topped in clear tape around the unit to block sound. You can also double tape with clear tape some aluminum foil or tape piece to block the lateral vent and some of the top vent so that water runs out in double the time. It uses 209 watts in regular mode 418 watts in noisy more vapor mode (measured with watt meter), dust gets in if not covering the water pour area with some paper flap or etc. It has an easy clean, avoid the black one as dust-mold can hide, this Honeywell is the safest because the boiling/other areas are white, including the water storage container, while the rest have blue, dark grey containers or boiling areas. You can remove the white-red level by pulling it by the handle and the rest can be taken apart by unscrewing the 2 Phillips screws to remove the red latch, the grey element protector. The heating element is very smooth and far more reliable than the Walmart Equate junk that disintegrated and gave small specks of black plastic, like other cheap trash humidifiers. The grey heating element, unlike the Equate rough one, is way smoother and can be cleaned fully of the brown mix of organic stuff residue in distilled (DI) water has 1000 times less minerals and organics, so cleaning this is easier, you may need a tooth pick from $ store to press on alcohol pads in the corners to get all the dust, etc, but generally, this is easy to clean since all parts, grey cover, grey chimney, grey element cover and its red latch, and white flapper valve (with red handle), etc can all be removed to leave only the grey element and all white areas that you can disinfect with alcohol pads, 1 cent each. Equate has a spring and a rubber thing to let water drip, while this one is allowing gravity to work using the flapper valve, having fewer parts though you need a Phillips

screwdriver to clean it well. Never use the high setting because the flapper valve apparently gives out in the higher temp per one video and then the boiling area becomes full of warm water that can overflow via the lateral holes damaging furniture. This is the safest humidifier on low setting, because it allows easy cleaning and all microplastics tend to remain on the bottom, unlike ultrasound humidifiers that spew all bacteria and plastics into the air. This one, you simply discard the water after each use or so and the microplastics go away. With DI water, it's so clean, you can just clean it once or twice a week. Be careful with the flapper valve, the one that failed in that video could have been a manufacturing defect of the heating element which caused a higher than set temperature, due to cheap China part.☺☺☺

3). Equate EQ3111-UL 1.3 gallon (heating element broke after 75 days: 100 pieces of black plastic coming out after each 20 hour use, due to heating element being made of some brittle plastic unlike the others more rubbery material, 164 watt while on regular setting, 332 on high, easy to clean tank); 3rd quietest. The National Humidifier University will need design a humidifier with stainless steel parts, in order to avoid the lung, body, brain, organs, destroying air microplastics. Same for food storage, we need them be glass or stainless steel, and plates too (porcelain or glass or steel), until they make a biodegradable plastic that won't get 7 g of it in our brains. The stainless steel plates need to be one piece, not curly at the end with a huge gap under the plate where bacteria and food get stuck. Again, with 10 million companies, nothing is properly reviewed, evaluated by food safety experts, customers receiving free samples before mass production, all ☺abysmal IQ☺ people become CEOs.

4). Honeywell HWM845W 1.0 gallon heating element broke after 2 days, 130 watts on low, 260 w on high, quietest of all 4, plastic stinks horribly like burning tires first days (could be 45 days, I stopped using it after 2) of use, tank is transparent carbon dark grey, so all mold can hide. The official HWM845W manual shows on page 6-8 that the cleaning to be done weekly is for tray and water tank, not for the mist chimney. The chimney is where all vapors with all deadly organic volatiles and semivolatiles are going to stick, react, create deadly new toxins and food sources for microbes, on the inside of the chimney, creating deadly biofilm in mere days and poisoning the people who never clean it within weeks or months. Anyone with lung issues or who uses tap, not distilled water (tap got 2000 times more scale that adheres to the base of this 'chimney' allowing bacteria to quickly have a bridge to the upper parts of the chimney) will totally sicken their lungs or kill them via pneumonia, even if they don't know it.

Thus, the Honeywell HWM845W is the most lethal humidifier sold in USA, designed in USA (99% of humidifiers are shamefully made in China, this HWM845 too, as USA plays worm IQ sports), the only humidifier that you can't disassemble and clean the mist chimney of, as in all others, a testament to the ☺abysmal IQ☺ of USA who allows such a deadly product to be imported,

manufactured, designed. The immortalists wouldn't allow any US/foreign company to import or export, sell inside/outside of USA any product before it's approved by the Immortality Nurturing Agency, to avoid poisoning USA or defiling the name of "designed or made in USA" with lethal junk products coming out of the 'anus' of a donkey aristoc-rat brain. This includes all subsidiaries owned by US investors, etc. In 2025, we import all and any lethal junk, without checking anything and this kills millions of Americans 5-35 years earlier. This is only 1 out of 25 million junk products we allow to enter USA. It's time to take America back from the grip of the parasitic aristoc-rats. In USA we get 500000 payroll managers, instead of one payroll software/manager for the 11 companies, 3 agencies that employ all Americans. Who can check all crap imported in USA? Nobody. Every student is an "economics, accounting, art, history, acting, administration, management" major. Decentralization is KILLING US. Raw capitalism (as opposed to immortality capitalism) made us experts at talking, sports and designing lethal products, clueless at doing good by making a truly safe lifespan doubling product. We're the hot air (nonsense) experts. Trump helps USA to become self-sufficient, produce all its solar panels via 846% tariffs on Chinese solar panels made in Southeast Asia, in a clever ploy by China to avoid US tariffs. It's time to bring some order in the insane chaos of making every US lethal design in China.☺☺☺

You need to remove six screws, with a special hex wrench to add to the offense and make it harder, to take apart the HWM845 mist chimney, and clean it, even though it was not built to be taken apart. You can can fit the whole hand in the tank to clean unlike Vicks. It makes 60 dB C noise on the side grills that have condensed water drip. If you want to die 10-40 years earlier buy it. Honeywell makes a black version HWM845B too so you can't see anything and ensure you will be breathing black mold and the most lethal microbes coming from the hard to see dark grey biofilm. The grid on top of the element is red and it's impossible to clean it well (no other humidifier comes with such a grid, so hard to clean), without wasting 10 minutes with a very advanced brush nobody almost sells. Honeywell should stick to aircraft, and not venture into every business. Honeywell, with 102,000 employees, designed this lethal product and gave Helen of Troy trash company (1900 employees) a license to make it too. Helen makes other trash products. We need a National Humidifier University or Lab, the size of MIT, with 9000 PhDs, to create truly safe products of the Eternally Wet brand of Immortality Building Inc, not these ☺ abysmal IQ☺ people with 3 PhDs creating products to kill people. USA has become a collapsing empire, a third world country of gullible masses fooled by serial killer (using products) aristocrats & killing cults frauds who stage fake miracles to become multimillionaires.

1). Vicks V745A 1.0 gallon TRASH STEAM HUMIDIFIER: you will also get sick with this, as water tank can't be cleaned well, due to the 2 inch diameter tiny cap. Additionally, the 2 circles united by a bridge assembly that caps the boiling chamber has a bridge with 0.5 mm holes that are impossible to clean, those gaps make no sense, except as perfect areas for bacteria to grow and

kill Americans. It seems this was designed to exterminate people and fines against the company are needed, to help all those damaged by these pigs who allowed 3rd grader IQ ☺abysmal IQ☺ people to design the humidifier sold at every CVS, RiteAid, Walmart, Target store in USA. 60 dB A above the steam vent versus 57 dB A for Equate. Both are about 60 dB C, but on dB A, Equate wins and you can notice that when having them by your sides, when Vicks is on, it's the main one you hear, being louder than Walmart Equate; even when you put your ear much closer to the Equate brand, you still can hear the Vicks so loud, so the dB A sound meter is more like our ears, very accurate for close to source readings, more so than dB C. For distance sound, away from source dB C is more exact. Vicks has an issue like all other steam types, the heating element sometimes stops after a few days and all you need to do is turn it off and restart it . You can simply remove the 2 Vicks springs, latch and screw that screws the latch, since everything will function and you avoid scale on the 3 hard to clean metallic parts: 2 springs, 1 screw. You recycle the useless parts or save them in case you return it, you never need those: it is a poor design to have to use screwdriver to remove the steam vent, but you can get around it by removing the screw like many did, a simple plastic latch would have been enough. Everything works for years without the 2 springs and screw, latch and recycling them is best, as they waste too much time to take and put back for daily cleaning. The other parts are easy to clean and even when using distilled water it needs at least twice a week (daily ideally) 3 minute wipe with a disposable 1 cent alcohol pad, to remove the brown dust-water impurities residues (high dirt is near heating element and on the first vapor redirecting plastic piece – a ring of brownish residue). *Gently discard the water left over after the tank is empty and removed*, as the heating element area water is highly rich in minerals and impurities that concentrate.☺☺☺ Equate, Vicks, etc humidifiers have a bright light when on, so you may want to cover the bright exterior walls of the unit with some opaque purple decorative (1$ at $ store) or gift wrap (avoid using aluminum since heat trapping may break the humidifier). This way, you can sleep well without lights. Equate requires more taping to make it 100% dark. Not all biofilm is $CaCO_3$ (scale) that reacts with CH_3-COOH (acetic acid) in vinegar, so scrubbing with something is important, mechanical cleaning, which is not possible with many. Some companies have UV and clear container, so UV escapes causing eye injury. Always use distilled water, not tap water, since the white dust in the tap water (the minerals) will completely destroy young lungs in the long run and give you pneumonia, asthma and other diseases. Below I explain why many online articles say steam humidifiers are far safer than evaporative or ultrasonic, though steam type make more noise so you need earplugs. The Walmart and other company employees who make these nonwhite humidifiers need to be fired or fined, because you can't encourage people to use such moldy humidifiers, and tap water and use the excuse of seeing 'white scale' to hide the mold and sicken billions of people. Anyone can buy a distillation machine and prevent mold. ☺☺

The so called “cleaning technique” they recommend in most manuals, soaking in vinegar, then bleach, is pointless without physical wiping or scrubbing, since soaking will remove only the top layers of scale. You need to scrub or wipe hard with some alcohol and vinegar wipe if you have such low IQ to use tap water with 3000 times more scale than distilled. Phony product designers (alcoholic friends of the CEO *sometimes for startups,* pure thief going for joint golf courses and sports from hell*, as* out of touch with reality *as the generals who're never on the deadly frontlines, but shielded and having 0 incentives to achieve* World Peace*, since slave cannon fodder dies only not officers living in offices 1000s of miles from wars, not the protected military aristocrat sent on easy non-lethal missions)* who don’t use these humidifiers design them and write these low IQ manuals, instead of people with years of experience using them, cleaning them, etc. The distilled water left over after it finished the daily cycle needs to be trashed, as that concentrates all scale in that 1.3 gallons of distilled. It’s only 50 ml left or so always anyway, so you won’t waste much. The evaporative humidifiers and cold mist ultrasonics give cold air. The steam types provide warmth in your room, which can prevent wasting so much electricity with an electric oil heater that dries the air and cancels out the effects of the humidifier. With only 160 watts, you can heat up a small room or cubicle and increase humidity to 70% so fast, without using 550 watts. The cubicle will be 10°F warmer. Not only that, but the radiant red hot heaters have elements that get to 800-1700°F, meaning they produce 1 million times higher level of carcinogenic compounds in the air, by oxidizing air chemicals, than an electric oil heater (silent with max temp reaching 200°F on low 550W, 230°F on medium, 300°F on high 1500 watts) and 50 million times higher level of some compounds than room air heater by hot air from a steam humidifier that reaches (when it exists the humidifier) only 170°F. Today, in our society of “aristocrats bandits bamboozle all to steal trillions from gov and all people”, every ☺abysmal IQ ☺ guy says on TV “Buy our amazing (deadly) radiant heater (or medicine if Pharma mafioso), we're number one in Europe/USA or the world leader in (lethal) room heaters. 20% off today only”. In an immortalist society, these cannibal chimp wolves in sheep’s clothing would not get a free pass to pollute the airwaves with such junk. Every product ad will be approved by the Immortality Nurturing Agency, after 100 tests over 12 months of their product, and passing the criteria, and including in the TV-radio ads a short URL with the 2000 references to the 100s of studies proving that their heater or humidifier produces 300 times less carcinogens and bacteria than another and that their rank on carcinogenic output and bacteria mold output is # 12 if so. Everything is backed up by data, one can't make statements to loot, deceive, sicken, kill people with deadly products anymore☺☺. The age of Republican banditry and genocide (via humidifier filters (watch in horror), bad humidifiers, bad food☺☺☺) is over. Every wanna be millionaire starts his crap company to poison millions of people, in a true “we are one family one language” style of “me first, to hell with everyone else”. Likewise, the churches who're not online and receive donations, are businesses, and must submit evidence for any claim made on the national

airwaves, to prove said events occurred when evidently they did NOT.

Vicks uses 135 Watts in low setting, 270 on high, noisier on high setting of course, more bubbles. On the low setting, Vicks makes 60 dB C noise 1 cm above that essential oil holder at the top, but only 54 on the side grill located 8" lower. Play some background music to avoid distraction. Vicks smells like volatiles in plastic for the first 40 hours of use, the factory smell of cheap plastic. So you may want to run it outside of bedroom in some hallways with ventilation to get rid of that new tire smell, that is also found in Honeywell HWM845W, though that Honeywell smell takes longer to die down. Using a Tatedo decibel meter and the dB C setting it makes 52 dB near the unit and 48 dB 3 feet away. The dB A setting is not good at a distance as it shows the reading at 3 feet as 34, which is not true, since that is the same as with the humidifier off and much less noise and in much quieter areas of the room where humidifier noise is absent. The stench of Vicks is horrible, meaning this crap company created by bloodthirsty aristocrats uses the most toxic fumes emanating plastic. The Equate doesn't smell at all on first use and the water tank doesn't smell. This is logical, the container of water in Equate is wholly superior in design allowing venting off of plastic smells well before it reaches a customer and the plastic itself is safer. One thing that strikes you is the incredibly low IQ of the so called "Jewish Aristocracy (Jewish students 2% of population but 10-60% at many Ivy League universities where alcoholism and Wild parties with evil music destroy the youth) Run Educational System" PhDs, who designed a water tank that is impossible to properly clean to avoid the spread of bacteria. Essentially, it's a sealed water tank (dust can't get in like in the Honeywell HWM440 1.5 gallon open water tank model) that is impossible to open to clean like Equate (where every corner is simple and ultra easy to clean, you remove the grey cap and clean it). Nothing to worry, the (Jewish, British, etc) Swindlers can claim it is "the number one (Jewish, etc) MD recommended brand for vaporizers", the deadly poison that will ruin lungs with carcinogenic exhaust from the cheap plastic Chinese use, so that the CEO can build a Big Palace to Sing Gently. ☺☺☺ Scale in tap water is 2000 times higher than distilled, so you will basically have to use vinegar soaking, washing every day and some very special brushes to reach all areas of it every few days, to remove all biofilm that naturally won't disappear with mere soaking. Wait, all these PhDs will say in the instructions that using tap water on their impossible to clean humidifiers is OK. So, thanks to these abysmal IQ☺ engineers, you'll have to waste 20 min/day at least to be unsafe with this junk product that no decent government would approve since scale will build up and nobody would be able to reach all areas of the tank to wipe them up properly with a soft cloth or brush soaked in vinegar or rubbing alcohol. Not only that, but the same instructions booklet ? PhD? writers often suggest simply soaking it in water, not wiping anything, which evidently won't remove all biofilm that builds up over time. Every low IQ loser is allowed to sell anything in any store, like pills that, even if sold at Walmart don't contain what the label says in most

cases.

There is no central agency, Immortality Nurturing Agency, to make sure humidifiers are easy to clean in 3 minutes. Every greedy bastard starts a product line using the 2 ☺leech IQ☺ people (perhaps Mormon) PhDs they got. This is how vampires get to become millionaires: each is a CEO or Protestant cult starter, having a "harem" (intellectual slaves of low IQ, not literal sex slaves) of filif flea IQ☺☺☺ "yes sayers" worshiping their fraudulent nonsense. The focus is in 10000 useless toxic products, instead of 10 good ones. With one big 30 million employees and 5 million PhDs company, like Universal Immortality Inc, you can assign 50000 PhDs to create world's easiest to clean, safest quietest humidifier, *whose vapor is bacteria free even 3 years after purchase, not only 3 days after purchase*. In the capitalist thug banditry system today, we get some PhDs study molecular biology or quantum physics, and, unable to find a job, end up with Vicks to design the worst humidifier. In an ethical HONESTY (not fraud) first society, where we back any claim with evidence, we have 1000 majors in humidifier chemistry and physics and 1000 PhDs produced by the Centralized Ethical Tone Education system. Then, upon graduation, they go to the only company☺☺☺ in USA that makes humidifiers, Universal Immortality Inc and work in the Humidifier National University Campus, a huge complex of many buildings each specialized in one area. Today, the magnesium chemistry PhD, unable to find a job due to Jewish and other Wall Street/etc aristocrat speculators unleashing world chaos and financial crises, ends up working at some trash Troy company and is the guy in charge of learning how to make a product, that would take him about 10000 years to design alone, vs 1 year for a team of humidifier chemistry physics majors and PhDs who worked and build a whole knowledge base on that. Centralization is central planning that gives 100 times more people jobs related to their education. Not only that, but everyone has a job, nobody is fired, only positions change, no unemployed. This is efficiency, this is how we attain results and progress 1 million times faster. United We Stand. Evidence, testing based products first. THINK.☺☺☺

So, the state (We the People ☺☺☺ of the future immortalist state of 11 companies total, 3 agencies max) is defrauded by the Jewish, British, etc Aristocrat Vampire 5 times:

►►► 1). ►► the aristocrat stole millions of taxpayer money (federal grants, infrastructure use, etc) by overcharging for education that would be free in the immortalist capitalism,

►►► 2). ►► destroyed the sleep of the students damaging their brain and innovation capacity as no quiet on campus housing exists or online edu 1 week/month on campus for labs,

►►► 3). ►► created violent thug music, spread it worldwide and on campus, so no peace exists only loudness and boisterousness and alcohol parties (alcohol killed 1 billion already), fraternity hazing rituals that killed people or damaged brains, got many unwanted pregnancies,

►►► 4). ►► wasted 8 years (plus national resources) of the PhD (4 PhD, 4 college) slave to

study magnesium chemistry and then the gentile slave ends up working at McDonald's or in a humidifier ☺abysmal IQ☺ mom+dad company as the only PhD, which will take him 9000 years to design a decent humidifier made by 9000 PhDs in 2 years, PhDs who built a huge PhD program and Bachelor of Science program for that at the National Humidifier Immortality Labs program of the Centralized Educational System of 1 million Immortality Labs and 20+ quadrillion courses, ►►► 5). ►► sent the worker to work for a monster CEO/owner *(the cousin of the for profit university, where taxpayer money is stolen to Build Big Palaces to Shout as a Gorilla like these five 1 min clips of the "Avatars of Hell":☺☺☺ pastor, rabbi, Buddhist monk, imam, Hindu preacher)* who designs a product that kills millions of gentiles 5 years early thru deadly humidifiers, equivalent to losing 5 times 100 million people, 500 million lifespan years or the same as killing 10 million people aged 30 (80-30=50 times 10 million, 500 million), a HOLOCAUST; this then leads to more fraud and conflict, war and blame, and then the 10 second end of the species. This happens in 100s of product types and "industries", the same pattern. Today, when Consumer Reports test most humidifiers, over 3 days, not 3 years as it would be required by Immortality *Nurturing* Agency, brand new ones, they emit tons of bacteria. After their 0 IQ PhD tests (like the low IQ folks who claimed Tesla is the best car because some 0 IQ consumers like it, when it produced 100000 more RF than other cars), lasting 3 days, in which the wick filters can't get too dirty, they came to the wrong conclusion that "evaporative types are safer", which may not be true at all after 3 months of use since wick filters often end up looking like THIS HORRIFIC PIC. Notice how this youtube is even approved for TV broadcast, when it is, like with half TV content, pretty useless and trash. 3 days of tests mean nothing, and can lead people to make bad choices. Quantity over quality, wait, the aristocrat owning the TV station told slaves to produce more junk content so he can make billions. Wait, aren't you supposed to believe in the religion of the Consumer Reports? Without any proof? Like in Jesus miracles? These studies and humidifiers show what small government does: a pure jungle where the ultimate bandits steal trillions and con everyone they can with their scam companies. This fraud based Troy company that makes endless trash Vicks humidifiers ought to be shut down for fraud, deceptive marketing, poisoning lungs of millions. Their 17$ vaporizer is a disaster too, promoted at main health stores like CVS, RiteAid, the elements spew black carbon into the water and air, etc. First of all, where is the evidence this is the number one recommended humidifier and how is that relevant if MDs are paid by Vicks to recommend their product? Any ad in a decent honesty based civilization needs 5000 references and 2000 page PDF explaining why the product has the specific (nothing general vague allowed) qualities: Valid ad "on day 50, it produces 12339882 bacteria of Z type, vs ## times more for Brand X, Y, Z that got 55 billion, 22 trillion, 3 quadrillion bacteria respectively. Visit immortality.gov/342288551 (number is the universal UPC code or national system) for all references and bacteria # on day 100, 500, mold, viral emissions, carcinogen emissions on day 1, 10, 100, 1000 of use of this humidifier if

following the cleaning protocol of 2 minutes daily." Specific, to the point. No vague charlatan Bible Thuggery Type of statements like most ads today. End hooliganism now. Every product is at one of the 11 companies websites, like immortality.gov for health products, with all claims and relevant links to the 200 studies and references, specific references, not "We are world leader in bamboozling and warm humidifiers". ☺☺☺ When will America wake up from the Bible induced trance of theft, genocide, rape, and dishonesty?☺☺☺

3). Equate EQ3111-UL 1.3 gallon Least Deadly HUMIDIFIER: stopped heating up after 5 days, had to turn it off, turn the power strip off for 20 seconds and restart it to get it going, same issue happened with all others, in a nice testament of the ☺abysmal IQ☺ of decentralization (in line with 100s of Amazon 1 star reviews about all types of humidifiers stopping working in days), so beware, always get the Walmart 3 year replacement insurance plan in case the stop is not temporary, but permanent. The white chimney thru which vapor comes gets dirty and you can see little yellowish drop and condensation marks on it after a while and need to clean it with 70% isopropyl alcohol soaked cloth or 1 cent alcohol pad. The issue is that the same wall faces the blue container and the blue color makes this slight brown yellow green invisible, so here we go again: we need white containers to see dirt, not blue ones. The safest cheap steam type humidifier (the only safe type is steam type in the long run, as wick filter types grow bacteria fast) seems to be any that has easy to clean container and inside, which from the 4 above is Equate. You can watch how disgustingly dirty the grey cap gets if you use tap water and don't wash it daily, and why the cap should be white to be able to see mold; with distilled water, no dirt ever builds, except whitish spots above the black heating element. Due to grey, black and blue, you may miss mold spots if you don't go around the black heating element. Due to the blue see thru water tank, you may miss mold that may build every 6 months or year if using distilled water and 100 times sooner if using tap water. Even with DI water, you can see *grey/white $CaCO_3$ scale spots on the black element.* Distilled is not clean, just 2000-3000 times cleaner than tap, so scrub the black heating element with an 'alcohol' pad or soft cloth soaked in vinegar, daily as most dirt is in the boiling area, specifically on the top of the black 'dome'. The white plastic cylindrical *steam chimney has some slightly* grey dirt after each day *of use 2 inches from base at the area* where it contacts the grey boiling circle area with the black element. The white chimney also got some *condensation drops on the top 3 inches from steam due to dust falling in, as well some brown sports in the essential oil aroma area gap due to gravity and dust.* The cap and holding talk ought to have been white to see more grey dirt/dust/mold areas, since DI water leaves no scale anywhere except 10 spots of 2-3 mm diameter on the black dome, due to the simple physics of that area being so hot and water dropping on it 24-7. All humidifiers need to be white inside, to see dirt, mold, etc, since distilled water should be the only water used; anything else would be catastrophic for health, as the amount of biofilm forming daily would be

2000 times higher, due to scale acting as "extracellular matrix" or mesh for the bacteria colonies; *the container ought to be white, not blueish transparent for all humidifiers. Wash* grey areas with some alcohol pad. Ultrasonic that are basic like 39$ Levoit are easy to clean, but water they spew is deadly, even if distilled is used, since distilled in bottles grow bacteria, besides the tank.

Evaporative (like BlueAir) humidifiers spew microparticles of scale $CaCO_3$ in the air, causing pneumonia and death, because the filters are not changed every 5 days, washed every day (filters only remove all particles first week, filter performance decreases daily) as required to prevent white dust from ruining lungs, eyes with calcium stones. The filters grow bacteria daily, look how horrific those filters get, spreading bacteria in your room more with each passing day. Nobody washes, disinfects filter daily as required for proper health. Cleaning, disinfecting the wick filter often requires enormous amounts of vinegar and alcohol, to soak the huge wick filter in for 20 minutes. ☺☺☺Avoid tap water in any humidifiers☺☺☺, as scale makes bacteria multiply. Ultrasonics have no filters: scale is spread as air white dust, and 1000 times more toxic chemicals than boiler type. In an ultrasonic you need to trash the left over water to prevent growth of microbes, but all junk goes into the air. In the boiler type, all junk concentrates on the bottom of the humidifier where the heating element is and you simply discard that thing every 24 hours and prevented inhaling all that junk that ultrasonics happily give you: distilled water has 100s of trace chemicals seen on spectrometer. Boiler types trap most scale left over in that left over water, make sure to trash it daily. Ultrasonics are deadly, they grow bacteria so fast and spew so much crap and bacteria. Boiling makes ultra fine steam, ultrasonic makes big droplets in the steam that fall to the ground. Boiling water and then removing the remaining plastic and scale rich left over water is a way to remove 99% scale + 90% microplastics, since even distilled (DI) water has $CaCO_3$, just 1000-4000 times less than tap water. The Consumer Reports studies are for tests on day 1 of a new humidifier, which are meaningless. After a few weeks, the evaporative and ultrasonic ones will spew tons of bacteria (ultrasonic from day one, as even bottled distilled water is full of bacteria), but when a ☺0 IQ☺ government is in power, everything is banditry and fraud. How can any decent government allow these ultrasonic deadly humidifiers to be sold when they emit so many bacteria even when new? Isn't it time to vote for Immortality Party? Same Consumer Reports said Tesla, which has 100000 times more deadly radiation than other cars, is the best car… Go figure.. In the case of war, vinegar, wick filters, alcohol are hard to find. So have 30 boxes of 100 alcohol prep pads for any emergency and perhaps a distilled water making machine. How can companies make a good humidifier with 10 PhDs? We the People ☺☺☺ need 1 million PhDs of 1 company making 1 good humidifier, not 1 million companies creating 5 million bad humidifiers. Governments don't need to check 1 million trash humidifiers for safety, just 5 really good ones. The US government allows all frauds to sell the most lethal humidifiers, without any check of bacteria spewing after 1-90 weeks, how can

they check 1 million trash products, what is the point, they're all trash, except a few. ☺☺☺

USA is the land of pure jungle whom all copy. Check out an evaporative humidifier filter after 3 months, that Consumer Reports praised as the "ultimate humidifier type" with tacit gov support. Behold a horrific filter. Most people don't clean their filter daily and let us state the obvious: no way to REMOVE the scale from a wick filter that adheres to the filter tightly after 3 days, and that scale will trap bacteria even if filter looks white and much better than the nasty ones above. These types of filters, ubiquitous in furnaces or separate humidifiers, are deadly. Vinegar soaking of a wick filter won't remove all scale and then bacteria grows exponentially. As you may have noticed, it is very hard to even remove a tiny amount of white scale from a black element in a steam humidifier, and that's plastic or ceramic, imagine how much harder it is to remove that scale from a cloth like paper like filter. Let's be honest, not even 1% of people soak their humidifier in vinegar for 20 min, let alone their wick filter, and then wash it with bleach and water, etc. With tap water, advertised as fine for evaporative types, which has 2000 times more scale than DI, the results are catastrophic fast. Welcome to USA gov standards: 0.☺☺☺

If you love using ultrasonic humidifiers, due to being quiet and breaking less than steam ones whose heating element fails often, you could try the Crane cool mist one, with 1 modification to prevent water damage to floors. Generally, it helps to avoid the ultrasonic humidifiers where the cylinder has holes on the sides (instead of being solid) and, especially avoid the ones with a 100% (instead of only 30%) open top (like the cool mist Crane) as they create a water pool on the floor. However, if you can't find an easy to clean one, like the Crane cool mist one, you can modify the Crane to make it stop shooting water droplets. This paragraph explains how to do it on any simple humidifier you buy from Target or Walmart, using a white vitamin bottle to source the plastic piece to regulate how much water comes out at a time, 15% or 5% of the original manufacturer flow. I bought the cool mist Crane humidifier and it spews too many tiny droplets in the air, not just vapor plume like the other humidifiers. Good humidifiers got a solid cylinder that keeps water far away from the rising vapor, a plastic tube thru which vapor rises and has no contact with water for 8-15 inches and a tube partial cap to prevent that vapor from shooting upwards so fast, by blocking that rapid ejection of droplets. The Crane one got huge gaps thru the central cylinder, meaning if filled to the max line, the water is ultra close, 2 inches, to the top and the basic cool mist (easiest to clean of the Crane family) Crane lacks a partial cap on top of the tube to prevent overshooting of water droplets. Due to the water going in on the Crane in the cylinder at all levels, the humidifier has only 2 inches to shoot the vapor and lots of droplets come out making a pool of water on the floor, carpet or table, destroying people's carpets, furniture without them realizing. Like me, you can fix it by placing a plastic piece at the top of the tube to block 85% of it, by pressing the pins to remove that circle white 'cap' at the tube top and then placing a trimmed circle piece with 2 protrusions at the opposite ends that fit into the 2

diametrically opposite spaces of the white cap that don't pass thru the pins of the tube holding the cap down, so that the white piece you made doesn't fall into the tube and rests on the tube via the 2 protrusions. To further minimize water droplets and bring humidity to 70% where eyes are, raise the humidifier 12" by placing it on a box so the water disperses in the air and doesn't reach the ground so fast to form a pool, and if water still pools, simply fill the humidifier to half the max level, to give water droplets 5 inches (not 2) to jump and come back into the water. This water pool never happens with humidifiers with solid cylinders where water is only 2% of the cylinder height, not 80%, and where the top of cylinder is partially blocked to prevent droplet splashing. The cheaper cool mist only humidifiers with similar ultra simple design (meaning no cleaning, just pour some alcohol and vinegar if distilled water and wipe with a 2 cent alcohol pad) and with a solid tube cap to prevent overshooting of 'steam' are the most practical ones, since you will spend 3 minutes daily to clean them if using distilled water, instead of 30 with the vast majority. In the Crane there is nothing really to wash, except this plastic piece you create to fix Crane low IQ design, the tube, top lid, the center steam redirecting hole cap. ☺

Many humidifiers often also have a longer and extra parts system of diverting vapor to prevent any droplets from splashing nearby, but that also means a lot more work when cleaning up. USA imports a lot of junk from other countries, as the goal is profit at all costs. A useless product on Amazon that I used for a while, before returning it, is the grey Crane that allows you to heat the water, this one has endless parts and is so much harder to clean. The silver 1 inch diameter circle where ultrasound comes from gets dirty with grey brown 5 mm spot within 3-4 days, when using distilled water. You can only imagine how much grey will exist after 1 year, since vinegar soak doesn't prevent biofilm formation, which is 1000 times stronger, due to scale being 1000 times higher in tap water, than in distilled water. Yet, these ☺infinitesimal IQ☺ guys chose grey color and people can die from moldy infected dirty humidifiers. By law, all humidifiers need to be white to allow people to see these yellow, light grey, beige, black mold traces. The reason they use grey and black parts is due to the culture of using tap water, which has 2000 times more white scale, so people can see the scale. This is low IQ, because the grey dirt, mold, dust won't be visible and you cultivate deadly habits of using tap water which tends to cause catastrophic lung damage via white dust or mold via scale biofilm. Tap water ought to be illegal to recommend to use in any humidifier, just design good distillers for at home that vent outside and make distilled at home. No wonder the grey Crane it got 3.8 stars versus 4.2 for the white basic 20 times easier to clean Crane or 5.0 for other humidifiers. On Amazon, anything below 4.3 stars is suspect, so read the 1 star reviews and think twice about those below 4.0. Humidifiers can break fast with daily use, so 4 year warranty is a must so you can replace it or get money back to buy new brand . If you move the grey Crane, it may give 'no water present' error or EF code, which means you got water in the tube or into the other container that holds the

removable container, so you will need to empty THE WHOLE THING BY INVERTING IT first to get rid of EF or drop shape light error. The Crane one won't get rid of the 'no water present' drop light error if you got some drops into the tube, so some returned it per Amazon reviews as it gets very annoying and it requires too much work to get that tube dry all the time, perhaps you need pour water super slowly, while covering the tube with some temporary cap from a bottle, or perhaps you need to fix a manufacturing defect in the sensor, which is impossible. Crane engineers are too low IQ or waging hybrid warfare on USA to realize Levoit and other brands seal that top of the humidifier tube so this error doesn't happen. There are 7 balls inside a grated device that screws into the base which are impossible to clean well. FDA is too understaffed to ban such Crane like junk designs from being imported. Aristocrats in USA design trash products that slaves in China export back, they call this "economic activity", the purpose of all existence, GDP growth, import junk products and call it God's work. ☺☺☺ Then brag about market economy and your Godly preaching of genocide in China. Every greedy low IQ person is now company CEO. If you find other UV light humidifiers, make sure they're opaque, since UV can pass thru a clear container and harm eyes, or escape from a semi sealed area into the clear container. A good 4.7 star humidifier is Petsaint, with UV control.

To sanitize water without the UV, you may need the 4.4 stars 6 L Levoit warm mist type, that *boils the water to kill all bacteria (biggest issue in all humidifiers),* since even distilled grows microbes in between uses. However Levoit can't be easily cleaned perfectly. Instead of inspecting products and setting standards so 70% of trash imports are not allowed in the USA, USA promotes genocidal scriptures and evil sports, after all they need to drive that anger, pathological systemic institutionalized violence against the working class and palatial aristocratic desire to beat and torture, so well deified in "scripture" [beatings deified in the Bible/Torah (kids, workers, sex slaves) or Quran (sex slaves, mutilated infidels, kids, wives)] to higher levels, so they have 5 million torturers on aristocratic government payroll, to truly live the Gospel in its REAL MEANING: "faking miracles… and genocide via torture are God's love". The thirst for violence is ever increasing, they got a whole army of terrorists paid by our taxes. The cunning devils incarnate, the aristocrats, pay workers to torture workers, to enslave all fully. ☺☺☺

CUBICLE TO RAISE HUMIDITY FASTEST: if your room is big or humidity fails to rise fast, you can always buy $1.25 foam boards from dollar tree stores or online (pack of 50 google search or eclipsusa.com 65$/50 pack to shield more of your rental room or a bigger cubicle with protection above too, you can use cubicle to protect against Toxic Cell Phone Towers that shorten lifespan by 20 years if close by, Neighbor WiFi too can cut your life by 10 years if you sleep with head near wall (aristocratic terrorists live far away where no cell towers exist, the 90% slaves live in concentration camps called cities full of RF pollution usually, aristocrats put cell towers to spy on the 95% via cell phones) where he has his WiFi, 3.2 mil 8"x150ft aluminum

tape covered with 8”x435ft clear tape (cheapest: 9.7sq ft/$)), and *use the foam boards to create a 60 inch tall enclosure, against a wall, with only space for you to exist the computer desk chair area of your ‘cubicle’, as that will increase humidity to 80%* around your eyes, instead of a 45% without the cubicle as all water is blown into the room. A cubicle is cheap, costs about 20$ to make for your bed area or your desk or both, but it will save your dry throat, your sleep quality will improve due to less microwaves, and your eyes will be happy too. *This also blocks foreign spies, criminals parked outside from reading stuff on your computer, by blocking EMF*. The square, rectangular, hexagonal, circular, triangular cubicle, or any shape enclosure that works for your setup, *saves 3500$ a year, since to humidify a whole house you need at least 10 gallons a* day, can't use tap water, only distilled (Amazon has distillation machines for 200$, like this Taiwan one or automatic shutoff 350$ distiller, but you need to spend 29$/year to buy filters too) or reverse osmosis (Amazon has many such reverse osmosis units, don’t add minerals) or one with 0 TDS using the 0water.com filter, as white dust kills you via dust pneumonia, and those evaporative humidifiers are lethal since filter doesn’t remove all white dust from tap water as they claim, not after 3 weeks of using the filter. A 0 TDS filter only lasts 5 gallons for high TDS (450-500) tap water, as the 0 water chart shows, so that is 3$/gallon, way too pricey given distilled is 1$/gallon at some stores. To save money on 0, use old 0 water filters or other Brita fitlers to prefilter the water. An issue of course is that you need to filter 0 water first to remove all organic stuff well, with epic pure so that those don’t become volatile compounds during ultrasonic humidifier use or even boiling if using a boiler type humidifier. One brand pitcher was found to increase microplastics in water 12 fold, while most pitchers did reduce tap water microplastics. Because plastic can leach, it is better to use a 75$ 0 water glass dispenser for humidifiers if you go the filtration route and measure the TDS weekly to make sure the TDS is below 0.2 ppm (with a good 58$ AI213 Apera resolution 0.1 ppm if you use the 0-100 ppm scale). You can thus create a Florida climate inside your cubicle, a Hawaii paradise climate, with humidity in the cubicle 60% and inside your glasses-eye area of 90%. Move the humidifier from bed to desk, have bed near desk for easy moving, so you humidify the cubicle where you are. *Lungs* need humidity, in many areas, *humidity is 15% inside due to heat, which shortens your lifespan and kills your eyes.* This allows you to turn off humidifier often and to save electricity and distilled water. The real issue is that high TDS means 30$ for filters will last only 1 month. By *placing your favorite humidifier in this cubicle*, you boost the relative humidity inside your glasses to 90% levels natural outside in coastal areas of California in the summer. If a humidity meter is in the path of the visible steam, the reading rises to 99% and 72°F if your room is not hot. This means *19.5 g of water/m^3, Florida summer level* humidity. At this level you don’t even need the moisture glasses anymore. However, only the area right in the center of the steam plume is 99%, as soon as you shift away from it, it drops fast to 80% where your eyes might be, and some people find this humidity too high for the lungs. Adjust humidifier position to achieve

the desired comfort for eyes. Then, with a gentle electric silent sealed oil heater, set to low, so 450 watts, you boost temp to 75°F, to mimic a very humid environment that will enable you to live without the need of moisture glasses always and without dry skin, dry throat, dry lungs. Use distilled water or water free of minerals (filters that remove TDS, all minerals) always.

The simplest "DIY warm humidifiers" we find described on youtube (kettle, pressure cooker to boil water, water boiling element, etc) use 5-10 times more energy and are *risky as they can set your house on fire* ☺☺☺ *if you don't add water and leave for more than 10 minutes*, and it goes dry and somehow it gets too hot or falls on something, etc. So, be very careful, since *many youtubers say you can just boil water, which is not good if you leave the house,* you don't have automatic shutoff like humidifiers have when water is low. A $17 single cup 125 watt heating element is too weak to produce any steam, you'll be waiting there 500 years to get some humidity doubling from 30 to 60% in a large room (125 watts, Amazon has more but most are 300 watts for bigger water containers). Boil type humidifiers use 100-240 watts. You can make DI water at home separately, $625 US made machine, or 200$ h2olabs.com US made machine, and use that water for humidifiers. Infrared plates are way better than electric by the way, as we talk about warm mist humidifiers, as air gets a little warm, not super hot, and that gentler warmth prevents the oxidation products in the air. DI water you buy in bottles doesn't get sterilized 3 minutes before you use it, so bacteria grows and microplastics too. Distilling water at home is cheaper in the long run than removing TDS via 0 water filters. For those hating to distill water, you can take tap water and filter it with 0 TDS (0 minerals, 92% of mercury gone) Culligan American filters after you use the Epic Pure to remove the toxic mercury, chemicals that become volatiles during boiling, etc… and then use this ultra filtered water to boil now on 1. the 100 watt infrared plate or on 2. any pressure cooker program with lid open or lid closed and then open the vent to get the humidity. Again, *I don't suggest filtering as you leave minerals and some white dust will attack your lungs*. USA makes stadiums to be a shouting gorilla, but not 1 safe humidifier. 20000 humidifiers exist, they grow bacteria fast, unless you clean them 40h/week, take them apart, etc. Discard last layer of distilled water in the pot as it has dangerous products, microplastics, etc. since distilled is full of impurities still. ☺☺☺

If you visit a hotel, use their laminated menu to cover the 24-7 bath fan and reduce air suction 20 fold, as that fan can suck all humid air you create with your portable distilled water humidifier and suck in the toxic eye irritating air from the hallways (very stuffy, dirty stinky hallway carpet, hallway germs, coming from the door to hallway gaps), from the sink drain, tub drain, water overflow sink/tub hole which contain mold spores. Hotels ought to have those fans in the room. You want your humidity meter to show 55 to 83%, typical outside humidity, not 25% as in many dry Western states. Don't bring dry air from outside, as humidity will drop from 65% to 25% immediately, since outside air can be so dry in California, Arizona, etc. USA makes

some water distillers, like the 625$ SteamPure which can make 3 gallons a day, or 12 liters. Having your own countertop distiller saves 9000$ in the long run, and prevents a huge amount of energy used to recycle the 9000 plastic bottles. Using the DIY Instant Pot Max based humidifier (canning program allows 15 PSI, 250°F for 1 hour to sterilize the inner pot which you can use on the infrared plate, you sterilize it as good as a microbiology lab autoclave) is even better, no need of activated carbon filter and waiting 7 hours for a gallon of water or bottles of DI water recycled. However, you need to use a lot of water filters to remove TDS (total dissolved solids), so you may just choose to make distilled water at home, in a well ventilated area with an air filter too, or even outside under some canopy, to prevent inhaling the toxic volatiles.

Some claim online that evaporative noisy humidifiers that filter those minerals out are the best, but the filters can fail to remove all minerals and can thus destroy your lungs unless you use distilled water. As you know any air/water filter will filter well first few days and weeks and then efficiency drops to 50% or less. Thus, using tap water for humidifiers is more like suicide, even if you replace the evaporative filter weekly, as nobody does (every 10 weeks maybe is common for a few people, but most change filter every 6 months). All evaporative/ultrasonic humidifiers are impossible to clean 100% without taking them *apart completely and wasting hours every day*. Just like with the lethal eyedrops made by the Big Aristocrat Mafia, and the lack of saline drops (0.9% NaCl only, no other additives, single use, like these) in US Pharmacies, we have to resort to creative solutions for a safe humidifier, buy stuff on Amazon, like a ceramic heater and pot, etc, like we buy other sterile saline online. You see, the thieves can't make trillions to build 1 million mansions with salt water, so the cheapest, least allergenic products that we need the most for dry eyes are NOT sold. With the abysmal IQ society aristocrats created, we can't replicate even 50 compounds in natural eyedrops that contain 2100 chemicals, so we have to use the harsh crap they make or saline. Too little profit for the palace dwelling monsters, so everyone suffers, the beasts could care less. In general microplastics are much bigger (so not part of the steam, no lung damage from bottled DI water, but each day smaller nanoplastics come on the market, so who knows what may happen...) than molecules of $CaCl_2$, $MgCO_3$, $CaCO_3$, NaCl in filtered water that still has a few minerals, or in tap water with 100 times more minerals than TDS filtered water. Apparently, boiling water removes 80% of nanoplastics, so if you use bottled distilled water with some leaked microplastics, you discard the left over last layer of water as it has plastic etc. 1 liter of bottled water has 250000 microplastics. Water sitting in plastic humidifiers can get some too, so discard the concentrated left over water at the end of each session when you refill. If you want a natural humidifier 24-7 in all places, the 6 top states for humidity are: Hawaii has 65.2°F average dew point, Florida 62.7 (houses are 2.5 times cheaper than Hawaii on average), Louisiana 58.3, Mississippi 55.6. Alabama 54.0. However, the big problem with humid states is that they have an insane level of molds, fungi and bacteria that

grow in that humid place, increasing risk of dry eyes via allergies and of asthma, lung disease via microbes that attack the lungs, so you really need to replace that filter for AC or central heat every 4 weeks and get the best FPR 12 to protect yourself if you live in a humid state. Please buy a home with good insulation, since poor insulation causes the house to heat during the day and remove all moisture from the air if window is slightly open or humid air can escape thru leaks and cracks under the door or baseboards where you didn't caulk, etc. and then when night comes and temps drop, relative humidity will be much lower too. Well insulated homes are best for dry eyes, as the first paragraph on Immortality Building Inc shows.

***Arizona, Southern California, etc are deserts with low humidity and high temps*: this is the worst possible combo, as in high temp the water on the ocular surface evaporates fast and there is no water in the air like in South Florida or wet parts of Hawaii. On the contrary, in colder states (where outside temps for example are at near freezing often), even if relative humidity is about the same or only slightly higher, in Seattle, Washington, Oregon, etc where it rains more often), the *water on your cornea will evaporate much more slowly and your eyes will be much happier. In Florida, the meibomian glands that produce oils that prevent water layer evaporation, will be warmer and more able to produce oils and this will help more than the cold weather in some cases, depending on the nature of dry eye causes.* If all oils are gone (glands don't produce), then very cold or ultra humid are helpful in keeping ocular surface moist naturally without chemical rich drops. It all depends on how many tears are produced and how outside temps influence tear and oil production, how eyelid circulation is, etc. Southwest USA, in arid microclimates, is the worst for dry eyes, since you can't stay always indoors, the moment you drive to a store or you open windows to get fresh air, dry air comes in and nullifies your humidifier moisture effect. To get high humidity you need to be in the wettest warmest parts of Hawaii, Florida or one of the Texas, Alabama, Lousiana, Alabama areas as humid as Florida as seen in the dew point (scroll down) chart. A better set of 13 dew point maps for annual and monthly USA dew points comes from NOAA, you can see how much drier central and north Florida are, except the coast. The best map for 7 day dew point in any state and city (zoom in to go to the cities of choice) is weatherstreet.com. These 3 maps make it easy to compare weekly, monthly and yearly few point averages. AccuWeather.com monthly tab shows the typical daily levels for all 365 days of the year. The Forbes map made by an amateur is making it look like all Florida is the same, which is totally false, some areas are almost as dry as California's wettest areas. However, those coastal Texas, etc areas outside Florida will never match the absolute (dew point) humidity in South Florida, which is much higher than Florida as a whole, due to warmer annual average temps (Miami 47.7" rain/year). In Wailuku, Maui, dew point is way lower than in Pahoa, Big Island, Hawaii, so you need to know microclimates in every state by googling "city 2 letter for the state climate" as in "Pahoa HI climate" (or "Pahoa climate" for cities whose name is not in 2+**

states) and clicking "graphs" on the desktop version of the webpage, to see how warm it is and what rain is like (blue bars). You'll see via the graphs that Wailuku (27.4" rain/year) summers are ultra dry, hence the Maui fires, but in Pahoa (126.3" rain/year), June gets 6.8" rain vs 0.5" Wailuku, so no fires. In Colombia, Medellin has a 'dry eyes ideal' climate too, with daily lows 63.4 year round and daily highs 81 year round, good humidity.☺☺☺

Volcano, Hawaii though has the eye irritant sulfur dioxide at 1.78 ppb in 2023, or 30 times the level of many California cities (Rancho Santa Fe 0.06 ppb in 2022), so it won't work, since the volcano is killing your lungs and eyes with more than SO_2, thick plume of smoke, etc. Keaau is 0.22, Kurtistown 0.37, Honolulu 0.27, Kailua Kona 1.6 (where tourists go to damage their lungs and experience 27 times more SO_2 than San Diego), Mountain View 0.81. Pahoa (next to volcano) is 1.07. Sadly, the US average is 1.51 ppb, 26 times higher than San Diego, where there are not cars and cruise or cargo ships to emit SO_2. Rancho Santa Fe, where aristocrats live, has decent air quality, so I guess to be fair we need to switch to electric transportation to give all Americans decent air quality. Unless you stay indoors and use the strongest activated carbon filters, Hawaii is not healthy in areas with vog. Plus you get many Hawaii homeless. The 2022 values (they fluctuate little over the years) are: Los Angeles 0.27 ppb, Riverside 0.53, San Francisco 0.65, San Luis Obispo 0.94, Seattle 0.44, Denver 0.77, Washington DC 0.53, Chicago 1.7, Detroit 1.5, Atlanta 2.0, ►►►► San Diego 0.06 ◄◄◄◄ *(no heavy industry, good wind breeze away from city, no major ports and ships, so all San Diego county coast and Orange county is low)*, Escondido 0.06, Rancho Santa Fe 0.06, Malibu 0.15, Santa Monica 0.32, San Clemente 0.11, Irvine 0.47, Newport Beach 0.47, Laguna Beach 0.11, New York 0.36, Phoenix 0.48, Philadelphia 0.56, Miami 0.30, Tampa 1.26, Lakeland 0.90, Jacksonville 0.67, Dallas 0.68, Fort Worth 0.90, Houston 0.24 (near the coast, the ocean breeze takes SO_2 away, Chicago is inland, so much more stagnant pollution cloud), like the worst cities near America's most active volcano. Slaves got sulfurous/sulfuric acid poured into their eyes (a true *terrorist* attack on the masses of workers, by blocking electric cars and solar-wind-hydro for 75 years, promoting gasoline, oil and coal that kill our lungs, hearts, arteries, brains and emit SO_2), while palatial aristocrats build casinos, strip clubs, violent sports arenas, gyms, to "make us happily go to grave fast". Rancho Santa Fe, a more inland city, is so low due to the fact everyone's house is several acres (not 40 apartments in quarter acre), so then no car traffic, truck routes exist to pollute with SO_2. South Florida near the coast is way wetter than N. Florida inland. Eyes need an air purifier that traps SO_2.

This article explains 13.3 g of water/kg dry air exist at *80*°F in *50*% humidity, or 59.7°F dew point (dew point calculator) and only 4.9 g (*2.7 times less*) at *50*°F in *50*% humidity or 32.1°F dew point. This means that in South Florida wettest cities, air will often have 3 times more water in it than in many California cities, with an amazing & beautiful *healing effect on* dry eye patients, almost like having a super strong humidifier in every store, street, house, etc. In January 2024,

Menifee and many inland Southern California cities had 70°F and 24% RH (relative humidity), meaning 4.4 g/m^3 AH (absolute humidity), while many South Florida cities had 70°F and 90% RH, meaning 16.6 g/m^3 AH (1 m^3=1.22 kg air). This means the South Florida cities had, some days of January, 3.8 times (16.6 vs 4.4) more water in the air, making people FAR LESS likely to develop dry eye disease. However, it's not like that every day, usually the difference for those cities is only 50-100% more water/m^3 air. Yet even 70% more water in the air is a HUGE difference☺☺☺, it's like having a humidifier on or not having it. No optometrist told you perhaps, before 2024, that moving to a humid city will be the same as having 3 humidifiers with you 24-7, in any room, street, etc, requiring tons of water used around you to increase street humidity. If you move to San Juan Puerto Rico, a US territory (no visas needed), you get a typical 20-24 g/m^3 very often, beating out Hawaii and Florida by a wide margin and wiping So Cal off the map with its 4-7 g winter water, due to warm nights during the winter unlike anything in Hawaii or Florida, so air holds way more humidity. However, San Juan (1000 miles southeast of Miami) night minimums are 74-80°F all year, so you will need to use split (ductless) AC (air conditioning) systems, which use far less electricity than window units or *central AC, which is not the main thing in any country*, except USA. Using AC lower humidity, so you will need a swamp cooler to reduce humidity only 1%, not 40% as with AC. However, going 35 km/22 mi inland to Caguas, gives you cheaper land to buy (4 acres 100K if lucky, 23% cheaper cost of living than San Juan capital) and also, night minimums are 61-69, like in Hawaii, so no AC is needed at all, day or night, if you're skinny. In Ponce, PR, night minimums (click on graphs to see easier) are 69-76, much better than San Juan. While violent crime rate is high, and homicide rate too, the Puerto Rico life expectancy, on average, is higher than most of the world and USA, Germany. This proves that hot humid climate is not anti-life, as humidity haters claim. At night, eyes are closed, so you don't need the super high humidity of San Juan. Puerto Rico also gets more direct hits from hurricanes than South Florida, so living in a concrete dome is a must if you want to survive a storm, buy land (not cheap) and build a dome if you move there and want to live your natural years. If your ancestors lived in a cold climate, the ocular water did not evaporate much at all and dry eyes were never an issue, so living in Southern California desert is a huge challenge that will give rise to dry eye disease faster if you also have poor sleep, sleep in warm places *(heaters dry the air 3 times more than outside, while in South Florida you can sleep with window wide open, it's that warm in the winter),* with AC blowing in your eyes (our ancestors didn't have AC everywhere), or are tortured by the spies and soldiers who attack eyes, etc. Reading these numbers will totally blow your mind. How many times have you heard about these things from your "dry eye optometrist"? San Salvador in El Salvador, is wetter (click on graphs) than any US area, except Puerto Rico. Its climate is like Caguas, PR, just a little nicer. On top of that, El Salvador violent crime rate is lowest☺☺☺ in Latin America and 2 times lower homicide rate than USA, but they eat more junk food due to "higher civilization", instead of legumes, etc, so

they live 6 years shorter than the 'violent' Puerto Ricans. Keep in mind that statistics can be highly manipulated too, some countries report a lot less. The governments sometimes report less to boost tourism economy, world image. The 0 IQ US government doesn't accept Puerto Rico as a US state, even if lower crime than some worst US areas.

Hilo (123.5" rain/year) is 2-3 degrees warmer than Pahoa, so it gets more water in the air, has 2.71 SO_2 (vs 7.23 for Pahoa), with double the rain of Florida, so it's possibly the wettest place for dry eye folks, though SO_2 level is 27 times higher (2.71 vs 0.1) than in some California cities. Even the cleanest far more expensive zip codes of the Big Island of Hawaii, where house prices are 4-5 times higher, the SO_2 is an unhealthy 10 times above the cleaner mainland cities. The only consolation is that the humidity is high: Hilo, Hawaii gets 17.3 g or higher year round. In January and most of the year, typical water levels are at least like: Honolulu 14.7 g/m^3, Wailuku, Maui 15.4 g/m^3, Kailua-Kona, Big Island, HI 19.4 g/m^3 versus a paltry 5.9 g in Riverside, CA. That's good day in Riverside, since on bad days, it can be 4 g, usually lower than Menifee, Murrieta and other cities near lakes. Volcano smog can drift to the other 4 islands too, sometimes covering Oahu, where 80% of Hawaii lives, in smog for 45 days at a time. People pay 5 times the house price vs other states and cities, to inhale it. On top of that, Hawaii gets many floods, see mud and stones bury trucks, hurricane caused 2 billion in damage, raised water by 5 ft in areas, killing 7 people, and people reporting 4 ft of water, news on 50 ft ocean waves. Always live at 60 ft or higher. Strong currents can wipe out Hawaii mobile homes and kill people. 2 ft of water almost and huge currents destroying homes, many homes totaled, or damaged, waves cover 2 story condo. Oahu houses cost 10 times more than the cheapest areas of the Big Island and Oahu is much drier than the Big Island, where only 200K people live due to volcano smog making it hostile to humans. The nice thing about Hawaii is that in colder higher elevation areas of Big Island, it never gets above 80, except a few months for 3 hours of the day. However, in Puerto Rico and Hawaii, they got the sound of coqui frogs everywhere almost on the eastern half of Hawaii Big Island and some areas of Western Big Island and other islands as youtube shows 900+ videos from all islands. In 1987 these frogs were brought by gangsters, possibly to make noise, so that robberies and burglaries, domestic violence, sounds of rape victims, baby cries during abductions, possibly even Hawaiian style human sacrifice, are harder to detect, since in some areas it's really loud, like human cries. However, some South Florida cities, near the ocean, may have higher yearly dew point than the wettest Hawaii cities, due to higher temps for 6 months in Miami, etc. So the humidity charts are useless. You can gently buy a humidity meter to calculate dew point inside your home. This 7 day dew point chart, of the temp at which humidity would be 100%, shows which states (Florida, Hawaii, South Florida within Florida, click on a state of interest, red is higher than yellow) are holding the absolute (not relative, RH on websites) highest amount of humidity (RH 80% got less moisture than RH 50%, if *dew* point is lower; the

warmer the air, the more water vapor; so when outside is 60F, 57% *d*=45°F; inside at 71F, 42% *d*=47°F is more humid even if "*humidity is 15% lower*", so opening the window will lower humidity; dew point calculator shows for dry eye we need *d*=50°F at least, ideally 55-65; RH is not accurate, we need d=temp at which moisture is maximum (RH=100%) so it forms dew, it condenses; NWS shows dew point for every location, like SpaceX), < 40% at 70°F can cause: dry eyes, dry throat, asthma, bronchitis, nosebleeds, sinusitis, hoarse voice), *don't overheat bedroom as it dries the eyes, unless you use a humidifier*. The Immortality *Nurturing* Agency needs to add to those climate graphs on google, the dew point highs and lows, day and night, so people know which city has higher ABSOLUTE, not relative (meaningless) humidity. It can be easily calculated, as they got relative humidity and temp data. Type "city state weather" and you get temp and humidity, from which you calculate g water/m^3 and decide if it's good for you. Calculate that for 20 days in winter, spring, summer, etc and compare 2 cities within a state or country to see how wildly different they are, contrary to appearances.☺☺☺

Type on google "city state climate", "Irvine CA climate", then click/tap Graphs and you get the average high and low for every month to get an idea how cold it is, if you may like it. For other countries, you may need to type "Sydney NSW climate", since their states have 3 letter symbols sometimes. Google won't give climate data without perfect spelling of city name *and* state for smaller cities nobody heard of (so state doesn't need to be typed for big cities), so add that 2 or 3 letter state, no country is needed, as Google figures it out. AccuWeather also gives daily high and low temp for 365 days of last year under the monthly tab for any city globally, if the monthly average of google graph is not enough for you and you want to see extremes, how low the min goes or how high the max goes, which can be 15°F sometimes below or above the google graph. Average relative humidity helps in calculating absolute humidity (online calculator) using the temperature data, so you can check humidity annual averages in any major city, Brisbane 52%, Darwin 55%, Melbourne 51%, Canberra 66% (wind speed is 3 times lower, so water evaporates far less than Melbourne), Townsville 70%, Florianopolis 80%, Naples & Palermo 72%, Miami 73%, Orlando 74%, Los Angeles 65%, Tucson 38% (desert), San Diego 69%, Boston 67%, Iasi 71%, Bucharest 77%, Constanta 82%, Paris 78%, Madrid 61%, Barcelona 72%, Nice 76% (ideal city for dry eyes in Europe, like Palermo, since temps are very warm in the winter vs most European cities), Berlin 69%. The higher the average annual temp *(which is listed at wea..com summary section)* and the higher the average annual *relative humidity*, the more water in the air, so the higher is the average annual *absolute humidity in g water/m^3.* Thus, in Miami, the *absolute* annual *humidity* is about 18.2 g/m^3, due to 73% and 79.6 temp. Darwin 83.8 temp, 55%, so 15.6 g/m^3. Townsville 76.7, 70%, so 15.9 g/m^3. Tucson AZ got 72.8 temp and 38% relative *humidity*, so 7.7 g/m^3. Brisbane 73.0, 52%, so 10.6 g/m^3. Melbourne 61.0, 51%, so 7.0 g/m^3, Canberra 60.0, 66% (wind speed 1.3 m/s vs 3 m/s in Melbourne, less evaporation of water

in air and eyes), so 8.8 g/m³. Constanta 58.4, 82%, so 10.3 g/m³. Obviously for the same g/m³, the city with lower temp and less wind is ideal, as less water on the eyes evaporates. Los Angeles 71.2, 65%, so 12.5 g/m³. These numbers are rough estimates☺☺☺, since the absolute humidity is not in a linear relationship with the relative humidity and temp, and the daily variations will lead to slightly different real averages of absolute humidity, but it does inform you of the general trend. The warmer it is the more humid it can be in some climates. Too much warmth without humidity means eyes get dry via evaporation due to heat, but don't get wet as 3 times less water is in the air. Thus, either live in a colder wetter climate or in a super humid warm one to help your dry eyes. Australia, the driest continent, has mostly desert and some tropical areas in the north east (green) which are near Cairns, etc, almost the same as South Florida, so for dry eyes, you want to be in dark green areas of this climate map, within 10 miles of the ocean, as inland it is drier. Thus, you can compare San Diego average low in August of 67 with the Miami one of 79, meaning coastal South Florida needs AC at night in the summer, while most coastal (within 3 miles) California doesn't. Some people get sick in Miami, due to asthma causing a negative response to such heat and humidity. Miami is much warmer in the winter (63+), so no electric heater needed then. However, going just 9 miles inland as the crow flies, you get way lower temps, 70-72 low at night in Florida, especially as you go towards central Florida. The same is true for all areas, the climate can change dramatically in just 3-7 miles, with average high or low dropping 10°. For dry climates, you need humidifiers to prevent health issues. This data allows you to go to a city that has temps you like, uses no AC (better insulation and temps drop at night) that causes dry eyes/lung issues (due to central AC vents and/or filters not being clean in 99% of houses), doesn't flood too much (use stilts or fill to raise house and make it hurricane proof, like a dome), is not too cold or hot, has low violent crime, low AQI.

A humidifier is not capable to create 90% humidity many need, but if you get one, get 4 year Amazon plan to make sure it doesn't break fast, and also read all 1 star reviews or simply ask for an exception via chat if it breaks and to return it to get a refund; as the next pages explain, most humidifiers have so many issues (hard to clean daily to prevent mold growth being the major one), you may be better off trying the 100 youtube home made ones that have 2-4 parts and give you better control (use everything white, to see any grey or black mold, insects, dust, hair, etc and use any cloth piece only for a day (have 10, wash at once separately in a strong detergent, with strong nonchlorine bleach); get some set of 20 hangers for 2 $ from $ store and place 10 small towels on them soaked in DI water, let it be, near the bed, or just get bigger towels; the way I do it is just use a normal 2 by 5 bath towel and I sprinkle it with DI water, then let it try by hanging it off two things in a way that doesn't cause drip - use two towels if needed, you will see a 5-10% rise depending on room size, etc; if small towels, buy 10/1$ wash all 100 at once, every 10 days; a tiny 1 watt fan (0 dirty electricity USB socket from $ store) near your

electric oil heater, to draw warm air away from the heater and towards a little container with distilled (DI) water (to avoid scale made into dust that gives pneumonia, like ultrasonic humidifiers give pneumonia due to white dust from tap water): white container, white rack inside if you want a taller container that has 4 trays of water stacked, to avoid any use of towels and have to only disinfect with bleach weekly, use DI water for 500 times less scale and bacteria. Taking a towel and wetting it with distilled water and then letting it dry near your least moisture reducing winter heater (or container with water) or something like that may work too; placing a wet towel on top of a plastic support near a room hot vent is not a smart idea (never use central air, it dries air, use electric oil heaters only, but if you rent a room, you can find solutions) as white dust from the tap water will get into air and destroy your lungs, so don't just follow every low IQ *(or evil spy liar who mind controls people to type something on youtube, you're suggested his video, you do it and disaster happens, while the spy is not really using that setup more than once for youtube or stops soon after because 'he found a better way': ultrasonics with a dye make a white paper purple in seconds, while something with a filter won't, so always use DI water for home setups, especially if a fan or vent is used; all scale in tap water will be made dust for your lungs)* on youtube who has no measured ppm of 2.5 micron particulates emissions of his setup; read the next pages to understand the issues with white dust, etc and how to avoid them; Amazon has floor heat vent Amazon water containers (clean them well weekly, daily minicleaning) that provide a solution with rare housing having floor heating; avoid crates or things that are not white, as they're hard to clean and inspect for mold, etc. Think of all issues that may exist with any towel, etc and how easy it is to clean daily. ☺☺☺

Most humidifiers (Levoit, Govee 24 dB, etc, ultrasonic, not 19$ Vicks vaporizer) emit some new plastic smell in the first 5 days, so to avoid wasting DI (distilled) water, simply take it apart and let all parts vent in an area with high air exchange. Humidifiers need to be cleaned every 3 days per EPA with vinegar (acidic, to dissolve alkaline scale, though if you use distilled, no scale) and even bleach, as video shows for the 40$ warm mist Vicks, the cheaper humidifier with boiling water that is free of ultrasound, the Vicks water container has a big gap being always open to ambient air, molds, dust mites, it's not sealed like the other units. The Vicks water container is impossible to clean well with a brush, you can't insert your hand into the container, or a brush to reach all areas, so only works with DI water, the heater element is a sticky silicone covered thing that needs to be cleaned daily. Vicks, sold at most stores, using 200 watts, leaks a lot. Amazon automatic chat gave me refund since they don't accept returns (tell them "huge plastic smell, deadly chemicals coming out of this heating element that boils the water" per some Amazon users, unsafe to use due to short circuit risk, leaks, the heating element runs even when no water exists, so you get poisons in the air, etc, you need to be very careful if you get boiler type to use one with real auto shut off, high quality, etc, never get a cheap humidifier with warm

mist as they can cause so many issues and fires too, clean heating element and ultrasonic generator weekly, otherwise huge mold forms, avoid silicone elements as mold is huge, see pic, etc, read all 1 star reviews for anything you buy, I never used it, a lot of these need something under to catch water in case it leaks, hard to clean chimney,) so you will wait 10 min for steam to come out (can use some taped aluminum thing on the night, see video, light for darkness).☺☺☺ Consumer reports looked at 34 humidifiers and found the 10 evaporative wick humidifiers emit no bacteria when new and used little (not after 4 months of filthy tap water), but all the vaporizers and ultrasonic did emit microbes, except for an ultrasonic and a 19$ 200 Watt (15 min to reach 150-250 W, sometimes it reaches 500, the more water in the pot, the more W, due to taking longer to heat all that water, so keeping water level lower saves electricity, initially only 75) Vicks warm mist vaporizer that got no bacteria WHEN NEW. The 3rd grader IQ of these studies is evident, since they did not do this test for at least 36 months as most people use a humidifier for years before trashing it and even 20 years, and you need to evaluate how they work after that, not when new. PureGuardian humidifiers for higher quality, they have been doing it since 2002, unlike Levoit since 2017, Pure Enrichment since 2010, Crane 2005 and others from 2015. Humidifiers today often use ultrasound (above 20 kHz, inaudible to humans) too, they may be low intensity or have some damaging effects on our body too, though endless appliances, from regular humidifiers, to fans, AC, compressors, fridges also make infrasound (below 20 Hz, in audible to humans) that may be far more damaging. The ultrasound section explains how ultrasound pics of babies can cause birth defects due to the effects of heat on tissue destruction. However, the sound traveling outside these units may be negligible in intensity to do any damage. Ultrasound of a mom belly is not the same as you using a humidifier, but there is certainly going to be some perhaps negligible effect, since that plastic doesn't block all ultrasound from the humidifier (because the hole to let mist come out allows some ultrasound out too, though a small level, since ultrasound doesn't go around corners well, and can only travel a 200 meter distance usually, while sound can go on for 50 miles), it's a question of intensity at a distance, so keep ultrasound humidifiers 10-20 feet (3-7 meters) away to be safe, unless you have an ultrasound detector. I think the evidence says that all humidifiers are very risky, could cause mold in lungs and other lung issues, so go with the safest methods, not ones you're not going to be able to clean well daily or weekly. Plexiglas from Home Depot is known to block ultrasound well, so the Immortality *Nurturing* Agency needs to mandate all ultrasonic humidifiers and appliances to be made of plastic etc that blocks, absorbs etc these waves, so that nobody has unwanted health effects. The jury is out, but definitely more research is needed into the toxicity of ultrasound for humans who use an ultrasound humidifier or even regular appliances that produce harmful infrasound. You know we searched chemicals and found some double our lifespan, and we search sounds and we will find some sounds double our lifespan too. Never underestimate the acoustics nutrition. We need real research, not the

garbage today, since evaporative humidifiers with a motor and fan could produce infrasound and normal sound levels that damage the body more than ultrasonic ones. Plus, evaporative have the filter chemicals that leak into the water slightly and go into the air and lungs, plus slime from tap water and bacteria, mold develop in the filter in days, and most people replace filter in 3 months or 6 months, which is too rarely. It may be that the "toxic ultrasound" types with DI water only are overall safer, but we need data to prove it. You need setup a lab with 10000 rats and place them near all types of humidifiers and measure all longevity biomarkers and see what happens with or without the humidifier on, for behavior, hunger, biomarkers and all those things so we know how to design human studies and what to look at with far more attention and precision, so as to discover what is true in humans and save money in study design for humans. The boiler type can set house on fire while you sleep, if it runs out of water and the auto shutoff fails due to a computer chip malfunction. You need ozone meter, UV meter, ultrasound meter to measure 500 humidifiers and see which one has the lowest of these 3 for the UV-negative ion ones that add a layer of safety to the steam coming out. If you're paranoid, for UV ones, you can tape the bright area in some way, so no UV can get inside the room.☺☺☺

Always read the 1 star reviews to see the real issues; however, I and others on Amazon got grey residue accumulating in the water after using Vicks, due to the 2 carbon electrodes they use to boil the water that can be cleaned with a T27 torx bit unscrewing of the top to scrape the rods and extend lifespan to maybe 12 months allegedly if used daily a lot, per one Amazon review; oddly, one review on the 1 star review list, says that the mist contains tiny black particles from the carbon electrode, so definitely, never use this junk that Consumer Reports found to have no bacteria and recommended people try, since some units may not emit electrode dust, while others may emit this grey and black dust; this vaporizer got carbon elements, not stainless steel ones and also, it will use up a gallon of water in 4 hours sometimes; so, if and before you buy any humidifier, for your lungs and eyes, please read the pages below and all Amazon 1 star reviews which always show what the issue really is with any product on Amazon. I don't recommend these electrode type units, just get a pot and use an infrared plate at 100 watts to boil DI water. SAFETY first, you don't want moldy water, get a brand new pot used for humidifier distilled water purposes only; clean it often with soap or 70% isopropyl alcohol or both.

This type of carbon electrode deadly product that destroys eyes and lungs doesn't work unless you add filtered (filter it first to remove chlorine and VOCs) to inhale all left over chlorine and VOCs in the filtered tap water, as if you distill water and inhale all poisons released, not a smart idea to destroy your eyes and lungs like that; if you get a Vicks that works right (normal warm mist with heating element not carbon electrodes, the Vaporizer is not safe, since even if you test it one time and no particles come out, another time it may do it, and you would not know), you can use it as humidifier and as a warm compress (eyes closed near the steam: Levoit and most

dual warm/mist ultrasonic ones make warm mist that is too cold for a good warm compress, so don't waste 100$ with that, when 19$ does a better job; if you want mist to be cold on Vicks, simply place eyes 2 foot away or more; to moisten eyes, use cold or barely warm mist, to prevent irritation, so maybe 3 feet away, *since by then the mist is like a warm shower mist*). You might wonder if the other Vicks would emit no bacteria and the answer is they're probably worse than this deadly 19$ vaporizer, like almost all warm mist and ultrasonic humidifiers Consumer Reports found to be deadly, for one simple reason: it is impossible to clean 99% of humidifiers correctly, because they have springs, rubber, grooves, corners, at the bottom of every container (except for Vicks vaporizer which is deadly due to carbon soot entering your eyes and lungs) and many parts of plastic with corners where biofilm of bacteria grows after 3 months and allows your humidifier to become, over time, a mold or microbe spewing machine; few people take the time to mechanically wipe out biofilm, more like 1 in 9000000, most just do a superficial cleaning with 1 spoon of bleach as videos show and some rubbing, but bacteria will still thrive in corners where biofilm is thick and white, invisible due to sometimes white scale; companies say use bleach or vinegar, but that attacks the rubber, creates crevices where 1 billion microbes will colonize. The main idea is that the current tech is not safe. DIY is safer.

So, if you can find in year 2100 a humidifier with minimal parts, no carbon electrodes (all have heating elements except a few vaporizers), no rubber, no springs that are impossible to clean, and plastic behind springs at the bottom that is impossible to mechanically wipe etc, then you're towards amazing & beautiful ☺☺☺ 21st century humidifier standards of We the People's Health instead of Eternal Bombing of All. I've seen mass spectrometer chromatograms of distilled water from stores for years (you can see that too in certain online databases) which was dirtier than lab purified (in house purification) water for some organic chemicals, and I was shocked to see how dirty the distillation equipment must be to have so much junk in it, so definitely, even with the purest 'purified and distilled' store water, you're going to have real growth of microbes due to organic impurities that act as food for mold, etc (this is organic junk in the pure distilled or, to a lesser degree, osmosis water) air, parts contamination, etc. Cheap distiller units on Amazon may do a far worse job than store water.

The only company making a stainless steel ultrasonic has the most horrific 1 star reviews. It's 275$ Korea Made (buy it on Amazon, as they offer 4 year plan for free full refund or free replacement plan if it breaks, and it seems most break fast and company refunds only a part of it within 30 days) Carepod carepodone.com which is the only cool mist ultrasonic humidifier with all steel lid/pot, read the 1 star reviews to see why you need the 4 year insurance: noisy for some people, rust inside after 2 weeks (read all 1 star reviews to see how bad this is), bright lights you need tape, beeps when water is low nonstop waking you up at night (not an issue, since it lasts 30 hours on low mist, 12 hours on high, so you make sure you refill before bed),

shoots mist straight on the side at 30 degree angle (see Amazon videos), not up, water pools under the pot due to bad design. 1 review seems to indicate that this grow mold too, like all others, in a lid area hard to access and clean (you see it in their Amazon cleaning video, stop video at 3-4 seconds, the grey grate, visible in the 3rd Amazon video too, so hard to clean, very poor design), but you can probably clean it with a tiny brush you bend or baking soda and vinegar, as with toilet tanks. Carepod is the one with plastic free container and lid, that is silent, *easiest* (1000 times easier to clean than all humidifiers out there in US stores) to clean water container out there, all stainless steel lid and container for minimal microplastic contamination. If you want sanitized warm mist ultrasonic that doesn't boil the water like all other warm ultrasonics, but simply heats all water to 158°F (less noise than boiling at 212°F) to kill fewer bacteria than other moist humidifiers (that have a long tube impossible to clean), then try 450$ Carepod Cube with the 80$ four year full refund plan since it will break way before that, as it's easiest to clean and the heat causes some of the microplastics to settle on the bottom of the pot more, plus kills microbes that naturally grow over hours and months sitting on store shelves as distilled water. However, even Carepod needs stainless steel ultrasonic band in future versions if they want to avoid any microplastic contamination (the white thing inside that needs daily cleaning with with alcohol pad or their 3 methods). Clean it daily and use distilled water only to avoid mold. While some evaporative 500$ humidifiers have HEPA filters, the air quality coming out after a few weeks of mold growth in HEPA filter is unknown. Steam types boil the water, kill most bacteria growing in the distilled water. Steam types use 5 times more energy, can burn your house down and are very hard to clean, USA can't even design something as easy to clean pot as the Carepod Korean humidifier. An easy to clean stainless steel (less microplastics contamination of 7 grams in your brain) Chinese design is Livatro steam humidifier, 120$, though it has horrific 1 star reviews, so buy the 4 year insurance for replacement if you dare try Livatro noisy fire hazard that won't raise humidity. Any humidifier needs a 4 year insurance plan, they break fast or get moldy fast and you need return it and get full refund to buy a brand new one yearly, until these leeches create a product that is possible to actually clean well.☺☺☺

Evaporative humidifiers take 50,000+ times more air/day to give to mold, dust mites, bacteria in air, their favorite food (water impurities, organic chemicals) and water and then poison your air more if you don't buy a really good brand with a really good air filter you replace monthly or twice monthly (that comes out, they take air in, wet it and bring it out), as if our cities aren't already a deadly soup of filth due to gasoline cars: so, be ultra diligent with cleaning any humidifier and perhaps, get a humidifier, air purifier combo. Some Amazon humidifier, purifier combos don't clean air well at all, have no filters available, motors blow fast, no 4 year Amazon replacement plan for 7$ needed since fans blow out fast; make smart choices. If you live in an area with high outside humidity, you may be fine just opening window and using some 2-3 tiny

25dB 1 watt fans (use e-circuit 1$ USB socket from $ tree, as that one has no dirty electricity, as those are easy to wash in the hot shower with a small 4 mm diameter handle painting brush (set of 20 at $ store in kid section) for areas that water jet can't clean (if little dirt, moving the yellow plastic fan blades away from the white grid will allow you to finish cleaning in 3 minutes, so water can reach all dirty areas better than a can of air, a duster can), without breaking them, since dust needs be washed weekly. Outside humidity really brings in a lot of moisture. The amount of time needed to clean most humidifiers correctly every 5 days is so high, 1 hour at least, nobody does it. The easiest to clean evaporative ones that allow use of DI water, and have UV seem the ones like the 80$ UV rays Honeywell that cools room by 10 degrees in winter and barely brings humidity up (as Amazon 1 star reviews explain, actually all evaporative swamp coolers use similar tech, so evaporative works well in the summer to cool your room and such, but not in the winter unless you want to waste electricity to heat room more. As you can imagine, evaporative cools the house, so you need extra heat if winter.☺☺☺

Many evaporative humidifiers don't raise humidity above 60%; filters need replacing weekly, or mold grows fast, especially in dusty areas like desert, fan requires huge effort to disassemble (see free info for all section). Fans can lower humidity, so these evaporatives often lower humidity if filter gets dry and no longer helps water go up: with 4$ wicking filter (so cheap, 24$ with subscription for 6 filter A: can replace it every week (not every 4-7 months, since after 3+ months most filters become ultra moldy like this Amazon review 6 month mold pic which will make you reconsider buying evaporative which gets black mold even after 2 weeks see Amazon review (may be dust, since fans get that grey dust), another 3rd review says mold appears after anything more than 1 week, this is true probably for most evaporatives, see if we had Immortality Capitalism, we had Immortality *Nurturing* Agency test these way better before releasing them and email everyone issues that one star reviews found so all don't repeat the same mistakes, get mad and pissed off, know when to replace, etc - but it's a jungle, gov doesn't care, people don't have time to read every 1 star review for 4 hours to get the main issue with some product they buy anywhere with a credit card, a unit as gov can to save everyone hours that can be used to invent things, instead of reading same garbage by 1 billion people looking for a decent humidifier or appliance. They also got antibacterial filter where coating is blue so you can't see grey mold well to prevent mold growth and migration, definitely get this one, with Protec blue coat for 11$ or only 9$ for a vastly superior compared to other junk on Amazon if you buy a pack of 3, it ships automatically every month or two as you wish, you need to clean water tank well every week, with a spoon of bleach perhaps, and also replace the filter twice monthly at least (since filter is so cheap don't overwash with water; just soak in a clean container and rinse gently, nothing else, never with hot water, as you may get the anti-microbe thing off; if you overwash it with water, you may ruin it, even cold water; just replace every 15

days), and also clean the fan, every week: those fans get so dirty in desert Southern California areas in 3 days, and adding moisture to that fan dirt would cause huge mold in lungs and eyes, so it is best to clean fan every week, clean filter every week too; a boiler type humidifier, much harder to clean well around heating element, circulates over the exit and internal parts 50,000+ times less air, dust mites, etc per day vs the fan evaporative humidifier, so you don't provide air dust mites, mold, etc with the concentrated on the fan ability to grow off the dust mites, dust, organic matter food for mold and dust mites. Ultrasonics have a fan too sometimes, and that gets dirty with mold and will destroy your lungs, since ultrasonics don't have a replaceable filter; those without filters can spew 100 times more scale, so use DI water. Buy from companies that made humidifiers at least 20 years, not some new kid on the block. Try get one with UV where UV doesn't get out and it's safe, so you kill air microbes, without UV risks. Ultrasonics are hard to clean and it is safer to definitely get one that disinfects the air first, like the Crane 69$ warm cool mist ultrasonic boiler hybrid type (warm + UV + neg ions for babies, though ultrasound may damage healthy organs if too close to the body) one with UV and negative ions and warm mist too, the UV disinfects the inside and you can put something on top to prevent UV coming into the room, for the times when you use UV to disinfect it for 5 minutes. The crane humidifier comes with 4 yr replacement for 12$. You can get an ozone meter, so that the UV or ions don't produce ozone to destroy your lungs. *Ultrasonics without UV spew bacteria and white dust, unless you use DI water, and even then, bacteria come out.* Don't buy UV ones until you got ozone meter bought, as ozone can be wiping out your lungs in no time and kill you.☺☺☺

Use DI water ideally on all humidifiers *to avoid minerals in the water giving you humidifier lungs: it's like those silicosis workers who inhale rock dust daily and then die of lung cancer or lung disease.* DI is WAY safer since it is *scale* free. The 19$ Vaporizer that everyone hates due to electrical hazards, grey soot in vapor, etc, the Vicks is made in Mexico under license from Procter & Gamble, the great genius company delivering black lung disease to all American Citizens, in the name perhaps of Jesus Christ too, to make it☺☺☺ nicer. The issue is any water with minerals forms biofilm which is then used for bacteria to create colonies and will infect all air coming out, so stick with distilled for ALL humidifiers, to save your lungs. It costs 5 cents a gallon with a good kitchen distiller to make your own DI water: see 625$ distiller, or the future ones Immortality Building Inc creates for all to buy and make at home for their humidifier. I bought the 19$ Vaporizer humidifier from Target, returned it right away, after noticing odd watt fluctuations and the grey crap in the tank and also the deadly odd feeling that the mist has something wrong with it (it was probably that deadly soot); watch the amazing & beautiful ☺☺☺ Target videos that show how deadly Procter & Gamble can be, that everyone wants to return it almost after 1 day of use. This garbage product is recommended by Consumer Reports, the great agency of consumers, *9000 times* more useless than Immortality *Nurturing* Agency with 3

million staff members at least to test these junk products better before approving their sale. The Target videos are showing how to clean it with 1 spoon of bleach weekly, however, these were short-term studies and they added bacteria to water to see if any comes out; anything that produces instant mist uses ultrasound, boiling takes 5-10 min to produce vapor that comes slowly, not shooting upwards. Warm mist seems safest if you use DI water, if it has stainless steel elements, as no fan/filter bacteria, no wick to change - the simpler the better, plus evaporative produces infrasound (can damage organs) due to fans; it also got more dirty currents due to transformers in the fans. Ultrasonic bombards you with ultrasound and is SO HARD TO CLEAN, requires DI water only too. Vicks Vaporizer is at CVS, Target, near the eyedrops in the Target Pharmacy for the destruction of all US citizens lungs and eyes. A problem is most warm mist types today come with fancy useless bacteria white dust (if not using DI water) spewing ultrasound, so they're hybrids really, because people like a jet of mist, and ultrasonic have a noise dampening pad that grows bacteria ultra fast and most people never replace when it needs it replaced every 3 weeks ideally, even Levoit has it, a popular one). Boiling volatiles and semivolatiles can lead to you inhaling that junk, so use DI water.☺☺

Lower the thermostat, open the window, this way you can raise humidity inside by 10% often, which a big humidifier barely does in a big room with window slightly open for fresh air. Water with minerals will cause white dust that can damage the lungs (especially for ultrasonic humidifiers, those get 300 times more dust than the other guys, hence RO or DI water is best, 0 minerals, avoid ***UV types if using with eyes*** open). All humidifiers can technically spew tiny nanoplastics (so can polyester, etc clothing) into the air too even if we use DI water, plastics from the bottle, DI maker of a machine or from the humidifier plastic parts, so more research needs to be done on which type is ideal for minimizing plastic pollution that would damage our body, brain, organs, lungs as blood is filled with microplastics from the air. ☺☺☺ To prevent some dogs from becoming angry due to ultrasound 0.8-2 MHz sound (humans hear 20-20000 Hz), we can use the warm mist function that boils that water and is more sterile; however, some dogs may bark less due to the sound if trained so, so it will help humans to sleep better in the neighborhood; more studies need to be done to see if dogs are unhappy, using brain monitoring of dogs; the birth section explains the dangers of 2-18 MHz ultrasound, so it may be humans have organ damage from humidifier ultrasound if used daily for years, without us knowing, so you can buy evaporative or steaming types. Grace Yang, CEO of Levoit.com humidifier made in China has her DNB name as Young apparently and her site says United States, to sort of make people think it's US made and she's not Chinese? By email Levoit said that ultrasonic refers to the mist being made with the vibrating atomizer inside, this being how the mist is made regardless of the warm or cool function. Their youtube channel has a violent boxing MMA video of the fallen humanity sports that brings more war, company has no phone, do check websites,

phones of these Amazon companies, their social media, to protect your lungs.☺☺☺

To prevent ultrasound spewing bacteria and toxic sounds that destroy the body without us knowing how, it's better to use a humidifier where you know it doesn't produce ultrasound in warm mist mode; what people don't realize is hat dual mode humidifiers use ultrasound in warm mode, damaging babies and kids especially; cool mist uses for Levoit (and most ultrasonic humidifiers that are the worst ones to have) 15W, 19w, 23w on the 3 levels; warm mist has 3 levels: low heat, medium, high heat, 102W, 202W, 282W watts, add 4 w for each mist level up, so 106w on level 2 and 110w on level 3, same for the other temps. It generates ultrasound on mist level 1, 2, 3 in warm mist mode, since raising temp to get that much more mist would lead to a much higher watt usage rise and also, boiling types don't shoot mist ever, unless they got ultrasound going, so Levoit and ultrasonic ones are the worst brands (as white dust will give you pneumonia and lung disease) because even if you use mist level 1 for warm mist it still uses ultrasound. Amazon promotes Levoit, so it comes out first, perhaps people are addicted to digital fancy stuff, timers, etc while ignoring the lung and heart chemistry; people make youtubes and say it's cool, because it reaches humidity level, but the most important thing is health in the long run; hottest steam on Levoit, level 3, has the strongest clear sound of boiling, so it may be safer; same for all other warm mist humidifiers, higher setting uses almost double the watts if 2 settings. Evaporative use filters that need replacement, so they're more costly, so the better bet is perhaps the boiling type as it has no infrasound that can cause heart attacks, organ damage from fans. There is also stove distiller, for those wanting to distill water at home for their humidifier, though the purity of that water is lower initially maybe; however the electric ones have so many parts where mold can grow over time and are so hard to clean perfectly, use that carbon filter for gases, etc that those pose serious long-term contamination hazards absent from the electric or gas stove type that is 100 times easier to clean perfectly, and a humidifier doesn't need the perfect water anyway, this also humidifies your kitchen in of itself while you run it or area with electric portable 10$ stove from Amazon; for a big house, it will save money in the long run and the environment, no more water bottles recycled, trips to the store all the time, etc; get a TDS meter (4.6 rating 0Water is reliable, they sell their stuff in every Walmart, Target) to check TDS before, say 200 and after, 2. Filters for humidifiers create many issues with bacteria and mold, so safest bet is a filterless and DI water; you can add minerals to DI water and drink it, saving more money that way, no more filtering water with Brita or etc. ☺

Avoid IR blankets or IR cheap *Amazon eye masks* heating *your head or eye area*, as they tend to heat the inside of the eye too and cause dry eyes if overused. If you lower room temp in winter, your nose may get clogged, so in that case, maybe buy menthol (which many use for mouthwash preparation, my $9 bottle lasted 4 years, don't eat peppermint oil or menthol, because peppermint oil contains the neurotoxin pulegone (the ketone of menthol, menthone, with an

extra double bond, about 2% of peppermint oil, vs 30% for menthone) that can also damage liver, not sure if breathing it will get it absorbed into the blood and damage kidneys, liver or brain) or much safer, Ohio menthol, or food grade US tested menthol, and smell it, keep it by bedside; peppermint oil contains 41% menthol, the ingredient in store mouthwashes, in cough drops people use to decongest nose, but you don't need eat all that sugar, you can just smell pure menthol and it will be the same, that's why cough drops clear nose, that menthol is breathed in;☺☺☺ turn *down* thermostat for *central* heat or turn it off and use an electric quiet oil heater, 40$ at Walmart, etc. However, don't go too low, as a 9°F/5°C drop in temp can half our innate immune response in the nose and cold air is known to shrink blood and lymph vessels, causing less fluid transport, higher ocular pressure, more glaucoma and then eventually blindness. So, when going out, in the winter, wear mask to keep nose warm and nose immunity double than without the mask. 82 is not needed, 73-77 is fine.

11.17.1.6.7 The silent oil heaters, (like Homcom with level 1 using 450 watts only as measured with meter, allowing you to save electricity versus most, which start at 550-600 real watts) are much safer than ceramic, radiator, IR, etc which produce far more free radical generating chemicals. The ceramic, red hot radiator and any heater whose heating element gets above 215°F are like the fried foods of portable heaters, and sadly, hotels don't use the safe oil filled heaters when you turn those dual use (cooling, fan and heating) units in the walls. The immortalists would require any wall unit to be tested to produce very low levels of radical forming air chemicals (which destroy our skin, cornea, nose, smell cells, airways, lungs, blood and every organ the destroyed blood gets to), like the silent oil heaters by incorporating oil heaters into these wall units. The gas heaters still legal in USA and gas furnaces are an act of genocide, they produce so many bad chemicals. If you rent a room in a house, move to a house that has electric furnace or heats via a small unit each room (since electric heats air to 95°F, not 140°F like a gas one, and electric has far fewer toxic chemicals, less oxidation of ambient pollutants), and also, ideally the ductless mini split AC, since vents form biofilm and carry pathogens, causing yearly cold, flu, COVID reinfections. Dry heat is deadly, for air contaminants and also for food, see AGE section. Air organics are like food and that dry heat is forming 100 times more deadly chemicals than traditional gentle warm water radiators or oil radiators. Since water radiators temperature is lower than for the oil ones, they're even safer, so oil filled heater manufacturers need to lower than temperature and increase surface area to compensate for the lower temperature that is safer for our bodies. We eat two things air chemicals and food, so beware of food toxins and air toxins. Cholesterol is deadly, OK, but oxidized one from frying is 100 times worse, same with air smog crap: see what oxidized cholesterol does before using central heat, ceramic, radiator hot red element heaters: the picture of the arteries. Use electric silent heaters that heat up slowly; the hot area of these heaters is 100-700 times bigger, so they

don't need a super high temp area like ceramic and radiator ones, so they don't generate lethal chemicals. Heaters too hot to touch anywhere are bad since they make air contaminants react with oxygen and become far more deadly and free radical generating in the lung and on the ocular surface once contact is made. Humans thought coal is great when it came about, but then they noticed it spreads toxic metals on all arable land, destroys our lungs, food crops. Today, we realize central heat ruins our eyes and lungs too, and lungs bring free radicals to the blood which bring that poison to all arteries and organs, leading to shorter lifespan; as tech advances, we will use better warming techs, like change the color of our houses (just use a nanotech material on outside of houses that once treated with a certain laser light changes its properties from heat reflective to heat absorbing, which may mean changing its shade from say ultra light lavender to dark purple, or etc) from bright white (it is most reflective in summer) to black in winter (or whatever paint they discover absorbs most heat in winter) to avoid having to cool and heat houses so much which creates positive ions and ruins our lifespan and eyes too. ☺☺☺

Future physics would be able to heat/cool interior too in other ways without needing to absorb/reflect all sunlight heat etc or use oil heaters. Central heat (especially using natural gas, but electric is bad too) is the lowest IQ idea for anyone with dry eyes, as that type of heat is very dry and brings in junk from all the AC lines, etc, traces of carbon monoxide, nitrogen oxides, oxidized by the hot electric parts (sort of like red hot radiator heaters) air contaminants that are free radical generating, etc. Oil heaters in rooms mean COVID19 in air will be killed in seconds on contact with the 200°F parts of the heater (dies at 40°C/104°F in hours, 70°C/158°F in 5 min, 167°F in 3 min, oil heater surfaces are 158-200°, or even 240 some models, so at 240°F it dies in seconds), as well as many viruses. We get no such benefit from central heat, which may bring COVID, flu, cold microbes from another room, vents, etc. COVID19 is like the common cold coronaviruses and flu viruses, so we get sick in winter because the sun is not as strong ☺☺☺ and can't destroy the virus in the air as much. I used to run an oil heater 12-24 hours for 4-5 months of the year, then I ran it 0-8 hours depending on how cold winter-fall days were in California (when I lived there, until 2023); home depot has 2 types of heaters that help dry eyes: the biggest 12.5A $74 Comfort Zone or @ home depot 19.6 lb taller ones with 600, 900, 1500 W watts (depth 6.4", height 26.9", width 16" so heats medium/big rooms much faster having 60% more surface area) – this and others like it use 590, 850, 1350 watts under the "600, 900, 1500" settings, measured with the most known (sold) $35 watt meter (cheaper meters on Amazon are 18$) from P3 (since 1987). These numbers ± 5 hold for 90% of oil heaters on the market.

Comfort Zone smelled strong and it caused me to return it, its fins allow only about 3% of the air that other heaters, like HomCom (see below), allow to ventilate the inner electrical thing and thus the heater takes 30 times longer to get rid of that initial smell (months, not days) and may last shorter due to overheating of the electrical things inside. 18.6 lb depth 11" height 26" width

14.2" Pelonis 59$ one lowers humidity less, see chart on Amazon (try buy Pelonis in a store to make sure the paint seals the round fin connections very well, or return it if there are gaps), (*2% lower humidity vs 14% lower for hot element type*) probably because it's wider and taller fins than many other similar 1500 W ones, increasing surface area; Pelonis is a top brand and mechanical knob ones last longer than digital ones for all brands and temp is 140-200°F in most areas (*temps in this book refer to when thermostat is set to max and level 1 on all the heater, unless otherwise stated, for Pelonis that is* 220-239°F *on the round fin junctions that face inwards (down for top ones, up for down ones, as those are not cooled by air so much*), meaning least toxic compounds formed vs 90% of heaters on the market; when you go to level 2 or medium and thermostat knob is set to max, all heaters max temp for fin junctions (hottest area of heater) go up by 30, so 271°F max on Pelonis (max on level 2 will be lower when the room is colder, maybe 240); level 2 is (for those wanting warmer room) needed on colder winter nights when outside is low 40s, so about 20 days/year in Southern California, for bigger rooms (>200 ft^2) – otherwise, you may get only 70°F in the sleep area. Because every greedy aristocrat makes heaters and other products (1 million contractors instead of Immortality Building Inc), we have 1000 types of products and 100 times less scientific testing by these private tiny companies, instead of Immortality Building Inc testing the amount of oxidized air products after heating a room to the same level (depends on how hot those elements get too), the dirty EMF, etc. We need to have a real testing, and maximize lifespan, not 'fancy designs'. Generally speaking if you move a heater to the hot setting or even medium one and crank thermostat high within that watt setting, you will be getting the burnt smell more, as the carpet under 'burns' chemicals and the air is being destroyed, together with the viruses. You get a lot healthier air (less free radical forming chemicals) with 2 heaters on setting one (500-600 watts) than with one heater on setting 3 (1200-1500 watts), unless you have some nasty virus that only dies at very high temp.☺

Buy a humidity meter and see what happens, place a small plastic tray with water under it and it will maintain room humidity as before, preventing dry eyes; don't let inside temp go above 73°F ideally, to prevent dry eyes; the bottom is hotter, so the tray there ensures your eyes remain wet (with water, humidity may even increase 2% vs before turning heater on); air that's dry hurts your lungs, vocal chords and eyes. Using 2 oil heaters on level 1 means 540 W (real use, not 600 on paper) each or 1080 W or < 1220 W☺☺☺ for 1 heater on level 3; (even theoretical #s give 600*2=1200 < 1500); 2 heat up a larger space much faster/better, produce less toxic air chemicals (the straight fins move from 190 on level 1 to 230 on level 3, fin junction middle (thinnest) goes to max 280°F on all, instead of max 240, average being 270 vs 230 – higher temp means more burnt air smell, more deadly oxidized compounds form by reacting with oxygen, like with dry heat AGEs for food. Nearby objects get much hotter with level 3 and risk of fire increases if flammables are near), so always use 2 on low instead of 1 on high, to save electricity

and your health, achieve a warmer room; electricity is not yet 100% renewable and kills people by pollution via *coal, etc;* if you set thermostat to less than max on the low '600 W' level or any level, the heater will go on and use electricity only part of the time, not all the time, depending on how cold a room is nearby; 2 heaters are only needed for large rooms in cold winters (outside < 37°F), like Master bedrooms of 250-400 ft^2. Mainstay one can be ordered online for 45$ only.

There is also HomCom, with remote control, 56$, the one I like the most and use, since it also has a memory of last setting (temp, and which level selected, 1, 2, or 3 – 1 is more than enough, 600 W, 550 actually; the 900 W is 780 and 1500 is 1220) and all goes dark – no lights after 1 minute, unlike Pelonis etc. Remote control allows you an extra option for turning it on and off, that is cleaner, ☺☺☺ since buttons on heater are harder to clean than the remote – especially useful at night during sleep when it's too warm or too cold and you don't want to wake up and walk 7 ft to the heater, as that would often disturb sleep a lot. Some heaters of many brands I tried come with some areas between fins that need extra paint, so you can go to home depot and buy 5$ rust-oleum up to 1200°F spray paint to touch up any missed paint or any that may chip off in the future. When spraying garage doors, etc if you accidentally spray cars nearby due to wind taking the particles, 15% rubbing alcohol to water on a soft microfiber cloth, will remove the paint droplets without a scratch or 7$ Goof Off from home depot; for big mess, try the home depot paint remover. There is also $70 Costway 17 lb depth 5", height 25", width 14" with same watts, but this one has the bottom fin junction reaching 290°F (level 1, on level 2 it reaches a max of 350°F, and 370 on level 3; max reached when room is colder and it tries to bring temp up, after that it lowers down 30-50 degrees), higher than most heaters, while top area is only 120-150°F when measured from above (*about same when measured from below, unlike Pelonis which is 200-220° when measuring top fin junctions from below*), so air will form toxic stuff, so avoid Costway from home depot, since it has burned air smell (permanent, not the rubber or plastic smell any heater may have first day of use) like red hot radiator heaters, though not as bad; avoid any heater with 5" inch fin width, go for those with 6 or 6.5" as those won't burn the air and damage eyes, lungs, throat, vocal chords. *The heavier the safer it is as temps will be lower, so go for 18-26 lb, instead of the 15-17 lb ones.* The small 10A $42 15.8 lb shorter thinner with 500, 700, 1200 W that is best for small rooms for people who're overweight and don't need much heat, it's 30-40% less heat generated versus the other ones that use just 100 W more. ☺☺ *Lovingly gently* not let your room become too cold (varies by person, 71°F for some) with a small heater or no heater, as it will cause sore throat and rough voice next day. ☺☺☺

The small one depth is 4.5", height 21.5", width 13"; temps are 200°F for side flat fins, 220-238°F for the very center of bottom junctions, 178°F for the top junctions. I bought the small one to test it and returned it later due to hot fins and low power for medium rooms, plus huge rattling noise when moving it a little; the wattage is 456, 632, 1015 W actually, they're always lower

when measured with a precise device, which is great, saves electricity; 456 W is 3.3 times smaller than 1500 watts ceramic heaters that bring hell to your eyes and kill people with coal emissions (we are decades from 100% renewables). This means that the difference between typical size and the small one for each of the 3 settings is only 100-150 watts, 150 for the medium setting, 100 for the others; this means it's not saving much electricity at all, and the big one may actually be more efficient per W used since it has more surface area to keep heat alive, but small one is useful for people wanting minimal heating; the big one may reach set temp faster, then go into 0 W for longer, so it may save electricity, but may get too hot in tiny rooms on minimal setting; they even have some with thermostat in temperature, instead of the knob, but you can learn what temperature corresponds to what knob position or what knob position is your comfy temp, so digital thermostats are not needed. These heaters are also safest for homes with pets and kids, as burns can't occur, papers can't catch fire if papers get near as with red hot element heaters. However, 139$ digital Delonghi 26.6 lb, depth 10.3"wheel, 6.5"metal height 26.1" width 16.4" offers an even safer☺☺☺ to the touch exterior (fins are encased), no more sharp fins, so it will dry eyes less due to most air coming in contact with a colder surface; heats up to 144 ft^2 rooms, unlike typical Pelonis that heats up to 300 ft^2 for same W at half the price. The Delonghi digital unit I got was defective, fins separated, with gaping holes in between, and the design is bad – it allows dust/dirt to get on the wires and motherboard, which you can see from above, so I returned it, but try other models with encased fins (not Delonghi, maybe this 11 lb Walmart 70$ one for small-medium rooms, though pic shows same poor design allowing liquids/dust from the top; liquid spilling while it works may start a fire ultra fast if alcohol, or slowly if water; less likely to hit knees on the fins at night and pets/kids won't get burned or hurt by sharp fins if it falls over due to toy playing, dog jumping near kid etc; *temp of outer case is much lower (90-120) and even the inner fins temp (IR thermometer) is in most areas much lower (150-170)* than 170-200 in typical heaters due to more metal to dissipate it fast, so fewer toxic air compounds form, more humidity retained. The 3 levels use 600, 660, 1140 W. 119$ mechanical Delonghi 24 lb is the cheaper version d 6.5" h 25" w 16", less surface area, so more humidity loss and less capacity to heat a bigger room, is safer than Delonghi digital, i.e. water getting inside from the top if a cup is spilled above or anything flammable is less likely than digital one, but not 100% safe, dust gets inside from the top easily, while other models have side openings and very well covered, allowing 5x less dust in – however more air in can mean more cooling and less risk of fire and wear. I got this one, returned it: the paint job for the fin junctions was very bad on the top and bottom junctions, while the actual watts were 610, 670, 1200. The element or fin junctions (exactly where they join, hottest point) for this mechanical Delonghi are lowest temp of all, about 165 max, on level 1 (if run in a somewhat warm room of 70F, in a colder room of 64°F, fins can go to 260 up and 300 down), but on level 2 in a colder 65°F room, the bottom junctions reach 300, while top ones remain 165; on *level 3* however, top fin junctions

(and nearby fin) reach 300, bottom ones 396. This means Delonghi is the safest heater if run on level 1 only in rooms above 70F, because fins reach lowest temps of any heater. However, Pelonis fins become colder when room gets colder, so Pelonis is safest I tried so far. (the smaller the width, depth and height for same watts, the smaller the room heated and the dryer it gets, with more toxic air compounds since metal is hotter). Being 26 lb, instead of 16-20 lb, wider, it will be less likely to fall than most models. Try the 1.25 GPM shower head, to save your water heater, pipes, body from chlorine and the environment – water takes coal, toil, energy to purify, that could be used instead to triple lifespan, prevent dry eyes. ☺☺☺

When the AC people do their maintenance every year or two on houses, they don't really clean the ducts or sanitize them, so you will have to open the air intake, and inspect the vent and see if dust exists, because if a lot of dust exists, it's urgent to hire a duct cleaning company (use google to find a good price, 300$ for duct dust removal and sanitizing it, not 900$ minimum price certain bandits charge). Otherwise, that dust will trap endless microbes that will increase ocular inflammation via dust, dust mites, pollen, etc, plus systemic inflammation via toxic air destroying every organ via the lung poisoning of the blood. Use MERV 13 or FPR 12 filters always. If the law required FPR 12 we would not need 4000 frauds setting up these scam companies to charge 200$/hr for doing 1st grader level of complexity tasks using stone age cleaning brushes or kits that don't really remove any biofilm, just dust only. These genocidal vampires (owners of the companies that charge > 300$ for 2.5-4 hours of work) make 10x what real scientists make for doing the tasks 50x less complex than the scientists. Capitalism at its best. The filter would trap it all before it would get to the vents if they designed in system to be perfectly sealed, and filter FPR 12. If you replace the screens in windows and door, use a mobile screen company that will make a most perfect fit, to prevent insects whose bites can cause lifelong hidden disease (we always discover new diseases, each decade).

11.17.1.6.8. Blink often while at the computer, since we forget that and eyes get dry, causing inflammation which then infects MGs and makes eye even drier if glands clog. Eat breakfast to hydrate eyes better with more antioxidants. If you wake up and type at the computer, and you don't drink water, eat smoothie with antioxidants, take vitamins, your eyes are just getting tears (water) without many nutrients, proteins and eyes will get drier and redder. So, when waking up, eat well, generate tears. Recall the point with sleep hours above too. After generating tears when waking up or using saline, take a shower to increase circulation. Take showers when you wake up, not when going to bed, or both times. After waking up eyes need new tears, new nutrients and new circulation, so that's the best time to generate tears, to take a shower and to generate tears again after eating, when antioxidants spike in the blood and therefore the tears too, which comes form the blood. This looses the MGs oils and helps oil release.☺☺☺ Consider moving a few miles or 100s, 1000s of miles to an area with higher humidity, like South Florida,

Hawaii, etc, see the Immortalist anthem/flag section for ideas on how to find a decent place. As you know humidity means nothing, it's the absolute humidity, the dew point that matters. The warmer it is in the winter, if relative humidity is the same, the wetter and whiter your eyes will be. The colder it is, the less water can remain in the air and the worse the eyes get (and MGs). While in California, North Florida winter got 35-50 lows, South Florida coast got 56-65. Winter temps and dew point vary wildly even from 10 miles away, as you can see in the flag section.☺☺

11.17.1.6.9. See if more vitamins (without magnesium stearate or stearic acid that can block absorption 40-95%) oral choline (increases tear volume for me always), *B_1 or methylB_{12}* (JO 2020: 9539674), Zn, Cr, Mn, selenium (thyroid eye disease), iodine (thyroid eye disease, low means no tears or lipids generated), vitamin A (many studies (70x RDA loading dose and 3x RDA preformed A that vegans don't eat) show vitamin A reverses dry eye in A deficient patients (maybe try 10000 IU 250 caps 10$ or 100 caps 5$ if blood A is not high, to see if your dry eye vanishes), so take a blood test, the antibiotic section shows studies on azithromycin and doxycycline being able to restore carotenoid (provitamin A) content of meibum/tears and removing dry eye, so try eat carotenoids (red pepper, watermelon, carrots, or kale/greens, etc) at each meal and a walnut to increase absorption 15 times, to drive tears and meibum to those of a healthy person, because extreme stress causes ultra fast depletion of blood carotenoids), C, E, D, ω3, *(vegan ω3 is triglyceride form, s*ee why doctors prescribe this for dry eyes or optimal eye health; many studies show ω3 increase tear *production ;* ☺☺☺ *"a high ratio of ω-6/3 fatty acids (>15:1) was associated with a higher than two-fold (*2.5x times *vs <4:1) prevalence of dry eye… ideal balance of (3:6 was) suggested to be 1:2.3"* ► Ntr 2020; 12(5):1526*)* polyphenols and CoQ10 can lower sugar levels and fight oxidative stress; lipoic recycles vitamin C, E, CoQ10, GSH preventing dry eyes; omnivore Dr. Allen suggests eating less dairy, meat, fatty foods, taking vegan algal oil if fish is disliked. Lycopene and astaxanthin also help prevent dry eyes.

11.17.1.6.10. Listen to peaceful music to relax to reduce inflammation coming from stress. Stay calm, even if it's urgent; to lower cortisol, inflammation also meditate, relax, massage self, laugh (theonion.com jokes generate tears but avoid cutting onions without sealed safety glasses, as the sulfuric acid formed on eyes by the volatile gas causes damage to the cornea, even if some tears come out), fake laugh, watch or listen to (to give eyes a break) a comedy watch 5 min, of hilarious youtube videos of gaffes of various vice presidents, presidents, public persons, since our brains find that ultra funny, being unexpected, or recall something funny. Take action fast, but remain tranquil to keep catecholamines low. Meditation is 1 million happier than orgasm, so no need of cancer causing, eye drying birth control pills, anything affecting hormones (animal foods) or introducing wild cytokine signaling or lipid metabolism changes in the body. Happily smile ☺☺☺ and breathe consciously more often to help yourself relax and lower inflammation of eyes, relax after meals to diminish oxidative stress Take screen breaks, close eyes for 3 min.

11.17.1.6.11. Wear sunglasses (wrap around for better shielding against wind, smog, dust, bacteria) and blue blocking wrap around glasses, filters, software, etc. Avoid excessive iodine from kelp, nori, spirulina, chlorella, seaweed or iodine pills, since anything above 150 µg or 200 may cause dry skin of the body, eyelids, cornea and even styes, pimples, acne that increase cornea inflammation and dryness. Hypo and hyperthyroidism can cause dry skin and via that, over time, dry eyelid margins, MGD and later dry eyes as a result of no strong lipid layer. Also avoid linden tea (some drink this astringent herb tea *(astringent herbs will dry your eyes)* almost daily for years before going to school as a child in Eastern Europe (I did it too), which can cause semi-dry eyes that are not felt as such and undetected MGD 10-20 years earlier). Avoid coffee (poison that dehydrates), caffeine rich energy (even green and black tea) drinks. Avoid sugar *(beets too, as they're high in sugar, any processed food high in added sugar, like store fruit juices void of fiber who sit in clear bottles and* have antioxidants become poisons via oxidation due to light and heat*; always eat the whole fruit, don't juice, or make a smoothie to slow glucose spike,* since insulin is a hormone that brings down glucose but also causes dehydration, styes and pimples, *which often occur after high sugar low fiber meals that lack nutrients that keep glucose low; don't eat 5 lb of grapes or watermelon a day, opt for more complex carbs like lentils, grains, etc).* Avoid salt (all sauces are deadly combos of salt and sugar that cause dry eyes, so they fuel the epidemic), alcohol (poison), high protein intake, coconut water, simple carbs as they pull water out of the body (are diuretics) and dry eyes, cornea (a type of skin), and skin. Chamomile is a mild diuretic, so it is a mild dehydrating agent. Avoid flaxseeds, chia seeds as they lower tear volume during yawns and normal blinking, overload body with toxins due to slower bowel movement via sucking up so much water. Eat flax oil or chia oil instead and *just use* vegan ω3 oil pills *and* walnuts too *to achieve* healthy 1:1 ω3:6 ratio*; use bee pollen only 10g a day max morning with gigantic smoothie, as it also lowers tear volume* (just as any powder or dry foods, popcorn, cereals, chips, do if not enough water ingested); stick with the diet that gives fast bowel movement (7 hours or less, not 30-45 as with many omnivores) and soft/wet stool; dry/hard stool=dry eyes, ALWAYS for me; toxins in blood = short life AND DRY EYES.☺☺☺ Eat high fiber/calorie foods to move stool fast and lower inflammation. Eat plenty of low cal veggies and fruits, to get electrolytes, eat calcium, magnesium, sodium, potassium.

11.17.1.6.12. Avoid plastic water bottles, bottled water, plastic food containers (buy stainless steel boxes), as microplastics disrupt hormones via BPA or its "BPA free" analog replacements, leading to dry eyes, infertility, Alzheimer, organ damage, living to 70. Discontinue sleeping aids known to cause dry eyes, antihistamines *(present in eyedrops sometimes, bad idea since they suppress eye ability to fight infections, bacteria you get out of glands by* MGs *massage)* or switch medicine brands as some (antidepressants, etc) dry the eyes via "inactive ingredients", preservatives with dehydration effects. Melatonin is a natural sleep aid, not man made, and is

hypothesized to help wet the eye, at least based on rat studies like iSci 2024; 27 (7):110367. Rabbit studies showed topical melatonin metabolites in eyedrops caused more tears. At higher doses especially, melatonin is known, to cause watery eyes in some, so it may cure dry eyes in some. Melatonin is linked to a lower "risk of AMD" (the leading cause of blindness) ► JAMAO 2024;142(7):648-54. Use a satin/soft silk pillowcase to diminish collagen layers breaking, to prevent acne bacteria from entering these collagen crevices made by cotton pillowcase friction, since acne stresses ocular immune resources; change pillowcase twice a week.

11.17.1.6.13. When in the sun, try wearing a hat or cap, if you don't use the earplug silicone or foam or rubber sealed (upper protection as many safety glasses have) glasses, since the hat rim protects eyes from UV/blue light entering your eyes from above (*most sunglasses fail to prevent sun rays from above hitting the glass and reflecting into your eyes, destroying them*). Wind brings dog, cat, bird, mice, lizard poo dust, viruses, bacteria, pollen into our eyes from above by gravity. Good hats reduce eye/body oxidative stress. The same eye protection as hat/cap is a safety or swim goggle with rubber holes/vents (no fogging). A polyethylene foam (plastic made into foam) thick opaque cowboy hat (or even the thinner $1.5 or $2 polyester hats from dollar stores – sold at 10-13 times on Amazon) is 3-5 times more effective than a cap at protecting eyes/hair follicles from UV because it has 5 times larger rim (*protects eyes from sun rays reflecting into sunglasses then eyes, from upper left or right where caps got no rim; solar rays reflected off ground are less intense, the upper ones are intense; front and back rim being bent down protect eyes/back hair a lot, the sides have less hair, so rim being up is fine*), it allows no UV, while a cap allows plenty of UV thru its fibers; it's 5-10 times more effective than a cap at blocking brain heat (heat shock proteins daily can shorten healthy lifespan of brain), being much thicker, a much larger surface area, no tiny holes. *Without a brain*, eyes are not of much use, as brain controls everything related to eyes/organs.

Avoid too much blue light at night, use 2700K warm white or 800K bulbs (never the bright day light ones before bedtime), 1200K flux computer light *to protect your eyes,*☺☺☺ so perhaps try a high contrast white keyboard that is easier to see at night in dim light, like *world's* quietest *and* most amazing & beautiful ☺☺☺ *desktop* keyboard, *Apple Magic Keyboard.* With a 2$ letter size note pad that is heavier, from $ store, you can rest your Apple tiny keyboard there for an absolutely comfy position so that you no longer even need to pull and push back the keyboard sliding holder of your computer desk and you can simply pull this note pad to achieve a much better angle and everything; faster and easier. You can do yourself a favor, go to Best Buy and try typing on the Apple Magic keyboard or just order a free to return one from Amazon; after that, you will never want to use a Windows mechanical keyboard like I did until June 1st 2021 all my life, having no clue Apple makes such amazing products. Not only will your eyes thank you, since you fake far fewer typos and have less to correct. You will be able to type 5 times as much

before you get tired. To think the only difference is 40$ between Logitech scissor switch small one (which costs 40$ and is itself better than mechanical) and Apple and the difference is so GIGANTIC, that the *return* on *investment* for your eyes and *hands* is simply 20,000%; a mere 3 cents a day, and you can for the first time ever, enjoy typing and give your eyes some relief. It's Apple (or Tesla Model S) versus typical mechanical ones (or 1900 cars), rockets versus mastodon. Alt is like Option on this keyboard, but it's easier to insert symbols in your word processing software, as you add most inserted symbols to your favorites. The small Apple Magic (without numeric pad) they make is amazing, allowing your mouse to be near your right hand and enabling far faster mouse moving. Our brain will use energy to think of the science of living to 4000 instead of coordinating the hand movements that is so much harder with mechanical.

Gently read how to create custom delete keys, since Apple has only backspace by default. After that, you can buy a used one with 4 year replacement plan from Amazon or new one with 2 year replacement from Best Buy. I use the small version of Magic with 4 year replacement or refund, but you can get the full size with numeric pad if you type a lot of numbers like accountants do; just plug it in, no Bluetooth needed, comes with USB cable, can be used on old desktops without Bluetooth, you can use it as both wired and wireless, I use it as wired to prevent RF pollution and headaches, having no Bluetooth, since it comes with USB optional cord that also functions as battery charger if you use it as wireless; assign 'delete' from windows to one F key in your word processing software, if you don't like backspace, since this keyboard has no delete button), much easier to type on than mechanical keyboards, having the quietest scissor switch keys on the planet. They also got black or white small keyboards with 7 backlit colors that may be an eye hazard and make a lot of noise when typing, being quite backwards compared to Apple, double typing characters, hence they cost far less. We want something to save our hands and eyes, not something to flash lights and look pretty, it's all about productivity and prioritizing longevity. You *would need the dimmest setting since they got blue light in those backlit ones,* so I think white may be better without backlit keys if you want to remove all blue light 3 hours before bed, though even red-yellow light can hinder melatonin and cause oxidative stress too (400-450 nm causes 5x oxidative stress of 700+ nm, so staring at 400-450 nm keys is like staring at a UV laser almost, for shorter periods, because when all is dim, our pupils are dilated and blue light enters the eye and damages the retina a LOT more. Some forget 400-420 nm is almost as bad as 380-400. It's up to you, try and see what minimizes eye stress for you and improves sleep quality, but those cheap keyboards are not match for the Apple Magic one. *Science is fuzzy on whether 500 lumens of 800K non-blue light hinders melatonin and damages retina as much as 100 lumens of warm white 2700K lightbulb; which is more stressful, using more lumens of yellow or fewer of blue, probably few blue is total stress as we're not used to it after eons of fire and candle light, not before bed?* Eyes are stressed when ambient light is dimmer than the screen we stare at, so

keep that in mind when adjusting lighting and screen brightness. Keyboards with Bluetooth connect to phones too and a $10 USB Bluetooth dongle can turn older desktops into Bluetooth capable devices, but that RF pollution can also damage eyes,☺☺☺ so try an Apple small keyboard that allows wired use (unlike wireless keyboards sold today that come with only one option, wireless only; being smart, Apple makes a keyboard that can be used as both wired and wireless). White Apple keyboard allows us to dim our computer screen and use an 800K lightbulb which is so dim, that screen temperature has to move to 1200K. It's not a one 2 hr exposure that damages, it's hours daily that leads to retina or optic nerve damage via ROS.

11.17.1.6.14. Check your eyes daily with a 20x magnification mirror (or a 30x magnifying glass on top of a normal 1x mirror, this is one of the best on Amazon, I tried 20, this one is easiest to use, *most won't work with the mirror, too thick or weak;* move magnifying glass closer until resolution is perfect and be blown away, you will see eyes and eyelids, oils coming out when expressing the MGs like you never dreamed of to determine which glands need more warm compress and massage, usually temporal, not nasal), to see how your eye care improves eye appearance; this can be taught to 3-12 year olds, so they learn to take care of their eyes when small, not at 30-40 after glands are atrophied. ☺☺☺ Lower histamine, in many ways (clean house, get rid of mold, dust mites that make allergenic poop, keep most cooked legumes frozen to prevent bacterial growth, explained in this video, since histamine is one way to cause dry eyes by inflaming the lacrimal and meibomian glands. The famous spermidine (see why dry eye folks need avoid it) in supplements can have histamine like effects (meaning dry eyes, headaches, etc), by inhibiting DAO that breaks down histamine, just like putrescine in putrid (fermented) foods can. ☺☺☺ Use 120 Hz HDMI cables for 4K to connect monitor to desktop, not 60 Hz, as higher refresh rate is easier on your eyes - so go to Amazon and get an 8K 60Hz 4K 120Hz or 144 Hz HDMI 2.1 *48 Gbps* (6 to 14$, depending on length, 3ft, 6 ft, 10 ft) instead of the old 4K 60 Hz HDMI 1.0 to 1.4 *10 Gbps* your monitor most likely came with between 2000 and 2021. With DSC, HDMI 2.1 can do 8K 120 Hz too. This is true especially if you watch movies, TV, fast moving engineering or physics/chemistry visual simulations, videos online a lot: you will get fewer headaches from eye strain for all tech jobs with visual stuff or long computer time (most jobs today). These are Ultra High *Speed* HDMI Certified cables, HDMI 2.1 and above. There is a new cable now used in many desktops lacking HDMI, called Display Port 2.0 and 2.1, that reaches *80 Gbps.* For eons we read fonts that were always there on paper, while on digital screens the image appears 60 times a second (60 Hz, 1 Hz=1/s) for old HDMI or 120 times, so it creates a stress for optical nerves our eyes are not used to; it can take 13 ms (milliseconds) or less (they didn't have computers to generate images for shorter periods in the study) for the brain to process an image, so that is about 77 different images per second, 77Hz. Avoid monitors with built in cameras, Ethernet, WiFi, USB-hub, USB-C, any internet connection, since these can be

hacked and then foreign spies, gangs can record all you do on your computer, kidnap or kill you.

At 120 Hz refresh rate, we have 120 images of a font per second flashed in the same place, so it appears more solid as eyes can't detect much of a change, but even at 60 we can't detect much, yet *120 would obviously introduce less* neural *processing strain, so you get to* read more science papers without getting a headache. 4K monitors reduce eye strain☺☺☺. 50$ and you help your eyes to the tune of 4 million dollars in interventions. So, you would need also a monitor that can do 120Hz or higher (type "1000R monitor 4K", 300 for max price on Amazon, buy 22-27" ideally, because large monitors increase eye strain; curved monitors reduce eye strain & dryness because we don't refocus our lens (see MD explain why it's healthier) so often, when viewing distance increases as we look at the edge of the screen to read a book, each second, with each line we refocus the lens (lens oxidative stress increases and we're more likely to get cataracts), our eyes get so tired, and our natural field of vision is curved at 1000R, see 5 min video on 1000R benefits (curved monitors are 1000R-4000R: 1500R vs 1800R picture difference, 1000R is the easiest on the eye refocusing muscles, but glare can be an issue if lighting is not well placed in your work area) like our eyeball: UHD (and to a lesser extent QHD) make images/text less blurry to reduce eye strain, FHD is 1980×1080, QHD is 2560×1440, UHD or 4K is 3840×2160. Avoid FHD monitors, you spend 40000 on a car and save 90$ on a monitor for your eyes? Here are 3 cheap curved 27" QHD 1000R Amazon Rating 4.6 (highest for monitors), though they're not US made, so pose some risk of torture, brain writing, etc: AOC CQ27G3Z 270$ 240 Hz 0.5 ms (millisecond, meaning it is less strain on eyes than 1) also on new egg for faster shipping, MSI G271CQP E2, 180$ 165 Hz 1 ms, LG 27GS60QC-B 160$ 180 Hz 1 ms HDR10 (meaning 1 billion colors, not just 16 million as the rest). Best Buy 1000R monitors: 27” Samsung Odyssey 300$ 240 Hz 1 ms, Samsung Odyssey 260$ (is 340$ on Amazon 4000 sold/month) 32” 1 ms. Go to bestbuy.com and type 1000R monitor and get one, then return if not for you. Many people hate curved displays due to glare or other issues for text near the right or left edges (normal, just don’t stress your eyes, choose curve only if you like it), since google search results etc are on the left and many webpages too, so it looks really strange. In that case, simply buy a Retina 1 billion colors 4.5K display (better than 4K) Mac computer, all in one for $1200 and Retina 1 billion colors 5K display 27” Apple $1440 desktop or used 398$ Retina 4K display 21.5” desktop or used (2021) 24” retina 4.5K display 700$ desktop, HDR10 $299 27” 4K ViewSonic 1 ms 60 Hz (designed in USA, US company, not other nations to attack/write your brain, eyes). $349 27” Pixio 160 Hz 1 ms no HDR10 may be better for real time video users (cops catching spy drones or cars with another remote drone etc, soldiers detecting enemy targets and positions watching 3 windows at once) or fast simulation applications, where refresh rate is more critical than color rendition, allegedly human eye prefers 160 Hz more than 60 Hz, though not sure if HDR10 makes it less stressful, since some say HDR10 is for content optimized for that, videos, not for everyday computer use

which makes it more stressful. However, most sites say or reading science papers 24" is better than 27", so I would avoid 27", as I too find it too big, and you need zoom font 300% to cover the whole screen. For espionage safety, Dell, HP, ViewSonic, Pixio are the best US company designed monitors. US company monitors are usually flat, or 1500R, 1800R, no quality 27" (under 350$) 1000R US company design monitors exist. However, most people reading text read only stuff on the left or right depending on the text area, so the curved ones may cause stress due to glare and distortion on the right and left. Any electronic device, mouse, keyboard, USB, monitor, PC, laptop need to be by an American company (or whatever country you live in), made in USA (or your country of residence), ideally, or at least US design (if you're American). Buy those with rating 4.6 or above ideally. With most windows, the text is on the left, in articles online on desktop or huge html papers, so you can minimize window, the adjust size to almost 97% of max and shift it more so text is on the center, until you buy 1000R, curve of a circle with 1 meter radius, which is our eye curve and also ideal since we sit at the PC from 1 meter or less usually. Otherwise, you refocus lens to 6 inches longer when reaching the left end of the text line. ☺☺☺

Response time increase blur with movies, but for reading, it's not important, just curvature, resolution and refresh rate. HDMI cables, like USB flash drives, present a security risk, so maybe buy a trusted or $6 gold plated 3 ft HDMI 2.1 Amazon brand that was more screened (made in *Vietnam*, unlike most made in China). USB cables (USB 3.0 10x faster, 4.8 GB/s than 2.0 0.48 Gb/s, though they cost almost the same on Amazon) also have security risks, but are OK as extension for fans, etc. Often times, foreign products can be ultra cheap, due to being fixed with military spyware installing hardware; a 10 ft HDMI 2.1 cable is 14$ from Amazon, etc, but a tiny few sell it for 6$, possibly as a bait to install spyware, etc. Old VGA cables used to transmit only visual data, now they can send audio too, so speakers on a monitor can become hacked by HDMI cables engineered to add sound frequencies that alter the brain, issue silent commands, damage organs via inaudible sound. Likewise, HDMI can have various alterations to mess with visual perception, make suggestions by images created in the background that we don't detect but the brain can sometimes, etc. On Amazon you can check *Sold by,* before *ordering*. ☺☺☺

11.17.1.6.15. Totally avoid sun gazing (invented by some engineer and popular in many Indian "scriptures and old writings", see old site; recall, same ☺abysmal IQ☺ guys in India thought Ayurveda with lead/mercury is good for you and a Chinese emperor took mercury sulfide to live longer and died young), a technique that Indian fake gurus claim will improve eyesight, when in fact it can make you blind, as the ocular lens focuses sunlight and then burns the retina just like a magnifying glass burns insects or leaves if you focus sunlight with it. Wear sunglasses when out more than a few seconds if sun is intense and UV index above 4. Don't burn your retina as you may lose eyesight. Avoid using *skin* drying powders without bandage and silicone seal glasses; *before naps or sleep remove makeup (avoid makeup, since makeup and makeup*

removers damage the eyes, see page 98), acne drying powders, creams, etc by using lint-free cotton pads 540/10$ (for areas above eyes to minimize shower water moving it to eyes) and then washing face (the area above or around eyes needs be washed with soap ultra carefully, while holding the other hand on top of the eyes, if head is not horizontal for a few seconds (using hand with water in the palm to wash off), to avoid a soap+acne lotion oil emulsion from dripping on the eyes and tiny traces of it remaining nearby, later combining with excess eyedrops that return to eye when we tilt head by gravity). *We don't want sulfur,* salicylic *acid, zinc oxide, charcoal and other dry pimple 'lotion' (powder) constituents to dry the 'skin of eyes' (cornea)* – so be ultra careful and tape anything above eyes as the powders can fall into eyes if you don't tape it with bandage and don't wear silicone seal glasses, fall off on your eye mask and pillow and enter eyes… causing dry eye... even if home made) or acne ointments, facial cleansers that contain chemicals that redden or dry eyes, see acne section for non-chemical sonic non-spinning face cleaning and blue/red light acne removal. MSM and sulfa-drugs can induce severe eye issues, so beware of 100s of products with MSM (even eyedrops) on the market, washing acne sulfur powders well too. Acne is a risk factor for dry/red eye, since it can spread to the eye area, increasing eyelid oxidative stress, thus indirectly assisting the atrophy of MGs and making it easier for ocular rosacea to appear, *depleting face immune system from eye protecting antioxidants*. We touch our face 100s of times daily, with dirty hands, we wash face once, our face is so dirty, it needs to be clean, pillows changed often too, bed sheets, etc. for best eye health. Use the Pulsaderm acne mask or similar to diminish *P.* acnes *bacteria, since these* bacteria *secrete lipases which break the tear lipids and* cause dry eye. P. acnes is also found in MGs, arteries and can cause styes and plaque.

11.17.1.6.16. After you do warm compress or eye mask and eyelid massage to express the gland oils, especially if you have crusty eyelash base (evident when you wake up in the morning, it's called blepharitis) due to the Demodex (or face) mite, or if you have normal eyelids but suspect "subclinical hidden infestation" by these mites. Dust mites are killed by salt (put fine salt in a container with open lid) and they run away from essential oils and the smell of onion. Their poop causes eye allergies. Face mites (different from dust mites) are Demodex mites, they increase oxidative stress, by making it more likely to get pimples and styes too, as they live near eyelid hairs, causing the destruction of the eyelid glands, since some live inside the eyelid gland, not just at the base of the eyelashes and facial or scalp hair. Too many e*yelid or cornea blood vessels seen with a 20x mirror or* 40x magnifying glass over your phone back camera, can be indicative of overgrowth of bacteria (P. acnes, etc) over time which led to inflammation; bacteria secrete lipases (lip-ases, ases is ending for all enzymes), which break down lipids of the tear film, causing dry eye and more inflammation of the MGs, which then causes bacterial overgrowth and more lipids being broken down and worse dry eye. Both face mites and bacteria cause dry eyes,

due to weak immunity, ultra low glycine, *a common issue in A+ blood type (low acid, low protein digestion) vegans. Half of humanity are* half dead ultra infected beings, due to low vitamin D, *meaning* immunity is ultra weak and they suffer from undiagnosed sepsis, so none can live to 4000. *Face mites are* present on everyone's face, yet destroying only some people's MGs; we need (be aware of risks for people with abnormal vasculature around eyelids explained in the NuLids paragraph) to scrub the dirt (bacteria, etc) that came out and clean eyelids with a foam (can't return on Amazon) like as explained in the NuLids section. ☺☺☺ Many useless foams, wipes, sprays are presented at the dryeyeshop. None of these work, so ODs suggest 1% ivermectin ointment (paper explains all failed for years except ivermectin) or xdemvy eyedrops (first FDA approved artificial tear for demodex). Ivermectin is 20$ on Amazon, just apply a little, remove it after. The mites go to the hair follicle base (see video) to eat the sebum, and can cause eyelashes to fall often, to thin, or, for a few people, even scalp baldness and meibomian gland atrophy as they go inside the MGs too to eat sebum there, depriving you of the lipid layer of tears and causing dry eyes. After age 45, 75% of us have Demodex, 100% after 65. Collarettes are the clinical sign of Demodex blepharitis (not bacterial blepharitis), the long sleeves, the long cylindrical (see pic) clear, white/yellow dandruff like mix of keratin, dead skin cells, mite feces. The difference is visible in the bacterial short spherical 'sleeves' dandruff pic (seborrheic blepharitis) vs mite 'long thinner sleeves' dandruff (Demodex blepharitis). 3 examples of useless Demodex control (not eradication) sprays are: 1. Zocular 2. Cliradex (next page) 3. HOCl 0.02%

1. $39/1.7 oz free shipping Zocular contains phenoxyethanol stabilizer/preservative that destroys meibum cells in vitro, so maybe avoid Zocular on the MG orifices, since they show no clinical studies on meibum glands production capacity with 5 year daily use of Zocular as described with the 1000+ compounds in the plant extracts, hydrolyzed soy protein, phytate (binds metals we need in the eye for DNA repair), caffeine, etc mix of Zocular; Zocular was developed by MD Peter Pham of aphado.com who also created some free online tests for monitoring our vision as we age (glaucoma, AMD, retinopathy are common issues as we age); he kindly explained to me via email that in vitro toxicity is not the same as in vivo, for meibum cells, which is true – especially in that mix, phenoxyethanol may be 90x less damaging, and the mix could help meibum glands but they offer 0 proof of that; we need wait decades for effects, but they may be able to do some rat studies, rabbit etc. It may still be very safe even in 2050 for eyelash base wash once a week or two, as long as we never use it on MG orifices (see video)? Zocular is okra based so it causes far less irritation (tried it 1st time Jan 4th 2022) than tea tree oil (TTO) based products, see ETM 2021;21(4):338 for TTO (better overall, 40 min kill Cliradex with the best TTO compound vs 115 min okra) vs okra Chinese product comparison. Cliradex is even better than TTO. See 5 min eyelid cleanse with ZocuKit for ideas on using STERILE q-tip at home with a safe foam as validated by human studies in 20k people over decades (none I'm aware of

exists, Cliradex is too irritating, but no such studies exist for most products first few decades; it's whether you trust or not); with Cliradex we can never do what the video shows, as stinging would make eye red for a day or two when that stuff gets inside as Zocular did a little in the video – to really get to the base of eyelashes we need something like a q-tip and strong surfactant to wash it off, just face wash with soap and hand won't do it, since hyaluronate and sticky lubricants dry out at the eyelash base and trap bacteria and can cause inflamed eyelids or eyelash root where Demodex can hide, so bad as it is, Zocular is one of the few options out there. In theory, you could take soap and water, use a q-tip and rub with eyes closed well, since finger angle is not small enough to reach base of eyelash. You can do this twice/week for 0.5$, instead of paying 150$ for Blepharitis office treatment every week.

One MD claims that Zocular was good for her patients, but we have no long-term safety data; yet, short term, if used rarely, this may be safe, even long-term if not used more than once a week, with the daily use of a 'Cliradex like' brand that doesn't involve 5 minutes intensive scrub that risks spilling tea tree oil into eyes. Perhaps silicone q-tip is way safer (because we don't destroy the fine eyelid skin, don't create collagen tears, valleys, cracks that become new demodex infestation places or other bacteria) than the optometrist video dry cotton q-tips (always wet with sterile saline sterile swabs if using cotton ones, it's 50x safer than dry ones for skin integrity) if you have no visible blepharitis (meaning you don't need to high friction, vs easily sliding silicone, cotton q-tip to grab the sticky solid junk as the doctor does in the office for people with no good habits of daily or twice weekly eyelash cleaning; the junk is not always demodex stuff, can be just sticky eyedrops that solidified with some eye mucin/oil secretions). However, silicone slides too easily, so it may not be good to grab the loosened junk at the eyelash base, gliding over it. Cotton fibers often get into eyes, if you don't moisten the q-tip and cause cytokine storm, red eyes, so use mirror afterwards, remove with tweezers or a moist q tip any lint pieces or take a 1 minute cold shower to wash off the lint (not ideal, due to chlorine and chemicals). Amazon carries only Zocular wipes, the foam+wipes are $83 on their site free shipping, vs $89 for Cliradex foam+wipes, but Amazon pic allows you to see ZocuWipes (can't return on Amazon) ingredients, which are similar in the foam as with all brands, with tiny differences, *I would not use* 2000 STERILE q-tips/40$ with the foam *to save $ on wipes, but* instead go cheaper with reusable q-tip and save your eyes too, just get a $9 alcohol dispenser to easily clean q-tip or use alcohol pads (400/4$, Walmart online purchase, free ship if buying 10); wipes and cotton q-tips contain tiny fibers of cotton that can irritate the eye, so silicone disinfected q-tip is safest; recall to always wash with some water your eyes afterwards, so maybe get some purified water in a squirt bottle, to avoid harsh chlorine & save water)☺☺☺

2. $30/1.5 oz Cliradex preservative free foam made by cliradex.com, which contains only 9 ingredients, vs 900+ for Zocular (Zocular has also virtually 0 PubMed studies on its long-term

safety), with the active ingredient 4-terpineol, (2% for the foam, *4% for the towelettes when I asked the company, meaning* way better than most 1% tea tree oil products *which are less effective*), the tea tree oil chemical that kills Demodex mites (not dust mites) and other bacteria which are in some cases causing or worsening dry eyes, since the creatures bury deep within the eyelash and facial skin, invisible to doctors, and eat sebum at the base of the hair follicle and cause inflammation of the eyelash hair roots and nearby MGs leading to its clogging and atrophy over time, thus to dry eyes, even if no crusts on eyelash like in the worst Demodex infestations ► TVST 2013;2(7):2 found 5% Terpinen-4-ol or T4 killed as much as 25% TTO (tea tree oil)… better than TTO at all concentrations, while "reducing the adverse and antagonistic effects from other ingredients in TTO… (T4, the main TTO ingredient), was found to be the most effective and was the only ingredient in TTO that remained effective at… 1%. Demodex is observed in.. 100% of (those over 70)... demodicosis is the most common… cause of 29% to 74% of… blepharitis… ocular demodicosis, verified by microscopic examination and the counting of mites on epilated eyelashes, is strongly correlated with MGD". A 2022 preprint paper (no peer review yet), found that 5% thyme oil kills Demodex in 6 min, vs 2 min for 100% thyme oil, while TTO takes 4.6 min at 100%, *36 min at 25% TTO* (40 min for T4 4% paper above) vs 5 min for thyme oil, so you really need leave Cliradex there for a while to be able to kill it. BJO 2005; 89(11):1468-73 found demodex is not killed by some things people try. In July 2023, the FDA approved world's first Demodex Mite killing eye drop called Xdemvy, which may be 300$ for 6 weeks with insurance and 2000 out of pocket. Xdemvy supposedly works wonders in some people, where tea tree oil based eye scrubbers, Cliradex, etc do nothing. Get a microscope and after you grab yellow dandruff from the base of eyelash with a meibomian gland expressor forceps, see if any mites exist @ 500-900x magnification. Please read Universal Immortality Inc 2nd paragraph to know more about Demodex in vivo confocal microscopy IVCM & HD-OCT.☺☺☺

Demodex is like P acnes (on everyone's face, causing no acne until they grow out of control), on everyone's eyelash and hair follicles, but sometimes they grow out of control and cause crusty eyelids or dry eyes via blepharitis induced MG clogging or inflammation. Dr. Allen uses OCuSoft tea tree oil, but this is less effective (see paper above) and burns more than Cliradex, which doesn't contain cineole, the component of TTO typically responsible for skin irritation. However, Cliradex contains controversial compounds: polysorbate 20 (polysorbate 80 was found to kill 30-40% cornea cells in vitro, can it degrade to release sorbitol?), butylene glycol, allantoin, *(EWG score of* 1 only, pretty low, *keratolytic effect of skin thinning means it can thin your cornea and skin of MG orifices, leading to potential issues, though it seems to have mostly benign effects),* cocamidopropyl betaine CAPB *[also in Zocular, a little similar to toxic* BAK preservative, BAK is $Cl^-N^+(CH_3)_2(\text{-}CH_2\text{-}C_6H_4)(\text{-}CH_2)_{7\text{-}17}CH_3)]$, mix of coconut oil fatty acids derivatives, main one being lauric ($CH_3\text{-}(CH_2)_{10}C(=O)NH(CH_2)_3N^+(CH_3)_2\text{-}CH_2COO^-$) that makes up 50% of coconut oil (keratolytic effect

that causes canker sores in our mouth and gums can also destroy our eyelids and cornea just as cationic BAK like surfactants often do; CAPB destroys oral mucosal cells, FD 2019;16(6):450-7, can they destroy goblet cells on cornea, the mucin layer?, see 'allergen of the year award' and CAPB video), sorbitan oleate *(contains sorbitol unit, like many "dry eye sprays, etc with sorbitan oleate or other sorbitan esters", and due to its less polar nature could pass thru cornea and do some damage as sorbitol can).* So, wash it off after use to prevent eyelid damage, don't open eyes while you leave it there a 2 minutes to treat the eyes, since some will remain stuck to the eyelash base for 1 hour and kill Demodex. They sell tea tree oil products on Amazon or $ store, so you can use that to disinfect any cold compress you may use and then wash it away with water, to disinfect Demodex, also wash pillows, foam pieces of your eye mask. If you don't have demodex, it may be better to not put any chemical on the eyelids, since inactive ingredients may block orifices or cause allergic reactions which will clog and atrophy the MGs. If we wash pillowcases, sheets, towels, hands, often, face with soap etc we keep eyes clean without need to put chemicals on the eyelashes, eyelids that may irritate the MGs.

It's good to wash hands at least 3 times, face at least once; they got 12$ touchless Jzori or Jzori2 (mine were white, so I bought white USB to DC cables to match the USB, easier to see mold and dirt to clean: see video on how to install it, though you can just rest it on a window sill or on a piece of plastic, like a $ store cylinder bottle, like I did, no screws needed) same product as Sears, *no batteries needed, just USB to socket adapter* to plug DC cord in (8$/5 black cables 3.3' USB to DC 5.5×2.1 mm, for soap dispensers in all baths, kitchen areas; or 6$/2 white/black 3.3' or 8$/3 white/black 4' or 2 white + 8 adapters that you can use later); cable comes with the soap dispenser for Jzori, but not Jzori2) into, *best of all, as bo rechargeable lithium bateries, keep it plugged in*) and other IPX4-7 waterproof soap dispensers for COVID19 era at Kmart, Amazon that allow you to use no batteries (unless you travel to no electricity areas), all you need is the cord that comes with it going from AC adapter circular port to a USB to socket adapter like the one described in the dirty electricity section; downside of many (Umickoo, IPX4, or ipx7 Aobor) is that the battery is rechargeable and if it is bad, it won't work anymore and it's not replaceable, so it's best to always choose one that can work without any battery (disposable or rechargeable) too, like Jzori, which can last forever; rechargeable batteries can stop reaching the required voltage and not work, whether they're unremovable built in or the removable types (3 or 4 usually); the issue with removable is most stores sell 1.2 V rechargeables (which don't work), so you need buy 1.5 V rechargeable to avoid buying endless batteries or to use 2 1.2V rechargeable and 2 alkaline as that will do it too, sometimes even 3 rechargeable and 1 alkaline to save $ and the planet in the long run; the 1.5 V purple Delipow rechargeable Li-ion discharge fast and can't be recharged with provided charger, same for other AAA Li-ion from Delipow; their 9V Li-ion also discharge fast, so can't be used for 9V battery soap dispensers much or

smoke alarms; no wonder we can't find in stores Li-ion 1.5V rechargeable, only at Amazon stores. Li-ion can explode easier than NiMH, so alkaline may be the only choice if buying one with 4 batteries or the rechargeable Li-ion built in types to save batteries; I measured Jzori electricity use, they use 0.7 watts when you use them 1 second, then go to 0 – this saves the planet as you don't need use disposable or rechargeable batteries that also waste time to recharge and change, buy, dispose of at Goodwill for free or other electronic waste, etc).

Just as we don't want to use the bad artificial tears ingredients making eyes redder and drier long-term, we don't want to scrub eyelids so much with inactive ingredients, etc, they destroy the glands and block them with chemicals; even makeup removers can damage them: page 98. When you buy one of those $8 magnifying glasses on Amazon for jewelry 30x-60x (place it on phone back camera to take pics, don't use the light, as it's too bright for open eyes) and see in a mirror how fragile the vasculature (of the eyelid and eyes) is, *you will be so careful and gentle, so cautious about what eyedrops, scrubs, methods, treatments you use, compared to some of these people making youtube videos doing scrubs and using so much force as if nothing can break in there and it's pure rubber*. They probably never saw 30x+. They got many brands for demodex, see which one is working best for you☺☺☺. Cliradex 24/40$ towelettes got triethanolamine, so I avoid the wipes, using the foam only; Clear-C has B_5 and similar ingredients to OCuSoft wipes, but it's only 20$/90 wipes; Clear C is not a strong demodex fighter, but it says it's for dry eyes, US made; they got 70% alcohol wipes at $ store 50/1$, to use in days when you forgot your wipes, so stock your car with the alcohol wipes for hand and face disinfection before you use eyedrops while outside; rarely you can use alcohol wipes on eyelids if you got something bad there, but gently avoid using alcohol wipes always, since alcohol can damage eyelid skin. Zocular got a 2 min & 3 min video on why artificial tears are useless vs natural ones.

Because Cliradex is quite irritating, for many patients, hypochlorous, next product, may work better as it doesn't sting so much. Or Zocular may work, if safe for your ocular area with eyes closed. OCuSoft emailed me that they even sprayed hypochlorous inside the eyes and it caused no irritation, that would be unheard of for Cliradex, it would make the eye ultra red and sting like nuts. So, do keep in mind that the ad for Cliradex, spread the foam and let it there for hours is a little unrealistic. Well, never spray anything into the eyes, no HOCl is for open eyes, HOCl reacts indiscriminately and attacks good cells and cornea too, not just microbes.☺☺☺ *At least Cliradex PubMed search gave 10 results, while Zocular got 0, HOCl 9,000.* The main Cliradex issue is eye/eyelid irritation, so you need wash it in 30 sec, can't properly foam, wash base of eyelids without irritating eyes since some will slide into eyes when you do a 5 min cleaning as in this video. If we wash it 10x faster than Zocular, it has no time to loosen gunk, to kill off microbes. I no longer use Cliradex or any cleanser, after using it for 1 year, due to irritation of eyes/eyelid. If you have mucus on the eyelid base, use 2.1.6 expressor to gently grab it as explained here.

Zocular possibly gave me styes after using it, unless it was Hylo Night ointment.

3. HOCl 0.02% spray, a compound produced by neutrophils to fight off infections inside the body, but do read scary Amazon reviews and discontinue use if anything weird happens, like red eyes or falling eyelashes. When I tried HO-Cl for 2 weeks in 2020, it was the $16 Thera by Akorn 0.06% NaCl, 0.01% HOCl, 0.002% NaOCl, 99.928% electrolyzed water (as box shows at RiteAid, Akorn makes over 100 ocular pharmaceuticals) so my eyelids became swollen; this is that same company that never gives any info on phosphate concentration in their tears, even though it's critical people know. You can also try $20 OCuSoft (no returns, double the HOCl, so more irritation maybe, yet stronger killing of microbes, but lasts 18 months vs 24 for Thera) that has 99.93% electrolyzed H_2O, 0.02% HOCl, 0.048% NaCl, 0.002% *NaOCl* (*NaOCl* 5% is *bleach, so it contains 2500x diluted bleach too like all these solutions with NaOCl; Dr. Allen video above says it has no real bleach, which is correct; bleach is 2500x more concentrated, with higher pH*). Says store 65-75°F, so keep away from heat/light. OCuSoft sells just a few products, while Akorn sells over 100 ocular medicines. You could also try $18 Heyedrate *(free returns if irritation happens)* that has NaCl, electrolyzed H_2O, 0.015% HOCl, though this is subcontracted to some company, they don't make anything, it's just two eye doctors. However, the Amazon second video on OCuSoft indicates that HOCl won't have ability to remove bad oils, since it has no ester surfactants in there, like Cliradex, OCuSoft Clean & Spray do. OcuSoft CLAIMS that HOCl is for severe cases of Demodex infestation, and is not needed daily for most people, so it could be used in addition to Cliradex; so maybe used once a week max or month to do a major eyelid cleaning, so then we want something that lasts a long time. If you use sterile q-tips moistened with 0.9% saline you can gently wipe eyelid junk too, after using HOCl if surfactant ones or Cliradex irritate. Some use cotton balls or cotton pads, though using 20x mirror is useful and needed to make sure no lint remains on eyelid (since it gets to cornea and scratches it and makes eyes red), especially if you use sterile q-tip moistened with HOCl to wipe the MG orifice area of eyelid to disinfect it that way once a week or so in addition to the outer cleaning with disinfected silicone q-tip or sterile saline moistened sterile cotton swab, q tip.

OCuSoft eyelid scrub has PAPB preservative, while Cliradex doesn't have preservative, Cliradex seems safer, having fewer odd chemicals. ☺☺☺ Avenova has 0.01% HOCl for a gentler effect and NovaBay Pharmaceuticals explains on Amazon these things need be used within 30 days, otherwise, they lose the potency, like OCuSoft, Heyedrate and others did in NovaBay tests even after 1 week. Not sure why Avenova costs 50% more than Heyedrate if same ingredients, but HOCl is losing potency fast vs Cliradex: "HOCl is unstable against ultraviolet (UV) light, sunshine, contact with air, and elevated temperature (≥25°C)...stable HOCl solution requires formulation in *pure water harboring concentrations as low as possible of various compounds and ions*, as well as storage in dark and cool conditions (<10°C to maintain the concentration of HOCl" ►

Bioco Sci 2017;22(4):223-7. RO explains more about hypochlorous acid, HOCl, says OCuSoft lasts 18 months, Thera (Akorn) 24 months (6 months extra since HOCl concentration is half); 0.002% NaOCl shifts equilibrium towards HOCl formation; pKa is 7.42 for HOCl = H^+ + OCl^-; papers and OCuSoft staff explained that companies that make HOCl without NaOCl will have product expire in 1 month, while those with NaOCl expire in 12-24 months, so maybe Avenova, Heyedrate will become useless well before OCuSoft, Thera, Zen; see this for electrolyzed H_2O; RO says that Zenoptiq got "99.94% electrolyzed oxygenated water, 0.048% NaCl (salt), 0.01% HOCl and 0.002% NaOCl. Not sure what oxygenated water means in this context, but google it. Zenoptiq says on bottle it lasts 18 months if kept at 65-75°F, away from light, while Heyedrate doesn't say that, indicating NaOCl may make it more stable than Heyedrate and NaOCl free formulations.

Don't forget to wash face with soap daily or at least use 2 alcohol pads *to wipe the 2 eyelids when waking up, even if you take shower later, since soap destroys the* envelope *of many bacteria, viruses, COVID19 too*. Wash eye mask, cold compress, anything that touches eyes with soap daily: $ store has some *vegan* soap with safe ingredients, called Venezia, for only 1$, see pic and ingredients here. Change pillow case weekly. By using soap, you remove the need of so many foamy surfactant rich products that may irritate. Cliradex folks say in their experiments Cliradex 4% kills Demodex in 40 min vs 88 min for 0.01% HOCl, so maybe 0.02% HOCl is needed for faster action and controlling bacteria growth. The reality is many ODs say HOCl is useless for Demodex, and works only for bacterial blepharitis, not mite blepharitis. And Cliradex, tea tree oil products can be useless for deep demodex that feeds on the meibomian gland, not just the eyelash base. But even for eyelash base, the concentration is so low, it takes hours and nobody leaves it on for hours. I tried to use Thera in 2021 as some of the MDs said on youtube, just spray and rub and leave it on, but again, it did cause swollen eyelids and even area above eyelids, like it did in 2020. If we use cotton round or ball to apply, we get lint into eyes too, and we remove it, so it may not have time to eliminate the microbes we want gone. But the official instructions show a cotton round (500 for 10$) and the spray wetting that and using the round to wipe eyelids. This HOCl wiping or spraying is not going to do anything about sticky gunk at the base of eyelashes (not visible at 1x, only at 20x mirror can you see this barely, since it's so small and only on 1-5% of eyelashes usually), which needs Zocular foaming washing with q-tip (see above), HOCl wiping is more of a complimentary hygiene for more severe cases, as OCuSoft explains.☺☺

11.17.2. How to activate the trigeminal nerve to make natural tears with 2100+ nutrients (vs 2-10 nutrients in man made artificial tears)

☺Dry or Red Eyes☺ disappear within minutes often when you generate your own tears by simulated yawning after meals ideally (see pages below on all the science on the super critical trigeminal nerve activation), when the parasympathetic nervous system used for tear

production turns on naturally due to digestion, without you having to make a 20 times greater effort to turn it on, when nutrients pour into the blood and can produce vast tears (close eyes, relax in bed, wear eye mask, earplugs even if you wish, simulate going to bed, as that's when we yawn, to focus all neurons on generating tears, instead of visual-audio stimuli; can even open mouth, roll tongue and press *the* back mouth floor or roll it the other way to press back mouth roof 8 sec, if this makes tears 20x more *for you)* prompted by 20+ alarms/*day (30 on phone & 30 on* desktop*, to recall to add drops, yawn tears or take computer break)* (or laughter, we laugh at a joke, let the laugh continue 20 times longer, or blinking 100 times), eyes closed for 5 minutes (except when blinking 4-7 times to produce lipids/proteins, not more, since we drain 2 µL of tears (a tear is 10µL) when blinking while horizontal) to spread/absorb the nutrients, tears 900 times healthier than store ones; ideally don't yawn when makeup is on. You can (after practice) get tears in 2 min, lower cortisol (aging hormone). Read the next pages (after the list below with 1000s of nutrients in yawn tears vs 8 in artificial) to see how to yawn (clears brain toxins too).

The ►►►►► Thousands ◄◄◄◄◄ of Nutrients in the 3 layers of NATURAL TEARS:

Wikipedia explains tears, which *are* 98.2*% water,* got 3 *layers:*

► *The* 1st tear layer ◄, or *the mucin layer*, is 0.035 µm thick. It sits on top of the corneal epithelium of 60 microns or µm. It's also called the *mucous layer. It's produced* mainly by *the conjunctiva goblet cells,* a tiny % by the cornea, limbal conjunctiva glands of Manz, tarsal conjunctiva glands of Henle, main lacrimal glands. It contains proteins (mucins 1, 2, 4, 15, 5ac, etc), hyaluronic acid (12-1900 ng/ml), silicic acid, amino acids. Total proteins in all 3 layers is high "we have identified *1543 proteins* in the tears" ► JP 2012;75(13):3877-85.

► *The* 2nd tear layer ◄, or *the* aqueous *layer*, is 8 µm thick. *It's produced* mainly by *the almond size lacrimal glands around eyebrows mainly, a tiny % by* 2 smaller lacrimal glands, Krause and Wolfring, see pictures at JO 2016:7542929 (which found "*52% and 74% of (dry eye) patients over the age of 50 showed signs of (lacrimal gland) periductular fibrosis and ductal abnormalities*") and on Google search images (Krause are where upper and lower conjunctiva meet, 40 above, 8 below, above main lacrimal ducts, Wolfring right near the end of meibomian). It contains carnitines, sorbitol (used in Hylo Gel at maybe 130 mM, or 1500 times above serum level, with serum 0.088 mM possibly even higher than tear level, since serum glucose is 32 times higher than tear glucose), inositol, taurine, metabolites (amino acids 76 mg/L, urea 0.4 mg/L, lactate, glucose 25 mg/L *(if healthy,* diabetics have 4-5x higher*, so it is used to detect diabetics)* or 32 times < healthy 800mg/L *serum* level), many proteins such as those in BJO 2006;90(3)372-77 , lipocalin, lactoferrin [tear LF or Lf is an AMP or antimicrobial protein (20% of milk protein), with anti-inflammatory functions, used as a biomarker for our immune function (FI 2019; 10: 1178), that binds iron (ferrous ion, thus the name is ferrin, easy to recall, ferrying or transporting

ferrous ions, + lacto from milk) used by microbes to grow, Lf "was 3.16 g/L, 1.73 and 0.90 for colostrum, transitional milk, and mature milk" ► Ntr 2018;10(9):1235 (7 g/L in colostrum, 5 g/L first 28 days in other papers or 15 g/L in colostrum in preterm babies who need more protein to grow)], lacritin (generated in small amounts by the MGs and conjunctiva), antibodies, sialic acid 37 mg/L, lysozymes 1-2 g/L, citric acid 6 mg/L or 0.031 mM, lactic acid 1.5 mM (1 mM=1mmol/L or aprox 1mmol/kg tears), vitamin C 1.4 mg/L, nucleotides, phosphates (all forms, HPO_4^{2-}, $H_2PO_4^-$, PO_4^{3-}) 1.45 mM, bicarbonate HCO_3^- 26 mM, chloride Cl^- 106-135 mM, growth factors, cytokines, minerals ► Sensors 2017;17(12):2840 ► sodium Na "(120-170 mM)... (0.9% *NaCl like blood plasma*) potassium K (6–42 mM), calcium Ca (0.3–2 mM), and magnesium ions (0.3–1.1 mM)", zinc 0.7-6 ppm or 10.7-92.3 µM ► JMDM 2016, 5:4, Mn^{2+} 0.2-0.9 µM. 97% of tear minerals are Na/K. *Lysozymes, 20-40% of tear* proteins, are glycoside hydrolases, *anti bacterial enzymes* that cleave glycosides off bacterial walls, killing bacteria; *tears have more lysozymes than any other body* fluid ► CO 2008;2(2):261-7, being the only body area that is always wet, in contact with air bacteria that can stick to the wet surface.☺☺☺

► *The 3rd* tear layer ◄, or *the lipid layer*, is 0.1 µm thick. *It's* produced mainly by *the* eyelid *meibomian glands*, MGs, a tiny % by the Zeis and Moll glands. It contains about 100 proteins, 600 lipids. IOVS and PLR report studies found in expressed meibum: hydrocarbons like squalene 0-38% (though most authors believe non-squalene hydrocarbons are from *cosmetic* products, eye ointments people used before), wax esters WE 8-45% *(wax ester examples:* fatty acid bound to fatty alcohol, such as lauryl palmitate or lanolin wax esters, 100s of fatty acids bound to lanolin alcohols, like sterols, hence they use wool fat (lanolin) and hydrocarbons from mineral oil *in* ointments, *eyedrops to provide some similar or identical compounds to those in tear 3rd* layer, since lanolin, like tears, contains 8.1% ceramides (Table 1, free pdf, J Cosmet Sci 2006;57:23-35) and other types of fats in the 3rd layer, since meibum glands are sebaceous type of glands and sheep and humans share many similarities; hence when we take a lot of vitamin A, retinoids, acne medications to suppress sebum, we can get dry eyes as we suppress the *3rd layer),* cholesterol (0-1.7%) & cholesterol esters (CE) 0-39%, free fatty acids FFA (oleic most abundant unsaturated acid in FFA, CE, WE, TG) 7-24% & their triglyceride TG esters 11-43%, phospholipids 0-16%, ceramides, 0.01% carotenoids, a lot of variation.☺☺☺ PLR says polar lipids include 70% phospholipids PL (PC phosphatidylcholine 38%, PE phosphatidylethanolamine 16%, SM sphingomyelin 7%), 9% cerebrosides, 21% ceramides; dry eye patients got much less SM, PE as % of polar lipids in meibum, so some think SM & PE are key to tear stability; they reason so because polar lipids interface between the rest of lipid layer and the huge aqueous layer, so when PE-SM are low, the lipid layer may break easier leading to evaporative dry eye; this is why a diet low in PE (major component of lecithin in soy, legumes, pollen) could cause dry eyes. The lipid artificial tears section explains Clear Eyes got PC, and Systane got DMPG, an artificial PL

(dimyristoyl phosphatidyl glycerol, a form of PG, phosphatidylglycerol; PG is a PL present in most cell membranes at 1%; not as good as PC, since tears have way more PC *than* PGs). PC helps, since if eye senses more PC, the synthesis of PE is boosted (at the expense of PC & other PLs), since there is limited phosphatidyl addition capacity. "More than 600 unique lipid molecular species were identified" ► JLR 2018;59(11):2223-36, "more than 90 proteins in human MG secretions" ► BJO 2006;90(3):372-7. The lipid layer prevents the evaporation of the aqueous layer. *"the* number of minor components *and compounds yet to be identified* could be in thousands" ► PLR 2011;50(3):278-301. We eat 2-5 kg food/day. If we don't eat 2 µg B_{12}, 1 billionth of food intake, we can die fast. Our eyes 'eat' a lot of nutrients from tears to be healthy and prevent dryness, so there may be B_{12} like compounds, in billion times lower levels, we didn't identify, that are key to eye regeneration and health, minor components, like B_{12}, that we don't know. "Meibum hydrocarbon chain order decreased from about 48% trans rotamers at birth to about 30% trans rotamers at 90 years old" ► OR 2010;44(1):34-42. This & other changes explain why as we age we get more dry eye. We need complex eyedrops (500+ compounds, not 8 today) that mimic healthy meibum in the future, like at age 20. ☺☺☺

Advantages of yawn tears and HOW TO GENERATE YAWN TEARS:

1). The Holy Grail and science of preventing eye destruction with artificial tears:

1.1. Introduction: the science of trigeminal stimulation. Before we go into yawning as tear producer, to help the skeptics to understand how it works, this long paragraph will present some technologies, advertised by many ODs and MDs as amazing dry eye devices (*without explaining the deadly effects*) to sell to clueless desperate 'wonder dry eye device seekers' buyers, that use slightly similar ideas to yawns but very different forms of excitation of the trigeminal nerve; when you yawn hard, you tear slightly, if you noticed it. Just because these devices are toxic and give endless headaches and produce no tears, doesn't mean yawns are similar, they're wholly different, even if they do excite some common trigeminal pathways. What we would be doing is taking this to a 40 times higher level. We use an existing path of neurostimulation and make it 40 times stronger tear flow than in a normal yawn. The first deadly and useless device, made in USA, is the iTear100 2.0, as an amazing and safe device..., a 2022 approved device that costs 200$ and 30$ a month to refill (what a ripoff.) produces 150 times above safe EPA level of magnetic field for monitors at which we stare for hours daily *(about 300 mGauss even at intensity level 1 (minimal, not 5 used in clinical studies), 3 times higher than under the most toxic, cancer causing super high voltage lines in USA, in our houses it's about 1 mGauss or less all the time)* and will cause as a result a big headache that lasts 2 to 8 hours, since that RF field is super deadly, like a cell phone to your eyes, same high reading like a cell phone 5 mW/cm^2, causing eye *cancer*, like cell phones cause brain cancer tumor in the shape of antenna facing the

brain, so you will get nasal cancer and also possibly brain and eye cancer; *we can't fix dry eye by killing people*; they didn't even refund the 100$ they promises, until months later I asked for a refund after shipping it back within 10 days, not good customer service; the Q-device vibrates too, the eyelid, and it produces no RF, magnetic or electric field like this, being 1000 times safer.

The iTear100 may have a remotely installed component by a supplier to cause headaches in people to facilitate mind control; some will say that it's just 1 minute, 30 seconds per nasal side, 4 times daily, so 4 minutes total, but this is not really the best idea, since people can get brain damage from cell phones used only 10 minutes daily, even cordless phones; so definitely, save your head, eyes, brain and money and if bold enough to try it after you measure the mGauss by letting the device touch your meters everywhere to detect the highest reading where the actual sensor is, only use it 5 seconds max at a time, maybe 20 seconds a year max, *then wrap it in aluminum foil, as it generates toxic waves;* I measured the RF, electric, Magnetic fields and iTear100 is putting a lot of RF even when turned off. This useless (for many at least) brain damaging device requires prescription from the company MD that is given within 1 day usually after filling a long questionnaire. Yawns work very well, as long as you had a good sleep last few days or at least rested well last few hours. iTear users place it on your left and right nose sides for 30 seconds at a time twice a day, 2 min total, to train eyes to produce healthy tears with 2100 natural chemicals, instead of the toxic man made drops with 5-20 chemicals. The author of this video claims in other videos that iTear100 works far better than a vibrating toothbrush applied to the nose; however, I tried it 11-24-2022 the 1st time, and it produces 30 times fewer tears than I can by the yawning technique described in the 20 pages after this paragraph (so, don't expect iTear100 to work in 30 seconds, vs 5 min to yawn without it); it vibrates your head too slightly, via the nasal bone area and gives a slight headache after 20 seconds; but it does work, a tiny 7 µL comes out after 30-50 seconds; 5-10 min yawns produce 210 µL, but this can't be used more than 1 min at a time without a big headache, so I returned it. Like with all tear generation, it only works 20 times better when well rested for prior 2 days, so if you had bad sleep, it will be producing 5-20 times less tears than when you got good sleep; that's why spies sleep deprive people for years in order to brainwash and cause dry eye via injuries to different body areas that take all immune cells to the toes instead of eyes, so bacteria multiply inside the eyelid glands causing dry eyes; the device helps skeptics to know the yawn thing is real and you don't need iTear. iTear seems 100 times safer than the invasive, into nose, discontinued True Tear device (30 page pdf here). Many iTear100 videos are of MD Laura Periman *(from eyeeco.com group of 4 MDs making the XL and odd inserts that may press on eyeballs if used as recommended and give glaucoma, due to foam inserts being too big and pressing on eyeball if not trimmed as I explain); Laura* did much of the research together with OD Paul Karpecki.

iTear stimulates the nasal branch of the ophthalmic branch of the trigeminal nerve (see at least

10 pics here to understand this super important nerve that controls everything related to dry eyes: cornea and the 3 layers of tears and the glands/goblet cells producing the 3 layers) linked to the 3 tear layers: lacrimal glands and water tears, MGs and meibum, cornea goblet cells and mucins (1st layer of tears); the trigeminal nerve has 3 branches: ophthalmic (eyes, upper eyelids, forehead, top of skull), maxillary (cheeks, nose, lower eyelids, upper lip and gums) and mandibular (lower jaw and ear: chewing stimulates it. Thus, *chewing (no toxic gum, just* empty), *swallowing, burping, kissing or being kissed*☺☺☺, *laughter* (funny video) make eyes wetter (or *massaging forehead, scalp or face* with hands or a very soft or a hairbrush), as these things move the face a lot, *though far less than yawns*; you don't need to touch teeth when chewing as that would damage them if you chew for hours, just move a little the lower jaw; swallowing also stimulates it, so *sip on a water bottle and swallow if it helps, chew, drink water to chew*; *if you sit on the stomach while yawning, you will burp 900 times more (especially after meals, due to air intake, and it can even cause some reflux of food at times, which is not good, as that pH 1 stomach food will irritate your throat)* and make movements similar to swallowing air. *Burps can make a lot more noise than a gentle yawn, distract you from yawns, plus sometimes they can have a little smell of food*. Burping can often distract you from generating tears and wastes neural resources, since sitting on the stomach with head raised uses a lot more calories and processing than resting on the back as if sleeping with some earplugs and eye mask to avoid all distractions and focus 100% on tear production for maximum flow within 3 minutes. It can thus decrease the efficiency of tears per time/calories spent 3 fold. It's not like you have 30 minutes 5 times a day to dedicate to tears. Resting on the stomach *is not good for your throat* to do it daily for years on end, since the rare reflux from burps can damage your esophagus. ☺☺Lovingly *gently kindly*☺☺ don't sit on the stomach, *so when you learn to generate tears always lie on your back with eyes closed*. If any reflux, drink water and go back to resting on the back on the bed, but sit a little higher, less horizontal: on the back, reflux will be about a million times less frequent. *Natural* tears are 900 times *healthier,* at least, *than anything* man made, so you can sip 5 mL of filtered water 100 times (or 20) daily if you want to exercise swallow activation, until you stimulate the swallow part of trigeminal so much, you cure dry eyes; you also need hydration anyway, so chew on empty, or kiss the air often or kiss your spouse, your imaginary yet to be born child (or an *archetype* of all humans yet to be born who need some affection) who will thank you for stimulating your ophthalmic and trigeminal nerve so his nerve will be healthier and lead to healthier meibum, tear production, cornea, etc. IOVS 2017;58(8):4387 found older intranasal True Tear device increased MGs lipids and tear lipid layer thickness in 8 min of device use *(that's 16 times longer than 30 seconds that gives headaches to almost all, so you will have a headache like none in 30 years for 4 days),* while after 2 min, only watery tears.

IOVS 2017;58(8):2694 found goblet cells stimulation for mucin gel like proteins. IOVS 2017;58(8):

2693 found tear meniscus height (TMH) almost tripled from 238 to 635 µm after 3 min of True Tear. Generally TMH < *250* µm is *dry* eye. I also noticed with yawns, I need to yawn about 10 min to get really good tears that last longer in their healing effect, probably that have more mucins and lipids. The trigeminal upper branch, the ocular one, goes to the top of the skull even, so you can see how stimulating that area can cause tears in this video on massaging the nerve points, good to do and stimulate even the optic nerve at the back of the head. *Drink* water always, to swallow saliva after yawns to activate it more, and to keep plasma osmolarity lower 295 maybe, not 325 like in dry eye, since high plasma (urine too, needs be clear) osmolarity means more chance of 325 dry eye osmolarity in general, from studies. See more itear100 studies; if it works, maybe use iTear100 when yawning doesn't produce tears; tapping on the nasal area where device is placed may also work, just like washing hands, massaging upper face, eyelids area will stimulate the ophthalmic branch of trigeminal too; yawns are safer than overstimulating only one area that may damage the nasal branch of the nerve, be gentle and gradually increase, see effects, stop if any dizziness repeats (sneezing is common on first uses). As this 3 min clip explains and the previous pages, store tears are no match for the 2100 nutrients in natural tears.

You may wonder how can yawns cause tears: some say the zygomatic branch of the facial nerve (or zygomatic nerve) is excited via IPL (since that's the zygomatic region the IPL flashes on), then this activates the trigeminal ganglion which activates trigeminal nucleus caudalis, then superior salivatory nucleus, then geniculate ganglion, then nasal or pterygopalatine ganglion, then lacrimal and MGs. A 10 min video explains why stimulating trigeminal causes more tears, using an example of a free with some insurance (500/month otherwise) Tyrvaya nasal spray that causes tears (no preservatives, ingredients in eyes, but may damage stuff in the vocal chords,☺☺☺ nose, throat (13% had throat irritation, 82% had some sneezing, 16% had cough, 8% nose irritation during the 28 day study, voice quality) – the nerve stimulation may work for 1-10 months, but they did no 3-7 year study to prove no rebound effect, i.e. a lowering of natural tear/meibum production 4 hours after this (creating a dependency, needing to use it more often) due to body learning to ignore the stimulation, sort of like redness reliever rebound effect. Yawns and chewing without eating all activate the trigeminal nerve, without sprays, IPL, or iTear, but iTear may be the safest of any tech for dry eye. Another method of generating tears is to mimic the air burps (but without the noise, gentler quiet air elimination) that come out of the stomach or intestine during yawns (see below), by sitting on a toilet or even chair and bending yourself at 40 degrees as if you were to defecate: you can bend 45° before defecating since it allows the feces to come out far easier than the classic sit straight 90° between thighs and the trunk. This position pushes air out and as air comes out you move your jaw, natural reflex to let air out, and this stimulates the trigeminal nerve causing tears when repeated 40 times. You can do it while in the bath before defecation, to generate extra tears when needed or

just bend on a desk chair. This is more of an add-on, since bending too much causes back pain.

1.2. Synopsis of the yawn method, totally different than iTear100 and other devices: no sneeze, no headaches: 86% of dry eye is evaporative dry eye to some degree or entirely, due to the lack of a healthy lipid layer of tears. This dysfunction starts when we're kids sometimes, with the MGs (meibomian glands of the eyelid) orifice (that releases lipids to protect tears each time we blink) getting dry, infected and leading to MGs infection, atrophy, which then leads to lower lipid production, which causes the water layer of tears to no longer be protected from evaporation by the lipid layer; this leads to drier eyes, which makes the inner eyelid part, that we don't wash in showers, to get drier and dirtier, as fewer tear lysozymes (enzymes that chew bacteria) go there to do the daily disinfection. As MGs atrophy advances, evaporation of tears advances and eyes get so dry, that the person even notices the dryness and they learn that 42% of kids have MG dysfunction or MGD, meaning partial dry eye, decades before it becomes strong enough for them to notice it. We clean our teeth, floss them, mouthwash them with solutions, etc 3 times daily, but we never have any ocular routine of daily cleaning of the thousands of pathogens infecting our eyelid margins where lipids come from, area which doesn't always get that many lacrimal lysozymes during walking, poor sleep days with 10 times fewer tear production, etc. We protect skin from the UV, but we don't even want to protect eyes with some wrap around advanced glasses that enable telepathy eterni tone, which would keep eyes wetter and allow antimicrobial lysozymes to reach the MGs orifices and us to have much better, whiter eyes in old age. What can we do? Can we create a simple ocular disinfection routine? We have 1 million articles online about "keep teeth clean because otherwise, systemic inflammation will occur". No such article exists about our MGs orifices cleaning or eye cleaning.

Eyes are the only wet mucous membrane area in direct instant contact with millions of fungi, bacteria, viruses, mites, etc and what do we do, like for teeth, to clean them daily today? NOTHING.☺☺☺ All eye diseases and all aging diseases are related to inflammation, and we need to keep eyes flushed of crap and bacteria. If eyelid glands get clogged, it's like having 20 cavities untreated, they're even in more contact with blood than cavities and will shorten the lifespan; read how today they can image those glands and use 76 micron probes to unblock their orifices (but costs 6000$ from Dr. Maskin to unblock all 4 eyelids). We can disinfect the meibum release eyelid orifice with 5 minutes of yawn tear generation, full of natural *antibiotics* called lysozymes, that don't have the terrible side-effects of synthetic antibiotics some use due to dry eye caused styes or MGD (meibum gland infection or dysfunction are almost the same), after the first or biggest 3 meals of the day (the biggest meals to prevent weight gain), time in which we need some rest anyway and we can meditate a little on World Peace in 3 months and maintaining it forever, to let digestion do its thing and avoid oxidative stress from huge ATP generation and use after meals. To avoid nerve damage on elbows, lean on your entire hands

that sit like a rhombus on the bed, while you support head and upper chest on a pillow, if you face the Earth while yawning. This is essential for people with existing dry eye and anyone who wants to avoid toxic artificial tears with so many bad ingredients that cause meibum dysfunction, clogging, inflammation. The tear generation within the first 5 minutes of finishing eating is 5 to 30 times more productive (depends on sleep quality, bad sleep = 10 times fewer tears), easier to achieve than the same thing done hours later; this is because to yawn and generate copious tears we need to turn on the parasympathetic nervous system, which relates to sleep, digestion, repair, anti-aging, not the sympathetic, which relates to aging, daily stress, fight and flight, computer work, etc. That's why when we eat, it is better to sit, because the brain uses huge amounts of energy to make us stand (you know how much when you have a very bad flu or food poisoning and standing leads to a huge headache or seems so draining), diverting it from parasympathetic digestion to the 'fight and flight', leading to a diminished ability to generate tears after meals. On top of that, eating while standing makes digestion less efficient, as the entire body is not focused on digestion (part of it is on standing, or even worse, on chatting with others and doing many things in between, moving, etc), which leads to poisoning the blood with toxins released from undigested food, thereby shortening our lifespan, increasing inflammation of body and eyes, leading to drier eyes. ☺☺☺

Since we only eat the food for 5 minutes, it makes sense to dedicate 15-20 min to eating only, using relaxing music (that removes anxiety and turns on parasympathetic) to improve digestion. For eons, standing up is related to stress and alertness, while sitting with relaxation. You won't believe what your body is capable of, that you can create by yawns more tears almost daily than when you laughed the most tearful laugh ever, that you don't need pharmacy toxic artificial drops if you got a mild case of dry eye, that you can create in minutes a chemical combo of 2100 chemicals no lab can create, that you're thus a trillionaire. If you don't take advantage of that special after meal time when stomach needs rest to properly digest and your eyes can disinfect better than at any other time naturally, you lost the entire day basically, just to rush to do one thing that could have waited 10 minutes; after meals we got high lipids or triglycerides, as we know from the test name, high sugars, minerals, antioxidants, energy etc to produce the healthiest most nourishing tears, most lysozymes to disinfect☺☺☺ the eyelid margins, the most meibum oils to moisturize the MGs orifice opening, like we moisturize hands after a hard day of work or after washing hands 15 times daily (which makes hands dry and in need of a cream); if not making the meditation after meal routine, we may get a migraine too sometimes, due to not resting after meals and rushing into stuff, causing biological chaos by ATP generation and use at once in vast amounts. Instead of watching sports after meals, just close eyes, wear earplugs, go into your bedroom (turn off light) to simulate going to sleep to trick brain it's time to yawn and generate tears, make blood sugars and lipids lower from the high after meals, by doing this

gentle 'exercise' that gives your brain a break, that is as needed as those for eyes. We saw in 100s of videos in this book how after meals, all nutrients the eyes need are high, we can thus create the best eye cream (from tear lipids, proteins) for eyelids, cornea that exists on earth.

We need to spread our tear producing minutes proportional with the meal size and antioxidants eaten (ideally each meal has equal antioxidant load/100 cal), 5 min after 500 cal meal, 4 min after 400 cal meal, 3 min after 300 cal meal, and spread antioxidants evenly thruout the day, not eat them all in one meal, to protect all organs and eyes and give tears with 10 times the antioxidant level vs 9 hours after a meal; this way, we provide the highest polyphenol, protein, lipid, nutrient/minute spent that we can give our cornea, eyelids, dark circle area needing high quality cream, lipids, peptides, amino acids from tears, etc. We need the highest return on investment for our effort, time, etc, we need efficiency like with one language or immortality capitalism.☺☺☺ The most important time of the day is after the biggest meal, which needs to always be breakfast to prevent obesity epidemics. Why is the biggest time after waking up so critical? Well, the eyes were dry and nutrient starved for 10 hours of sleep and not eating. If you get busy with useless stuff right after meals, instead of giving your eyes a few minutes, you lose the best time to properly "clean *with tear lysozymes*" our eyes like we "clean *with toothpaste*" our teeth after meals also, and keep eyes clean, keep eyes lasting in good shape 3 times longer than today, just like today 90 year olds have much better teeth than millennia ago due to daily teeth hygiene. After meals you have air in the stomach due to eating, so always rest on the back, as resting on your belly will cause burps: after *meals*, your tear producing *efficiency* is far higher.

2). Preliminary discussion on unclogging nose and electrolytes and Na/K ratio. You will notice when you yawn to generate tears, that your nose will get clogged a little, so to unclog it lie on your back and if needed, do some of the classical youtube unclog nose exercises, like eyebrow, cheek, (they got tons of exercises on youtube, search for it). *Water drinking doesn't help much except if waking during sleep;* only smoothies or highly watery fruits/veggies with electrolytes *quadruple lacrimal output: tears have 2100 chemicals, not just water. If I eat a sky high electrolyte & calorie, yet semi-dry meal, it doesn't work, body knows when we eat 5 times faster digested both biowater AND electrolytes @ 10-30x > bottled water. Only then it allows electrolyte release for tear production, heart is # 1 priority. So eat high water/natural* (not pill, 50-80 g carrots/meal, kale got vitamin A and sodium, can incorporate them in every meal, eat 200 mg C/meal with carrots to prevent kidney stones) electrolyte @ EVERY *meal, to* maximize *tear volume next 3-4 hours when* blinking normally *or yawning for tears. Electrolyte pills have less than many fruits/veggies.* Fruit/veggie water electrolytes are bioavailable instantly, digested 5-9x faster (so make each meal low in fat, distribute protein equally in all meals, since high protein meals take long to digest, high fat even longer*) bottle water NOT, it's not structured even the same way, even if drunk with sky high potassium lentil+ some pineapple. The*

hypothesis (test it yourself) is that max 20 g (more if weighing > 150 lb) g protein with PDAAS 0.95 (27g if PDAAS is 0.70, since 20*0.95/0.70=27), 9 g fat/meal prevents dryness, other diseases, since we hydrate body well every waking hour, instead of only after 2-3 hours after some meals. 5 meals better than 3 if you don't drink super high electrolyte water in between. Too much protein per meal creates free radicals and is used for energy per some studies, not tissue repair, muscles. Tear output is triple on good sleep days, so yawn more then to heal eyes.

Some people eat a lot of potassium (K) and little sodium (Na); since Na helps hydration or water retention and K helps water release, high K/low Na can cause dry eyes when also eating highly diuretic fruits or veggies, as you can see from above, *tears have mostly Na, with only a tiny level of K and far less calcium, magnesium. Thus, people with low salt intake may like artificial tears with more Na and no K/Ca like* 0.9% saline alone *or saline plus the yawn tears or their favorite drop. On the other hand, dry eye means* hyperosmolarity, so people like eyedrops that have low osmolarity, meaning less salts of any type, less NaCl (main salt in tears). Some veggies have 50 times more Na than others. While low Na high K diets have huge advantages for lower blood pressure, heart rate, etc – they could in some cases cause dry eyes (because tears may have low Na and hydrate eyes less optimally), so try increase Na intake, change veggies to high Na ones, or eat salt, because a little Na increase won't increase heart rate or blood pressure, since you would be well below the cautious 1 g or the 1.5 g American Heart Association guide of Na daily.

3). How dry eyes develop due to low blinking, intense computer use, central heating and cooling. Dry or red eyes are often caused by progressive MGD seen in 42% of kids in some studies; as kids stare at textbooks or digital screens, they form a new lower average blinking rate that causes the ocular surface to be less washed with lysozymes and bacteria to grow and invade the meibomian "tear lipids producing" glands, clogging them and then preventing the lipid layer from forming; as decades pass, more and more lipid glands get blocked and eyes get drier, until the dryness becomes felt (well after it started and would only be seen via microscope via tear break up time and meibography at a stage early enough to prevent major clogging), leading to tear evaporation and severe dry eye, all over many years. However, even the eyedrops without preservatives have buffers with scary effects at times. ☺☺☺ Since 1970s more houses each decade came with cooling and ceiling or window fans, house or car heating, cooling vents blowing air in the eyes without sunglasses, so unlike ever in history, we had many people sleep in very dry environments without realizing. All these, plus digital screens, led to dry eyes. ☺☺☺

4). Why our tech is no match for each individual eye tear we get from yawns: our current technology can't correctly identify certain compounds in the parts per trillion/quadrillion well, due to the fact we don't know some compounds exist and they're way below parts per trillion, we need fresh tears and the moment we do the processing to run it via GC-MS-MS, we can lose

the compound (it can act as a catalyst for a reaction that produces a cofactor after tears were released, so it can be in the quadrillion parts range or much lower, impossible to detect with current tech, since a catalyst is much lower sometimes in concentration than reactants if it can regenerate) if the compound (catalyst maybe) reacts with junk or a brand new instrument material compound in the pathway from sample to the actual spectrometer where electrons bombard the molecule and split it into ions we identify. Chemists know how hard is to even tentatively identify a compound and to get a real hit, not a false positive. When you don't know what compounds to look for, it's even more challenging. Our analytical methods are simply not capable to fully identify all the compounds in tears and the role they have, as undiscovered (due to low concentrations) "stem cell cofactors, hormones, cytokines, vitamins", so there may be 1,000 compounds with important functions, yet we buy artificial drops with 5 compounds (minerals added to mineral stripped water and Na lactate and a lubricant) and hope our eyes will be healthy? Fed up with artificial tears, one day, I tried to simulate yawning and I got some tears, and then again a few days later and I discovered in May 2020, you can generate as many or more (if you spend more time generating) tears by simulated yawns (*just open mouth wide and breathe thru the nose and then you naturally start yawning without any effort on your part*) than with eyedrops and the natural tears have 100s of chemicals and are $1 BILLION to custom reproduce for each person (to match their local area immune system and etc needs, and even then our tech can't do real reproduction, because we can't even identify compounds at low levels that may serve physiological functions unknown to science), than any eye drop with 5-15 chemicals. Some compounds are electrostatically adhering to a part of the eye due to electronic interactions with cells, to prevent them from oxidation, due to the mixture of lipids and proteins, so when we isolate tears in a plastic vial we no longer imitate this perfect electronic, molecular environment, we disturb the chemical equilibrium, oxidizing the lipids, etc, causing compounds to react with others and our analysis to reveal that the compound is not there, when it is, but only if you photograph the tear molecules. This is why we need cheap scanners for molecular photography of any cell in the body, in every city Immortality Center, this is essential for figuring out how to cure every disease and live to 900.☺☺☺

5). Other advantages of yawning: PB 2014;130:145 etc say yawning cools the brain and increases its efficiency and alertness (when waking up we yawn too, not just when we go to bed), so that's an extra bonus: you can use it while at work, by closing eyes, cool your brain so you feel much cooler and need less AC (which dries eyes) at work or home, since it creates the illusion you're colder. But yawning is also a home method to induce sleep, to decrease alertness, to start the sleep body repair chemical signaling, *when we simulate going to sleep, not waking up (lying in bed or in our car at work in lunch break, generating tears, closing eyes), and trick the brain to start body/eye repair and to lower cortisol,* inflammatory cytokines since "the day and stress is

over" and now we can relax *(like when simulating smiling*, we *trick* the *brain* to release endorphines and make us happy for real eventually). This repetitive "every few hours" tricking and lowering of inflammation can slow eye/body aging*, which is a product of inflammation*.

6). How to generate free yawn tears: Get good sleep. Close your eyes, while relaxing on your chair or belly (and at least 25-50% of the time *relaxing on the back on the bed to get more tears to the corners of the eye, which get less water and need it the most; on the back tears that fall towards nasal half will drain fast into the duct but that's OK*) to get more tears to the eyeball center, *so tears don't go into nasal duct, and* ☺*focus your* entire attention *on yawning*☺*: open mouth wide, very wide,* as you do when you yawn big*, and* ☺*HOLD* MOUTH *OPEN*☺ *for 5 to 20 seconds (even while exhaling), as this will wet your* eyes *in record 10-30* seconds *time*, faster than even trying to put a drop and have it reach the eye perfectly (not easy). If eyes are very dry, and yawns don't produce much, it helps to immediately wet them with 0.9% sterile saline, since this water will make the 2100 nutrients in tiny tears you generate spread faster, if you underproduce yawn tears, which is typical on very dry days. Tiny tears have a hard time to spread faster if eyes are super dry, remaining stuck near the orifices. To get faster and stronger results, you can additionally activate the superior salivatory nucleus, linked to the lacrimal and MGs via the geniculate and pterygopalatine ganglions, as this can increase or quicken tear generation by 5-20 times: *while you have mouth open to induce yawn, move tongue from its resting position,* to slightly *above* mouth floor, *then midair* inside the mouth still*, then* roll *it towards* back of the mouth roof *as if simulating real yawns; each person yawns differently, but once you discover the tongue movement that maximizes tears for you, you can generate 10x more tears since it triggers a real yawn, not a fake yawn; each person has a different tongue position that causes huge saliva and tears coming, discover it,* took me 1.3 years to discover moving *tongue* is so important *and saves so much time*. I no longer use the tongue method, since the reflex got so strong, each time I pretend to go to sleep, going in bed and placing eye mask, earplugs on, I trick the brain I go to bed, so can yawn and generate tears. We need uninterrupted sleep, 8 hours min daily, no eating or computer work for 5-30 minutes during sleep, since even 5 minutes of interruption can affect tear production the next day.

If this is too complex or hard to do, there is an easier method of keeping tears going any time during the day when trying hard to yawn is not fun or practical: *simply chew as if you had gum*, to *produce saliva as this stimulates the ganglions* that get suppressed by high stress (stress coming from bad sleep or etc turns off the parasympathetic nervous system, while chewing turns it on); so you achieve 3 things: *1*. *neurogenesis* stimulated by chewing (don't use gum, just empty chew, gum is too toxic, menthol, mints destroy nitric oxide, shrink brains by contracting vessels, due to an innate reflex in the brain, see how toothless people given strong dentures recovered from cognitive decline due to chewing pressure causing signals of neurogenesis), 2.

stronger *immune* system (like water drinking too, which stimulates belly fat loss, fat which is inflammatory for eyes) to fight ocular infections stemming from dryness 3. *wetter* eyes☺☺☺, since eye lacrimal glands and salivary mouth glands are sharing some neutral network nodes; we have an inborn reflex to *destress* and *turn off brain and eye inflammation when we start chewing*, as this signals eating and that's why stressed people gain weight (they can't cope with stress and the only way to turn on the relaxing safe feeling of parasympathetic is by digestion, or eating); so when you chew (not your finger nails or skin as people do at times when stressed to relieve their brain of stress by the same mechanism), to produce saliva, without eating, you trick the brain to lower stress hormones and the lacrimal system to produce again; you also, if currently you chew fingernails or finger skin, to break the addiction simply use the Amazon 8 cotton gloves/7$ set for 5 months until the neural connection is erased (long girl fingers use these, long guy fingers use these XL since cotton shrinks, these can help those who don't chew nails or skin too, to keep hands clean, avoid scratches during house chores, so when you touch face or anything with the hand or eyes, it will be a much cleaner hand; use moisturizer to prevent dry hands, typical of low fat diets vegans; will be able to chew less your nails by simply chewing to produce saliva or using the breathing technique, as the stress relief is achieved without eating the skin or nail, the brain craves chewing, not eating the nail; this desire is often caused by extreme stress during pregnancy, which causes a special need for solace *(relief from maternal emotions being felt in the womb or even after, if parents or one parent has temper flares that the kid feels (natural empathy) no matter how hard the parent tries to hide it)* once born, so kid starts chewing once seeing someone do it, due to the relief it provides the brain; this is especially true for kids who don't receive much affection from both or one parent; studies show moms who breastfeed only 4-12 weeks bond less with kids, so they increase chance of kids chewing nails or finger skin; so, you will notice quite often, first born is the least breastfed due to inexperience, so 1st born will chew more; so, if you have kids, love them, pacify them via serene music and eterni speech tone☺☺☺, hug them, massage them and breastfeed them 1 year at least, as that reduces stress, increasing bonding and communication, verbal and nonverbal, infants/kids are stressed by the new world outside of the safe womb and love provides a feeling of safety that reduces cortisol; emergency is gone when we chew, so neurogenesis and repair can start, as it does when nutrients come from a meal; it also keeps belly fat under control, helping you to lose it.☺☺☺ Chewing is also keeping teeth remineralized, prevents cavities and associated oral inflammation that inflames the eyes too; it prevents overeating, and burns calories too, forces you to drink more water to hydrate body and produce more saliva and tears. Lastly, if this is not enough when ultra sleepy at night, gently massaging the lacrimal and surrounding eye area (zygomatic nerve is linked to lacrimal) could help too. During daytime though, the salivation and eye massage are not needed at all, but I do it daily for 20 seconds during warm shower to stimulate meibum flow.

This simply releases the temporarily stored tears in the lacrimal glands, causing the glands to work a little extra (not much though, since we would yawn only once or twice a day usually, working to unblock MGs; we produce a lot of tears every day, so these simulated yawns may mean glands produce 10% extra at the most if you generate tears 5 times daily); an unknown is what effect the tears have on the eyes long-term, since the foreign body sensation tears are different than normal or yawn or laughter tears (*which simply discard some extra tears due to stimulating facial nerves linked to lacrimal ones, so I believe yawn tears are identical to normal tears of our film, unlike foreign body sensation tears; we yawn anyway and our eyes get wet, we don't realize we got free tears from nature and we open eyes, so they drain via nasal duct, instead of keeping eyes closed after yawning to take advantage of those 1 million dollars worth of tears with therapeutic chemicals etc*); the foreign body sensation tears contain extra chemicals (more alkaline) to kill bacteria linked to the foreign body. *Basically, at the computer we often blink only 15 times each 5 minutes, if your eyes get dry, you can just blink 100 times in a 5 minute period, as this will produce a lot of tears and lipids, as long as eyes are mostly closed it could have as much healing effect as artificial or yawn tears, yawn tears have the convenience of coming in bigger batches sometimes (but not as big as artificial ones) and faster at times of dryness. Don't briefly yawn many times, just 1-3 ultra long yawns will achieve much faster and better result. Feel free to give up yawns if it takes too long and try* laughing by watching these laughing videos, ideally after a meal or drink (hydrated), when you can relax 5 min: subway/tram laughs: 1, 2, 3, 4, 5, 6 *news laughs* (these are the *most effective in generating copious tears*, since our brains instantly laugh when we see others laughing, this is way better than comedy or reading funny articles on theonion.com or whatever): 7 (11 min), 8, 9, 10 (long 11 min), 11 (long), 12 (18 min), 13 (3 min wedding vow & 2 min vow), 14 (x factor 13 min); can also watch dozens of hilarious RSS or web streams and once tears are generated, immediately close eyes; as with unpreserved eyedrops, then keep eyes closed for 4-10 minutes (with the face facing the earth much of the time, not the sky, so gravity won't let the tears drain too fast via the lacrimal duct into the lacrimal sac in the nose, you want to soak eye surface well for 3 minutes at least, so lysozymes can kill bateria, blink once or thrice) to let the tears (made in the lacrimal glands) soak the eyes well and then, finally, flush the debris via the nasolacrimal ducts, (which for some can become blocked leading to watery eyes), while you *meditate*, so the redness disappears too; just as with *unpreserved redness reliever free* eyedrops, ☺☺☺ *redness disappears only if you wait 5 minutes after eye drop application*.☺

7). Meditative alternatives to yawns when you're bored of yawning: yawns have many drawbacks, like oxygen depletion unless you inhale deeply first, burping, so yawn while *lying in bed on* the back, *not on your belly, as back reduces burps 900 fold*. It's also boring. Thus, at times, you would want an alternative besides laughing (quiet, learn how to induce it at will),

watching comedy, like the infinite happiness exteriorization and internalization of energy exercise (or simply the astral exercise, radiation part, no elongation, etc, except we exteriorize thru eyes more, not just the upper body mostly) where we take in cosmic light thru crown and exteriorize it thru the 3 eyes (3rd too), process which can be consciously manipulated to generate tears without yawns or laughter, due to the sharing of certain neural networks. The problem with laughter, even the quieter one, is that it depletes us of oxygen. Yawns can do that too a little, so we can try do inhale (energy in), exhale (energy out and reentering crown). It helps to see all humans as those shimmering luminous Immortals, that are infused with this golden or whatever light that grants them trillion years lifespans, the whole world shimmering with trillions of colors, roads, buildings, like palaces of crystal of the future era, to step outside of our century into the world of Immortals. This will make our 'dry eyes' a blessing in disguise, that helps us to meditate and breathe more often, healing our entire body and maybe even helping us live longer as we oxygenate ourselves better (open windows for fresh air) and are calmer (use earplugs or soothing music if noisy where you are, so this is a nice experience first time, do it in nosy places only after you reached high bliss many times while producing the Living Waters of Life and Immortality, for your eyes at least). The alternative way gives us much needed relief when we're bored of yawns. It also provides extra safety, because yawning too much may not be good during daytime if we need do tasks that require high level of awareness and wakefulness. The meditation ecstasy states described later can be experienced 0.1% almost any day when we had some decent sleep, if we do this conscious breathing and energy circulation. It also provides a great oxygenation of our body, much needed in order to defend against COVID19 or anything anyway, that we need before a yawn or if we want to heal our eyes thru stem cell gradient production. Over time, for some people, this may become their preferred choice, though none need believe at all in soul or tech astral travel or any energy to simply visualize and 'feel energy'. While yawns reduce alertness and put us into a sleepier state, the meditation method can wake us up as we become energized by oxygenation and the '*infinite* bliss' of endorphin flood. If you experience bliss, continue for even 20 minutes, so your brain gets some healing from the inflammatory mediators of daily stress and reduces cortisol levels in you.☺ You can discover many new ways to generate tears on demand once you understand how your brain works better. But this provides an idea to develop new ways. We want to discover a quick way that heals eyes. Use 20x mirror, before and after different tear generation methods and see which one is better. Exteriorization thru eyes increases blood flow, neuron growth, but it may make eye red, increase ocular pressure causing glaucoma. Be careful. Monitor pressure.

8). Alternative tear generation using cold compress: when yawns, laughter, meditation don't work easily, you can get a cold compress (described here) and place it for 3 minutes on your eyes and you will see a natural tear reflex and moisture building a little; this is explained in more

detail in the cold compress section. If you don't want cold compress, use sterile saline drops to wet a $ store sterile gauze, wipe ocular area and then place a silicone mold pair of glasses to make ocular air humidity 97% (simulate rainy weather), hydrate cornea, prevent natural tear evaporation. We don't need to use a cold compress, one out of fridge that is left to warm a lot, will be very wet and achieve a mild soothing effect, plus hydration. Just recall to wash eyes daily and the compress twice weekly, to prevent bacteria buildup. ☺☺☺

9). An extra tip for the veteran yawn tear generators: In April 2021, after *11 months of generating tears, I discovered something mind blowing that makes generating tears far less of a hassle*. Using the most natural artificial tear out there you can find, that contains Hyaluronate (a sticky component of the mucin layer of tears) that matches perfectly your natural tears pH before generating tears, allows this sticky gel to hold those 2100 chemicals in our tears on our closed eyes for far longer; once you generate tears and become a 'veteran' at this, you will discover one *very* annoying issue: tears we generate drain into the nasal duct quickly even with eyes closed; so all our effort and the draining of lacrimal reserves are yielding fleeting comfort; if we can hold those tears on the entire ocular surface for much longer (*without punctal plugs, which have many issues, due to potentially causing lacrimal gland atrophy or infection, since the eye gets signal eye is wet, and the stagnant pool of water on the eye gets super enriched with microbes leading to worsening inflammation, since gunk is not washed into nasal duct and swallowed, without contact lenses, which have their own issues, cover only iris usually, like not washing entire eye in these nourishing 2100 chemicals*), *preventing the yawn tear drainage*, we can achieve 10 times the healing of the ocular surface with 5 times shorter tear generation at any given time; this in turn allows us to generate tears more often daily, as we didn't drain lacrimal reserves and our mental energy and patience reserves, by yawning so hard. The value of this is enormous, because our tech can't replicate human tears, even at $1 billion price tag for reasons explained above. How can we *prevent the yawn tear drainage? The safer way is to keep eyes closed for 5-10 minutes while lying horizontally, the other is using some 1st century after PubMed (so called 21st) eye drop that is* very hygroscopic (water retaining) tear with hyaluronate that you like: the water absorbing hyaluronate will *hold the natural tears with their chemicals well*, and we have to generate less tears, but you also get the toxic effects from artificial tears, so you may prefer eyes closed for 5 minutes while facing the sky or earth core to wet all ocular areas well, without allowing yawn tear phospholipids or polar molecules to ease transport to cornea of toxic ingredients in eyedrops of our stone age. ☺☺☺

It's good to wet patches of some ocular areas that were deprived of continuous presence of those chemicals during the day, due to poor blinking habits, etc, which led to gunk not being washed, inflammation rising, atrophying the MGs (producing lipid layer of tears) which then led to faster evaporation of the aqueous layer. For some people, the reflex of automatic tear

generation is not working very well, so this would come in handy, *since artificial hyaluronate tears alone* don't have the same healing capacity *as the hybrid of generated tears mixed* with artificial; not to mention, *our tears have lipids, especially* if we *blink* a little*, which lack in most hyaluronate tears,* the *lipids* are key to keeping the tears from evaporating if we open the eyes 1% without realizing while we sleep, allowing us to provide a much needed therapy before we go to bed each *night* at least, if not during the day too a few times when we recall to take a break from screens.☺☺☺ Why *hyaluronate* tears? It's a natural lubricant, unlike others which cause irritation if held with eyes closed for a long time it's also extremely hygroscopic compared to others, so a 0.2% hyaluronate brand will gladly retain our tears and remain quite sticky and bound to the conjunctiva mucin layer. Clean orbital area creams before bed, to protect eyes from chemicals. When cleaning, don't let running water over forehead wash out cream downwards on your eyes, as some will stick to the eyes and get into the eye when generating tears. Instead, cover your eyes when washing the cream or wash eyes with soap afterwards to use soap surfactant to remove it all or use a sterile alcohol pad to remove creams above eyes. You don't want your night foam mask to get all sticky with facial cream, powder that may make eyes red; I did that mistake, yet in just 1 hour my eye got so white, by removing the cream, and 4 things repeated 2x in order: 0.9% saline to wash eyes with 6 drops/eye, Hylo Gel, cold water trickle from the shower, yawn tears. The very red eye became the whitest at 2 am in 3 months.

10). *Dry* versus *red* eyes – what each needs most. If your eyes are very dry (you got meibomian dysfunction), not so much red, you can use sterile saline solution (or one Hylo or other 'all natural tears chemicals using only chemicals already in our tears' hyaluronate brand that matches your tear pH to minimize inflammation, right before you start generating tears to make the process of spreading the chemicals easier and provide instant dryness relief; often times when ultra tired, you don't even know if tear generation will work well, might as well provide safe non-chemical saline solution for instant dryness relief; after that, try to blink fast 10-20 times for 30 seconds (not too much though as you lose all tears into nasal duct) right after generating tears (lacrimal glands) to produce lipids (via meibomian eyelid glands) and spread them evenly on the whole ocular surface, blinking produces lipids that lubricate the inner eyelid and reduce friction and irritation (inflammation), lubricates the eye and soothes it; if eyes are more red however, with no dryness and healthy MGs, no blinking for 5 minutes is logical, since blinking also drains some water you generated into the nasal duct. ►► *Red* eyes need more water *with the* 1500 proteins, amino acids, etc in aqueous and mucin *layers (100 proteins from lipid layer too) to become white* (lacrimal glands chemicals that is). ►► *Dry* eyes need more *of the* 600 lipids of the lipid layer, in addition to the *water* and other 3 layer 1500 chemicals, to feel good, moist, prevent inner eyelid from *scratching* the dry cornea (scratching causes cytokine storm, redness, dryness etc). If our eyes are both red and dry, then we need both to retain those

lipids and tears well, so we can blink a few times right after to allow water to spread the lipids from healthy glands to the areas above the clogged or atrophied ones. ☺☺☺

11). More on yawn tears generation, advantages and how to implement a yawning routine. When you're very tired, yawns are hard, so you could simply plan to yawn after meals and sit on the bed, with stomach facing the sky. Rest on your back as that eliminates burps 90 fold; once you train your body into a routine, it becomes like Pavlov effect, you sit in your bed position tricking the body you're going to sleep and generating tears, etc, you use eye mask, earplugs maybe to further enhance the illusion and tears come out sometimes just from the position. Yawn tears provide instant relief like no eye drop can, much better feeling, kept for far longer via hyaluronate thick gel drop right before tear generation if you don't like yawn tears alone. You can do this after meals or use phone alarm to create 3-10 (most in the first 8 hours of waking when tear generation is easier) reminders/day with some mp3 song (no alarm sounds) in your eterni tone to "change tone, generate tears, keep eyes closed (use phone 8 min timer if needed), to relax brain (reach infinite ecstatic blissful happiness or learn to smile and be a million times happier than usual), relax stomach if after meals". ☺☺☺

Our brains are very easy to trick with simulated smiles to "produce happy hormones and reduce aging hormone cortisol secretion", and with simulated yawns to produce tears. When we yawn, *we can consciously work to significantly trick the brain we go to bed (simulate it, lie in bed as* when sleeping*), in order to induce the* strongest possible system wide relaxation response *and associated* chemical changes, *so the brain will relax and lower cortisol, chill out* and prepare for sleep, so *we diminish some of the* primary *drivers of* eye aging*:* stress hormones and catecholamines; this *lowers body inflammation and further helps the* eyes *to heal from over inflammation* caused by dirt, dust, pollen in the air that were not flushed by tears *into the lacrimal sac and began to rot there*. *Then do relax and pretend to sleep for 5-10 minutes, since eyes need those drop chemicals to heal, while closed.* don't use/contract the eye muscles, as that can create temporary wrinkles for the lower eyelid if you do that excessively for months; yawn by opening the mouth, without activating eye muscles too much (*let the* yawn *be quite natural though, so tricking the brain you go to bed works*); if you ever use thick drops without generating tears right after, wash the sticky eyedrops that missed the eye within 3-5 minutes or let the generated tears wash them out, dilute them, as they can dry out and contribute to lower eyelid wrinkle formation; wear sunglasses often; don't stress eye muscles when using yawn or artificial tears, as that will create tiny wrinkles faster, that nobody sees except from 1 foot away; practice "my eyes are relaxed" meditation to reduce inflammation, relax eyes. ☺☺☺

The tears are so abundant at times after yawning, they spill over and wet the under eye area and the eyelids, face, nourishing them with amino acids, lipids, nucleotides, antibacterial enzymes

(that prevent acne), *water, keeping that softest skin of the body hydrated* and younger looking, so much so, in 50 years, one may look vastly better (less raccoon eyes in their 90s, no need of creams for dark circles *anymore, see* cold bag section) than someone who didn't do this to heal their eyes or to keep them in top shape in old age. If at home, lie in your sleeping bed, to further trick the brain you're going to yawn like you do when tired at night, and dedicate more brain resources to yawning simulation, not standing. Thus, before you weaken eyes and bank account with typical quite toxic *artificial* eyedrops, instead of the natural hyaluronate artificial drops (which have drawbacks too, like citrate bufer or any buffer has, so yawn tears and saline can dilute these buffers), drink more water, eat more *vegan* algal oil that has EPA-DHA, and then if dry, yawn by opening mouth wide many times and wet your eyes, blink too to produce lipids. This gives you far healthier tears, with far healthier unoxidized lipids than the "3 layer restoring expensive eyedrops" with oxidized fats (light and aging, heat, etc, inducing eye oxidative stress, free radical damage such as floaters). The natural tears from yawning stimulate the MGs too, giving 590+ lipids that are absent in man made eyedrops with just 5 lipids, yawns flush the eye well. The MGs producing tear lipids will atrophy slightly if we put tons of eyedrops with fat (signals it's enough, we no longer blink to generate 600 lipids, relying on 2-10 artificial lipids only), or even without fat (gunk accumulates due to tear evaporation). Thus, we need real tear lipids, flushing, blinking. When we yawn, blink right after, we send neuron signals to MGs and lacrimal glands to start exercising, to not atrophy beyond repair. Thus, try yawning first, a lot, and only use healthy artificial tears when absolutely needed (or only as part of the yawn routine if yawns alone are insufficient for you, with hyaluronate and natural chemicals only), to prevent having to put 20 eye (not two) drops in 20 years as the glands die out or shrink. The neural signaling during yawns is totally different than what happens with artificial tears.

Yawning can help heal MGD and keep lacrimal glands in top shape (they atrophy with age ever so slightly). Yawning is VERY difficult if you wake up in the middle of the night or at 7 am, or after a long nap and then want to sleep another 2 or even 6 hours. ☺☺☺ In these cases, you may want to have wet eyes, since not blinking for 4 or 7 hours led to somewhat dry eyes. If that is the case, before going back to bed, it helps to drink some electrolyte rich water, filtered water or spring water (or use food processor to liquefy watermelon or pineapple and add to it reverse osmosis water) or eat some watery veggies too. Because the brain is in a sleepy state the tears don't come instantly as they do the rest of the day, so you need extra effort to avoid the trap of not wetting eyes or of putting toxic eyedrops because of laziness. *Don't give up, it's way better to use your own tears*. So, *in these sleepy states*, for best prevention of eye issues, if eyes are semi-dry, try wet them by gently raising your head a little as if leaning on your elbow, so *your head is vertical, not horizontal*; this signals to the brain to be awake, so the simulated yawns are done easier and more fully, lacrimal glands will respond much faster and makes yawning and

tear generation *far easier*. If you do that, you can go for a week without artificial tears (if dry eyes are not very dry) and only use those healthier artificial tears (see below) with therapeutic agents, like pro*vitamin* A, vitamin E (Stye eye ointment), hyaluronate, zinc (Bion Tears) rarely to heal any tissue that was damaged when you were too lazy to wet eyes or too misinformed, and used redness relievers or the worst preservatives.☺☺

12). When I'm too tired to yawn or too dry to generate tears, what tears do I use in my life and what did I use prior to discovering yawn tears? After 2021, I use saline 97% of the time. On 12-22-2020, after 40 days of using artificial tears more often (once a day at least usually), I realized they didn't improve anything (even after trying for Dec 6-27 Refresh Optive and Dec 18-21 Mega-3, not daily though, and then returning them Dec 22) versus using more minimalist ones (Hylo, Clear Eyes Advanced) twice a week. It *made me realize that it's worth trying to generate your tears no matter how hard it may seem* and avoid the brands with so many chemicals or temptation to have many brands of tears (which leads to temptation to use them since "you bought them anyway" and *they can do, if heavy chemical type, more damage than generating your tears, which sometimes, like at night, takes 30 times the effort and time to produce vs squeezing a bottle 10 seconds; but in life, what is much better is worth the extra effort; laziness gets us nowhere*); in Oct 2020 I used 1-2 drop/wk by emphasizing generation, then Nov-Dec I moved to daily drops to provide a break from yawning so much. On 12-28-2020 I started using Hycosan Fresh (ebay) (same as Hylo Fresh) and Boiron saline for 10 days only, then 0.9% saline on 01-07-2021, plus Hylo Dual, Hylo Gel) since I ran out of Hylo Care on 12-20-2020. In 2021, my *main* drop has been saline (it is now my main drop, the only thing I use at night, and during the day for many days in a row often) and then Hylo Gel. Recently I didn't use Hylo Gel much, due to sorbitol. In 2023, Optase launched Hylo Relief, so I love it more than any other Hylo product, no "sorbitol, ectoine, B_5". However, glycerin can cause eyelid swelling, so don't use if eyelid swells. ☺*Recall to* clean the eyelids *daily or at least twice weekly, because sticky hyaluronate (0.2% instead of 0.1%) or* any type of sticky tears (Refresh Optive, Mega, Advanced, Celluvisc, 90+ others) *if not diluted with yawn tears or* sterile saline tears *right before or after) can dry on top of the* MGs orifices and clog them temporarily *and to* check if the orifices are open*, otherwise, sticky thick tears can do more damage than good*. It's critical until you return to normal, to check daily, clean daily, etc. 2015-2020 I used Clear Eyes 7 symptom, then I gave that out as it had redness reliever, and tried Refresh Optive, "Refresh Plus" CVS equivalent, Celluvisc 2 months in the summer of 2020, then moved to Hylo Care and Clear Eyes Advanced mostly until 12-20-2020, when I started used Hylo Gel more, besides Advanced until April 2021, when I stopped using Advanced much (maybe once a week) due to rather acidic pH and odd preservative and borate buffer; in May 2021 I stopped using Advanced completely for 2.5 months, then decided to use it less, due to the risk of phospholipids forming eye stones; in Oct 2022 I stopped Advanced

forever; in September 2021 I stopped using any drop for about 2 weeks except 0.9% sterile saline to discover how good saline alone is (even though I resumed using Hylo Gel, Clear Eyes Adv, etc in October) – though saline alone is not as good as combined with other drops, at night especially, (even if you squeeze eyelids a lot and blink 10 times to remove 50-70% of thick drops to avoid night irritation due to insanely big drop size this stone age century). ☺☺☺

This 2.3 week experiment that blew my mind into how well saline alone (9 days there was not even 1 drop of Clear Eyes Adv) can work for those with milder dry eye at night and day, was due to having noticed all drops cause a lot of problems if used at full strength *(no blink, squeeze to get much out to reduce drop size from artificial 30-50 to natural 10)* without saline first, especially thick ones; there is a lot we discover when we do 20x mirror and more testing on actual drop amount and with or without saline first to dilute and soften impact. Vitamin E in capsules (olive oil) around eyes can also help the dark circle disappearing and eyes to get extra E, though 200-400 IU d-E will get more. Using a drop with tons of ingredients at 0.1-3% (not 0.00000000001% homeopathy) is like the equivalent of 10-50 other drops with mostly water and salt in terms of possibly unknown side effects from emulsifiers, polymeric lubricants, buffers, inactive ingredients, humectants, osmoprotectants; so it's good to have some minimalist unpreserved drops on hand for days when yawning is not productive (tired, etc), it gives us peace of mind too. People with MGD will naturally like tears with lipids. I found saline tears 15 times cheaper than normal tears, that have no ingredients and due to slightly acidic 6.5 pH, they may go fine with yawn generated tears, which may be more alkaline than the normal tiny droplets we produce by blinking. Many may be able to do fine with sterile saline 5-10x/day, yawns 3 times/day and a lower pH Hylo rarely if their tear pH is lower than 7.0. ☺☺☺

13). An extra tip on persistence for the yawn enthusiast and veteran: On 12-23-2020 at 4 am, I broke an old habit of never even trying at night to generate tears if I wake up to pee and notice my eyes are not super wet; you do need to sort of wake up for 5 minutes, since you need to oxygenate brain a little to wake up fully and have neurons respond to yawning and tearing conscious effort. I opened window and generated tears in the middle of the night first time ever because I first did pranayama, long inhale, short exhale, to oxygenate, since yawning deprives us of oxygen/air if too much when doing at night and tired; so this way, by first oxygenating, by first filling lung with air by longer inhale, I was able to yawn longer; a long yawn can produce tears easily, short yawns are a waste of time and leave you airless if many; so get enough air, then do a long yawn and see how fast tears come vs many short yawns; oxygenating and exercising belly is good to lower inflammation body wide, as belly fat is killing us slowly; by mustering enough will to not give up immediately as every other night and some fast pranayama and also equal length inhale-exhale of medium or medium-long duration it worked; the body is a machine, once you know how it works you can fully control it to produce meibum via blinking,

tears via yawning; laughing, etc; *some exercise a lot their muscles to become athletic, but in this day and age, we need athletic eyes to read 200 papers a day, not muscles, muscles are useless* these days for research or discovering how to live to 900; ☺☺☺*our leg and hand muscles atrophy without exercise, same for our MGs without blinking, lacrimal glands without generating tears (relying on artificial tears)*; you will love pranayama it gives the same endorphin release exercise or jogging give, the "runner's high" - recall to also smile to release even more endorphins and make your tear generation more pleasant as it can be tedious sometimes and you really need all the motivation you can get in the initial stages to overcome laziness, belly fat and "using man made tears" temptation; you will know what I mean when you get there, it's very similar to obese people disliking exercise (too much effort) or lacking motivation; we're all "obese" or at least "rich in belly fat" (actually 97% of people have quite a bit of belly fat) in our *eyes exercising habits* too sort of, even the thin types like me (underweight people can have real belly fat too), since we blink 4 times less when glued to computers 12 hours daily, so it's like someone who walks 50 meters instead of a mile a day; our blinking muscles really atrophy too, not only the super critical glands; our digital lifestyle brings obesity of body and extreme atrophy of eye muscles, glands, plus immense stress on the "eyes" we never had for millions of years; recall to blink often while staring at digital screens. Your heart will thank you too, since if you don't exercise much, like many people glued to computers these days, this breathing is a way to get it pumping a little and do something to live a few extra years; *until direct seeing by direct brain imaging to visual cortex bypassing eyes, the telepathy of future learning, we need eyes to read 200 papers a day fast*.☺☺☺

*Re*member, *re*call the mantra "*respirate, rehydrate, regenerate, rejuvenate, recreate Eternal Immortal youth and* cosmic bliss states too, via slow conscious breathing thruout the day later, *as well as nutrient* conservation leading to slower aging*". We're (or we can, not required, just far easier to yawn long when tired (neurons are sluggish, a little extra oxygen brings responsiveness up so they generate tears) or dehydrated at night or when waking up, since we didn't drink or eat for hours)* doing a sort of "artificial respiration on ourselves" or oxygen enriching, not the normal one first, to fill lungs and body, brain with oxygen, long deep breaths before yawns so yawns can be long and tear rich. This rise in cellular oxygen and later decrease during normal breathing and yawning, creates the oxygen gradient that creates stem cells and renews the body and eyes. It recreates the eyes from within, with 2100 chemicals absent in store bought tears. Rehydrate, regenerate, rehydrate eyes again, via tearing and drinking fluids, smoothies, etc, keep self detoxified and hydrated; respirate, generate (tears), rehydrate, then 1 hour later drink water/smoothies again, then generate tears again even 2 hours later, even 5-10 times daily if needed, to rehydrate ocular surface, recreate the whole body with stem cells; sleep well as this helps generate tears easier too; repeat with persistence until your eyes are healthy, white and

moist, no longer red and dry. Recall to take warm showers or warm ziploc bag touch to liquefy oils in eyelids or use cold water ziploc bags to reduce redness, and keep those neurons and areas stimulated, alive and oily tears flowing, MGs *functional by blinking often*. Stop all activities on digital screens when eyes are dry or red, recall the cold ziploc bags, hydration, yawns; eyes need a break, they're not made to stare at screens all day; the same is true for any muscles, we can't do pushups all day. You're most hydrated after eating smoothies or drinking water, so within that first 30 minutes tear generation is easiest (not before a meal, when you didn't hydrate for hours, but right after). Use all these ideas to design a strategy against dryness that works best for you, as dryness drives all inflammation and redness later. ☺

14). A final note on the more *toxic* artificial *tears*, plus *healing* the eye that may be redder. The redness reliever tears *are only showing their bad effects when you discontinue using them* and try some simple tears or your own tears, which enable you to see the rebound redness they caused, that can be worse than before, or eye dryness, that can be worse than before. You also notice that you need to use far more of the redness drops, initially maybe once a month, then once a week, then twice a week, then daily, then twice a day, etc until they become almost useless and you no longer use them and you see they made long-term your eyes worse. If you used the junk tears for $5 with preservatives like BAK (benzalkonium chloride, $C_6H_5\text{-}CH_2\text{-}N^+(CH_3)_2C_nH_{2n+1}Cl^-$, n=8,10,12,14,16,18) etc and redness relievers, in one eye only, that eye may get rebound redness, more dryness later on, so stop using that and switch to *yawns* (directed at the redder eye) and only unpreserved eyedrops when/if yawns fail to improve the condition; try yawns only first (when *yawning* focus the opening and yawn on the affected eye more, as that one needs more drops to reach equal whiteness with other eye before you started using toxic *redness reliever* eyedrops, just as with energy exercises in astral travel, focus attention and energy there and stimulate the lacrimal gland above the redder eye only) and see how that goes, but don't expect instant results if you have been using redness relievers causing rebound redness for many months daily or even 1 year (it may take as long as the time you used redness relievers daily to return to normal); *yawning* will wet both eyes a little bit and to bring both to the same whiteness you will have to wait a few months (or however long you used redness relievers daily into one eye only) to see if it naturally heals by more focused yawning and selective lacrimal stimulation, without unpreserved eyedrops placed in the redder eye only. You will be blown away by the fact that if you wait 4-10 minutes, as with unpreserved eyedrops, after generating the tears yourself, you can get one eye you focus on become whiter due to more tears you generated into it, whiteness which will equalize of course as that eye will revert from equal whiteness to being redder for a while until it heals after months of daily use of toxic (because they cause drier eyes long term) preserved redness reliever drops which don't work any better at making eyes whiter than unpreserved without redness reliever:☺☺☺

11.17.3. Preservatives side effects and 106 preservative free eyedrops/ointments (95 pages)

11.17.3.1. Intro & recall to visit the 30 page humidifier section as this is enough for mild dry eye
11.17.3.2. Preservatives to avoid and how they damage eyes; use only unpreserved tears
11.17.3.3. Basics of watery, less eyelid swelling lipid free eyedrops: avoid phosphate buffer
11.17.3.4. 9 Saline Tears Brands: cheapest drops, least eyelid swell, best at night, least allergenic
11.17.3.5. 7 pages on Hyaluronic acid Ocular Effects & 10 pages on 7 Hylo Hyaluronic Eyedrops
11.17.3.6. 15 dry eye ointments (avoid: contain petrol toxins, block MGs causing drier eye later)
11.17.3.7. 56 other Preservative Free (PF) eyedrops free of lipids
11.17.3.8. 19 PF eyedrops with lipids (more gel like): 86% of dry eye is due to lipid deficiency

☺☺☺

11.17.3.1. Introduction: test thick drops at 20x carefully, as they can clog the nasolacrimal drainage, irritate, scratch, damage cornea and deliver toxic ingredients to cornea much more readily leading to increased damage. I now avoid thick drops at full size without saline first (only blink first a lot to squeeze out, so amount in becomes smaller and closer to natural 10 µL size instead of 30 for artificial drop), especially at night, having discovered in 2021 that sterile saline is often enough at night during sleep (since eyes miraculously produce a thick transparent mucus at night to protect us like thick drops do) and also, saline is often enough during the day, but, often enough only if you wear silicone seal glasses (hard to do it due to water blur, but some can live with it, by swapping pairs every 5-20 minutes). Otherwise, without glasses, the eyes get too dry quickly and you use more saline and eyes get red due to washing off nutrients and too much Na, and then you make a bad impression of saline, like I did for half a year, and ignore how much better and less irritating it can be versus all other drops (except yawn tears), if used only one drop/30-200 min max. This mucus is invisible at 1x, only when waking up and looking at 20x before showering can you see this mucus, and try pull all of it out with a sterile q-tip to see its nature, before shower removes it. This mucus may not be much in people who're choline deficient, since choline stimulates mucus and tear production, so taking choline, eating peppers and enough protein (they produce more mucus too; mucus is mucin proteins) may prevent using toxic thick drops. It's safer to avoid drops that contain calcium and phospholipids or phosphate within the same day, ☺☺☺since this may cause cornea calcification, which may require surgery. It's safer to avoid drops with unknown concentration of calcium or phosphate, since high levels of each can cause eye stones and atherosclerotic plaque (starts with Ca and phosphate) near the nasal vessels in the lacrimal nose sac, which could be many facial, ocular, brain vessels too, leading to eye and brain damage that is subtle and not visible like eye stones. Since companies don't indicate usually phosphate, calcium or phospholipid concentration, I avoid/minimize those drops. Note: at night, we don't blink, so if you use different brands of drops and ointments, they

may form new chemical compounds that may not be good.

Companies say "wait 15-30 minutes before using another drop or ocular product", but what if that is only true for daytime when we blink 4000 times more? Not to mention, they add lanolin for example at 3% or more in eye ointments and it has 10,000 compounds at least, if it takes 25 years for one compound to bioaccumulate and cause severe damage, who would know if no such 25 year daily use 1-3 times daily study was done? Who has the $ to isotope label every lanolin compound, mineral oil and see where it goes and what it does to the deeper eye structures? That's why reading a few papers or this chapter helps, since it may be 500 years before they know what is truly safe for eyes, among the safest products today. Not everyone has the same genes, if our genes come from people who lived all life in low wind areas, their eyes are not equipped to deal with 10-30 times more bacteria, animal feces particles (dogs, rats, cats, cows, pigs, birds, etc) dust that wind, drafts, central air, fans, etc bring today due to the love of 'living near the windy areas' or modern convenience without daytime wind protection. So a study where everyone comes from windy areas will lead to totally false conclusions for people who lived in no wind, no dust area. At night, that stuff takes way longer to flush and dissipate, so do more research before using a drop at night on top of another drop or ointment, unless it is just saline solution with salt and sterile water; even ointments that some papers say 'OK to use during daytime' may have so many compounds (lanolin or wool fat got thousands of ingredients and it's part of many ointments) that are reacting with other liquid drops used during the day. 200 years ago doctors prescribed what are now known as poisons, 20 years ago they used thimerosal mercury preservative in eyedrops, and people used non-sterile eyedrops 150 years ago, etc – so 200 years from now, what will people think about our eyedrops and the way we mix them and there is no PDF emailed to people to explain these chemical reactivities of ointment compounds and liquid/watery or more gel like tears. The food/cosmetic industries are allowed to not list some ingredients, is that true for eyedrops? We got buffers, surfactants, preservatives, emollients all with reactivity, except for mostly inert hydrocarbon mineral oils.

11.17.3.2. The toxic effects of preservatives and why avoiding them is best

Preservatives: if you don't want to go to the bath while at work or practice yawning for 3 minutes discreetly at the desk, you can buy eyedrops: with preservatives or unpreserved (also called preservative free PF).☺ The only truly safe eyedrops today are ones that contain no chemical not found in tears (or if found, at tear concentration not way above) and contain only water and NaCl 0.9% as found in tears, i.e. saline sterile unpreserved unbuffered tears. Why be so paranoid about additives not found in tears? It's because with any toxin, we humans are fine as long as it's eaten in amounts below our maximum detoxification capacity. Say we can only eliminate 5 µg of mercury daily, so we eat 5 µg for years and nothing happens; then we eat 5.5

µg daily and it accumulates, and then the damage that 0.5 µg (10% extra) does is 2000 times greater than what 5 µg did. A dam handles 5 million tons of water, but if you go above that, it will break. So is with buffers, preservatives that damage cornea, conjunctiva. The 6.5 pH saline is the savior of some people with aqueous and lipid deficiency, since saline drops can be used to compliment their generated or hyaluronate (sorbitol, citrate, hyaluronate are present in natural tears) drops and minimize toxic exposure, some may use 90% saline as their tears even *if* their tear pH *is close to 6.5*, 5-20 tears a day saline and 1-2 some drop they like, maybe alternating if more than 1 brand. All eyedrops bottles contain viruses, especially the preserved ones which after a few months get touched and contaminated so much. In 2023, FDA gave a warning that some preserved dry eye tears at Target, CVS, etc contain P. aeruginosa and other deadly bacteria that can cause infections and even blindness. All eyedrops contain preservatives, unless the box says "preservative free";☺☺☺ "incidence of pain and discomfort reducing from 52.4% to 7.8% following use of preservative-free compared to preserved drops... lower levels of burning/ stinging (40% vs 22%), dry eye sensation (23% vs 14%), foreign body sensation (31% vs 14%)... After a minimum 3-week switch to a preservative-free artificial tears, Ocular Surface Disease Index (OSDI) scores were significantly reduced for 97% of the patients, along with a reduction in frequency of superficial punctate keratitis" ► CO 2019;13:1409-25. ☺☺☺

However, some companies use marketing scams to call preserved drops as unpreserved. Some inactive ingredients combined can be more deadly than the least damaging preservatives as explained in the next 25 pages. The buffers, polymers used as lubricants, emulsifiers, etc are also toxic "the ideal artificial lubricant should be preservative-free... Preservative-free formulations are absolutely necessary for patients with severe dry eye.." ► TOS 2007;5(2):69-204, the *DEWS* (*D*ry *E*ye *W*ork*S*hop) Report (142 page PDF; this long PDF explains how eyedrops are formulated, how toxic some ingredients are). *The most toxic preservative is BAK* (benzalkonium chloride, for short, or alkyl dimethylbenzyl ammonium chloride, the correct name, with alkyl C_8H_{17} to $C_{18}H_{37}$; BS 2011;16(3):117-21 found 0.01% BAK (used in many eyedrops) is far more toxic than boric acid 1% (eyedrops boric is 0.1-0.3% as part of buffer); BAK was worse than polysorbate 80 which is itself far more toxic than boric acid, about 30-40% of conjunctiva cells died]. BAK was "shown to cause opacification increased hydration and corneal thickness and also cause irritation and redness of the eye. BAK being cationic detergent causes epithelial toxicity and is also responsible for a shortening of the tear film break-up time, disruption of surface cell layer and slowing down of the epithelial healing process" ► Pharm 2012;4(1):243-51; 0.01% BAK (0.01 is typical in BAK drops) "causes severe loss of microvilli and large holes in the cell membranes of some of the apical epithelial cells" ► Diag 2020;10(8):511; JOPT 2009;25(2):13-9 found in vitro toxicity at artificial tear concentrations for cornea/conjunctiva cells to reach 6-59% for *0.01% EDTA* (chelates metals, inhibits metalloproteases on the ocular surface, deprives "the tight junctions

between the epithelial cells from Ca2+ ions and thus weaken the paracellular barrier function of the epithelium" – dishonest companies list EDTA drops as unpreserved, but Bausch, the ocular company, clearly states Soothe Hydration is preserved with 0.1% EDTA (*10 times above* the 6-59% toxicity) and 0.1% sorbic acid, ☺☺☺ which could be reduced to controversial sorbitol), 23-59% for 0.0025% perborate $Na_2[B_2O_4(OH)_4]$ (banned in EU, not boric/borate, but used in US eye gels like Systane), 30-60% for 0.01% methylparaben (parahydroxybenzoic acid methyl ester, HO-C_6H_4-$COOCH_3$), 50-86% for 0.25% chlorobutanol, 56-89% for *0.025*% BAK (thankfully, at 0.01% usually), 70-95% for 0.0025% thimerosal mercury compound which destroys nerves.☺☺☺

Chlorobutanol, very toxic, used in Allergan Refresh LacriLube ointment (goes there at night and stays 8 hours without being rinsed by blinking and destroying eyes; so try Hylo Night or others instead, expires in 6 months, not 3 years, but it has no preservatives) and Lacril (US, Brazil, EU) 0.5% HPMC eyedrops "works by disorganizing the lipid structure of the cell membrane, which increases permeability of the cell, thus leading to cell lysis... causes cell retraction and cessation of normal cytokinesis, cell movement, and mitotic activity. It disrupts the barrier and transport properties of the corneal epithelium as well as inhibits the utilization of oxygen by the cornea" (hypoxia will cause redness, thicker arterioles due to need of oxygen); "The irritant response was found to be caused by the presence of chlorobutanol" ► SAMJ 1989;75(5): 233-5.

Yet even Purite or SOC (Stabilized Oxychloro Complex) (mix of 99.5% $NaClO_2$, 0.5% $NaClO_3$, traces of ultra oxidant ClO_2 to wipe out bacteria) causes corneal staining; PQ-1 stains too (polyquaternium-1 or polyquad, far less toxic than BAK, "Travoprost PQ (0.001%) produced significantly better cell viability and less apoptosis than travoprost BAK (0.015%)" ► CER 2011;36(11):979-88). They also make dry eyes worse over time ► CO 2019; 13:1409-25, that's why MDs suggest unpreserved if using tears often. Other preservatives include: cetrimide (a mixture of 3 quaternary ammonium bromides similar to BAK), sodium chlorite 0.005% $NaClO_2$ by OccuPure (Blink Tears, 9% electrolytes, 11% NaCl, 80% $NaClO_2$), Dequest/GenAqua (whose name comes from 'aqua (H_2O) that generates oxygen or *oxygenated water* or hydrogen peroxide (H_2O_2)') is sodium perborate (perborate is a peroxide (H_2O_2) bleach with B-O-O-B unstable bond, less aggressive than hypochlorite, *banned* in EU since 2010 in cosmetics, along with many borates due to carcinogenic mutagenic effects; perborate is made by mixing *borax* with *NaOH* ► $Na_2B_4O_7$ (borax) + *2NaOH* -> 4 $NaBO_2$ (metaborate) + H_2O; then $NaBO_2$ is mixed with H_2O_2 ► $2NaBO_2 + 2\ H_2O_2$ -> $2NaBO_3{\cdot}H_2O$ or $Na_2[B_2O_4(OH)_4]$ (perborate is $NaBO_3{\cdot}nH_2O$ or $[NaBO_3{\cdot}H_2O]_2$). Perborate with EDTA is used to slowly release H_2O_2 to act as an oxidizing 'disappearing' preservative. The least toxic preservatives in eyedrops are thought to be: polyaminopropyl biguanide PAPB $(C_5H_{11}N_5)_n$ or $[(\text{-NH-C(=NH)-})_2\text{NH-}(CH_2)_3\text{-}]_n$ and the similar (*same structure,* except 6 methylene CH_2 groups instead of 3 at the end of the polymer unit) *polyhexamethylene biguanide* PHMB *or* *polyhexanide* $(C_8H_{17}N_5)_n$ $[(\text{-NH-C(=NH)-})_2\text{NH-}(CH_2)_6\text{-}]_n$; ☺☺☺ PAPB is used in

Clear Eyes Complete *and other tear brands*, plus in many contact lens solution brands, PHMB is used in Clear Eyes Advanced & others; polyhexanide name is also used for R-(CH_2)$_6$-[(-NH-C(=NH)-)$_2$NH-(CH_2)$_6$-]$_n$[-NH-C(=NH)-NH-(CH_2)$_6$-]$_m$-R, they even call PAPB PHMB sometimes or viceversa; the n:m ratio =10:1 usually (on average m+n is 11, but it's 2-40, MW 1600) *(being a biguanide (n), not guanide (m) polymer primarily)* while the end R groups are one of 3: H_2N- 40%, guanidine NH_2-NH-C(=NH)- 25%, cyanoguanine NH(CN)-NH-C(=NH)- (35%,; *polyhexanide (PHMB) can* cause corneal staining ► OVS 2007;84(1):65-71. ☺☺☺

ECHA has got 10-100 page PDFs on their search for "PHMB" & "polyaminopropyl biguanide"; in pure form, not .01-.0008% in eyedrops, it's toxic to eyes/lungs. PHMB may cause conjunctiva epithelial barrier *breakage* and thus infection in vitro ► ECL 2008; 34(1):50-5, but it *may be poloxamine only causing* barrier *breakage, with PHMB action possibly inhibited by* macrogolglycerol hydroxystearate, since PHMB + poloxamine was bad, but PHMB + macrogol glycerol was OK. PHMB destroys bacteria membranes, this is why it's a preservative in detergents, etc; the cell wall of healthy cells can be destroyed, since normal and bacterial cells share similarities. A 50 page report on PHMB indicates, like many eye drop *polymers* used as lubricants, emulsifiers, preservatives, the impurities of polyhexanide, PHMB include: heavy metals and compounds with cyanide groups, which may be toxic in certain conditions that create *cyanide*, since excess drops go into the nose and we ingest or breathe a little these chemicals. That's why if one wants to use drops often, it's best to use one with minimally toxic additives, since they don't list all impurities of *polymers*. Dispose of PHMB vials after 3 months, since *PHMB byproducts start to appear after 30 days* ► PeerJ 2018;6:e4549. Byproduct formation happens with even unpreserved (Refresh, Systane) drops using artificial polymers as lubricants, emulsifiers and is nothing specific to PHMB*; gently return Amazon products expiring soon (instead of 1.5 years typical at CVS)*. MDs recommend unpreversed if you use drops a lot: Dr. Allen suggests using drops 4 times/day for dry eyes to keep them always very moist, so that means *yawning* 4 *times/*day for 2 min when dry, to avoid side effects of artificial tears.

A study found polyhexanide is much less toxic in vitro as a preservative than most out there at very low concentration *(not the same in all eyedrops, some may have it at 26 times higher level, 0.02%, so then it may be as toxic as other preservatives)*, with corneal cell viability *100*% (Vismed Light, $CaCl_2$, (though Ca and phosphate drops can form eye stones), NaCl, $MgCl_2$, KCl, *0.01*% EDTA (chelates metals inhibits metalloproteases) which *is very low vs 0.11% in other drops* (hence it's least toxic), 0.00076% polyhexanide, HA, sodium citrate, 10 mM phosphate buffer) versus *63*% for *PolyQuad* (Systane Ultra in the study, but also used in all preserved Systane; *if 37% lost viability due to PolyQuad alone and not also due to other differences between* Systane Balance, Complete *and Ultra is unknown; PolyQuad is present in all 6 preserved Systane drops, except the gel that uses toxic perborate; but "Polyquad 0.001%* induced significantly less cytotoxicity than

cetrimide"), *4%* for *Purite* (many brands), *6%* for *Oxide* or *Oxyd* (another chlorite type oxidant preservative), *0%* for *BAK* (BAK is a mixture of BAC8-18, including BAC16 or cetalkonium chloride, which is about 5% of BAK), *7%* for *cetalkonium chloride* in Retaine MGD (same as Cationorm), etc *36%* for Hylo Care predecessor (*dexpanthenol* or provitamin B_5, citrate, HA), *73-77%* for other Hylo brands (HA, citrate, not all brands with HA and citrate give 100% viability like Vismed due to *low* quality inflammatory (*high* quality is antiinflammatory) HA and/or higher toxic (when high) citrate concentrations) without dexpanthenol (due to citrate toxicity or using low quality HA), *100%* for unpreserved Tris-HCl buffer Hyabak (Thealoz without trehalose) and *103%* for Thealoz, Thealoz Duo. "Cellular viability was moderately reduced by *Perborate* and *Polyquad*... dramatically reduced by BAK...Thiomersal and *Oxyd* (Oxyal, Artelac Rebalance) preserved tear substitutes" ► TIV 2010;24(1):276-85. ☺☺☺ *Oxyd* or oxide *viability* was *6*%. "PQ-1 (polyquaternium-1 or *polyquad*) demonstrated a comparable level of toxicity to HCEC as that seen with phosphate buffer solution" ► CO 2019;13:1409-25. However, MV 2012;18:1189-96 found "*Cell viability… declined by up to 50% after exposure to …Systane Ultra solutions which contain 0.001% PQ-1* (*polyquad*)… BAK at 0.02% evoked total cell death signs on HCE-2 cells… cell membrane permeability, as measured by LDH release, was elevated by sixfold with Travatan and by a maximum threefold with Systane Ultra… Travatan and Systane Ultra activated NF-κB and elevated the secretion of inflammation markers IL-6 *by 3 to eightfold and IL-8 by 1.5 to 3.5 fold*"; polyquad 0.001% was more toxic than BAK 0.001%, but most got BAK 0.01.

Polyquad, a hydrophilic cationic polymer 27 times bigger than BAK, *is believed to* be too large to enter human cells, *but can do damage*.☺☺☺ Many have high opinion of Systane, but an in vitro study found some shocking results: an unpreserved imperfect sting causing Thealoz helped maintain cornea cell viability *way better* than all 6 preserved drops after 5-45 minutes ► BRI 2014:292139; at 45 min, preserved Systane had only 0.6% of cells viable, Thealoz 10%, *a BAK preserved drop 0.6%,* 4 others 0%, Keratostill 4.5% (had proB5 to help cells, besides the less toxic cetrimide 0.01% preservative), NaCl saline 0%; at 15 min, 91% Thealoz were viable vs 35% cells using BAK preserved drop Hialeye vs 10% with Lacrimal. Hialeye used HA, Lacrimal used PVA, suggesting the *destruction caused by BAK* is 3.5x smaller when industrial lubricant PVA polyvinyl alcohol is replaced with the tear film component healing promoting high MW hyaluronate (HA). "number of damaged cells is significantly reduced when applying 0.01% BAK dissolved in 1:10 diluted Healon" (Healon is 0.1% HA of MW 4 million, higher than most OTC, used for surgeries by prescription usually) ► Diag 2020, 10(8):511. So, if you use preservatives, go for the healthiest lubricants and buffers.☺☺☺ Since inactive ingredients *(even if not preservatives, artificial lubricants, emulsifiers or* redness relievers*)* can also have side effects (as shown below), so if for your genome some ingredient is bad, and it won't be known for 400 years. The advantage of using several brands is that some inactive ingredients are not random or inactive, they actually

have a role and help some genomes a lot more, we don't know which. To minimize stock losses, we buy 5+ stocks, likewise, to minimize damage, it's best to have 5+ brands of eyedrops and use each a little or alternate brands (a few months each), since not *all* HA, *citrate conc, sterility* are the same. It will be centuries before we really know which one is safest, what conc, when eyes respond equally subjectively. That's why below I include several brands popular worldwide. Some drops say "*water for injection*", instead of purified water; it's sterile purified water, safe for injection. *Those with* MGD *may prefer to use drops that are either thinner (no lipids) or* with lipids *or use the thicker types less often, because not producing enough lipids can, in some people, make the eyelid scratch against cornea more with thick drops which causes* temporary eyelid swelling. The disposable plastic vials of unpreserved tears *can be recapped* (most brands, not CVS, so best is to avoid CVS eyedrops if you want reusing).

11.17.3.3. Basics of Eyedrops without lipids, preservatives, PO_4, redness *reliever*, toxins:

72 Lipid Free Drops: 9 Saline Brands 7 Hyaluronic by Hylo 56 Lipid Free Eyedrops

☺☺☺ Saline is safest/20x cheaper, apply only once to avoid redness. When buying eyedrops online, plan to order in cool weather, as warehouses/vans are cooler *gently* ponder temperature storage at Amazon issues. This section also has an explanation on how to test each eye product before using it, since all artificial tears are not ideal when compared to our natural tears (yawn tears), they always cause some irritation when eyes are stressed (yawn tears never do), having 5 chemicals vs 2,000 at different concentration in natural tears. Before buying eyedrops, recall that FDA forced Amazon to pull out 7 brands of eyedrops that you may find sometimes even at physical stores. These India made drops were found to have bacteria, cause blindness or other issues. Avoid *India or developing world* manufactured drops, as they don't have the same strict standards as USA or France. Gently *read 4 pages on how to* 20x mirror check eyes many times to test every new brand of drops you would use, to test redness, floaters, stings, itch, reactions, cornea ridges, caruncle inflammation, during 5-10 daytime minutes of eyes closed, 1 hour naps (no blinking), 2 hour naps, morning oversleep and night, before ever using at night, when eyes get 900+ times more exposure (no blinks to wash it) to a drop than during a daytime 1 min eyes closed use (*20x more exposure for thick drops as they stick*). Avoid cheap unknown brands with eyedrops Made in China, like AvKare, recalled by FDA due to microbes.

I suggest avoiding phosphate buffer containing eyedrops as you can get blindness from cornea crystals that form with calcium. Absolutely avoid tears with unknown phosphate PO_4 level (to prevent eye stones that require surgery) like: Thera Tears (*$10 Amazon, 15 RiteAid, 18 mL* total, 30 vials of *0.6 mL*) has: H_2O, NaCl, $MgCl_2$, $CaCl_2$, Na_3PO_4, baking soda ($NaHCO_3$), *borate* buffers, *0.25%* CMC *(carboxymethylcellulose as lubricant)*. Very dangerous *since it contains both* Calcium *and* phosphate*, which can form eye stones*. CMC is less biocompatible than glycerin (glycerides

are everywhere in our body, glycerin is in our blood (comes from glukus or sweet in Greek); wood not much, *all eye lubricants, emulsifiers are synthetic* except glycerin and hyaluronate (HA) which are found in natural tears, so most tears on this list contain HA or glycerin). The list below also covers the pitfalls of citric buffer and HA drops, which contain HA at 1000s of times above physiological level; so simply because a drop has natural ingredients, like citric at 800+ natural level, etc doesn't mean they're way better than others. Hyalogic ($14, 10 mL) has 0.3% hypromelose, PO_4 buffer, benzyl alcohol and it *claims to be unpreserved;* benzyl alcohol is a preservative ► IOVS 2011;52(7):4214-22. *We actually* have *to google* "ingredient *name* pubmed *safety* eyedrops" *for* every *single ingredient out there and read a few papers first to see if it's a cytotoxic chemical.* Even brands that use borate (some Refresh unpreserved, etc) as buffer are not really unpreserved sort of, since borate/boric in of itself is used to kill ants and mold, being preferred by many due to its anti-bacterial action or preservative like action, not because of being the best buffer? A few brands don't use preservatives. You can research, time travel, to see which buffer is better. We need huge 10 million people studies, possible easily with 11 companies. PO4 + Ca could cause cornea calcification (blurry vision) and atherosclerosis of ocular vessels, calcification is the first step in plaque formation. *Thera, Hyalogic are not* ideal due to "proprietary", eye atherosclerosis (Oasis, less risky, France made, got PO_4, no "Ca, borate, CMC (glycerin is much less allergenic)" of Thera, but not telling PO_4 %, so if you like PO_4, Oasis is better, but risky). Artelac Splash got PO_4, pH 7.1, 0.2% HA, NaCl, KCl, [PO_4] = 2.1 mM > 1.4 mM physiological, but < 5 mM in Genteal, 10 mM in Vismed. Even at 2.1 mM there are risks. Before we continue with 30+ other drops, the next section deals with the cheapest, the saline:☺☺☺

11.17.3.4. Minimalist 0.9% NaCl Sterile ☺☺☺Saline☺☺☺ for eyes (least discomfort, least long-term ocular damage vs other tears), vials must be clear, not pink. Some of the best 9 salines:

1). Nephron Pharma 100 inhalation (not for eyes?) 3 mL saline vials/12$, made in USA, in the world's largest BFS facility, **doctor/Amazon clinic can send Amazon the recurring prescription.** Risky since it doesn't have strong quality control that saline for eyes has, though I and millions used inhalation saline for eyedrops for 4 years, without issues. This is cheapest for poorest folks, inhalation saline is "recommended" by Scleral Lens Society and many ODs worldwide per one OD, who forgot that Class I (surgery) or II (contacts) sterile has more stringent purity, very low pyrogen & bacteria endotoxin specifications (plus must be free of foreign particles) than Class II sterile for inhalation. It's required to have < 0.5 for inhalation, < 0.2 EU/mL (endotoxin units) for eye saline use as intraocular (eye interior), but you would have to ask each manufacturer to see where your product stands. So, **buy an ophthalmologist Class I intraocular saline to get the best.**

2). VibrantVue, Cheapest FDA approved Eye Saline 100 vials 5 mL/$35 ($37 without subscription, ships from Virginia, pH 5.1-5.6, acidic vs other salines), 33 µL/drop, made in USA.

The Best and cheapest ocular saline, anyone without a medical license, can order online. Uses LDPE, as box indicates, low density polyethylene (high resistance to water), which gives a healthier higher pH than PVC. LDPE leaches fewer microplastics/additives than PVC, since LDPE has no additives. If you trim the bottom appendage, it fits into a Dove box (like Knoxzy) to reuse within 24 h. The plastic holding the vial in the Dove box can be sourced from any hardware store (1$), it's used to store nails or screws, sterilize it first. The Dove cream costs 1$ at $ stores. At night, eye may be dry, so when you grab a saline vial you don't know where the tip is and can accidentally touch it and contaminate the eyes. To avoid that, take some paper and fold it in 4, to a rectangle of 4 by 8 mm, then tape this to the lower half of the Dove box (not the lid) that is about 8 mm tall, so you know by touch that the tip is located where this bump is, so you don't try to spend 4 minutes and wake up to see where the tip might be. When you use your saline vial, realign the tip to point to this taped paper bump on the outside of the Dove bottle, if it shifts during the day, though it shouldn't shift if you made that plastic holder fit very tight in the Dove box. Wipe the Dove box with alcohol pads weekly to sterilize well, avoid styes. This LDPE vial VibrantVue plastic is the softest of all salines/single use vial artificial tears I ever tried (about 70), so it will cause least damage to finger joints, nail, etc over decades as you squeeze it.

3). Tangible Fill, pH 5.1-5.6, 5 mL, 60 vials/30$ if Amazon subscribe eye designed saline, made in USA, California company, can get 56$/120 vials too on their website

4). LacriPure Contact Saline, 5 mL, 98 vials/$40, 50 µL/drop, made in Japan, spills easiest if kept in a box due to large opening. Never place LacriPure drops at any ° except 90°, to avoid contaminating the drop with dirt from 1-2 mm below the tip. LacriPure needs smaller opening/drop, and a neck like the others (it lacks a neck). pH is reportedly 6.5.

5). Knoxzy inhalation saline (20 vials/18$, available in UK only now, it was in USA), 25 µL/drop, has an opaque sachet, to better protect vials from microbes, light, unlike the others. For inhalation, but many eye doctors recommend inhalation sterile saline. It's best to use the ophthalmologist version of Knoxzy, that is purer than the inhalation version. Made in France. UK sells a EU made Amazon 20 vials/28$ sachet packed inhalation saline of pH 5-7, UK stores sell this way cheaper. Knoxzy customer service had some Hindi accent guy who confirmed Biovantic sells a 5 ml saline for ophthalmology (medical device, MD, class Is, meaning lowest risk (class Is) and sterile), not on Amazon, and another for multipurpose (inhalation, etc, class IIa, low to medium risk) as the Unither contractor site shows it too, so the ophthalmology saline is purer.

6). Bausch & Lomb Minims, 20 vials/15$, online UK stores got it made for eyes by world's biggest eye company in France, says keep < 25°C (good idea for all saline). Not available in USA.

7). Physiodose by Gilbert Labs, 40 vials/17$, Amazon description is wrong, it's water with 0.9%

NaCl, no vitamins, 50 µL/drop, French site says it can be used for infant eyes. Made in France.

8). Unimer 50 clear vials multipurpose (inhalation, ear, eyes, etc): 10$. Made in France. Contact lens eye saline has higher standards than baby eye wash saline, as lens stays there a long time.

9). Salimar Sanavita (official site says safe for eyes, like all baby drops) vials by Paladin Pharma 3.5$/30 vials or many other sellers for Paladin, try Italian search. Made in Italy. Order online a bunch to save on shipping from Italy if you trust this company or live right next to Italy.

The pH of saline is not important, since the bicarbonate buffer concentration in our eyes is 200 times higher than the bicarbonate buffer in the saline (due to dissolved CO_2), so the ocular pH returns in seconds to whatever it is usually. Saline reports article shows pH for common brands: Addipak 5.3, LacriPure 6.5, AirLife 5.6. It's possible they're all close to 5.1-5.7. However, I had 3 pH papers and tried Knoxzy, Physiodose and VibrantVue, LacriPure, and they all gave same color because 99% of papers don't work in saline, they only work with buffered solutions. Only a good pH meter can notice differences of 0.1-0.9 pH units. Just ask your eye doctor to give you prescription for 5 ml "water for injection 0.9% saline" (Walgreens has it) or whatever you can find that is cleaner (saline for injection means fewer bacteria and bacteria produced endotoxins than inhalation saline) and order it from whatever place has it. The most hypoallergenic saline is the one with nothing in it except water and salt. Low pH has antibacterial effect, so it may be better for prevention of microbe growth during storage. IJMS 2013;10(6):747-50 explains why most saline is pH 4.6-6.5 "PVC can liberate diethylhexyl phthalate (DEHP)… formic and acetic acid… (saline solution had) similar pH to that predicted (median 5.47), the median pH of the PVC packaged saline was 4.6… pH of saline in polypropylene packaging was 5.71". The pH of saline solution can vary. Dissolved CO_2 ($CO_2 + H_2O = H_2CO_3 = H^+ + HCO_3^- = 2H^+ + CO_3^{2-}$) generates H^+, lowering pH. Test whatever brand you buy. *Store any of these in the fridge to prevent light and heat from degrading the plastic.* If you live in warm areas, order in cold months (order 6 packs in March, instead of delivering one each month April thru October hot months, since Amazon California, Arizona, Florida warehouses keep them at 90°F often and that is going to be a disaster) and store in the fridge in their sealed packs (Physiodose is wrapped in plastic during shipping) and in ziploc bags to prevent heat induced polymer leakage into the saline. Any saline (pH 5-7) *makes eyes sting sometimes,* due to osmolarity drop by dilution, dry eyes pH is 7.7. From the youtube videos, website, the Physiodose family company seems less professional and having such a huge size drop makes it a worse choice vs VibrantVue.

The Physiodose drop (like all 5 ml vial brands) is twice as big as Knoxzy, makes the eyes more irritated, due to high salt disturbing ocular homeostasis, too much NaCl which changes the osmolarity of the tear layer and causes the displacement of the mucin layer of tears at the base of the tears, thereby causing ocular sting sensation like eyedrops of high or low osmolarity do,

so you need to get around that by placing drop with eyes almost closed, so only 25% of the drop gets in. Many other brands exist, Medline, Walgreens, etc sell saline too, but they got pink vials, so avoid those, Walgreens allows you to select saline for injection, which is purer than saline for inhalation. *Saline is the* safest drop, *my* favorite, *the one I use the most*, the only eyedrop I like to use, since we're in the stone age, centuries away from safe drops. don't forget to yawn 5 times/day to overflow eyelids with antimicrobial lysozymes though, as blinking is different and doesn't overflow and disinfect; failure to yawn and using mostly saline or other eyedrops will lead to microbe proliferation and the need to use antibiotics later due to conjunctivitis, styes, chalazions, etc. At night, as NIH papers explain, our lacrimal glands release many antimicrobial enzymes and antibodies, far more than during daytime, *that patrol the eye and keep bacteria growth on eyelid margins and cornea under control, since due to dryness, not flushing via blinks, bacteria multiply fast; we don't blink much for 9 hours and the hydrocarbon oil of* deadly ointments *breaks contact between the disinfecting agents from the lacrimal glands and the* MGs *orifice and other areas,* leading to a grave increase in bacterial growth and styes*; this also happens with* 99% of eyedrops approved by the FDA *used at night as thick gels or, to a much lower degree, with* normal daytime 'thin' (thicker than natural tears, but thinner than night gels) drops, almost all are much thicker than normal natural tears and impede the ocular hourly disinfection; thus, saline is a lot safer than most drops that are simply too thick and interfering with MGs orifice cleaning, risking MGD via orifice blocking via infection; once meibum is blocked, glands atrophy and our tears have no lipid layer, evaporating fast and making us dependent on Big Pharma (75% of Pharma world profits, 4% of population to finance PALACES in Mexican Cartel Style Trillion $ Thefts) eyedrops even more. Our natural tears contain potassium too, so overusing saline with sodium Na only, may cause an imbalance that causes eyelid tissue to swell thereby closing the MGs orifice and causing severe dry eyes long term by meibum gland atrophy, inflammation to occur, MGs to atrophy, since Na helps tissues to retain water, while K helps us release water, and reduce swelling, puffy eyes, etc which may be caused also by high Na intake; i*n a* world of Immortals*, we would be able to buy 100 vials with 5 ml of* saline *for 15$ that has* natural *level of* K *and Na, so we don't swell eyelids and cause dry eyes long term. Genteal tears, #19, are too thick, but they got KCl, without Ca/Mg, which if high, can cause issues with* phosphate precipitation *and calcification of blood vessels that causes atherosclerosis of eye vessels, leading to serious damage to every eye part;* swelling also occurs with ointments and thick drops due to cornea-eyelid friction/biophysical stress that triggers an inflammatory response, *so that is something that also needs be addressed to remove eyelid swelling, i.e. find thinner drops and* safer ointments that don't exist. Try find a watery drop that has K too or less Na, since eyes got K, Mg, Ca in tears also. You can try use 10 µL (natural tear volume) of a 25-40 µL saline drop, to change natural pH less, since changing it causes inflammation, by having it spill more outside the eye via eye corners. Saline drops can also be used when nose is stuffed, it

decongests as WebMD explains) *since NaCl has no side effects and is about 0.9% in* tears, 20 *times* cheaper/mL *than the cheapest* unpreserved *(Refresh+, 9.2$/30 vials)* man made tear.

While Addipak is the most known, Addipak is the most toxic for long term use due to pink plastic that may make eye pink in 10 years as microplastic particles get stuck and dye interacts with the cornea. Addipak is made in US by Teleflex of 12000 employees, but don't put pink dye in lungs and respiratory tract or eyes, since red dyes can cause cancer in animals. AVOID ANY SALINE WITH PINK OR COLORFUL VIAL. Avoid AirLife because it has pink vials. Avoid pink vial Vyaire brand that low IQ ODs suggest for dry eyes. That pink pigment in the plastic Addipak over 12 months of storage and 8,000 unknown chemicals in plastics slowly leaks into the saline and eyes.

Avoid BUFFERED SALINE, the buffer is usually boric (toxic) or phosphate (forms eye stones), and they can create stress via a different pH supported by a buffer at 200 times higher concentration than in plain saline. Boric buffer irritates some eyes, boric destroys the ocular surface (redness, eyelid swell for me/many) at night, it is used to kill ants, damages cornea cells in vitro, so it may be wiser to avoid buffered saline. Bausch got ScleralFil, 30×10 ml, 17$ best deal per volume of buffered saline, but can't be recapped, single use, made in Taiwan, no sachet (but has no void tape to indicate if anyone opened it) so air can contaminate exterior, ozonate before use, so not very useful, though pH is 7.4 with my 4 pH papers. ScleralFil causes eyelid swell when used 5-10 times daily, while using it only 1-2 times is fine every other day. Boric buffer is probably the cause: this eyelid swell lasts for about 24 hours, and it is dangerous, as it can increase inflammation and increase chances of styes: it may be ScleralFil has microbes in it, since twice I noticed a correlation between using this and the appearance of a small yellow stye (later vanished after I burst it). Amazon says not refundable for many items, but if you explain what is wrong with it, like for example (a drop comes and its expiration date is a week from today and normally it's 15 months, then go to online chat, select product, then choose 'i need more help', 'something else' and ask for a refund without shipping back and the AI Amazon assistant will process refund to your Amazon balance in 2 hours; the decision will be taken in 10 seconds, just write a very long complaint; same thing with this ScleralFil, they gave me refund in 2 hours, as I explained it came without plastic wrap from Amazon & Bausch, without sachet to protect the ScleralFil vials from microbes and when putting into eye, you can get 1 million bacteria from transport from Taiwan. You can confirm that boric is an irritant versus plain saline and write it in your Amazon reviews and help us further the research, Bausch reads all reviews, take 20x mirror pic before and after with plain and boric saline and sensations database. Amazon is the best company, you can get a refund on any nonreturnable product, without shipping it back, provided you have a good reason for it. *It's important to realize that buffered saline can be buffered with phosphate* PO_4*, like* Nutrifill *(subcontracted to a 3rd party manufacturer) 105 vials/80$, pH 7.4, cruel* dishonest *customer service, won't tell the concentration of Na, K, Ca, Mg,*

PO_4, when anyone can get it by sending the vial to a lab, food labels are there for the same reason, so we know how many cals, carbs, fats, Na, etc; Nutrifill lied by email and said *PO_4 is at physiological level, but that is 1.5 mM, not* 29 (*19* times higher) as in Table 1 of patent; the website patent explains *PO_4 can be at 29 mM or 10-100 mM, or a* level at which most people got eye stones as explained *in the PO_4 section, so even if you use this as a scleral lens filling solution only, not as an eye drop, NUTRIFILL or any saline with PO_4 > 1 mM, let alone 30 times above that, is* ULTRA DANGEROUS since Nutrifill saline has Mg, Ca that can form eye stones with phosphate. *So, do more research before ever using any buffered saline with phosphate, Ca, Mg. So only use buffered saline daily if it's free of PO_4 and you're not irritated by boric acid; otherwise, use plain* sterile saline. Customer service people are sometimes low IQ liars and they don't even know what the concentration is exactly, believing the lies of the website designer who wrote "It has been physiologically formulated to mimic (PO_4 20 times higher is mimic?) your body's natural tears." It's unethical marketing. Never trust emails without docs showing the exact Certificate of Analysis or patent concentration. The inventor is Ralph Stone, Fort Worth, TX, giving us eye stones of $Ca_3(PO_4)_2$. Dry eye stores carry Nutrifill, without warning customers of its dangers, just like CVS got a dozen eyedrops with PO_4 buffer at deadly or ultra risky levels. ☺☺☺

Perhaps, you will like the Physiodose 5 mL vials, 120/28$, OTC, no prescription needed, see video of Gilbert packing the saline boxes, *and another one* of machine making the saline, *Physio is made by* Gilbert Labs in France (800+ employees, not subcontracted, see youtube of Gilbert). Knoxzy is made by Unither a contract manufacturer founded in 1993, with 1650 (double Gilbert) employees on 4 continents, see video of vials being made, Unither is more professional as youtubes show. ☺☺☺ *Knoxzy* ☺☺☺, which is 600 ml/98$ vs 600 ml/28$ for Gilbert and 270 ml/12$ for Nephron (prescribed, plus cost to get that prescription), is distributed by Biovantic Pharma *UK company founded in 2020 by Indian Britons (most of those who answer phone are from India). Knoxzy* was my main *eye* drop Oct 6th 2022- Dec 2025. *99.9% of artificial tears I used* for years were saline of various brands. Tariffs made the UK company no longer sell it in USA, it vanished from Amazon, ebay. Physiodose *is the* only cheap *unpreserved* saline from Amazon (OTC, over the counter, no prescription required) with clear vials (not pink). Physiodose box is very tight and sealed, and the 3 boxes are shipped by Amazon in a sealed plastic bag to avoid air contaminants, unlike the open LacriPure or Addipak shipped as it is without plastic seal, without box totally sealed and glued. However, air can get in and contaminate the exterior of Physiodose vials, so you need be very careful, since sometimes the plastic seal can be broken during shipping; the vial needs to be at 90 degree angle to avoid water getting contaminated with stuff around the hole. Physiodose allows vial opening that is fastest of any type, due to the angular momentum aiding given its shape: least damage to your fingers and also shipped the fastest of any, same day Amazon Prime. Most of the Physiodose are in opaque big boxes most of their life,

so the light thing is not really a big issue, due to high Amazon turnover. Knoxzy, VibrantVue and Physiodose fit in the same Dove cream box described above (Dove with plastic support inside, except the big one is a tighter fit, that is essential, as that one is longer. The Knoxzy vial has 4 sides, Physiodose is cylindrical, Knoxzy got 2 paper labels (not one like Physiodose), labels on both sides, so if placed on the paper side Knoxzy may get wet or scrub against the plastic support, while Physiodose requires no scratch of paper that may cause bacteria films from the wet rotting paper or invisible paper particles. Thus, clean the containers and that tray with alcohol pads weekly. Save the Physiodose 35 left (out of 40) you didn't move into a bigger box that holds maybe 5 at a time (like the Johnson first aid kit white ones that allow maximum visibility of insects, mold or anything dirty) into a ziploc bag to prevent air contamination when people sneeze or dust comes in from outside with viruses. If you travel, keep saline below 75°F ideally to prevent plastic leeching into the solution. If renting a warm place, store it in the fridge.

Knoxzy seems to cause less mucus than Addipak or LacriPure in the morning when using it at night, though that may be due to drops being smaller for Knoxzy and too much saline causing inflammatory response and mucus secretion, or could be plastic impurities that cause a cytokine storm leading to mucus as defense; but Knoxzy may cause more floaters too.☺☺☺ Each Knoxzy vial can be *recapped, but it takes a huge effort and it's not worth it*. *Gently* disinfect those single use vials saline with ozone if they were not in a sachet, *for brands of saline without a sealed paper pack inside the paper box. Recapping may be optional if reused quick and stored in an air tight tiny container that is almost daily cleaned with 70% isopropyl pad to keep it clean, since our eyes get contact with air all the time anyway. Recapping* can cause microplastics to get near the tip and if placing drops at non-90 degree angle, you may get some invisible plastics in the eye, so don't recap. If you recap any saline, the pressure of the cap causes the opening to widen and the drop size to increase 50-70% and irritate the eye by too much NaCl, so you need a plastic holder that holds the Knoxzy in place inside your round cream box, avoid recapping. We need to ask the government Immortality *Nurturing* Agency to create an affordable *sterile* saline leeching no chemicals and plastics inside, that is stored in a preservative free type of bottle (like 100s of eyedrops now, even Refresh, Systane, etc) made of glass, with a spray cap (like Optase spray eyedrops bottle, without the odd ingredients), to make it easy to spray 100 ml, instead of using 200 plastic single use vials of 0.5 mL each. The 0.1 micron filter will remove all air microbes with each pump, allowing us to hydrate eyelids and dark circles too. The problem with existing saline sprays is infecting the saline with air microbes due to poor design. If glass is too heavy, they can design a plastic for that bottle and tube and spray cap that leaks only 0.0001% (one millionth) of the plastics current bottles used by Alcon, Allergan, etc leak. I guess instead of heavy metal music composing, we could have more materials ☺☺science☺☺☺ graduates. Since companies don't care about the cornea opacification via microplastics, or phosphate, as the previous

paragraph explained, it is *the moral duty ☺☺☺of the government* to create a product complimenting the 90 quite toxic and useless RiteAid products that irritate the eyes and damage the eye a lot, and oddly, are all covered by insurance. The nice thing about saline is that it's less reactive so the plastic reacts 1000 times less than with normal eyedrops, so plastic leaches less into the water and forms no toxic combos, as plastic doesn't react with salt. The more you avoid light and heat, the less the plastic degrades, the less it leaches into the water, so always keep these in the opaque sachet and in a cooler place of your room, or, in 2 "lid tightly screwed" Dove cream containers (similar to the container in the pic for the vial you open and use now) that can hold 5 vials each, 3 facing one side, 2 the other side. *Knoxzy also has the smallest opening if you don't recap it, so less air gets in with bacteria and drops are smaller which is ideal, since one of the most annoying issues with* all drops is they're way too big and cause inflammation, even Refresh hole is huge like most eyedrops. I explained in the eye guide section how vital it is to design eyedrops with smaller opening and 2-5 times smaller drops, since normal tears are 8 µL, not 25-40 µL like the saline drops.

You will notice how eyes get way redder when using 2 saline drops vs 1, using your 20x mirror; so definitely, only use 1 drop. We want only a tiny bit of saline for routine daily use, one drop at a time (maybe 2 at night if eye is dry and it's a brand with 2 times almost smaller drop than other brands), unless we want to wash eyes of some junk once a week. A capped Knoxzy also can fit into a round cream container for air tight seal of the exterior too (useful when driving or going out), unlike Addipak types that require a container twice as long in length or diameter. An uncapped Knoxzy (not ideal) needs a smaller version of this box I made for longer saline vials when I tried them for a few days (capped with Refresh cap) to minimize air contact inside a small 100% air tight round container (like Dove cream, etc) that you screw the lid on (see pic of this hybrid box with a Knoxzy☺☺ capped with a slightly different cap than the one it came with, 1 of the 3 holes in the plastic separators is smaller to prevent the tip from touching the box, so there is one position only in which to place the vial, you can use a marker to draw a smiley face near the 3rd smaller opening, so in darkness you can see better how to align it back), to prevent the tip from touching the box, and shaking from having water spill out into the box; even a capped saline would benefit from this, as it would prevent too much shaking. To put things in perspective, most eyedrops without the special 0.1 micron filter used in unpreserved multidose special bottles that expire in 3 to 6 months will accumulate a lot of air after 30 uses, air that sits there for months, sometimes a year even and will be worse in contamination than these saline in a sealed container for a few hours. Thus, you need to discard any eyedrops that have been sitting without a filter more than 3 months as they're dangerous, unless you have the most amazing air filtration in your room: air is full of microbes, pollen, dust mites, molds etc the wind brings from grass and far away houses, etc that can grow out of control in a moist place. Knoxzy

vial, as pic shows, is like Refresh single use vial. ☺☺☺Knoxzy says Sterile A☺☺☺ on the pack and vial, like Hylo eyedrops and many others. You'll need this type of hybrid box for any saline for air tight seal, especially the LacriPure with a huge hole that spills water 10 times easier than all others when moving the box as you walk in a store. The idea is to never have any water spill out, so LacriPure is useless, it always spills. After you use Knoxzy or others better saline, seal the sachet laminate paper after taking 1 vial, and place back into the box, to prevent air contamination of the vial exterior and use the 10 vials within 2 months of opening as instructions say. Knoxzy, and all salines with small opening, are by far the best in terms of functionality. Perhaps, we need tell FDA, gov to provide at least one unpreserved saline unit dose brand, more choice of eyedrops, since the saline is the safest eye drop, no chemicals, etc, the most basic one that would normally be expected to be there at a price 20% of the cheapest refresh plus single dose. Many ODs (some even from Lenscrafters) use inhalation saline and tell patients it's fine. The most shocking thing with eyedrops is that many companies, even Refresh, don't seal in laminate packs all their eye drop brands like Knoxzy from France, so shipping can contaminate them a lot, around the neck where you open it, so always place drops while in bed, so vial is perpendicular on the planet, to avoid contaminating with the neck. Avoid preserved buffered saline at Walmart and on Amazon, those are only for rinsing contacts; they may damage eyes via preservatives and bacteria grow fast in open preserved containers vs single use ones as studies show in the preservatives section. Single use is safer; *plastic quality is also a factor, so it's critical to have* tests done *by the Immortality Nurturing Agency.*

Walmart has alcohol pads, 400 for 3.8$, online purchase, free ship if you buy 10 packs, *that you can wipe right hand finger tips before you grab the saline vial from your air tight box, to avoid contaminating it after you're done, so you can bring while going outside some of those pads in another box*. Even if you don't put a cap (can buy a box that holds it, so tip doesn't touch box, disinfect it with 70% alcohol and maybe ozone after trimming some areas to fit the vial), after each use, some water remains in that narrow neck of each vial for Addipak which I strongly suggest to avoid anyway, so it seals the rest of water from the air, so next time you use it 1 hour later, just get that water away, squeeze it and you get freshest saline, though a cap would be worth buying to protect eyes from air bacteria (though our eyes are used to dealing with far more air bacteria by walking alone and being open than the little would get into saline via air in a few hours) – just get the cheapest unpreserved vials and use their caps even if you don't use those tears except for the caps; this water squeeze is not possible with other vials that don't have this narrow neck. LacriPure has paper on the vial, which sometimes can have small pieces come off, if container gets wet due to shaking the sealed box you store the vial in and reusing it minutes or hours later, so tiny pieces of this paper could, in theory, get inside the eye, if you're not careful, but so tiny, you would never see them, though enough to cause inflammation,

though our eyes are used to a lot of that; this is a real issue with LacriPure since it spills so much water. LacriPure is distilled water, so no F is present, except in tiny amounts. When reusing the cap on a new saline vial, try to flush it with the new saline vial drops to remove any invisible debris. Sterile Addipak is used by many optometrists, even LensCrafters ones in Redondo Beach, California. *All salines got an advantage over LacriPure, because you can recap with a Refresh cap etc, while LacriPure can't be recapped. Addipak customer service is 20 times more unhelpful than Menicon LacriPure, Knoxzy, Biovantic' Addipak always evades the answer on how they sterilize the water and how much F may be there. There are many dry eye shops that carry Addipak/LacriPure, besides Amazon.*

0.9% saline ☺☺☺Knoxzy☺☺☺ is 3-7 (depending where you buy it from, how many packs at a time for discounts) times cheaper than cheapest preserved tears. A doctor explains in this article that she prescribed 0.9% sterile inhalation vials to insert moist contact scleral (also used to treat dry eye) lenses. Basically, our eyes deal with a lot of microbes from air etc, so a sterile for lungs solution is pretty clean, could be cleaner than the LacriPure one, but that I don't know, it depends on what purification devices they use. On Amazon, 100s of reviews explain these Addipaks is what their eye doctor told them to use for dry eyes. Others use 0.9% saline homeopathic eyedrops: *30 vials of 0.4 mL*/13$ Boiron (pH 6.5 or so, made in France, distributed by Boiron USA PA, safe), but these have polyphenols, so they need to be kept at a lower temp, away from light (seal sachet after taking one out etc) vs other saline. While both are made in France and use sachets to seal vials, *Boiron (12 ml for 13$) is 5.4 times pricier than Knoxzy (100 ml for 20$), which has 2.5 ml saline per vial, not 0.4*. LacriPure is distributed by Menicon USA MA, made in Japan. The pH paper used for saliva or for buffered solutions won't be able to measure pH of saline unbuffered solutions, you need a normal pH paper, see links in the buffer section. 2.5 ml per vial is enough for a using it 30 times a day even. How do we carry around saline? You can store it once opened in a 3-4" (8 cm) diameter round cream container bought for that purpose from $ store (trash the cream if it has toxic aluminum), to make it air tight and be able to reuse 'the single use vial' minutes or hours later with no contamination from pocket, air, table or other areas where the capped one would be placed.

Many optometrists and eye drop labels on vials say it's OK to use within 12 hours (vials by manufacturers) or 24 hours (optometrists who believe in fridge storage) if kept cool, etc; put a smiley face on the side to help self smile more;☺☺☺ I put 1 smiley on the box I take out that gets dirty hands on it, when I keep it in my pocket if I need it while driving, etc and keep it in the car; and 8 smileys on the box I use only in the home with clean hands. Or have one box only and clean it with alcohol pad once you get home. This way you can store any other single use vials you may use. However, cheap/'safest' is not always better, BRI 2014:292139 found *at 30* min saline *solution in vitro (in vivo it can be vastly different) cell* viability *was* 0% *while* Thealoz *was*

52%. Saline often whitens my eye instantly, so I carry a sealed one with me in my car in a plastic container in case I get dry. Use only 1 drop usually *(unless washing a bad drop), since at 2+ drops the eye dislikes it as we disturb the fine balance, by washing the existing film, electrolytes and chemicals too much and eye can get red, due to* hypertonicity. Saline *is very useful (when it fails just use a thicker drop) for getting eyelashes stuck into your eyes out, I got several out in 10-20 seconds with the indispensable* 20 x mirror *and just about 2-7 drops (these are cheap gigantic drops), it came out off the nasal corner the eye or center eyelid and then used q-tip to drag it out; put drops and use them to wash it on the nasal corner of your eye and then with eyes closed pull on the little part that got out of the eye and get it out; this is amazing, 30 times faster than before I knew anything about artificial tears.* However, there is a simpler way to get eyelashes out when the eyelash is more than half way outside of the eye, with only one end touching the cornea: use a 20x mirror, to see well, at 1x you can't see what you grab, just grab it with clean fingers (2 seconds, versus 20 seconds using eyedrops) if easy to grab or, if hard to grab, with a pair of ultra round ends (safer) tweezers (see pic, this one is from a 1$ store manicure 5 piece set, so 0.2$) or, much better, with the meibum expressors that I use now exclusively to get eyelashes out when partially on the eyelid (flush with saline and blink first, to get them partially on eyelid if they're fully in the eye), which for eyelashes that are not much outside works better, without having to disturb the eye so much with drops and q-tips to move it off eyelid. Unlike buffered tears with 6.5 pH, the ability of these drops to retain this pH once in contact with human tears (which usually have pH 7.3 for most people, plus minus 0.2) is null. However, this is not a reason to overuse these due to being so cheap, because that can cause eye inflammation due to lower pH than eyes are used to and flushing the nutrients too much. ☺☺☺

Saline can work as eyewash solution, it's so cheap, after any drop that didn't work as expected and you wanted to get out of the eye after trying 3+ times, 3+ days to confirm it's the "new brand" that's bad not other confounding factors. 0.9% saline seems good to use 5-9 times during daytime, if your tear pH is typical 7.1-7.5, with other 7.4 pH tears *right after* or before to keep ocular pH around 7.3 (or yawn generated tears, or *tears generated by blinking 20+ times in a row; when we blink we automatically produce a tiny amount of tear*; after *makes more sense, so you don't waste valuable drops and pH is truly alkaline; using alkaline drop first may wash most of it off if placing many saline drops*; seems like using 0.9% saline 10 times alone/day is fine (no alkaline, yawn or blinking drops) if your natural tears got pH 6.5-7 since it won't cause pH mismatch inflammation (explained in the 1st paragraph of the buffer section), but even at 7.2 pH, without buffer it won't cause an issue if only one drop at a time is used. At 7.7 pH, it may sting for 2 seconds. ☺☺☺ Before bed or during the night, 0.9% saline drops may not work very well sometimes, so try to eat choline to increase mucus/tear production to get that 'thick drop effect' when saline comes in, without using thick drops, gels with toxic ingredients. All saline is distilled

or reverse osmosis filtered so it has super low fluoride so *low retina calcification* risk. LacriPure is FDA approved for eyes, but so is Addipak USP, meaning FDA approved for inhalation, not eyes. However, the only way to make sterile water easily usually is thru reverse osmosis and/or distillation, so Addipak is probably also free from any fluoride. If osmosis, it may contain more fluoride, since some osmosis filters only filter 90% fluoride, while distillation removes 99.9%; USP means no viruses, so that may mean more reverse osmosis; however, distillation won't remove as well as osmosis the big molecules of chloramines, etc, volatiles and semivolatiles that boil at a higher temp than water does, so it's hard to know which saline is the best without more studies on what is more toxic, and without certificates of analysis required by the government to be posted for all to see on immortality.gov). If boiled long enough, LacriPure, which is distilled (like Addipak may be too) will become free of chloramines, and other common irritants.

Walmart distilled water has carcinogenic hydrocarbons at times (lab analysis), due to improper cleaning of distillation equipment or short boiling. Addipak is meant to be used to make water mist that is inhaled, so it has to be very clean. It's possible both go thru excellent filtration and both have low volatiles, etc, but it's not clear which brand has less fluoride. The key is to know the quality of this purification and what USP inhalation solution means in terms of impurities. *What some don't realize is that when they go to CVS and buy a normal Visine or others and use it 5 times daily with* BAK ultra toxic preservative*, the* MGs *orifice closing (if that closes for a long time,* ***dry eyes for life are the result****)* "redness reliever" *arteriole/venule constrictor, they can do 100 times more damage/day to the eye than using the 10x cheaper 0.9% saline in combination with a $14 unpreserved* hyaluronate drop *(Bayer, Hylo, Vismed, etc used 2 times).* Saline tears may only work 4 times/24h*, since too much may cause a little discomfort or redness,* so one can often combine saline with a favorite (Hylo Fresh?) ***drop that*** brings pH closest to one's own natural pH value (if known) ***or ideally,*** yawn tears ***to get healthier nutrients***.☺☺☺☺ I mixed a drop of a normal buffered eye drop with 0.9% saline and pH remained the typical pH of that drop, which is what happens in your eyes too. *However*, if you mix more of the saline solution with 1 drop of a normal tear, that pH shifts slightly more acidic if pH > 7 originally. To be safe, just mix a drop of saline with a drop of normal buffered tear on a piece of plastic, then touch the new mixed drop with pH paper, measure the pH is what you want. 2 drops per eye, first the buffer one, seems more than enough to avoid placing so many buffers inside the eye. 2 drops saline and 1 of Hylo Fresh led to pH of 7.2 or so; 1 drop Refresh Optive + 1 of saline = 7.2 pH.

Do single use vials present advantages of more accurately retaining their pH, since a saline spray or bottle is so open to new CO_2, it can shift its pH over time? Yes, since most saline vials are discarded in 1-2 days. Placing HCO_3^- in our eyes with saline or other drops is not an issue, since HCO_3 is part of our natural *tears. Only use contact insertion approved solutions in small sealed vials that require no preservative, sterile and free from any chemicals;* ***never use solutions that***

are for cleaning contacts only as those have corrosive chemicals and they're not for insertion of contacts. 0.9% saline can be used before, after or without a normal eye drop to provide that extra water that brings less toxic buffers and brings drop pH closer to 7 (be it acidic or alkaline) or alone. ☺☺☺ Boiron is also $13 for 30 vials for curiosity, but it also has polyphenols from plants which may irritate some people, may help others. Try and see, after reading all below. People make fun of homeopathy, but without trying Boiron that showed up in my Amazon search for man made tears, and seeing how great saline can be, I wouldn't have searched for saline and found the way cheaper and safer brands, without polyphenols oxidizing due to high temp during Amazon or warehouse storage. Always measure *pH of any tears to make sure they're not too basic or* acidic *compared to* your natural *tears*. See how eyes respond, and decide if saline are worth trying to dilute other drops to minimize artificial buffers pouring over the eyes. Our eyes have a buffer of phosphate, proteins and bicarbonate, so Boiron won't change pH at all almost, eye pH returns to its average within 20-40 min, for buffered drops and much faster, maybe 1 min, for saline. Human ocular pH is 6.7 anyway, in the morning, quite often. To be avoid damaging eyes with a very alkaline pH, you can always dilute it by placing some saline before the alkaline (with respect to your pH, which is lower in the am, highest in evenings) artificial tear. Boiron 'saline' contains homeopathic dilutions (i.e. negligible amounts of) of 7 things *(marigold 4X-0.25%,* eyebright *4X-1%,* dusty miller 6C *HPUS 1.5% (*6C is same as *12x), 10x* HPUS*-0.25% of these 4: $MgCO_3$, SiO_2, CaF_2, KCl, such a low 25 ng/L that more may be found in the purified water itself) besides the* NaCl (0.9% level of natural tears, 308 mOsm/L), purified H_2O and ethyl alcohol traces used in the extraction of the 3 plants; *10x* HPUS 0.25% means $0.25*10^{-10}$% or *25 nanograms/L or 0.00064 µM fluoride, so this* means *fluoride* added is at a level 1000 times lower than what is in our natural tears and blood, which is about 0.5 µM. 6C means 10^{-12}.

This Boiron *is* basically an eye wash solution, salt and water, made into eyedrops, *since the "7 ingredients" are truly negligible except for* marigold *and* eyebright polyphenol *extracts,* but it has traces of ethanol, though Boiron USA said by email that it has 0% ethanol in reality (0.1% or 0.3%? not sure how the rounding of 0.3 is done to 0% or 1%), after all the water-ethanol dilutions of the ethanol tincture, see how Boiron explains dilutions. They got ethanol sometimes (you would think it was 2.75% for the 3 plants, but apparently dilutions are not all in ethanol but water-ethanol). Odd how homeopathic companies don't write about ethanol safety at all, or the fact high ethanol can "give a burning sensation" when placing eyedrops ► Pharmaceutics 2020; 12(4):378. High ethanol can be cytotoxic. CaF_2 can lead to fluoroapatite crystals $Ca_{10}(PO_4)_6F_2$ if you use phosphate tears of other brands or retina calcification similar to pineal calcification; but keep in mind that most companies that don't filter out F^- well (most would, since reverse osmosis removes most F) before making drops may have F^- 800 times higher than Boiron, since Boiron uses < nanomolar CaF_2. I doubt the tiny CaF_2 makes any real difference in total F^- given

how much more F^- is in the 'purified' water to begin with; nerves can be damaged by high F^-, but not picomolar. However, many drops contain glycerin, erythritol, polyvinyl alcohol which are poly alcohols. What is the effect of ethanol on the eyes at such tiny levels? See the 9 min Boiron manufacturing facility video, amazed their large facility even exists, since many associate homeopathy with "useless stuff, heavy metals, pseudoscience". See their director speak & Boiron wikipedia says $0.6 billion in sales, 3700 employees. I found no PubMed articles on Boiron drops, but RiteAid got Boiron Arnicare foot products, and homeopathic Similasan with silver in it (avoid, since silver can damage organs.) Similasan even sells eyedrops with mercury chloride known to destroy the optic nerve and nerves on the ocular surface, and belladona poisonous plant (belladonna is used by MDs for some conditions, to dilate pupils). ☺☺

11.17.3.5. 7 pages on Hyaluronic acid Ocular Effects & 20 pages on Hyaluronic Eyedrops

The 7 types of Hyaluronic Acid HA (*m*olecular *w*eight *MW* 1.4-2.8*10^6) Hylo *Tears* are after 7 pages on hyaluronic *MW* effect *on* eyes. Jump to: ointment Hylo Night or drops: 3.1. Hylo-Tear 3.2. Hylo Gel 3.3. Hylo Care 3.4. Hylo Dual & Dual Intense 3.5. Hylo Fresh (best) 3.6 Hylo Parin

Only 3.1. Hylo-Tear 3.2. Hylo Gel use sorbitol, a controversial compound. All 7 drops are made by UrsaPharma *Industriestr. 35, 66129 Saarbrucken, Germany as written on the bottle* (yards from France-Germany border on google maps), 0.23 billion revenue, 700+ employees, see 5 min production video or see a 5 min Ursa expo clip, 3 min clip, 7 min clip on their presence in 70 countries, a 5 min video about the Hylo eye drop bottle manufacturing and a 4 min factory video here. HA is *found in many brands at CVS*; it is a humectant, *hypo-osmotic, assists in cornea wound healing, protects cornea,* prevents *inflammation,* lubricant, better *than* glycerin *at lowering tear* osmolarity, *more viscous after blinking to increase* tear breakup *time, retains water,* reduces mucous strands. This hyaluronate is also found (without the sodium) in the gel like fluid inside our eyes, MGs, joints, in the brain ECM (*e*xtra*c*ellular *m*atrix). Hyaluronic acid comes from hyalos, Greek for glass, (Hylo for hyaluronate or hyalos) due to its transparent quality and glass like nature of vitreous gel that contains it (detected in 1934 in cow vitreous gel), easy to recall due to word halos, shimmering, reflective and uronic acid, (uron is urine in Greek, this is because many uronic acids are in urine), with glucuronic being glucose with ending CH_2OH turned into COOH; glucuronic is 1 of the 2 repeating sugars of the polymer, the other being N-acetyl glucosamine, where the OH near CH=O of glucose becomes $NH\text{-}COCH_3$; the substituted (COOH, $NH\text{-}COCH_3$) glucose units are bound via alternating beta 1,3 and 1,4 linkages. That's why some seniors take glucosamine and chondroitin for joints, but glucosamine pills are "associated with accelerated AD progression and worsened survival.. a 25% increase in mortality risk among ADRD (Alzheimer Disease Related Dementias) patients… 25% increase in the proportion of patients with MCI (mild cognitive impairment) transitioning to ADRD" ► NM Jun 9

2026 (some believe that the "pain/arthritis caused the dementia, not the glucosamine"). HA was used since 1950s to replace vitreous gel in surgeries. HA is recommended by many MDs as drops/pills for dry eyes, floaters, since 1% of the gel inside our eyes is hyaluronic acid, 240 mg/day NaHA 390 KDa reduced dry eye discomfort after 3 months ► JO 2019:5491626.

HA reduces dry eye more when taken *orally* too, besides as tears, suggesting that atrophied MGs can regenerate when HA is abundant, reversing dry eye; however, the biological effects of HA vary with its molecular weight (MW): low MW can be pro-inflammatory and used a serum marker of inflammation and cardiac risk, high MW is anti-inflammatory. SWJ 2014:378024 found that most HA we eat goes into skin of rats, maybe even cornea too, since it's a skin like tissue; lower MW HA is absorbed easier; HA moisturizes dry skin and may thus moisturize dry corneas too. IJGM 2009;2:77-81 says 500-700KDa HA (mid MW) inhibits IL-1 downregulation of type 2 collagen synthesis. So, perhaps, if buying HA, buy high MW, at least 1500 KDa, like this Talsen USP > 1800 KDa (Amazon has other powders, like Pure with MW 780-1002 KDa, Nutricost 800, True Radiance 1300, XPRS 1006, higher MW seems better). BR 2021;25(1):27 found the same inflammation with low MW. TVST 2019;8(6):2 found "high- and low-MW HA acting as anti- and proinflammatory mediators" and MW in KDa: low MW or *inflammatory*, (<500KDa): Thealoz Duo 220, Thea Hyabak 248, Systane Hydration 432 (*the only Systane with* HA, *though due to being part of the HPC guar high MW polymer its effects may be very different from tears with low MW small molecule lubricants like glycerin, etc, since* JOPT 2015;31(8):491-7 found in vitro HP-guar + HA destroyed fewer 'cornea model' (not cornea) cells than HPG or HA alone, so HPG+432K HA may be same as 700K HA; so when we have HA + other 1800K+ MW lubricants, *damaging effects of cheap low MW* HA *may be attenuated;* low MW penetrates the skin and cornea, interacts more readily with smaller proteins and molecules and cytokines, etc and can drive up inflammation), medium MW (500-1000KDa): Artelac Splash 533, Blink Intensive 772, Artelac Rebalance 902, Vismed 918 (*2021 Vismed said 1100-1400*), high MW (>1000 KDa), *anti-inflammatory*: Refresh Optive Fusion 1178, Hylo-Comod/*Tears* 2026, Hylo Gel/*Forte* 1748 *highest* (Hylo Parin 1428). Hylo Gel MW was 2400-2800 in 2017 paper though, making it the highest. *Many* papers say high MW is best as low MW causes inflammation of dry eyes, like in serum low MW HA is marker of inflammation. ☺☺☺

"High MW HA displays anti-inflammatory and immuno*suppressive* properties.. low MW HA is a potent proinflammatory molecule... HA binding to the CD44 receptor provides the effect of coating the cell membrane. This protective layer of hyaluronan on a cell surface is able to mask cell death receptors" (so cells don't die; low MW HA can't do it) ► Wounds 2016;28(3):78-88. "Immediately upon injury, local HA (> 500 KDa mostly) production increases substantially… (during inflammation, high MW HA (HMW-HA) is oxidized to low MW HA (<200 kDa) that is) cleared via CD44-mediated endocytosis… Upon the resolution of inflammation, both the amount

and size of HA return to basal levels... in chronically inflamed tissues, shorter HA polymers predominate… HMW-HA predominates in healthy tissues and typically inhibits inflammation. Specifically, HMW-HA prevents cell growth and differentiation, diminishes the production of inflammatory cytokines by multiple cell types, and *impairs phagocytosis* by macrophages (*that may be bad, an eye infection may not resolve, so perhaps for some people, medium or 'low' MW HA may be better for a week or more*). Recently, HMW-HA has been implicated in the inhibition of tumor progression. Administration of HMW-HA is anti-inflammatory in ... a variety of other in vivo model systems… delivery of exogenous HMW-HA is beneficial in both the amelioration of airway inflammation and in limiting scar formation in dermatologic wounds" ► IR 2014;58 (0):186-92. "while HMW-HA (>1450 kDa) inhibits phagocytosis and induces cell quiescence, LMW-HA (<450 kDa) tends to increase the expression of matrix metalloproteinase genes, inflammatory cytokines, and angiogenic (*redness of the eyes, new arterioles*) factors" ► BBAB 2020;1862(9):183348. LMW-HA "can also induce angiogenesis and *tumor* progression" ► IJCB 2015:563818. Many herbs (ginkgo biloba, used for eye health, though side effects can occur, etc) are anti-angiogenic, preventing eye redness. Natural HA MW vary between vitreous gel (200 µg/ml) and aqueous humor (1 µg/ml), see this paper about livestock HA MW, it's always more than 500K; 3,000+K in human and livestock babies; HA also contains silicon; in adults "Native HA has a MW of 4–10 million Da, and is present in articular fluid in a concentration of about 0.35 g/100 mL". "HMW-HA (mouse) group had significantly longer (tear) break-up time (BUT) than the 0.1%, 0.3% LMW-HA groups" ► IJMS 2020;21(10): 3516.

Collagen type 2 is the floater fibrils in the eye that float in the aqueous gap in the vitreous gel, due to an age related decrease in eye HA content that makes the gel acquire watery gaps in which type 2 aberrant collagen fibrils float, after oxidative stress induces their normal fibrils to become abnormal or cross linked; normally, enzymes dissolve these fibrils after a few weeks or months if oxidative stress goes down. 0.1% HA increased lipid layer thickness much more than 0.3% ► IJO 2018;11(3):389-94. HA 0.1% works as well as 0.05% *cyclosporine* (immuno suppressant in Restasis) prescription eyedrops for dry eyes ► JOPT 2017;33(2): 66-72. ☺☺☺ Most studies on artificial tears safety use some standard eye condition markers, but *never* the state of the MGs, since the glands are outside of the eye, in the eyelid; however, eye health is directly dependent on MGs health (meibum secretion), so if in vitro or in vivo studies we have toxic or *apoptotic effects* of (in)active ingredients on meibomian cells, eyedrops are bad, since MGD will dramatically weaken eye health over the long run, since no artificial tear comes close to the content of meibum. IOVS 2018; 59(8):3713-27 found "HA *promotes development* of the MG… an HA-rich *network surrounds the basal layer* of MG acini... *the tarsal plate is an* HA-rich tissue… HA regulates MG morphogenesis… meibocytes synthesize and accumulate lipids… (until they die upon secretion, *because* MGs *are* holocrine *glands, not exocrine)* MGs must constantly

replenish acinar cells that are destroyed as part of the secretory process. ☺☺ This requires that MG precursor cells (located within an HA-rich ECM) in the basal layer proliferate… a subset of MG cells differentiated into HA-producing cells, which over time encapsulated the acini with an HA-rich matrix", so HMW-HA eyedrops may be better than others. Why use HA present in mucin layer of tears & MG and not artificial polymers like polyvinyl alcohol $(-CH_2-CHOH-)_n$? "Symptoms as judged by the dry eye questionnaire, as well as both fluorescein and rose bengal staining, were significantly improved by 0.15% HA. The polyvinyl alcohol treated patients did not show a significant improvement in any parameter." ► ASEO 2005; 80:387-94.

"0.1% HA allowed better stabilization of the tear film and thus a significant improvement in the quality of vision compared to normal saline." ► FO 2018;41(2): e51-7. HMW-HA, other eye drop ingredients are antivirals, HA can kill some coronaviruses. "Over the past 25 years, HA eyedrops have gained recognition as the first choice of tear substitute in the treatment of dry eye disease in Europe and Asia… In the US tear substitutes are regulated as "ophthalmic demulcents", which, if containing certain active ingredients in established concentrations can be registered as OTC medicines without requiring a ***diligent*** approval process. As hyaluronan is not on this grandfather list of active ingredients, no tear substitutes with hyaluronan as their sole active ingredient have so far achieved approval as an "ophthalmic demulcent" by the US FDA… (so in US we see usually HA added as inactive ingredient to drops with glycerin and/or CMC as main lubricants; this is not by coincidence, it may be due to several reasons such as the ability of HMW-HA to increase absorption of toxic ingredients (sorbitol for example included in many HA drops which can cause cataracts) of same or other tears people used that 2 hour window because as section 5 of article explains more "The use of hyaluronan in ophthalmic drug vehicles has been suggested in numerous publications. Hyaluronan has a proven effect of counteracting the irritating effect of substances to the ocular epithelium (hides damage caused by non-HA substances)…the ability of HMW HA to suppress activity in nociceptive afferent nerves (hide ***pain*** caused ***by other*** toxins ***in eyedrops*** so people don't realize their eyes are destroyed). HMW-HA … due to its viscoelastic and mucoadhesive properties promote the prolonged, intimate contact of APIs to the ocular surface. (Very HMW-HA), but not LMW HA, is binding to MUC16 in the glycocalyx of the apical epithelial cells… ***enables temporal cell detachment and thus enhances the penetration of nanoparticles and drugs along the paracellular pathway***" (HMW-)HA "has immunosuppressive effects. Large HA molecules protect against lymphocyte-mediated cytolysis, suppress septic responses to lipopolysaccharides, maintain immune tolerance,☺☺☺ induce production of immunosuppressive macrophages, reduce expression of inflammatory cytokines, modulate the immune system and are antiangiogenic (***prevent new arterioles formation, prevent redness***); has intrinsic antiaging effects… diminishes oxidative stress… reactive oxygen species (ROS) generated during inflammatory processes depolymerize

HA… HA fragments trigger mucin MUC5AC hypersecretion… low molecular weight degradation products of hyaluronan can induce *inflammation and angiogenesis (redness)*… HA is involved in neurogenesis (being part of the brain extra cellular matrix too)" ► Diag 2020, 10(8):511. HA "can reduce nerve impulses and nerve sensitivity associated with pain" VM 2008;53(8):397-511. ☺☺

Most HA in eyedrops used for post surgery to avoid inflammation at all costs is natural 4 million MW, (sometimes 2.4 million Hylo too) not the cheap 0.2 million in Thealoz, see page 17 (Table 4) in Polym 2020;12(8):1800 which also explains HA level in "joint synovial fluid—1.50–3.60 mg/mL, vitreous humor—0.14–0.34 mg/g, human dermis and epidermis—0.20–0.50 and 0.10 mg/g… (HA turnover by biosynthesis/enzymatic degradation in vertebrate tissues is) 5 g per day… in blood-flow (HA turnover) reaches 30–100 mg per day… (HA with MW) 6–20 kDa possess immunostimulatory, angiogenic, and phlogotic (inflammatory) activities… 20–200 kDa takes part in biological processes such as embryonic development, wound healing and ovulation… >500 kDa has anti-angiogenic activity,.. (can be) a space filler… immunologic depressant… (animal HA has) endotoxin and protein residuals (with) immunogenic effects… (bacteria enzymatic synthesis HA has) 1.0–1.6 μg protein... 0.02 EU endotoxin"/mg vs 30-50 protein and > 100 EU endotoxin for animal derived, but bacterial protein can be more immunogenic even if in 30x lower concentration. For surgeries (not post) they go with natural MW, i.e. ≥ 4 million because HMW-HA promotes healing and reduces inflammation which is sky high then. 500-950KDa MW HA may be better for some with punctal plugs (which need stronger immune activity to clear out debris) and lower immune function due to medications, etc, while those with high inflammation, ocular stress (attacks), overactive immune system may need 2,500-3500KDa HA. Some papers say < 500KDa is angiogenic, others <250, 100 or 20KDa, so perhaps > 20KDa is ultra angiogenic, 20-200K mid angiogenic, 200-500KDa mildly long-term angiogenic; with 100s of papers read, we get a better idea, since Pharma don't tell the public much, not even MW being high or low.

Thealoz MW is 10+ times lower than Hylo; HydraSense Advanced is low MW HA and 6.5 pH, while Hylo Care is high MW HA, pH 7.0; a person goes to Walmart etc reads ingredients, calls company, 2% proB5, and thinks HydraSense & Hylo Care are the same. Doctors and patients have a right to know, because obviously, you need an ideal range for different patients, dry eye type, etc. so we can try various drops and figure which MW, pH is better. *We got* calories *and nutrients on foods, can we get* pH, MW of polymers, inactive ingredients concentrations *too, so we know buffer, Ca, Na, K, PO_4 concentration*, eye stone risk? ☺☺☺

The *Hylo bottle* has some *submicron* filter for air only (no liquid is filtered) *(preventing bacteria in air from going inside, other techs filter the liquid too, and liquid has preservatives that are filtered out due to particle size being bigger* ► RJO 2015;59(1):2-5*). Refresh has a preservative free bottle with double lock system, Hylo uses 1 lock system. The video about the* Hylo bottle that

delivers only 1 drop at a time has more; it's similar to the Hydrasense bottle ► Hydrasense 2 min video explains the bottle tech better. Hylo video explains well how to use it. The Hylo system, or *Comod* (*Co*ntinuous *Mo*no *D*ose) bottle, is described in detail here. There are many unpreserved bottle types and it seems Hylo is the only one that doesn't have a plastic seal that needs to be broken to use the vial, but has a cap and a taped cardboard box, which can be easily broken and then new tape placed it, after someone has inserted new chemicals into the bottle. It seems a very suspect unpreserved bottle system compared to the Thea, Bayer, Bausch, Refresh, all others, since it invites the delivery services spies or anyone to mess with it. Since other companies offer almost same products as Hylo in safer bottles, perhaps, others will consider the pros and cons. One thing to keep in mind is that a secure system would have a code to be scanned that is only correctly revealed by the company website (not a fake site) if the seal was not broken by some delivery employee inserting poisons into the eye drop. (would then be safer to buy drops from a physical pharmacy?). Like the Refresh bottle tech (with NaOH) here, it remains sterile for 6 months after opening.☺☺ Hylo bottle is 10x easier to use, place drops with precision in any desired eye area with an eye guide than any other. We don't need strain to squeeze bottle, missing the eye. Biotrue/Refresh/Bayer type are not easy for eye guides, because they shift on the eye guide, don't stay centered, don't fit on the guide, Thealoz ABAK style better than Bayer; Hylo by far the best for eye guide users, when you push Hylo, drop comes out, we know when/where it comes, with the others we don't. You squeeze, but never know when it comes out and by the time it comes out you may blink and waste one drop. Hylo makes more equal size drops too, smaller too, which is better, gives more choice to put less and then add more only if needed, while with the others it puts 67% more.

Some 6 popular ☺☺ *Hylo* tears are listed below (they got 13 total, 2 are in lipid tear section). Ursa/Scope *has a different a tamper evident seal*: don't use if tape is broken or plastic bag is not sealed; these got easy to remove/replace tape on the paper box, easy (for a professional, not anyone) to remake sealed air tight plastic bag that holds the box to remove the box from the bag, so USPS/Amazon, Scope, spies can use syringe to insert poison inside, put cap back. Check out my Hylo Care experience, and realize these drops are not FDA OKed in US. Watch out for keratinization (granulated appearance) of caruncle, cornea and eyelid margin, as that may spell doom for the MG in the long run (see MG death via keratinization in Clear Eyes Sensitive paper on epinephrine). *Most* studies *on "drops* relieved *symptoms of dry eye" are* ultra *superficial, they just* look at a *few* parameters *that the* thick *water retaining* HA *will help in the short term (*1-6 months*), without looking at the long-term (*5-9 years*) effect on all eye structures like* MGs *and inner structures*. We need radioisotope to monitor where everything goes and what the effect is long-term, etc and that requires tons of animal studies etc, waiting maybe 10 years extra, etc. I used Hylo Gel/Care in spring 2021, but now I use my left over bottles twice/month, due to issues

explained below *(some issues apply to most thick* drops: they dry out during naps or night in the caruncle, causing *caruncle* keratinization *and can* block the MG orifices thru similar crusts; *additionally, they may stimulate hair growth in the caruncle leading to an inflammatory cascade locally due to incessant foreign body response until the system gets used to ignore it, since* HA *is enhancing the* absorption *of many* impurities in HA *(whether* HA *is from animal or bacteria sources, these proteins have immune and other activities)* or ocular products *we use that day;* chemical mixes can turn one cell into another type and act like stem cells, especially if we use Hylo Night, Systane, etc ointments with lanolin chemicals that promote hair (keratin) growth in sheep to maintain their warmth, lanolin being sheep wool fat, rich is sterols that have hormone like activity in certain conditions if they convert to something, and we know androgen deficiency dries the eye while estrogen either low or high can dry the eyes). Thick drops clump easily when out room is colder (drops are colder) or before/after cold compress, cold weather, causing foreign body sensation, inflammatory response that reddens eyes, makes it all harder to heal. We're 100+ years away from decent drops, it's like *walking in a mine field*, so research before using any drop, and recall during the night we keep eyes closed 500 minutes, while during the day, after 1 drop we keep them closed 0.5 min, washing it off fast by blinking, so at night, we get 1000x more exposure to bad stuff in drops, so do 20x mirror test. Most eyedrops today treat symptoms (lack of lipids in tear film for example) instead of the cause (meibum glands produce insufficient lipids, so maybe cofactors to stimulate meibum cell growth, a topical AndroGel on eyelids to make meibum glands excrete lipids if androgen deficiency is the cause). As a result, the use of anything to fill in the void of lipids can lead to side effects, like worse MGD.☺☺☺

►► 3.1. $19 Hylo-Tear 10 ml (ebay), also sold in UK as Hycosan Original 7.5 ml (ebay), got pH 7.21, 0.1% HA MW 2.03×10^6, plus the stuff in Forte/Gel: sorbitol (issue?), citrate buffer. Caused 7 stings on both eyes, the 4th time I used it. Stopped using it after. To understand Hylo-Tear you need to read all the 6 pages of the next drop Hylo Gel that has the same ingredients, just more hyaluronate. Most Hylo Tears use a *10 mL bottle* that lasts *6 months only* that has: Hylo *Comod* is Germany name for the US/UK Hylo-Tear. Ideal for those disliking thick drops, this got 4 times lower viscosity than Hylo Gel, which means it will wash off easier and not damage the eye *thru extremely long exposure facilitated by the 4 times thicker Hylo Gel*, if the eye is allergic to the citrate buffer, sorbitol, etc. Alcon (Systane) chemists found Hylo-Tear to be good: *% "of corneas per group with 0% epithelial defects after 24 hours post-debridement were as follows: 12.5% (Optive FUSION pH 7.4), 26.67% (VISMED pH 7.3), 31.25% (Thealoz Duo pH 7.1), 6.25% (Hyabak pH 7.0), 43.75% (Hylo-Comod pH 7.2) and 53.33% (Systane HYDRATION pH 7.9)"* page 98 of the 2016 pdf. More tearfilm.org reports are available.☺☺☺

►► 3.2. The next 6 pages explain it all: $14 Hylo Forte (ebay) (UK/US) called Hylo Gel (official page) in Germany/Asia ebay, Hylo Confort Plus (official) in France, and Hycosan Plus (ebay) in

the UK (over the counter version that insurance doesn't cover), is the same as Hylo-Tear above, except double the hyaluronate, got pH 7.20, a higher quality HA than the other Hylo products *0.2%* HA for 4 times the viscosity of Hylo-Tear for a stronger treatment of severely dry eye, contains the same sorbitol and citrate buffer. Citrate kills fewer microbes than boric/borax used in Hylo Dual/Hylo Fresh, so you may get more styes with unpreserved citrate, phosphate, Tris buffer drops than with boric buffer. Hylo Forte the main drop I used for about 11 months, though since 2022 I gave it up, as my eyes didn't like it anymore, due to causing a slight 'acid feeling or caustic one' first 3 seconds that Hylo Dual doesn't have, maybe my eye *dislikes high citrate or sorbitol*. For some eyes, Hylo Relief works better; it has glycerin and HA, no ectoine (Dual can cause issues too, floaters, etc) or sorbitol (Gel). This book calls *Forte* Gel, the original name, since it's shorter; other UK companies call it *Gel* too; it's made in Germany like Hylo Gel, being identical. CO 2017;11:631-8 says *French Hylo Gel* "has a molecular weight of" *2.4-2.8*x10^6, TVST 2019;8(6):2 says Hylo Forte MW is 1.75x10^6. Analytical procedures can make errors and get MW way lower; either way, HA in Hylo Gel is the highest MW HA anyone can get in USA via Amazon for OTC drops, without prescription. Initially I used it mostly during the day, so I didn't notice anything but how it made the eyes happy and hydrated, if I placed saline solution first. But when eyes are more tired, placing the drop directly can be irritating sometimes (like with all other drops, except saline). Extra care is needed if this is used for naps or sleep, *since it doesn't drain easily and can inflame the caruncle and eyelids and cornea sometimes, due to the high citric concentration* etc – like it happened to me when using this at night or in the middle of the night, all these disappearing after stopping use – so make sure that if used at night, to test it first or if discovering only 20% of a drop works for you, you blink 10 times strongly, squeezing eyelids to push 80% out so only that tiny amount remains there that won't inflame the eye. In our stone age world, these droppers only dispense huge amounts, not tiny like a real tear, so check eyes often in 20x mirror to remove excess gel if there to avoid irritation. This issue is with all thick drops, ointments, we need to test eye's compatibility with any product during daytime naps. This may work as a night gel for some though, less toxic than others that have sorbitol etc. ☺☺

However, before using this, it's good to read my experience with Hylo Care and to realize that bad effects can take months or years of use to notice, since only with a 20x mirror you see the issues. I use it after saline 99% of the time (*since alone it causes irritation, redness doesn't disappear*) and it works well to remove eyelashes stuck in the eye, when saline failed to do so, due to eyelash being stuck in *a hard place where saline simply can't get it out fast, having no viscosity to drag it out of the eye*. International shipping takes weeks, Hylo *Gel* is $12.5 on ebay (4 bottles/50); before I knew Hylo Gel is the same as Hylo Forte I ordered the Greek ebay Hylo Gel and it arrived in 2.5 weeks, expiration date 26 months from delivery date; very nice, sealed and with blue bottle label, like the German one; since 'Hylo Forte labeled' Hylo *Gel* ships fast

from local Amazon warehouse, it may be subject to > 25°C heat during transport less than individual orders that take 1 month to ship (so if in US, ordering Forte is better probably, even if 1$ extra), as UK company ships it to US in big loads. Hylo *Gel* is "the first medical product for eye lubrication for dry eyes to be classed (in 2008) as prescribable in German history"; UrsaPharm Hylo products can be prescribed in UK. *Just because it's more viscous doesn't mean it works better for all, more friction can cause more redness if low lipids and the ability of* HMW-HA *to* stick to cornea can lead to *damage*, cornea ridges, because natural tears have 1000s of times less HA than most synthetic tears with HA: we *die* quickly if our serum (similar to tears) has some compounds at just 2 times higher, now imagine what happens when we have something at 2,000 times higher level, it may not always be good, so just because a drop has only natural compounds found in natural tears doesn't mean it's going to be safe. *Hylo Gel/Forte can be too viscous for some, so you can first use* 0.9% saline *to dilute it; viscous drops can cause eyelid to rub against cornea more, causing inflamed eyelid; if you miss and it dries on eyelid, wash it with water or* 0.9% saline*).* Hylo Gel *is slightly similar to* Bayer HydraSense Night Therapy product *below which has 0.3% (*low MW*)* HA*, citrate, NaCl, no* sorbitol or HydraSense *0.15%* HA*, citrate, NaCl, no* sorbitol. Hydrasense osmolarity is higher, so it may irritate more.

The Sorbitol *issue?* Hylo Gel/Forte/Tear contain sorbitol, found in human serum (tears are similar to serum in many chemicals) at about 16 mg/L vs 139 mg/L for fructose and 800 mg/L for glucose in healthy people. It's not clear if sorbitol $CH_3(CHOH)_4CH_2OH$ can increase platelet activity and cause blood clots inside the eye or on the cornea, but recent studies show similar compounds, xylitol, erythritol $CH_3(CHOH)_3CH_2OH$ (sorbitol without a CHOH) ingestion cause blood clots, strokes, heart attacks. Micro blood clots may appear to our naked eye as red or dark dots on our eyes (cornea) and they could also be caused by sorbitol concentrations 1500 times above physiological (natural tears) in artificial tears. Sorbitol is also *the* nerve damage agent, to remove cornea sensations, to create illusion the drop is healthy and comfortable for the eyes, but it is oddly also in sperm at 100 mg/L or 0.55 mM. Sorbitol endogenous production can cause cataracts, which are the leading cause of blindness worldwide. External sorbitol drops with *1500+ higher concentration than natural tears*, may also cause cataracts over 20 years, so gently try use sorbitol drops rarely, max 5 times a week. Sorbitol can reportedly cause issues at high serum levels, but it's used by many companies in eyedrops, OCuSoft, Systane, Thea, Optase, overnight eye gels (Refresh lube; overnight gel exposes eye to *100x the sorbitol*). What is *sorbitol?* ☺☺ Similar to osmoprotectant erythritol used by Refresh eyedrops, it is a sugar in apples, lowers viscosity of eyedrops, dissipates quickly so the drop becomes more viscous once on the eye. Glu*cose* and galact*ose* are stereoisomers *(one carbon is R in glucose, S in galactose, everything else the same, ose is suffix for sugars, ol for alcohol, al for aldehyde)* of penta hydroxyhexanal $CH(=O)(CHOH)_4CH_2OH$; ga*lactose* combines with glucose to form *lactose*, so it's

easy to recall this galactose name, galactic lactating (milky way, our galaxy), many are intolerant to lactose in dairy. Glucose and galactose can be reduced (CH=O group becomes CH_2OH, CH=O + $NADH^+ + H^+$ -> CH_2OH + NAD^+) by aldose reductase (all sugars are aldehydes of a special type, hence aldose) to sorbitol (also called glucitol) and galactitol; sorbitol is 2R,3R,4R,5S-hexane-1,2,3,4,5,6-hexol or $HOCH_2[(R)CHOH]_3(S)$ $CHOHCH_2OH$, galactitol is 2R,3S,4R,5S-hexane-1,2,3,4,5,6-hexol. Sorbitol and galactitol are often hypothesized to cause cataracts due to accumulating in the lens in those who can't clear these hexols, so we ask, can sorbitol from eyedrops do the same long term? Many drops have esters of sorbitol, esters, polar lipids which increase cornea permeability, can get hydrolyzed by cornea esterases to sorbitol and go to the lens causing cataracts. Any other drops that could ruin lens or cornea nerve fibers? ☺☺☺

What if waiting 15-30 minutes as all Pharma companies say is simply not enough give how sticky they're and linger for hours? Hylo-Tear and Hylo Gel are the only ones in the Hylo range that contain sorbitol, used to bring osmolarity to physiological level and make these tears more comfortable. The company explained that sorbitol in eyedrops can't penetrate the inside of the eye much and cause damage there. Hylo went thru EU medical device certification and they check safety, but once again, so do US companies selling toxic drops, though FDA doesn't maybe regulate these drops as they do typical drugs, so maybe EU is much more stringent on drops. Drops only touch the conjunctiva and cornea, not the lens, so it's hard for sorbitol to accumulate; however, caution is best, so use 0.9% saline and yawn tears too. The blood sugar everyone talks about, D-glucose, hydrogenated, becomes sorbitol (s-orbit-ol, orbital area, eye area), easy mnemonic. breastmilk contains 78g/L or 300 times more lactose than glucose, and *lactose* is g*alactose* bound to glucose; lactose is 95% of sugars in milk, most of the rest are 100 prebiotic oligosaccharides to help develop immunity. PubMed has 100s of papers about sorbitol accumulation in diabetic eye tissues causing eye damage, so it's not clear what effect eyedrops with *sorbitol* have, or what sorbitol level above natural tear level is safe. Hylo, Thea used to have phosphate buffers that caused issues (eye stones), not they have citrate and Tris buffers; OCuSoft uses odd labeling of Retaine MGD etc, they all 3 use sorbitol too, but we don't know at what level. How many decades will it take to discover the safest sorbitol level? Until then, more research/caution may help, since some believe high *sorbitol* generated endogenously within the lens for example can cause cataracts, though topical sorbitol is a different story. Discontinue any drop if issues appear, or try the other 6 *Hylo* drops without sorbitol below or *Bayer* analogs.

Bayer customer service did share provitamin B_5 is 2%, but can't disclose HA MW or those who control email traffic didn't allow it delivered in original form, was it a setup *to allow them to better run science experiments like Dr. Toyos IPL/Q? You can get* NaCl *from saline drops above used right before Gel, to get closer to* Bayer. Some eyes prefer no NaCl, others prefer sorbitol or the structure of HA in Bayer or Hylo, which are different; one study found a Bayer HA drop has

323 mOsm/L, hypertonic vs 280 mOsm/L of isotonic Hylo Gel/Forte and other Hylo, causing issues for some; dry eyes need hypotonic or isotonic drops usually, so some prefer Hylo since they can regulate NaCl level by 0.9% saline right before, while with Bayer we have no say. Many articles online imply Hylo HA is or may be *higher* quality than *Bayer*, because it was approved for post-surgery use in Canada. Cheap HA causes eye inflammation. Hylo Gel is ideal for daytime. If you want to help MGs with some hyaluronate, but don't want to put too much sorbitol, citrate, borate, buffers, then Hylo Gel has the highest amount of HA (0.2%) per buffer and sorbitol amount placed in the eyes, so it could be used in conjunction with some ultra minimalist drop like 0.9% saline solution free from preservatives, sorbitol or buffers.☺☺☺ The sorbitol question is valid, because it's present in natural tears at a 1500+ times lower level. Studies raise questions about safety, so to minimize risks, use brands with different ingredients, if you're afraid of sorbitol being too high. Once again, phosphate in natural tears doesn't cause eye stones, but when we go 35 times higher, and use that drop a lot post-surgery, like they used a *Hylo* drop, we get eye stones; likewise, sorbitol is fine at low levels, but at high levels it may cause issues with frequent long-term use. "in vivo results (damage to rat retinal nerves) were mimicked in human SK-N-SH cells (cells that behave like neurons, used as models in many studies of neurotoxic ingredients) when exposed to sorbitol in vitro" ► ABB 2020;679:108207.☺☺☺ "The most densely innervated surface of the human body is the cornea of the eye" ► OS 2022;23: 40-8, so why *are* we putting sorbitol there? Eyedrops don't reach retina easily of course, but the drops land on the nerve fibers on the ocular surface, can reach other tissues and cause some damage: "eyedrops (meant for retina) usually penetrate via corneal or scleral route, although some conjunctival contribution is noted… After topical administration through absorption process, a drug enters the aqueous humor… (later other areas, including the nerve, more viscous drops deliver sorbitol better) Conjunctival and scleral tissues have similar permeability to hydrophilic drugs (sorbitol like), while cornea is 15–25 times less permeable… exposed surface of the eye is richly innervated by sensory nerve fibers (they detect mechanical, temperature, chemical changes) originated at trigeminal ganglion neurons" ► Pharm 2012;4(1):243-51. Unfortunately, there is no drop that has no side effects. ☺☺☺

"407 µg/mL" was the concentration of citicoline in human eye vitreous gel (detected when they did surgery) after using citicoline 2% (20,000 µg/mL) drops for *2* weeks ► PO 2019;14(11): e0224982. That is 2% penetration *into the* vitreous *gel, so imagine what happens if you use eyedrops for 200* weeks*, and it accumulates, drops that didn't go thru safety study for causing floaters in the vitreous gel*. High MW HA is a good delivery molecule for chemicals, see above, and if you use some phospholipid drop around Hylo Gel (or other sorbitol drops), you weaken cornea barrier and facilitate the movement of sorbitol towards the lens which could cause cataract, so don't use phospholipid drops within 5 hours of Hylo Gel. *Can a connection between*

the use of sorbitol for isotonicity in eyedrops and the development of cataracts be safely ruled out? We can calculate the sorbitol concentration in Hylo Gel *and others using the data in the citrate section, since isotonic is 300 mOsm/L; mM=mOsm for sorbitol, so [sorbit]= 300 - [Na]-[total citrate]-[osmolarity of* HA*]=300-127-44.4-0.6=130mM or 2.4% sorbitol.* Now, *130 mM is 1500* times higher *than serum sorbitol level (1.6 mg/dL or 0.088 mM, see above). Is that* safe? We know tears can be absorbed via the nasal duct vessels. Glucose is energy source, so serum glucose is 32 times higher than tear glucose; however natural tear sorbitol may also be lower than serum sorbitol, so then the factor becomes even higher than 1500. *Is that* safe? We see sorbitol in endless drops, but concentration is *strategically* hidden. That's why I minimize Hylo Gel, Hylo-Tear or any drops with sorbitol: they could damage 1. *cornea nerve* endings *signaling* when a drop is *toxic* and 2. *even the optic* nerve. Just like antibiotic aminoglycosides or quinolones can. Because HA is big, its mOsm is low ► IJP 2018; 543(1-2):190-200. Glycerin, in many eyedrops and our natural tears, is basically half of sorbitol; to understand eye structure very well and why tears can't easily reach the back, see the topical route barriers at section 2.2 of the paper (some less useful eye physiology details are in the other sections, they explain vitreous humor has 65-400 mg HA/mL) where it says ocular penetration to the back of the eye is <0.001%, bioavailability 1-5% for what penetrates ► Pharm 2020;12(3):269-308.

Among all brands on our list, HydraSense Night Therapy *(low MW* HA *though) and* Vismed Gel *(half MW of Hylo* HA*) got 0.3%* HA*, so even* more HA per buffer. The *best Hylo product* for my eyes during daytime (least issues among the 4 Hylo products I tried so far: Gel, Fresh, Dual, Care) *was, for a while, the one that had* all 4 compounds natural ones, *something we only find in 1% or less of artificial tears worldwide, (in the eye: sorbitol in trace amounts, citrate,* HA*, H_2O) Gel, all the other Hylo with extra compounds were less ideal, but then that became too thick so Hylo Fresh was better.* When eyes are in a bad shape Hylo Gel works better than Clear Eyes Advanced, due to higher quality HA, helping eye redness disappear. The extra compounds in Hylo Fresh, Dual are *ectoin, eyebright, borax not in the eye, body, causing* irritation. Boric acid, in Hylo Fresh & Dual "is the main form of boron in blood, urine, and other body fluids", but at 0.3% in eyedrops becomes more cytotoxic. The high level of provitamin B_5 (not found in natural tears) in Hylo Care was less ideal; *Hylo Gel (and perhaps Hylo Fresh due to being so thin and watery) is among the closest to nature ingredient wise among the Hylo I tried. So, when I ran out of my first bottle of Hylo Fresh and Hylo Gel, I ordered a set of 3 Gel bottles (42$) which arrived taped well in an air tight bag on 3-12-2021 with expiration April 2023, 25 months later. Hylo Gel allows you to get 4 times more high quality (not found in any other drop sold in USA)* HA *per amount of buffer than Hylo Dual, 2 times than Hylo Tear/Hylo Care, 6.7 times more than Fresh.* If you combine it with 0.9% saline solution (previous tear, see above) right before or after to dilute it more during daytime, you get even less buffer, less sorbitol; we want to minimize buffers

because all buffers damage cells (since they're not the natural type of ultra low (not high as in most tears) phosphate-bicarbonate-lactate-lipocalin-protein buffer in the natural tears our (and many ancestor species) eyes got used to over 0.5 billion years. Citrate, sorbitol are more damaging at higher concentrations. Our body triggers inflammation when it detects eye chemicals it's not used to for eons, or at much higher concentration than it's used to.

I noticed viscous Hylo Care (and other viscous drops *like* Celluvisc, Refresh Optive *with no* HA) has that issue, so for some people trying the more liquid ones is better (Hylo Tear, Fresh, Dual etc). Viscous tears can dry out on eyelids due to missing a drop (goes outside the eye), creating a false impression of blepharitis, as that cellulose or HA sticks to eyelashes if we don't clean eyelids with silicone sterile q-tip often. Dry eye symptoms decreased more with *0.2%* HA than 0.1% in patients who did cataract surgery and had severely dry eyes ► Eye Vis 2019;6:6; however, the conclusions are not always true for moderate dry eye, if inflammation from swollen cornea or eyelid exceeds benefits of extra HA, due to people not knowing 0.9% saline, 20 times cheaper than normal tears, can be used right before Hylo Gel to dilute it. ☺☺☺ The pH of Hylo Forte is only 7.2, around the normal pH of many people with pH 7.0-7.7; maybe for those with pH 7.4-7.7, it won't be as good and cause some irritation; take your pH first? All current drops got bad buffers, our tech is simply too primitive, but better than dryness. pH changes as the solution sits and reacts with air CO_2, bottle plastic etc, so manufacturers often give a range, 7.0-7.4 *(Clear Eyes Advanced & Optase shared 7-7.4 is their range)* or 7.2-7.8 (Biotrue), 7.20-7.30, depending on what they produce, but most won't even share that range. 0.9% saline has no buffers, but pH of 6.7 is not ideal either, though having no buffer that 6.5 pH is very changeable by tear generation, since it's due to a little dissolved CO_2, i.e. HCO_3^-, whereas an acidic drop will keep that acidic pH if buffered way longer than 0.9% saline. You may notice saline with or without tear generation doesn't always work to relieve discomfort due to failure to keep eyes moist with silicone seal glasses (*forgot to make it a tight seal for example*) or yawn tears or partial punctal plugs, so then a 'good' (by current standards not 7 centuries from now) drop comes in to the rescue. I still try to understand the intent behind using sorbitol by most companies in many eye products, when it could cause cataracts. Blood pH is 7.35-7.45, so tears mimic that very well, so on average that's the normal pH, around 7.35?

It seems prudent to not use high % HA drops (or any ultra sticky drops) at all or more than once at night, because HA dries and creates sticky stuff on eyelids, sometimes even a layer of HA over cornea when waking up that takes 30 min to dissipate, or mucus near the caruncle, that could block the meibum flow when waking up and that inflames the caruncles (the nasal eye corner pink nodule), making it red and full of sticky HA and possibly causing hairs to grow in the caruncle (though that could be vitamin A from ointments), though hairs in caruncle are quite common and people remove them sometimes if causing irritation (caruncle hair is sort of like

eyelash hair; these odd hairs usually grow back in 7 months). I often cleanse my eyelids daily with Cliradex. So, since at night eyes are very dry (no blinks) and they need protection from dryness, for some people it may be easier to use Hylo Night and mostly saline drops when you wake up or rarely Clear Eyes Advanced (**to prevent infection, provide antiviral E, surfactant (*hydrophobic tail and hydrophilic head, binding aqueous and lipid layers*)** to spread the ointment and water into a more hydrating emulsion). All react differently to each drop, during the day we blink a lot and the water and saline dilutes the HA and crust or stickiness can't form. ☺☺☺

►► **3.3.** $17 10 ml Hylo Care (ebay), also sold as 7.5 ml $ Hycosan Plus (ebay), got **pH 6.9 (estimate, could be 6.95)**, ***0.1%*** **HA**, citrate buffer ***plus 2%*** **dexpanthenol or D-panthenol or pro*vitamin* B_5** or ***proB*$_5$**. This may be the most dangerous drop if you're allergic to ***pro***B_5, so maybe use it by diluting it with saline, 2 drops saline before and 3 after, to get a good dilution to start with (HA sticks really well to cornea, transporting across cornea the proB$_5$, so it takes many salines and blinking to get it diluted and drained, and 2% is too much B5, so it's a lot safer to go diluted if you ever try it and monitor it every 20 min, dilute with 40 saline drops if getting red), during the day, morning only, never at night for a new drop and see how it goes. This section covers the issue ***of artificial*** tears ***storage*** temperature, since it's ***critical for some eyedrops***. B_5 is a skin vitamin that is often used to treat acne. See the official Care page here. The instructions say, like all drops, to stop using it if you're allergic to it or one of the ingredients. In USA, Hylo reaches us via 3 sellers (read below), one being the UK Subha Enterprise (Amazon page), the Amazon choice for Hylo Care, Subha got a warehouse website and they answer questions @ 44 1923 517070; they say when I asked about storage temp and a long placing on hold on the phone, that eyedrops get shipped directly from supplier (Scope UK) to Amazon because of temp requirements. All who answer have Hindi accent and due to the less stringent QA in India, it's possible that they don't have the strongest temp control at Amazon (*though Subha claimed by Amazon email in 2022 that their warehouse and Amazon warehouse meets the temp criteria, another person than the phone one*), since if they supply eyedrops to USA, Subha and Scope UK would ensure Amazon warehouse is always cool enough for the many products Optase and the like they sell to USA, Walgreens with FDA approval, but 100s of articles online explain that's not true for all Amazon warehouses. Scope UK, UrsaPharma distributor in UK, etc didn't answer about temp, since these have to be kept under 77°F, as opposed to Refresh Plus that requires < 86°F. Unfortunately, eye products often require lower temps so on a hot day in Amazon warehouse or week, they may degrade or diminish potency, create toxic by products, so it's better to only buy via Amazon stuff that has no tight temp requirements (none listed or up to 86 maybe if in a colder area of USA) for storage and to buy it in winter time, so no heat during delivery – using RiteAid for the rest (they got Pharmacy and tons of antibiotic eyedrops etc need be between 68 to 77°F, so RiteAid temps are way better in general than Walgreens and other

places); likewise CVS is better than stores that get hot and have 0 or tiny pharmacies, especially in areas where summer temps reach 90 often. Amazon doesn't keep a huge stock of any product, but if they stay a month in high temp, it could really damage certain eyedrops or ointments, so *order eyedrops from Amazon in Nov-March to ensure colder temps*.☺☺☺

The 2nd Amazon page of Hylo Care is by Peter Pan or the UK Ved Healthcare, no phone on web, Ved Healthcare is also a name for an India company too. peter Pan sells really bad Hylo Care. A 3rd page of Hylo Care is by Moughans Pharmacy located in Galway, Ireland; the Hylo Care paper says distributor is Scope Ophthalmics in Dublin, Ireland, as opposed to paper on the other 2 Amazon sellers that has Scope Ophthalmics UK branch as distributor; this Irish coastal city has such cool weather, their storage of the item is probably better than the other Amazon sellers, before it gets to the Amazon warehouse. This Galway Hylo Care seems to create the same ridge as the Peter Pan UK one, so it needs 3 saline drops after use, within 4 minutes, to avoid issues and foreign body sensation, this is due to some quality issue I think. Hylo Care from Subha seems much better quality than Peter Pan one; *Subha Hylo Care has no foreign body sensation due to stickiness caused maybe by high temp storage; however, Subha shipped Hylo Fresh twice, in 2020 and 2022 that expires in 3 months from arrival, when normally it would be 1-2 years and it says on UrsaPharm label you can use it 6 months after opening if before expiry date; for stuff with polyphenols, like eyebright plant extracts in Hylo Fresh, you definitely don't want stuff that will expire right away, as it means it sit forever in some warehouse; polyphenols are very reactive compared to Bausch ointment that has saturated hydrocarbons 100% only. However, plant extract containing drops in general expire much sooner, and upon inquiry*, Subha says Hylo Fresh is made to expire fast *by* UrsaPharm*, which is a lie, because they can't write use within 6 months, if expiry date was before that. Another Amazon supplier said theirs expires in* 11 months, which is a lot longer than 3 months; this shows anything Subha says (like by email that their warehouse and Amazon warehouse is keeping it below 25°C/77°F) could be a lie.

It's important to store eyedrops at temps below the max allowed (that's the issue usually) and above minimum too. Provitamin B_5 in solution is a lot less stable than other chemicals at high temp, so this Hylo Care drop is unique among all Hylo/eye products, and needs to be bought from the coolest storage and delivery place, if any exists on Amazon (not clear if that is the case). Due to the bad experiences with thick drops, like Hylo Gel and Care at night, I would never use Hylo Care 0-7 hours before going to bed, and *only use them in the morning after you fully wake up, never before taking a nap or over sleeping one late morning*; even then it's odd since Hylo Care can form lumps triggering body foreign sensation; *using ointments within 2 waking hours or* same night (within 10 sleep hours) with Hylo Gel/Care (any high MW HA drop) etc is a bad idea *because high MW HA tends to make some ointments compounds linger more and irritate the eye;* I put Hylo Night ointment 2 hours after Hylo Care and later at 4 am, when I woke

up after 3 hours of sleep and started blinking a lot, the Hylo Care film created a cornea ridge (like it always does during wake state if no saline is used) that was removed by saline and blinking – it's that persistent. ☺☺☺ 2% *proB$_5$* "effect on corneal epithelial regeneration is of *minimal* clinical relevance… Still, eyes receiving *proB$_5$* showed better (vision and) values at the majority of the parameters tested." ► JO 2018:6537413. After 30 min, among preserved drops (Thealoz is unpreserved), only the one with *proB$_5$* (Keratostill) had a viability > 12% at 24%, vs 52% for Thealoz ► BRI 2014:292139. *proB$_5$ 5%* "effectively accelerates the processes of healing the wounds of conjunctiva and cornea. Congestion and edema of conjunctiva withdrew, the edges of wounds demonstrated smoothness and better adherence." ► KO 2003;105(3-4):175-8. "lesser congestion effect, while applying" 5% *proB$_5$* ► KO 2003;105(3-4):179-81. KMA 1996;209(2-3):84-8 says drops with *proB$_5$* were better than those without at healing dry eyes disturbances of corneal epithelium permeability. They even use 5% *proB$_5$* for babies as a skin ointment to prevent diaper rash. Bausch and Lomb also makes in Germany *proB$_5$* in Corneregel at 5% (cornea regeneration gel). A Mexican company making a similar gel made a clinical trial of its drop, claimed that it's roughly similar to the German one, but FDA didn't evaluate how well this study was done. The FDA approved proB5 for cosmetic use in 2004, for some prescription vitamin complex and is on a list of OTC (over the counter) ingredients that are not GRAS (generally recognized as safe) for the intended use for insect bite, analgesic drug (no mention of eyedrops as not being GRAS), 21CFR310.545 (see page 12 here and Ctr+F "eye" to read all eye notes and studies, page 33 explains rabbits got red eyes from *proB$_5$* 5% that returned to normal after 1 day). Na salt of B_5 (*proB$_5$* becomes B_5, not its Na salt though, once in the eye for a while) can cause serious eye irritation, see page 10, it all depends on concentration of B_5. *proB$_5$* is GRAS for some products, but eyedrops are not listed. *ProB$_5$* is used in eyeliners (up to 1%), eye shadow, mascara, eye makeup products. Corneregel was not enough in some cases, as VO 2014; 130 (2):59-67 indicates. Amazon carries 5% Corneregel made by the Berlin subsidiary of Bausch, Dr. Gerhard that makes Artelac Rebalance. The *proB$_5$* can cause contact dermatitis (so maybe cornea irritation) and even anaphylaxis, see cornea damage image at CED 2005;30(6):714-6, from some multivitamin pill with *proB$_5$*. Hylo Care has no sorbitol. pH *is* 6.9 *vs* 7.2 for Hylo Gel, hence *on Amazon reviews some say "*Hylo Gel is nicer as it doesn't *sting* at times*" due to more acidic pH disturbing homeostasis (*average tear pH is 7.*35?) and maybe proB$_5$ 2% itself.*

I noticed the stings/itch too sometimes in the *caruncle*, *especially when used without saline first.* When eyes are tired, there is rarely even a burning sensation all across the eye, very subtle, not *like the Lumify burn sensation (that one is 30x stronger); caruncle itch is often evident late* evenings when eyes are tired. *Why? proB$_5$ 5% can enhance conjunctiva cell viability, but can be cytotoxic like EDTA, see* Fig 3 *charts with cell viability after use of EDTA, polyvinyl alcohol, PHMB, proB$_5$: for conjunctiva cells, proB$_5$ slightly outperforms everyone; proB$_5$ led to healing of cells in*

half the time ► EER 2020;201:108269 *so it is widely used in dermatology; to avoid sensitivity to* ***proB$_5$*** *and get the* ***benefits*** *of* ***proB$_5$****, maybe use before or after it (after waiting 30 min), some alkaline drop like Hylo Tear, Fresh, Gel.*☺☺☺ **Hylo *Care*** *instructions say to wait 30 minutes after using any other eye drop, before using Hylo* ***Care*** *last; use* **ointments** *after* ***Care***. **Dexpanthenol or *proB$_5$*, $C_9H_{19}NO_4$, the alcohol of B_5, $HOCH_2C(CH_3)_2CH(OH)C(=O)NH(CH_2)_3OH$, a transparent moisturizing liquid, travels thru mucous membranes and it is oxidized to hygroscopic (water retaining) B_5 (CH_2-OH at the NH end becomes COOH) where it becomes part of the CoA, which *aids cell growth*. It's also used topically to promote skin or eyelid healing. However, a study *on conjunctiva cell viability* found a Hylo *Care* like drop (citrate, B_5, HA) caused 64% of cells to be unviable, vs only 30% for other Hylo, due to lower Care pH or *proB$_5$* itself.**

They even have a youtube with their office desk at UrsaPharm, not sure why they're not smiling or expressing much universal loving kindness in this video or if it's meant to be creepy, the first guy that is also shown last (oddly he has real or fake acne that B_5 treats sometimes) wears an intimidating "iron maiden" (see second 12 of video, heavy metal music from hell) T-shirt with a monster showing its teeth, while he stands by the blue bear at Ursa entrance (ursa means bear in Latin); not sure if BND (German spy agency) controls 20-100% of UrsaPharm, though CIA, MI6, Mossad, etc could remotely control 80% of BND itself. As the spy section explains, basically, *any company* opening branches *in other* nations *is likely used by* origin *or other* country *as a* cover *for* espionage. I would avoid this or any 2% *proB$_5$*, at night, and maybe daytime too. *Only* try this at night after 20x mirror checks during 0.5-2 hour naps first, and *perhaps after squeezing eyelids a lot first nights so only 10-20% is left after 20 blinks*, since I trashed 9-22-21 my last bottle (distributed by Scope UK, made by UrsaPharm) after it gave me very very red eyes during an almost 7 hour sleep, the worst floaters ever (typically, Refresh Mega-3 or other drops make floaters more visible for 30 minutes, but this was 50x worse, and *for weeks, not 30 minutes*) *and a blur or 'less* HD*' effect for a few days; the blur is* like when you're very very tired or put some safety glasses on or something and it's not the same contrast or HD like with HD glasses (due to some *poison inside that makes the cornea cloudier* perhaps, indeed it *regenerates* cornea, perhaps beyond easy repair, re-generate it in a cloudy form)*;* this could have been Hylo Care or a 'burning-drying feeling' military weapon used on both eyes, that makes eyes very red, since on Oct 7th the military☺☺☺ attacked left eye during sleep and made it very red too even though I didn't use Hylo products for 2 weeks. Yet on Oct 8, I used Hylo Gel @ 5 pm and it seemed to have caused the redness to vanish far faster than using yawn tears alone with some saline, so maybe Hylo Care just needed to be removed on Sept 22nd, and then use more Hylo Gel, to avoid proB$_5$ irritation, though the redness may have occurred in spite of Hylo Care not due to Hylo Care, i.e. it would have bee worse without it, if they attacked both eyes then as they attacked the left eye on Oct 7. I was too scared so I didn't use Hylo Gel after 9-22, using Clear Eyes

Advanced a few times and saline mostly. Oct 13 they attacked left eye only again like Oct 7, so this time I used my new Hylo Gel 5 times, Hylo Care 3 times (2 daytime, once for 2 hours before waking up), Clear Eyes Adv 2 times first 30 hours and eye became whiter faster, since Oct 7 I didn't use any Hylo just Clear Eye 2 times. *This proves to me that these drops* may work (could have been less weapon use by FBI in the days after, not the Hylo drops making it whiter faster, me just being mind controlled via gadgets to believe in whatever about whatever drops, so people use them to damage their eyes, for the own science experimentation) if used during the day and even at night for Hylo Gel, as many papers indicate speeding the recovery of the cornea from redness etc; I even used saline+Hylo Care at 4:30 am followed by blinking a little, yawn tears (almost none came) and Hylo Gel 15 minutes later (since they contain same buffer, same HA made by same company, it's OK to use them close by) and woke up at 6:40 am.

***Oddly,* US doesn't have any drop with *proB$_5$* *2% or* even 0.2% in it. On Oct 10, I got a new bottle of Hylo Care delivered that day and I used it at 5 pm or so alone, without saline first. After 15 minutes, 13 of which was with eyes closed giving a high chance of ridge forming due to intentionally not blinking to gauge toxicity, a ridge of hyaluronate HA formed on the cornea creating foreign body sensation, so I used saline immediately and discomfort vanished instantly due to diluting the HA; this happened in my 2 tests, at 5 and 6 pm, first on right eye without saline first and second on left eye when I used saline first (but because using saline 1st on left eye, the ridge was smaller and less annoying); this often happens with all thick drops used without saline first to dilute and then taking a nap or going to bed, including Hylo Gel, Refresh Optive, etc.☺☺☺ On Dec 11th, 2021, I used Hylo Care one last time and, while the left eye was fine, right eye got lumps/ridges of HA (sometimes it's the left who gets lumps only), irritating the eye. Thus, Hylo Care needs to be used during the day, 10 hours before bedtime, not 4-5 hours, to have time to wash off entirely. Due to the foreign body sensation during sleep, it may cause excessive mucous release during sleep, so this is a drop that is, like all thick drops, very troublesome at night sometimes. The good thing was no itch, no major redness (there seemed a slight tiny redness, but that may have been due to blinking, since prior to test I had eyes closed and when you close them 10 min, they become whiter than usual) or other discomfort noticed on both eyes, but all thick drops, these included generate a slight blur if you don't blink for a while after instillation, due to the thick layer of HA, so during the day, maybe 1 minute until blinking moves it into the eye corner mostly. But this was a day test of 10 minutes, not a nap test of 30; right eye felt better overall after Hylo Care after saline wash, than before, so it seems to help during the day at least when we blink. Oddly, the papers indicating cornea issues from multivitamins with *proB$_5$* could be designed to provide cover for plausible deniability for attacks using *proB$_5$* as a cover for the 'cause', so one doesn't know it was actually the laser or infrasound, etc. *This was the* first time ever I really used it right before going to bed and had**

almost 0 blinking during sleep while trying a drop or ointment; 99% of the time I used Hylo Care was during the day (maybe 100 times) and it washes off fast due to blinking 100s of times.☺☺☺

The possibly 'bad' Hylo Care bottle *was sold by Peter Pan* on Amazon (allows free returns if it stings or causes redness, odd how Peter Pan sells Hylo-Tear in various package images, maybe old image that was revised by Scope; though Oct 10 new bottle was from Peter Pan too), the other was sold by Subha Enterprise, both in the UK, maybe one got stored at high temp for months (all Hylo must be kept under 25°C or 77°F, as with most eyedrops, if it so says on the bottle), maybe both are same, just some attack that made Hylo Care appear worse than it is, or CIA, Mossad, BND, etc wanted to make the impression that "they want to make BND/CIA/MI6 KGB/PLA or UrsaPharm or Whichever Spy Agency created UrsaPharm look bad". Odd how *Hylo Care* means *Holy Race* rewritten, as in Jewish race, etc, in reference to WWII; UrsaPharm, Ursa=Bear, BearFarm, RabeFarm, RabiFarm, to further frame Mossad related or disliking agencies. This shows 2% *proB$_5$* may be toxic *(only 0.1-0.5% may be safe)* if used with eyes closed for more than 10 minutes, due to extremely high concentration, this 2% is in many eyedrops, see the 20x mirror check section on how important is to check before and after. B_5 can yellow the skin if ingested, so *this Hylo Care can probably damage cornea big time (while claiming to* regenerate *it so much, it* destroys *it) and make it less transparent, even blur or damage your vision itself,* hence this may cause increased sales of other products of ocular nature. Given the sorbitol issue, etc and HMW-HA issues as carrier of medicines and suppressor of pain caused by toxic ingredients in drops, it becomes clear that we need to do a lot more research before trusting any drop, fancy gadget (*dual use, to harm under the guide of helping too, asymmetric warfare*) in our stone age century. Given Hylo used phosphate at high level before and caused surgery for eye stones, it may be that other drops, like Hylo Gel etc have serious side effects the company's public customer service rep is unaware of, even if the *Chief Tech Officer knows it, but like all CTOs keeps is from public to avoid scaring the public (though if all did it, nobody would be scared, but hard to be 1st one to be honest with 100 page PDF on the downsides of one's drops, not just benefits).* I used it during the early am before, maybe 4 times, with no major redness occurring when waking up (2-3 hours before washing it off with saline etc, blinking a lot, not 7 hours of not blinking), but mornings our pH is much more acidic, while at night it's much more alkaline, so Hylo Care seems safe during the day for most people only. Be ultra careful with any drop with pH 7.0 or lower at night, and especially with such high proB$_5$ drops, like HydraSense Advanced, almost same ingredients as Hylo, which is even more acidic, 6.5 or so, and I would never try it at night, not even early am, since my pH is always above that; since HydraSense and Hylo 314 and 280 mOsm/L and Hydra has NaCl, it means HydraSense got less citric acid/citrate buffer, so it will work better for people with acidic average pH and who love NaCl more than citrate, since citrate is killing fewer cells at lower concentration and all buffers kill fewer cells at

lower concentration, so for those with no big issue from LMW HA (may cause redness long-term), low pH in Hydra, Bayer HydraSense may work better, but I think we need more info on their LMW HA. A *drop that gives redness at night, when exposure is 900 times higher due to no blinks, is not safe to use often or at all during the day, just try other drops*. The 30 minute rule is on every Hylo paper, to ensure one drop doesn't wash the others or react with the ingredients changing the pH, interaction; this refers to drops with real ingredients, not saline (NaCl 0.9%).

Hylo *Care* *has the same ingredi*ents as HydraSense Advanced by *Bayer*, except Hydra pH is 6.45 (much lower) and low MW HA*; you can get NaCl from saline drops above used right before Care, to get closer to* Bayer. Hylo *Care* seems generally for severe cornea damage or post-operation and not for intensive use with mild-moderate dry eye. ☺☺ *A good drop, absent in this century by definition of good of future centuries, in general can work well also if after use, we keep eyes closed for 10 minutes,* generate tears *and blink first minute for 20-30 times or so* ☺☺☺ *to stimulate* meibum *secretion and mixing with* $proB_5$ *and* HA *for maximum healing. The first few times (until eyes get used to 0.1%* HA*), you may get (like I did) the eyelids swollen many hours later, as with any thicker drops* due to chemical sensitivity or MGD not producing enough meibum lipids *and thus eyelid scratching against cornea more thus inducing the "foreign body" inflammatory cytokine response; in that case, avoid Hylo Care or thick drops that cause swollen eyelids. We can also use 0.9% saline 20 sec before to dilute. Too much* B_5 *causes yellow eyes, if taken as pill, so only use this slowly and make sure eyes don't become yellow.*

►► 3.4. $24 Hylo Dual (official page) (buy 10 ml from ebay sellers), also sold as 7.5 ml Hycosan Dual, got pH 7.1, boric acid H_3BO_3, *borax* $Na_2[B_4O_5(OH)_4]\cdot 8H_2O$, 0.05% HA and 2% ectoine (or ectoin) to stabilize lipid layer and reduce evaporation), no sorbitol. It may cause floaters to appear more visible. The HMW HA may suppress immunity and/or cause ectoine to penetrate the cornea, so for higher safety, you may want to try Allegro from Optase, that has the same 2% ectoine (company confirmed), but uses citrate buffer for people sensitive to boric buffer and/or borax and replaced HA with hydroxyethyl cellulose 0.35% as lubricant, though HEC has PEG subunits, and PEG can be irritating for some. This allows you to see if citrate or borax/boric cause issues. Dual, $16 Hylo Dual Intense (ebay) is a Hylo Dual for drier eyes that want a thicker long lasting drop, with 0.20% HA, but which could be more dangerous, since 4 times more HA could allow ectoine to penetrate cornea more, 2% *ectoine*. Hylo Dual, Dual Intense and Hylo Fresh use *borate buffer*, not citrate buffer if worried about citrate binding to calcium. However, some eyes dislike borate or borax, *so you can get a similar product (0.15% low MW* HA*, 2% ectoine) with citrate buffer from Bayer,* called HydraSense Allergy*. Ectoine is also in many other drops with* HA *not on this list. For me, Hylo* Dual *is irritating (after a while, not always, on some days only, when eyes are not that well) compared* to Hylo Gel*; Dual wetness feeling lasts much less (4 times less* HA *than* Gel *to retain water). As a result, redness returns and forms much faster*

due to computer work; irritation is probably due to borax mainly and a little due to more inflammatory pH (7.1 vs 7.2 for Gel), since Hylo Fresh (next drop, with 6.7 times less HA than Gel) *has similar Dual sensations* (even if pH is 7.2 like Gel) *and they're the only Hylo drops with borax;* on top of it, Dual has ectoine which may irritate some; if you experience discomfort with any drop, so just use others that work, like Gel with 0.9% saline works for me. *Try Dual, then use* 20x mirror to see if redness appears*, vs* other drops, after 5 mins, 10, 20 of eyes closed relaxing in bed (same conditions of relaxation for all drops); stop using if redness appears.☺☺☺

Redness is not the thickening of the main arteriole (not the other 50 tiny ones) that happens due to standing horizontal for 25+ minutes, but a general thickening of all tiny or some tiny ones *(when the main arteriole shrinks as it does always after 5 minutes usually with a decent drop)* that is better noticed ☺☺☺ if we stand on the chair we normally use at the computer (to simulate everything the same in terms of blood flow speed and pressure on the eyes as in normal awake state) or in *gentle yoga* (video on yoga injuries) position leaning on a wall, relaxing, with eyes closed to prevent gravity bringing more blood, redness and confounding our visual perception; do all tests and observations in the same way, standing for an hour for example before all tests, look at the same light angle, etc to compare apples with apples; this is a good way to give your eyes a 5 minute break and let them relax while you relax on a chair; horizontal sitting is not good, in bed, because it will bring blood in varying amounts to eyes depending on how you sit; abstain from physical exercise, since this raises heart rate and thus brings higher than normal blood flow to the eyes and confounds findings; do all 30 tests of some drops on different days the same way, position, everything the same to eliminate confounding factors and pay attention to all sensations, blur 5-50 min after, not just redness within 5-20 min. *As you can imagine, this requires real dedication and time, but your eyes are worth it; or just* generate tears *and no longer use drops except once a week. However, this is not an option for many, who can't produce much when tired or whose lacrimal glands are weak.* *Hylo* Dual has a 2017-2021 NIH study; *ectoine* makes the MGs, *lipids* more *fluid* ► Bba 2014;1838(10):2716-27; our glands clog also due to the solidification of the lipids due to bacteria growing.

Dual ectoine mechanism is in this 12 page pdf; Dual pH is 7.1 vs 6.95 for Care, 7.2 Gel, 7.3 Fresh. ☺ Sodium borate can mean 5 compounds: $NaBO_2$, Na_3BO_3, perborate preservative (banned in EU) $Na_2[B_2O_4(OH)_4]$ or $NaBO_3{\cdot}nH_2O$ or $[NaBO_3{\cdot}H_2O]_2$, *borax or sodium tetraborate*, though chemists think of trisodium orthoborate Na_3BO_3 as sodium borate. Perborate has B-O-O-B units, while borax got *much* more stable B-O-B units. *The toxicity of perborate comes from losing 1 oxygen far easier than borax (O-O bond is unstable, just like O-O* bond in oxygenated water $2H_2O_2 = 2H_2O + O_2$, if you recall from high school*), thus oxidizing, destroying healthy cells far easier.* So, don't worry, borax is not perborate preservative like, it's much safer. Perborate is made by reacting borax with NaOH and then hydrogen peroxide. An issue with *borax* food

additive is that it can be toxic to cells if it accumulates; try it or buy Bayer *citrate* product if *borax* is bad, though Bayer LMW HA may cause too many issues if pH is low too. Borax plus any tear chemical can end up in our nose and lungs, via nasal duct tear drainage, swallowed, sometimes inhaled; take these into account. Why play with our body? Citrate we got tons of inside, but borax none. What about other drops with 5 odd chemicals, used 5x/day?

3.4.0. Some odd new products for eyelids from UrsaPharm are worth a mention: they're on ebay: Posiforlid eyelid wipes (hyaluronic, euphrasia, horsetail), Posiforlid eyedrops (hyaluronic, salicylic acid), Posiforlid eyelid spray (euphrasia (eyebright), hyaluronic acid and *salicylic acid, the one that dries skin* and will dry eyelids too maybe and cause the damage to MG orifices?), Posiforlid Mask identical to eyeeco in the compress section. Posiforlid Ointment got bibrocathol antibiotic, has toxic metal bismuth, that damages brains; bismuth could damage neurons and damage internal organs as tears drain and are swallowed, but so *can Restasis cyclosporine* (*cyclosporine suppresses the immune system, makes eye infections more likely, yet used by some to increase tear production for a few months*) *damage kidneys, organs, myelin sheath*; so I would not use any of the posiforlid products, due to few companies using salicylic, bismuth, horsetail; but euphrasia (eyebright) is quite common in Bausch and Lomb drops too, etc, whereas salicylic is rare, choline salicylate drops exist. All products in a brochure. Since Posiforlid can't be bought in USA, one can try Hylo Fresh, which has euphrasia (eyebright), hyaluronic to get some of the same benefits, just use a sterile q-tip moist with this Hylo Fresh (or on your well washed finger) on the exterior of eyelids to achieve the Posiforlid mist effect for a lower price:

►► 3.5. $20 Hylo Fresh (ebay) is the same as Hycosan Fresh (ebay) 7.5 ml. Official website has details. Make sure that the sealing tape is not off, that the seal was intact. One time I used it, it seemed it has microbes in it, since twice I noticed a correlation between using Hylo Fresh and the appearance of a small yellow stye (later vanished after I burst it), so be careful with this, especially when used around thick drops that can form a sticky layer to trap its bacteria on the eyelid, like Hylo Relief or Hylo Gel. Ebay sells 3 packs for $55 total (or 1 for 22$) from California or 1 for 18$ (ship included) from Germany. Don't buy in hot summer or cold winter (unless shipping takes a few days and those days are said by weather to be very warm from shipping location to destination, since USPS trucks are not climate controlled), since freezing temperatures destroy Hylo Fresh polyphenols (like blueberries lose half during freezing), but 4 for a whole year or 2 in spring or fall when temps are above freezing, but not hot, since hot temps also destroy hyaluronate and the polyphenols. Hylo Fresh forms a yellow dried mucus near the eye corner due to yellow polyphenols as the thicker part of the drop is expelled from the eye. All got pH *7.3, 0.03%* HA *(almost 7 times less than Hylo Gel), Euphrasia* (eyebright) *original mother tincture, boric acid, borax,* water for injection, no sorbitol) to *reduce* redness; *didn't reduce redness for me much, it's the thinnest* of Hylo drops, so it helps for people with

swollen eyelids caused by thick drops like Refresh etc. Eyebright has been used for styes, allergies, etc. Polyphenols in this drop are antiangiogenic, meaning they prevent the formation of new blood vessels, so the regular use of this would naturally prevent eye redness from growing fast and it can also prevent diabetic vision loss due to excessive angiogenesis. More details on which foods are antiangiogenic are in the obesity section. As such, you may yellow your eyes over time, if used too often. The yellow dried mucus appears only on days when using this drop. *I tested Hycosan Fresh (UK) on 6-20-2022 and after 4 minutes of closed eyes eyes became brighter, hence "eyebright", but that happens with any decent drop if you close eyes 4 minutes.* This drop is much thinner, so it won't last like Hylo Gel does for 40 minutes in its lubrication, but this is good maybe for people who don't want sticky hyaluronate drying on their eyelashes. *Euphrasia (eyebright) reduced redness in infants* ► Fp 2020;8:449 *and adults* ► JACM 2000;6(6):499-508*; known to fight infections too; the antimicrobial properties of eyebright essential oil are at* EBCAM 2015:734101*;* eyebright *was "able to protect corneal epithelial cells from UVB-induced cell death and ameliorated the* wound *healing… exhibited a strong antioxidant activity, decreasing ROS levels and protein and lipid oxidative damage"* ► JPPB 2017;173:618-25. Eyebright is in many EU drops, in addition to marigold and chamomile. Bausch (world's # 1 in eye products) also makes Vidisan eyebright, HA drops. Hylo Fresh is for swollen eyelids, red eyes, etc, as the Poland Amazon description explains; it's true, since as previous paragraph explains, Posiforlid products contain the same eyebright for lid.

►► 3.6. $20 Hylo Parin (ebay) (heparin sodium 1300 IU/ml; 130 IU is 1 mg, so 10 mg heparin total per drop and 100 mg per bottle; one drop will thus have 100/300 or about 0.33 mg, a tiny amount, most of which washes away fast): pH 7.13, 0.1% HA, citrate buffer, glycerin and heparin lubricants (official page calls heparin as lubricant, when it is way more than that) to reduce friction between cornea and eyelid. No sorbitol. Heparin is a miracle drug for COVID19, as it dissolves the clots the virus creates in the lungs, since people inhale heparin. Because heparin, glycerin, citrate and hyaluronic are natural chemicals in our bodies, these drops are more biocompatible than others with synthetic chemicals. ☺☺ They got ParinPos (official page) ointment too. Heparin is produced by basophils and mast cells in all mammals, has been used as anticoagulant since 1950s and LMW (1500) heparins (Arixtra medicine) were made via chemical synthesis even in 2000s via a 50 step process with 0.1% yield. Heparin is a glycosaminoglycan disaccharide polymer *(MW is 10-15K, but can be enzymatically brought to 5K for fewer side effects),* similar to hyaluronan that is naturally occurring in mammals, so most of the unfractionated heparin (MW 15K) was extracted from pigs/cows, but in 2010s, new ideas led to an easier chemoenzymatic or chemical synthesis, though only pig extraction is mainly used today as a cheaper method, since cows have mad cow disease prions. The Amazon seller and UrsaPharm company both confirmed heparin in Hylo Parin is from the intestine mucosa of pigs.

No wonder then after I used it once, I got a small stye within 48 hours. However, there is no way for them to remove 100% of viruses and possibly some bacteria from the pig heparin during the chemical extraction from pig intestine (a very dirty area), so you take a risk when using such eyedrops. There is a certain misconception that autoclave sterilization for 1-2 hours removes all spores, viruses and bacteria, but it doesn't always do so, since heparin is often only sterilized a few minutes by Big Pharma. Some spores need much higher temps than regular autoclave. So, the risk is always there, due to poor quality standards, that heparin is contaminated or changed during the heat of sterilization to a more toxic or less effective substance. Presumably, it's safe, since people bought this Hylo Parin for 30 years. A 2019 China swine flu epidemic (China makes half heparin worldwide) led to a new push for man made heparin. US plays selfish sports, making heparin is not essential, why exercise building a heparin lab when you can be a gorilla moving balls? "HS (heparin sulfate) is widely expressed on mammalian cell surfaces and in the extracellular matrix and plays essential roles in a number of biological processes, controlling angiogenesis (new blood vessel *formation*), embryonic development, inflammatory responses, lipid metabolism, infectious disease, tumor metastasis and blood *coagulation*.☺☺☺ Heparin is a special form of HS, found within specialized granulated cells, having a higher level of sulfation, a higher IdoA content, and displaying prominent *anticoagulant* (red blood clots in the eye) activity… Due to the poorly regulated supply chain of pharmaceutical heparin, a worldwide distribution of oversulfated chondroitin sulfate (OCSC) contaminated heparin in 2007 was discovered and associated with over *200 deaths in the U.S.*, adversely affecting the purity and safety of animal-sourced heparins. Another potential threat to the supply chain of heparin is that other bioactive entities, such as *prions and* viruses" ► CS 2017;8(12):7932-40 (this paper mentions heparin 130+ times). Wikipedia confirms, with references, heparin can have viruses from cow lungs, pig intenstines (unless made by enzymes biochemically in a lab as with some LMW heparins), lethal bacteria (killed 80 people, caused FDA recalls) mad cow disease prions. Odd how UrsaPharm website lists heparin as a *lubricant*, without informing customers of the *many bleeding and clotting disorders* (low platelet count or heparin-induced thrombocitopenia, HIT) it could cause, especially in the light of COVID19 side effects that could cause more bleeding due to heparin ► NEJM 2021: NEJMoa2104840. The reason UrsaPharm doesn't mention these things is because it's almost impossible for the heparin to be absorbed or to even pass thru the draining puncta into our nose, being so thick. At 2 drops/week not much would get in anyway.

Heparin is contraindicated for suspected cases of COVID19 vaccine-induced pro-thrombotic immune thrombocytopenia due to AstraZeneca (the ones with risk of clots too), etc, because *heparin can increase risk of bleeding* in an anti-PF4/heparin complex autoimmune manner. COT 2017;36(4):377-80 says heparin helped in wound healing; a 2019 paper also says *heparin helped cornea* healing. *Heparin thins* the blood, so it prevents little clots of arterioles from forming

(common in old folks). UrsaPharm site cites a 1996 paper on improving wound healing. Used twice/week, it may improve eye condition, prevent red/dry eyes, due to better blood flow and nutrient delivery, fewer cornea visible (big) and invisible (visible at 20x only) clots; however, way more research needs be done, before taking it, due to risks of eye or systemic *hemorrhage* (since drops gets swallowed via nasal duct and enter the entire body, though unclear if any makes it to the nose in a quantity high enough to cause any bleeding), as explained in articles about people who died due to too many blood thinners. *However, 1 eye drop leads to far less blood thinner absorbed than taking blood thinner medication, so the risk of us dying from such an eye drop is probably 95000 times smaller.* Eye hemorrhage risk may be higher in those who take vitamin E, ω3 pills, so start slow, even if each drop has a tiny 0.33 mg heparin (most of which vanishes when we blink and gets outside of the eye, with only a 20% going to the nose) vs *15000 times more absorbed in normal blood thinning meds in hemorrhage cases*. Start with one drop every 2-3 days, watch eye using 20x mirror to make sure eyes get less red, and not redder. "Anterior chamber irrigation with heparin during pediatric cataract surgery may minimize early inflammatory reaction and decrease the # of postoperative inflammatory related complications... Heparin has anti-inflammatory and antiproliferative effects in *addition* to its anticoagulant function, inhibits fibrin formation after intraocular surgery, and has also been shown to inhibit fibroblast activity… In this study... early postoperative inflammatory reactions were rare (in the heparin group; low MW heparin is safer, prevents hyphema). Bayramlar... concluded that the addition of heparin to the irrigating solution during surgery decreases postoperative fibrinoid reaction and late inflammatory complications." ► CO 2009;3:363-5. 4 "children (5 eyes) with new-onset progressive CN (corneal neovascularization, *meaning very red eyes*) in at least one eye received topical rimexolone or dexamethasone in combination with heparin until complete regression of CN was obtained... All 5 eyes showed complete regression of CN within 5 months. An anti-*angiogenic* effect was found as early as 1 week after starting topical combination treatment. No ocular and systemic side effects were detected and treatment was well tolerated by all children… Combination of topical heparin and steroid leads to rapid regression and complete inactivity of CN. This therapeutic approach is promising, especially in children with limited therapeutic alternatives and a high risk for amblyopia." ► OSLI 2012;43(6):452-8. "Complications of cataract surgery in congenital cataract patients associated with postoperative inflammatory response found to be decreased with the use of enoxaparin (a low MW heparin) in intraocular infusion solutions. Furthermore according to our results the anti-inflammatory effect of enoxaparin was dose dependant." IJO 2012; 5(5):596-9.☺

Many NH_2 and OH groups of heparin are sulfated, so they're $O\text{-}SO_3$ and $NH\text{-}SO_3$ as Wikipedia shows. Heparin is thus a sulfated polydisaccharide unit. It's a strong acid in the human body, due to the sulfuric acid like ends. It's similar in structure to the polysaccharide part of mucins

(glycoproteins) of the mucin layer of our natural tears, which also contain glycosaminoglycans with high water binding capacity, in order to keep that water layer stuck to the cornea bound mucins. Besides lubricating the eye, heparin protects the cornea and the mucin layer of our natural tears. Even if one would use 6 drops daily, it is still far below the lowest dosage for the systemic use of blood thinner heparin. Thus, any systemic effect such as blood coagulation is impossible. UrsaPharm explained in their belief Hylo Parin doesn't have pharmacological, metabolic or immunologic effects, but mostly physical or physicochemical for the cornea. There is no systemic effect because heparin is a huge molecule of MW 15000 which is mostly available for injection because heparin doesn't enter the blood after oral intake. Due to its specific mode of action, the anticoagulant effect is only seen when heparin is injected. As the cornea is a very well-functioning barrier for the penetration of substances it is unlikely that any heparin becomes available systemically after eye drop use, though a tiny amount may be absorbed via the nasal mucosa, or swallowed, though digestion inactivates it.

11.17.3.6. 15 Ointments: avoid as they cause MGs atrophy and drier eyes long term

►► **3.7. 16$ Hylo Night (available in every US state to ship from nearby state) ebay is the same as VitA-Pos, and Hycosan Night (ebay). OINTMENTS ARE LIKE NUCLEAR WEAPONS, they need to be avoided at all costs (except for downing a civilization threatening asteroid), when all drops, procedures, techs, failed, since they're cheap deadly tempting via low price thick oils that *become solid far* easier *when mixed with cellular junk, vs meibum liquid oils and will* diffuse into the meibum gland, block its orifice *and give you styes that may require later even* surgery *to fix.* The way most drops used at night and ointments destroy our MGs is explained in the saline section. You can just use saline to alleviate night dryness, not these stye causing unnatural petrol hydrocarbon oils (90-97% of all ointments) or sheep hair fat lanolin; don't trade a little night comfort for deadly styes; Vioxx people took the pill for joint pain (like they use ointments to get comfy) and 60000 people died via heart attack; companies don't tell the whole story.**

Hylo Night is the same as 3 products: ☺☺☺

1. $20 Hycosan Night (ebay) *(bought this and 2nd time I got it, 10-18-2021, it was a 100% transparent clear liquid like gel, very different than the hard sticky quality of Soothe, Stye, Hydramed and other ointments, even this one bought 1st time 4-20-2021, which had a milkier whiter paste more solid consistency, perhaps Amazon warehouse heat impacted it, needs < 25°C/77°F; however, later ones were more solid than Refresh PM, Soothe. Ointments that are too thick can clog meibum glands leading to styes),*

2. $15 Hylo Night *(3rd time I bought this in April 2022, sold by Tiago's Store, San Diego, I got 2 styes within 2 days of using it, before I used Hycosan Night, no stye;* all ointments have more

solid oils than natural meibum oils (planet is too busy with 0 IQ music to create a drop or liquid fat mix with lipids in natural meibum) that clog meibum glands and cause dry eyes, styes in 1-3 years, even if in the short term they provide relief of symptoms; first time I used an ointment for 30 consecutive days, it was Hylo Night, and I got 2 styes; before I used them only 2-7 times a month. All ointments cause eyelid swelling if used daily for a few weeks, even at 20% of recommended amount, Hylo Night the least swelling (if no other confounding factors influenced conclusion, such as hidden eye torture, infrasound, microwaving, by FBI eyelid swell team (used on many people, watch carefully politicians, and journalists to see which ones got tortured, CIA etc), so I think this is due to hydrocarbons causing gland clog or impurities; so from June 2022, I never used any ointment; natural lipids mix is complex, way different than these ointments, these cheap alkane-lanolin ointments reflect our 1st century like chemical industry*)*

3. $16 Optase Hylo Night (discontinued probably because Optase realized ointments are like nukes – a last resort, Optase didn't say if ointment is kept below *25°C/77°F*. Optase uses US names of mineral oil and white petrolatum, while the other 3 use the EU names of liquid paraffin and white vaseline, all 4 are identical and made by UrsaPharm) the less known method to prevent dry/red eye: add vitamin A (component of tear film) and light mineral oil (light liquid paraffin in EU name, also found in some lipid tears) *to the 3 ingredients in most ointments: mineral oil, white petrolatum, lanolin.* If sensitive to lanolin or petrolatum, *then* Hydramed Sensitive (that has almost the same Hylo Night ingredients minus lanolin) may work better.

The 5 g Hylo Night tube *has 250 IU/g or 137* µg *VApal* (*vitamin A palmitate*)*/g or 75 µg RAE/g or about 1 µg in a tiny 15 µL 'drop' (MW: retinol 286.45, retinyl palmitate 524.86, so 250 IU*0.3* µg *RAE/IU=75 RAE; 75*524.86/ 286.45=137 (Wikipedia says 138 because they round up MW 525/286*75=138), thick 'drops', 300 applications, lasts 6 months.* "Vitamin A is required for the normal growth maintenance and maturation of the corneal epithelium and is effective in the treatment of xerophthalmia and experimental (rabbit) corneal epithelial wounds when applied topically as retinoic acid. The retinol concentration...in human tears was 16 ng/ml (0.5 X 10^{-7} M)… (or $0.5*286*10^{-7}$g/L or $0.5*15*286*10^{-7}$ *µg* in 15 *µL tiny drop, or 4662 times lower amount than with a tiny 15 µL snake of ointment, each blinking tear has 10 µL,* so 6-7 mm ointment is about the same vitamin A as in 7000 blinks, 10 hours of blinking, hence I used (before Hylo Care experience that prompted me to use as hand/foot cream the left over, since it was expiring in 20 days anyway, but I did use it 20 times or so, *no US made cream uses vitamin A*) 1 mm/eye to avoid overdose*)* vitamin A is present in the tears as retinol establishes the rationale for treatment of corneal disease with topical vitamin A" ► CER 1984;3(6):815-22. However, with vitamins, medicines, everything is about dose, *4600x* higher *dose* may *damage* the MGs, as IOVS 2013; 54(6):4341-50 found 13-cis-retinoic acid (acid in retinyl palmitate, metabolite of vitamin A) does. "*all-trans* retinoic *acid* decreases sebocyte growth, development, and lipid production and

causes blepharoconjunctivitis. It's ... converted in sebocytes to 13-cis retinoic acid (isotretinoin, used in acne creams, Accutane, since it *suppresses* sebum *production* by 90%, so it can also *suppress* meibum *production*), which leads to thickening and keratinization of MG ducts (chalazions too?), degeneration and necrosis of MG acinar cells, periacinar fibrosis, and reduced lipid content of meibomian tissue in animal models" and dry eyes in humans ► IOVS 2011; 52(4): 1938-78 (*this 40 page paper has so* much *info on* MGs). Too much of a good thing can be bad, though dozens of eyedrops contain vitamin A, a retinoic acid derivative that the paper claims to cause dry eye and even our tears have vitamin A; the real debate is about dose here. "Both *VApal* (0.05%) eyedrops and topical cyclosporine A 0.05% treatments are effective for the treatment of dry eye." ► AJO 2009;147(2):206-13.e3. ☺☺☺

"*VApal* improved subjective symptoms, clinical symptoms, and cytological findings in dry eyes" ► DDDT 2017;11:1871-9. *VApal* "and carbomer eye gel can effectively relieve dry eye" ► Glauco 2016;25(6):487-92. It has 1. *VApal* 2. white soft vaseline (or white petrolatum in US ointments), 3. liquid paraffin *(also called* MO *or* mineral oil of US products, *petroleum derived, transparent, contains mostly straight chain* (pharmaceutical grade, since food grade can have branched alkanes too) *C_{15}-C_{40} alkanes, C_nH_{2n+2}, but may have tiny amounts of cycloalkanes and some aromatic rings which are very stable nevertheless like all benzene rings are),* 4. light liquid paraffin *(also called* light mineral oil*, 'pharmaceutical grade mineral oil', white soft paraffin or white petroleum jelly, also mostly alkanes, so mostly saturated),* 5. wool fat or lanolin (or LA is widely used in Pharma and cosmetics) in US labels, which is a mixture of cholesterol (found in human tears), 10,000 esters of sterols (mainly), fatty acids, C_{18}-C_{26}, some present in natural tears; however, not all are present there, and some may cause issues explained below. Ointments contain hydrocarbons, wax esters, somewhat similar to those in the lipid layer of tears that dry eye patients secrete less of, so they can help compliment lipid tears. *Only* use ointments *IF moist night and dry/moist day masks and yawn tears 5x/day (that you hold with your eyes closed 10 min to soak the eye and heal it, especially after eye discomfort (dry, red, etc due to military attacks), since blinking thins and drains these tear nutrients) have failed to prevent use of eyedrops, except at night, and night drops were insufficient, since ointments have potentially toxic chemicals* (stuff we have never placed in our eyes for billions of years, certain alkanes, lanolin alcohols, sheep sterols, wool fat, etc – so start with tiny 0.5-1 mm snake amounts first daytime, to get eyes used to it first, build up slowly over weeks, months) *too that can damage eyes/body. Gels and ointments, if used in excessive amounts, can create illusion eye is wet, when it isn't, due to the weird sensations they create, so wear your silicone day mask and moist night mask as usual;* Hylo paper instructions say ointment (or eye drop) "should be applied about 30 minutes after" *any ophthalmic drug (or any other eye drop medication).* Hylo Gel paper instructions say "ointments should, however, always be administered after" Hylo Gel. ☺☺☺

Why do they make many ointments without lanolin? Due to reactivity of lanolin compounds, which causes eye complaints, allergies. "Saponification of crude lanolin gives an alcohol fraction (lanolin alcohols or wool alcohols) containing about 34% cholesterol and 38% lanosterol /dihydrolanosterol" ► BP 2003;57(8):321-5. Refresh ointments, etc contain these lanolin alcohols and to avoid scaring people they use lanolin alcohol name instead of *cholesterol and lanosterol*, as that would alarm people that diffusing into vessels it could create plaque under inflammatory conditions, and with Ca from eyedrops form real plaque. The level of cholesterol is low in these ointments, maybe 0.5% or so, if they use 2% lanolin alcohols and our tears do contain cholesterol too, though in a MUCH lower concentration. Plaque is made of cholesterol and hydroxyapatite crystals upon which more fatty stuff adds on. Lanosterol (lana means wool in Latin) is used to keep lens clear ATM 2020;8(22):1552 and prevent cataracts, while cholesterol makes 25% of lipids in the skin barrier (cornea is like skin). "111 mg lanosterol, 84 mg dihydrolanosterol, and 183 mg cholesterol" were obtained from 1.78 g lanolin JSS 2019;42(12): 2171-8. Walgreens PM ointment ("made in USA", if web has still correct info, box says nothing about "made in USA" like Equate Walmart ointments do) has the same ingredients as Bausch made Soothe, India made OCuSoft Retaine: 20% MO (mineral oil), 80% WP (white petrolatum, made mostly of microcrystalline wax (high MW) and high viscosity mineral oils (lower MW than paraffin or microcrystalline waxes), CAS # 8009-03-8, mostly alkanes > C_{25} called White Soft Paraffin or Vaseline in EU Pharmacopoeia or ointments, they can contain 1 ppm carcinogenic PAHs, see more on petrolatum here), minimalist, good for those worried about cross-reactions of non-hydrocarbon components, since MO/WP are inert, good for those sensitive to lanolin LA, plant extracts, though MO/WP oils have hydrocarbons from dead plants, animals. ☺☺☺

We know that cholesterol can form crystals, so we wonder if lanolin, which contains sterols, etc can also form crystals or atherogenic plaque via diffusion, enabling more crystals to form like with phosphate; plaque is cholesterol crystals sometimes, not hydroxyapatite (calcium phosphate); it's not clear what the long-term effects of using lanolin ointments are, so watch your eyes carefully at 20x each morning; even if tears contain sterols, they don't contain them perhaps at the same concentration as lanolin ointments cause, so like with phosphate, even if tears contain phosphate, crystals can form if too much phosphate; as a result, some people will be sensitive to LA, since they're far more reactive than virtually inert WP or MO. Hence, they made these LA-free lubes, like Hydramed Sensitive which has antiinflammatory vitamin A, but no irritating lanolin or petrolatum. Soothe 20% MO-80% WP *expires in 40 months, since 100% hydrocarbon ointments are the most stable and least allergenic, vs 3 months Hydramed with plant extracts, lanolin, vitamin A; Soothe, Walgreens, etc help us see if lanolin or the hydrocarbons irritate eyes; I called 1-800-553-5340, chose option 5, then 3 and was told by 2 ladies Soothe is made in Tampa, FL, that all Soothe brand is made in USA but some are made in*

France, as you can see on the box at RiteAid etc, so it may not be US made, the ladies having no clue or giving fake info; Bausch avoids saying location of production often on boxes, maybe because they shift manufacturing location often. It's the US leading ocular products company, and they got 12 countries where they make products per their website.

Walgreens 2nd ointment ("made in USA of US and imported materials" per Walgreens website, so lanolin alcohol may be imported since the 1st Walgreens ointment says "made in USA", meaning materials, MO, WP are also made in USA perhaps), identical to US made Refresh PM) and US made Equate Restore (Walmart): 42.5% MO, 57.3% WP, 0.2% LA alcohol. *Refresh PM has a cap that is sealed and to open it first time you need to twist and snap the 4 plastic pieces that hold it sealed;* only use if it's new and not open. This is nice, since Systane, Genteal, Hylo and others don't have this system of Hydramed, Refresh PM, Bausch, Stye, etc, *so you never know if it was open, other than the fact the box seemed not open (but boxes can be opened and reglued). The Refresh PM tube is the best of all, being* plastic that returns to its form, the other ones are metal and once pressed sometimes a lot comes out nonstop and leads to huge wasting, even after you stopped pressing to get some out. The only issue may be air getting in and oxidizing the lanolin alcohols in Refresh PM, but for stuff with hydrocarbons only plastic makes more sense; Refresh PM is very clear, unlike all the rest which are more milky, less clear. Refresh PM seems to irritate (red eyes or swollen eyelid) eyes less than Bausch, Genteal, Systane during daytime and night use, possibly due to no lanolin fats, etc and only lanolin alcohols and 23-37% less petrolatum (80%, 97% vs 57%). Refresh PM is not as solid as Hylo, but more solid than Systane, Genteal, Bausch, Stye. *However, since each derives lanolin alcohols differently from different grades of lanolin purification, there may be slight composition differences, even if all 3 contain 0.2 lanolin alcohols*. EU has often more stringent quality criteria for producing foods and medicines, so just being made in USA doesn't mean it's better purified mineral oil, etc, perhaps more likely to be free from bioweapons, viruses maybe that foreign countries spies could have inserted (3rd country) if EU governments didn't pay attention. ☺☺☺

Walgreens 3rd ointment (new) is unique (not sure if made in USA, webpage doesn't have a working Show More button that indicates that): 3% MO, 94% WP & 3% lanolin alcohols (Systane got 3% lanolin instead, *meaning way less cholesterol, lanosterol, the 2 main alcohols*). Major Pharmaceuticals (Livonia, MI, USA) makes (in Korea) Lubrifresh, 15% MO, 83% WP, 2% LA alcohol, and Rugby Labs makes in Korea an identical product called Artificial Tears Ointment. A "made in USA" on label ointment is Lubricant eye 12% MO, 88% WP (store 68-77°F). Some with 2% lanolin alcohol say store at 20-25°C. Not sure what MO-WP-LA alcohol combo is best, but that depends probably on each eye, hence we have many formulations for many eyes; some may dislike ointments with LA alcohols, since LA alcohols are not fats, let alone like natural tears fats, nor lanolin itself, but it may help those with sensitivity to the other LA components (tiny

levels of phosphate in phospholipids of lanolin etc), who tolerate a tiny level of LA alcohols, 0.2%, but not the 3% pure LA in Systane lube or others. Higher MO %, like in Refresh PM, may be better, since it's more liquid and more like our natural lipids, while WP is semi-solid; microcrystalline wax (in Stye ointment for styes) is more solid too, so that's not good. Refresh and Soothe are made by ocular products companies Allergan and Bausch, while Walgreens/Walmart are possibly lower quality cheap contract manufacturing. Refresh US made LacriLube got 42.5% MO, 56.8% WP and 0.7% other (chlorobutanol + LA alcohols obtained by hydrolysis of LA). LacriLube is more synthetic, doesn't indicate how much chlorobutanol or LA alcohols; I would 100% avoid LacriLube due to chlorobutanol (see preservatives section on how bad it is, use Ctrl+F to find it) and, to a lesser degree, due to *LA alcohols used alone* (without lanolin fats). Systane & Genteal ointments (both made by Alcon in Belgium) are identical (3% LA, 3% MO, 94% WP), so for many, it will be better than Refresh, Walgreens lubes; Systane & Genteal are very liquid, vs other ointments, so when you try use them they're a very different, more like a thick gel eye drop; this means they cause a lot of product wastage versus the other models, also due to the way this cap works on these tubes. Contamination of the product is far easier due to the fact the liquid thing spreads out to the bottom of the cap-tube contact and oxidizes maybe lanolin slightly; *poor tube-cap design for such a liquid ointment*; several times one eyelid got swollen, but that can happen with other products too. Systane/Genteal don't have a plastic seal for the cap like Soothe, Hydramed, etc, just a sealed paper box that anyone skilled can open and glue back; they have identical cap and tube, except for the writing. ☺☺☺

Systane made my eyes redder more often than Hylo Night, being less effective at dryness prevention overall too (Hylo Night being the best ointment so far among those tried). Lanolin ointments may lead to keratinization since lanolin is wool fat made by nature to help keep hair healthy, to help hair stay thick, protect sheep from cold. Finally, Stye, an ointment for styes, not for dry eyes, 31.9% MO, 57.7% WP & 10.4% *a* mix of microcrystalline wax (obtained *by de-oiling petroleum),* wheat germ oil and stearic acid *(a fatty acid common in food & our body, natural tears).* Walmart Equate Stye has the same ingredients as Stye, yet made in USA, while Stye is probably (company refused to answer) not, so Equate seems safer. *Wheat germ oil is 100% fat, 0% phosphate (*no worries*), 1.5 mg* vitamin E/g so a tiny 0.7 mg (RDA is 15 mg) per 5g tube max, a tube we use over many months; per USDA, germ oil has: 19% saturated fat (17% palmitic C16), 62% polyunsaturated fat (so oxidizes fast, unstable, keep in a cool place away from light), 55% linoleic acid (18:2, ω6), 7% alpha-linolenic (18:3, ω3), 14.6% oleic acid (C18:1), 0.5% palmitoleic (C16:1); *ω3:6 ratio is 1:8, like soybean oil used in* some eyedrops; more inflammatory than flax oil. *Stye was a product acquired by a small Insight Pharma company in PA, USA that distributes it now, but indicates no manufacturer name, location, just 800-344-7239, the Prestige phone; stye.com was bought in 2014 by Prestige that makes Clear Eyes drops in every pharmacy aisle.*

*They state "*Stye… is not for treating dry eyes*". I used Stye 15 times; since high naphthalene can cause cataracts, 0.05-0.67% aromatic hydrocarbons in ointments can cause cataracts too in theory, and vitamin E (in wheat germ oil) was proven to delay that. it works and feel similar to Hylo Night, but the tube snake is thicker. Wheat germ oil seems healthier (62% of fat is essential ω3/6), closer to what the human needs and got used to than the castor oil (see the issues in the L2 section) in most US lipid drops. Wheat germ oil also contains carotenoid, polyphenol antioxidants (see Table 2); Table 1 confirms USDA findings and is more accurate since the fatty acids % add up to 99.7% instead of 95% for USDA. Polyphenols are very heat/light sensitive, so try use well before expiration date. Wheat germ oil also contains squalene, a hydrocarbon present in skin (13% of sebum), and main component of polyunsaturated lipids, is also in the lipid layer of tears; oxidized squalene leads to skin wrinkles, so make sure anything with squalene is fresh; same for other skin-eye products. Stye ω3/6 ratio is bad inflammatory 1:8 vs million:1 in EvoTears ω3 or Vismed ω3. This is why Stye causes red eyes sometimes, so I used 99% of the tube as hand/foot cream on 9-5-21; it's not for dry eyes, only to boost inflammatory cytokines when a stye occurs to drive neutrophils and other immune cells to the site.☺☺☺

What potential issues could arise with mineral oil ointments in general, besides unknown, yet obvious, chemical interactions between non-mineral oil ingredients (far more reactive) and other drops used 30 min before or after etc? CMR 2017;15(3-4):75-87 explains in Table 1 mineral oil leads to folliculitis (pimples at the base of hairs) and lanolin to contact dermatitis (red skin spots), so when mineral oil-lanolin are put on cornea, a skin like tissue, the eye can also be allergic for some and get red, inflamed, drier long-term, even if providing short-term relief. Below are some issues and benefits of ointments: they got impurities, aromatic hydrocarbons that irritate and redden the eye (all ointments at times, when used even in tiny amounts, way less than what paper says, cause some irritation). Their biophysical properties are different: pretty solid at room temp, milky, even Hylo (Hycosan) Night which is a 90% clear semi liquid ointment, but not as clear as Refresh PM, while healthy meibum is 100% clear and liquid. This means, biophysically, future yet to be designed *ointments with clear liquid consistency are closer to natural and will irritate eyes less* via that mechanism.

Due to different electrostatic biophysical properties, mineral oils, petrolatum, hydrocarbon oils, waxes, etc could alter the fine balance of the chemical system of the tears and disturb the homeostasis of the aqueous-lipid layer barrier (*plug some outer lipid layer holes, but disturb the inner lipid layer stability where* phospholipids *face the water; i.e. reality being different than theory sometimes, not having such a universal 'all good effect' on 3rd lipid layer stability*), or by facilitating certain toxic compounds to more easily cross the junction points between layers of the eye: cornea-vitreous gel, vitreous gel-retina, etc. Additionally, most hydrocarbons believed to be natural to meibum are squalene, which is similar to β-*carotene*, etc, vastly different than

the saturated alkanes in mineral oils. Many authors think the alkanes found in some meibum studies are due to people using face cream, makeup, etc and these entering MGs (or mineral oils in every hand cream and shampoo, in food, etc), where, via different biophysical properties they can slow down certain important regenerative processes, leading to the MGs lipid underproduction or even atrophy in the long term, while offering short-term protection – just like redness reliever eyedrops offer 'white eyes' today, but rebound redness 2 years later and damaged blood vessels (by contracting and expanding 1-2 times daily for 3 years) when eyes no longer respond well and we need 5x more of a very acidic drop to prevent redness that destroys the eye since only around pH 7.4-7.6 some eye processes of regeneration are optimal apparently in vitro, not at 5.7-6.3 of redness reliever drops. Thus, not all is rosy just because 'alkanes don't chemically react with anything', they could change electric potentials across membranes, block certain enzymes from folding, proteins, etc, slowing thus important biochemical processes. Being solid vs natural healthy meibum, they're introducing cytokine storm via the 'foreign body' sensation they can cause in the first minutes of application, so that's why when I used these ointments I used a silicone q-tip (you can also use some meibum expressor too to apply ointment and massage eyelid, those with round edges, as those catch fewer bacteria, are easier to sterilize, rinse with 70% alcohol swabs, etc) I disinfected with alcohol afterwards (50 pads for 1$, @ $ store), and applied a tiny bit as explained in eye drop application section, since using 10x more as companies say, while harassing the eyelid daily and making it not fit flush on the eyeball, is risky in my view – it's too much like something the eye is not used to and causes a little inflammatory cytokine storm that damages the eye and makes people not use the ointment, when it could be safer than Soothe, RetaineMGD, etc drops with many chemicals plus the mineral oils. Due to huge irritation these oils cause, you may save your eyes from huge redness if you use less than 10 mm recommended amount, maybe 1 mm, via whatever technique you can discover, like a sterile silicone tip q tip or wiping out excess after dropping some ointment using an eye guide (wipe it with eyes closed with sterile pad you opened from a packet) with an alcohol pad, don't insert so much by pulling eyelid as that will overwhelm the eye. Write down sensations when using drops, so you recall and know when an ointment is bad.

"Pharmaceutical grade mineral oil consists of a mixture of saturated hydrocarbons" ► EHJS 2020;22(Suppl J):J34-8. Vaseline, (called Petrolatum in USA) (Eur. Ph.) can have 0.67% aromatics, while medicinal liquid paraffin (mineral oil in USA) 0.05% , light liquid paraffin 0.04%► F1000Res 2017;6:682. *Paraffin comes from parum ("very little" in Latin) and "affini" (affinity), meaning little reactivity of alkane hydrocarbons it contains.* It worked better for me many times than the best lipid tears; liquid paraffin can cause lipoid pneumonia if inhaled in large amounts (fire breathing) OM 2010;60(3):234-5, so if via nasal lacrimal duct we inhale tiny levels, what happens? Probably not much to be worried about, since we inhale lipids (though different types

of lipids) from our MGs every day, as long as we don't overdose with ointments. "Aspiration of liquid paraffin (liquid petrolatum) used for the treatment of constipation or intranasal instillation of liquid paraffin as a component of nasal drop or petroleum jelly such as Vaseline or Mentholatum for relief of sinus congestion is the common cause of lipoid pneumonia" ► IM 2002;41(6):483-6. Kids using it for constipation got in trouble too, so it may be better to avoid use for constipation. Even mouth cleaning with edible oils can cause it; however, the amount we would inhale from using it on our eyes *(most mineral oil would be ingested actually, as we swallow tears)* is way smaller than from oil gargling to 'clean teeth'; using lipid tears *(Systane, Soothe XP, etc got mineral oil (liquid paraffin) too),* we can also, in theory, get this issue, since *any lipid inhaled can cause it*; never heard of anyone using lipid tears getting pneumonia yet, but hey, who knows? Perhaps it's good to be cautious with these ointment products, use carefully, keep them away from kids and try them first 3 times daytime for 1-2 hours with eyes closed to simulate part of bedtime (*or even around the eye only, since many (see Amazon reviews) use this as eye cream for the area around eyes, eyelids, since anything around eyelids will affect eyes since it will go inside the eye too, so you can evaluate if it makes eyes red or not; if you use them anywhere, they may cause pimple if it blocks pores or 10,000 esters in lanolin cause some issue*), before you place them on your eyes for 8-10 hours of sleep, to make sure *the* 20x mirror doesn't show anything abnormal and there is no unhealthy sensation or any itching, burning, redness, etc. I bought this to test it and first time I put it was very pleasant first 15 min and reduced some of the weird feeling in one eye that's been there for 4 days after intense PC work. All CVS, Walgreens, etc ointments lack vitamin A, the key vitamin that many lack at organ level, even if serum or intake may be fine (see B12 cases where serum was fine, but all symptoms disappeared after huge B12 pills). *We can eat all zinc, salicylic, sulfur we want, and a pimple won't go away for 4 months, but if we put it topically, it vanishes in 2-3 days; the same thing is with our eyes, serum level may be fine, we may eat 4 lb of carrots, but the cornea may still crave vitamin A, E. We just don't understand how organ level deficiency occurs.*

There is a *fundamental* difference *between* an *ointment* and an eye *drop*; a drop washes out extremely fast giving us only 5 minutes of contact between vitamin A *if* we keep eyes closed, while an ointment gives the cornea epithelium 8-10 hours of vitamin A contact allowing far deeper healing, *100x deeper at least*; same thing with lipophilic fatty compounds, a drop has 0.1% of that or 1% max, an ointment has 99.9%, so it's almost☺☺☺ like 100-1000 drops with lipids, the expensive ones; though not the same, since it's a different fatty compound, but still, that's why ointments work often 20 times better than lipid tears even during daytime as they can protect a little the aqueous layer and lubricate the inner eyelid preventing it from scratching our cornea way better than a 0.3% lipid tear that drains in 2 min into nasal duct; the ointment has chemically inert alkanes mostly, while drops have very corrosive buffers sometimes and

many reactive preservatives and other chemicals – so an ointment may do far less 'side effect' damage for the same vitamin A or E (if using Stye brand, with wheat germ oil rich in E); besides, it can provide far more A, E than a drop ever can in a short time when needed. Few know about ointments for dry eyes and that there are none in stores with vitamin A in USA; so definitely, a drop during daytime with 3 min eyes closed is rather useless vs night ointment if eyes are dry due to vitamin A deficiency; eating more vitamin A (100,000 *IU/day, not* 3000 IU RDA, not 250 IU/g as in the ointment, or in this case due to severe deficiency doctor found) & D cured dry eyes ► JOII 2019;9:13.☺☺☺ Perhaps, we need more R & D into the best ointments. Even if way less bioavailable than night ointment, I included some drops with vitamin A below for those interested. This ointment doesn't need be used daily to help, even once a week may help a lot some people; it shows how useful lipid drops are. I discovered how to make a day and night time mask much better, removing the need for day drops and ointment when I have more relaxing days without trying to do a lot of computer work. The Hylo Night paper that came with the ointment says those with very dry eye can even use it 3 times/day, 2x daytime and once bedtime I guess, which makes sense, since lipid drops wash away fast, lasting far less in those with severe lipid deficiency. Hylo Night blurs vision far less than drops like Mega-3 from Refresh in the first 10 minutes (more blur later, after you took a nap of 20 minutes, but not really uncomfortable), etc. It may be one of the best ointments with minimal ingredients and A. I noticed right eye felt better while doing computer work than it did in days, while left eye, which I accidentally put 3 times more ointment as the paste fell in using the eye guide, got a little red and uncomfortable after 15 minutes, so definitely, put a little first, this was my first time using it. *Ointments are 30 times harder to put than drops with the eye guide and you definitely need very bright light (don't do it in darkness), so you see the snake of paste coming down and aim it properly, otherwise you waste 80% of paste going on eyelids, eyelash or guide which is not an issue first, as vitamin A, lanolin help orbital area skin to heal, so any miss you can use it as the expensive eye cream you never used.* The protective effect on right eye lasted until 12 hours later at least. The left discomfort disappeared after I washed excess with 15 drops of 0.9% saline and then ending with 2 drops of Hylo Gel to bring pH to 7.2 from 6.7 of 0.9% saline, and resting 5 minutes with eyes closed on the bed; due to washing it off, its effect wore off sooner than right eye, at about 11 hours. So, definitely, as with vitamins, don't take too much, especially first 3 times when eyes try to get used to a new ointment. Second day I tried it at 8 am, 3pm, 9 pm, 4-27-21, it was fine daytime, no more discomfort, eye got used to it. ☺☺☺

Farmigea Italy (founded 1946) sells Hydramed vit A ointment on Amazon that also has vaseline oil (petrolatum oil), lanolin or LA, white vaseline (white petrolatum), marigold, chamomile; however, some studies found "lid angioedema after eye washing with chamomile tea... Positive conjunctival provocations were also observed in all the patients with the chamomile tea extract.

In contrast, no symptoms were observed after oral challenges with this infusion... chamomile tea eye washing can induce allergic conjunctivitis" ► AA 1990;65(2):127-32; no such effects were found when drinking the tea, so placing ointment with chamomile extract may cause issues in most people, hence Hydramed makes a version without it, called sensitive, for those people allergic to chamomile polyphenols, etc. So, before you jump to chamomile eyedrops (many companies make them), recall this study and proceed carefully, watching what happens. A paper says chamomile can be contaminated with dog chamomile, and it's this poison that causes allergies sometimes. JEHP 2017;6:53 reports chamomile tea before bed improved sleep quality, so you may get benefits using tea if allergic to chamomile eyedrops, because anything that helps topically will also help, to a lesser degree of course, orally, since less goes to the eyes. *Maybe* Hydramed has more aromatic hydrocarbons than Hylo in its mineral oil*;* Hydramed was sent from chemist.co.uk, Frontline Healthcare Ltd, arrived in 5 days via airmail Royalmail on 4-28-21, Amazon said 4 weeks); however, on 8-20-2021 I saw Amazon allows 1 day prime delivery for only $13, with free returns, so you might be able to try it easier; after my inquiries into the smell with Farmigea (only after making Italy phone call they replied to my emails months later), they reportedly complained to Amazon that someone sells their ointment without their authorization so it was removed from Amazon temporarily for a few days in September 2021 since supposedly, it's only approved in UK and EU, not in USA, and they didn't know maybe if warehouse holds it at < 77°F/25°C; like Hylo, Hydramed instructions say to wait 30 minutes after using other ophthalmic products, before applying Hydramed. Hydramed came sealed with plastic where the screw goes on, like Stye and Soothe did, tube being bigger than others, even if it says 5 g like the others (lower density ointment?); however, while Hylo Night smells little and like a medical ointment, Hydramed smells 20 times more, like oxidized car oil or replacing tires, that typical smell of car shops, poly aromatic hydrocarbons (*carcinogenic PAH impurities in petrolatum, mineral oils, see* NIH; EU standards benzo[a]pyrene PAH <0.005% for example for cosmetic mineral oils that can have even 1% aromatic hydrocarbons, while pharmaceutical mineral oils far less); *this may be due to chamomile and marigold flowers, those smell like that*.

The company said even placing Hydramed at 45°C for 4 days didn't make the smell stronger, but the smell could be from all ingredients, *though* Hydramed Sensitive *(launched in 2019, much later than Hydramed Night, sort of like iPhone 13 vs iPhone 3, because 10% of people are sensitive or allergic to lanolin, see online stores for cheaper shipping, this one is 21$ including 1 week shipping from UK, expires in 90 days from opening) without marigold, chamomile and lanolin* doesn't smell they said; *I got it 11-5-21, 2 weeks later from UK, and it smells about 70 times less than Hydramed Night (no sheep smell from lanolin as with the smellier Hylo Night). Hydramed Sensitive lists ingredients as: A,* liquid paraffin and white soft paraffin. It's unclear if the white soft vaseline in Hylo Night is the one with 0.67% max monoaromatics or the white soft

paraffin in Hydramed is max 0.05% monoaromatics. It could mean Hydramed contains fewer irritating aliphatic-aromatic hybrid hydrocarbons than regular Hydramed, since paraffin can have 0.05% max aromatic hydrocarbons, while medicinal white vaseline can have 0.67% max; if so, Hydramed could be better the Hylo Night, if the total actual % of monoaromatics is lower. Hylo Night has wool fat, white soft vaseline (white soft petrolatum) in addition to the Hydramed A, liquid paraffin. Hydramed that has "vaseline oil and white vaseline". Vaseline is a brand or type of soft paraffin, petrolatum or petroleum jelly that allows more aromatics in than "liquid paraffin" or "mineral oil". Given how crafty companies are, a white soft paraffin could have more aromatics than a white petrolatum or white vaseline listed on another ointment of the same or different company, though the name paraffin is used to signify it's possibly better than vaseline. In our odd world, consumers are left clueless, without having any info on the actual total % of aromatic hydrocarbons in any ointment, profits first, health last. Hydramed may be, on paper, the best (least carcinogenic via least monoaromatics) hydrocarbon ointment on the planet (since lanolin compounds are very unstable during heat of shipping and storage in hot Amazon warehouse, etc), even better than Walgreens PM and Soothe 80% white vaseline (white petrolatum), 20% liquid paraffin (mineral oil); if US ointments with 80% WP and 20% MO contain more total monoaromatics, they may be more irritating than Hydramed Sensitive, even if Hydramed Night is more irritating than the few US ointments that have MO-WP-lanolin. ☺☺☺

Soothe XP PF, Retaine MGD, Systane Complete, etc all have MO in their drops, but no WP since it's too solid and impure. I tried it Nov 7th after midnight and even if I used quite a lot there was minimal irritation, while with an equal amount of Hylo Night or Hydramed there was a LOT more irritation, especially Hydramed. Being more liquid, Hydramed Sensitive will irritate eyes less during the day or night, when used, since lipids that are more solid (vaseline WP like) irritate biophysically more than those like liquid, MO. Hydramed is 3x harder than Hylo to place in the eye with the eye guide due to being thicker (diameter of paste is maybe 20% bigger, but the Hydra snake of paste keeps coming out of tube at very high speed even when not pressing, so you end up making a huge mess fast; thus, one way to place 1mm of snake in is described in the eye guide section on optical soap idea; it is 1 way to administer ointments fast *without damaging eyelid by pulling it out and without wasting 90% of the tube going around eye or eyelids*. Hylo breaks the snake and lands in eye when you shake it if you use the eye guide, Hydra drops before you even shake it ever so gently, and if you happen to blink then, you have it on your eyelid) and landing off-eye while *Hylo* lands in the eye as it doesn't break on its own (eye guide = no need to pull eyelid 1-3x/day and damage it as in the instructions on application, though I don't use eye guide as it puts way too much at once time, preferring the silicone q-tip method where you know exactly where you place ointment and how much); Hylo allows more precise control of ointment flow, but Hydramed has more polyphenols and natural antioxidants

from chamomile and marigold. *Hylo*, 8$, can last about same as Hydramed if you use the finger method to avoid waste, but longer if you use eye guide since it wastes less. Hylo costs less than half (Hydra is 17 due to high shipping) Hydramed, but Hydramed may be a better product for some people, while Hylo better for others allergic to chamomile/marigold.

Hylo Night tube says good 6 months after opening, Hydra only 3 months, since chamomile, marigold are less stable; with foods and medicines, fresh is better and lasts less; the more ingredients, the less the shelf life; longer shelf life is not indicative of quality; future eyedrops with 700 chemicals imitating human tears will have shelf life of 5 days probably, being shipped by Amazon in 10 hours from molecular factory 20 miles away. Application ease is key to patient compliance. Hylo being thinner allows you to place smaller **amounts with higher ease, for daytime, when you only want a tiny bit; this is not possible with the big Hydramed that splashes over eyelash, off-eye, big chunks of paste. Hydramed caused some itching 1st time, redness (visible even at 1x) in both eyes, so I washed it fast with 0.9% saline; perhaps I put too much, since it's next to impossible to put a little. 1 and 2 months later I used it again and it worked just fine, it actually made my left eye extremely happy for the first time in 10 days on 7-2-2021, since I used Hylo, Hydramed and Stye ointments, all 3 during the previous day (Hydramed before sleep). All ointments are damaging in our era, being made of mostly petrol grease used for car parts, our eyes are more valuable than that; if you use too much it's not very comfy or may get redness right away, instead of obvious styes, MGs atrophy after months of use. If you have to use antibiotic ointments or are curious about these deadly ointments, you can start really small, 1 mm of snake (impossible with Hydramed without q-tip method), to be sure your eyes are not sensitive or allergic to any component, and slowly build up to 2 mm, etc if needed. Always try them 1st daytime, not at night, to avoid too much eye contact and allergic reaction. During the day we blink a lot, wash it off, etc, in the night we don't, so it can cause mucus as a reaction to it. I discovered around 5-3-2021 after using Hydramed 1st time, that I need no drops (except saline at night) or ointments, due to improving my night mask and daytime moisture mask. ☺☺☺**

Farmigea.it 1 min video of their Pisa, Italy factory shows a less 'new, state of the art' vs UrsaPharm ($230 million sales vs 28 Farmigea) facilities, though another 2 min youtube looks very nice; see their clean hallway here; Farmigea didn't return any email questions until I called Italy, UrsaPharm did return 15+ without me calling Germany; *all ointments have compounds that are not liked by the eye, perhaps because* most of the compounds are NOT found in the eye, so consider another product if mucus forms when waking up etc. Hydramed smell may be a combo of chamomile, marigold and may not be due to sheep wool (sheep wool smells a little like engine oil, if their lanolin did not go gone thru complex purification techniques to make an odorless lanolin, like the Hylo lanolin did, indicating Hylo is possibly a much higher quality product, free of oxidative and environmental impurities that give lanolin its sheep smell, unless

the strong smell comes from chamomile and marigold extracts); so look out for wool smell in ointments and if present, don't use, especially if red itchy eyes happen first few minutes several days in a row (some redness may be OK first time until eyes get used to it if you put too much at once; 10 mm suggested on the instructions paper is way too much for testing, only 3 mm is enough to get eyes use to it); human dermis stratum corneum lipids are similar to wool fat or lanolin lipids; lanolin is used in eyedrops too). Hydramed is also available on UK ebay; Farmigea also got $8 HydraMed Night Sensitive (US ship 17$) without LA, marigold or chamomile that may work better than Hylo for those allergic to LA or chamomile, marigold (no smell means their mineral oil and vaseline are odorless, but I don't know if Sensitive smells; however their lanolin may smell, and be masked by chamomile and marigold, if cheaper smelly lanolin); however, without these 3, Sensitive just has oil alkanes, hydrocarbons like the cheaper stuff at RiteAid, but has vitamin A; however, lanolin and chamomile have many unsaturated sterols, fatty acids, polyphenols, etc which cross react and create new toxic compounds, so ointments with just mineral oil and petrolatum are far more stable and also safer if you keep a tube longer than 3-4 months. The issue of stability is explained more in the 1st paragraph of the lipid tears section; buy ointments as you use them if they contain lanolin, vitamin A, etc since *lanolin, A, polyphenols are* far less stable than *alkanes in mineral oils*. ☺☺☺

Lanolin provides more natural fats more like in our tears than alkanes, but quite different. farmigea.it also has a big list of their many (Pure got plant extracts only, amazing, it's like Bausch plant extracts eyedrops mentioned later in the B12 drops section) HA drops, sold via various UK, etc sites online (google it) like HydraMed (0.2% HA, citric buffer, mannitol, 0.2% TSP – Hydramed Forte is same, except 0.4% HA – high MW HA both, mannitol is safer than sorbitol? It's an osmotic diuretic used intravenously at high doses to lower ocular pressure by drawing liquid from the aqueous humor, from eyes; mannitol can also crystallize at 20% concentration, so if someone has punctal plugs and uses mannitol eyedrops and temp goes below 20°C during cold compress or shower and it's concentrating, they may form crystals that scratch the cornea or even deeper eye structures if it gets there and accumulates in a cellular compartment in high concentration; since it's C_2 stereoisomer of sorbitol, we need pay attention with sorbitol, sugar containing drops too), Cellusan (1% CMC, lactic buffer, KCl, NaCl, $CaCl_2$ issue?), Cellusan Light is same, except CMC 0.5%, same ingredients as Refresh Plus, different amounts of electrolytes and buffer probably. Hylo Night tube design is superior, since diameter is way smaller. *Hylo Night, Hydramed Night don't indicate % of MO, WP and LA, so we need do eye evaluation before and after, eliminating confounding factors.* WP and MO need to be very pure to avoid impurities that can irritate the eye, so brand quality matters also.

MO *may cause lung issues if used too much in theory, so perhaps Systane lube is better, having the least of it, though WP could cause issues too; any oily WP-LA component can cause lung*

issues. **Just like not all drops are perfect fit for all due to different pH and issues, not all ointments are performing best for daytime or night: LA is not LA alcohol, so try both? *They got a few gels with Na perborate preservative and sorbitol in them that I would not use, since during night, exposure to eyes is 100 times higher than daytime drops*. What about night gels? Systane gel got phosphonic acid, which could create eye stones (surgery needed) if it becomes phosphate and/or eye damage if the gel is too acidic (they say 'may contain NaOH to adjust pH, meaning it could be phosphonic phosphonate buffer), meaning not pH 7.1-7.7 as for most people; we don't blink at night, so placing carbopol 980 (also called carbomer 980, used by Liposic lipid gel), phosphonic acid, Na perborate preservative (see preservatives section, banned in EU) seems risky, since phosphonic acid is reactive and can damage the eye cells.**

11.17.3.7. 56 other brands of lipid free eyedrops (besides the 9 salines, 7 Hylo above)

1-7). Hycosan Extra (ebay) ($17, 7.5 mL) same as Hylo Forte, Hylo Gel. Made by UrsaPharm, who makes Hylo, distributed *by* Scope Ophthalmics UK, *who also sells Hylo and Optase, 0.2%* HA *with Tris-HCl buffer, see below. Scope has* a 3 min video with the optometrist using BlephEx and Hycosan *(an e*ye drop available at most UK retailers over the counter, including Boots, UK's largest pharmacy chain with 2500 locations, owned by Walgreens), showing how important is to also clean out eyelids with sterile silicone q-tips if we don't use BlephEx. Hycosan is same as Hylo, but Hycosan bottles use 7.5 ml not 10, are over the counter only; Hylo is approved to be prescribed so the UK insurance can pay for it. Hycosan didn't get the fees to get that approval, or UK approved the 10 ml bottle Hylo to save government costs. Scope sells *$18* Hycosan Dual *same as $20* Hylo Dual, *$16* Hycosan Original same as Hylo-Tear, $18 Hycosan Fresh same as Hylo Fresh, 17$ Hycosan Plus same as Hylo Care, Hycosan Night same as Hylo Night.☺☺☺

8-13). Evolve 13$, or 9$ on Amazon UK, HMW HA 0.2%, borax, boric acid, NaCl, water for injection, lasts 90 days, made by Medicom Healthcare Ltd, a company whose website didn't work since October 2022 (they do have another site that describes their 5 drops), having 1 page only, UK which makes an identical (bottle is different than the UK-NZ one) Evolve for Canada too, as the pic shows, and also Evolve Revive (the most expensive drop of their 5 is 30% the price on ebay, only the 2 main active ingredients listed on bottle box), with pH modifier (no buffer, just NaOH), *carbomer 0.2% (seems to cause* eyelid swell*. Any thick drop/gel will stay longer and if it gets infected by accident or intentionally (spies) with a microbe, it will be more likely to cause an infection, so use Evolve Revive mornings, not at night when you forget to wash to off, can't blink much, forget to wash off eyelash base, etc. Evolve swells eyelid a lot, so it may be better to avoid them like the plague, all products from this company),* glycerin, sorbitol (*the* nerve damage agent, though less than other drops without carbomer, since less is needed for osmolarity), HA 0.2%, see ebay for 6$ UK price. This Revive lists all ingredients only on the paper,

not the box and comes with a sealed cap; you need to shake it well after each use, so the tip doesn't touch the cap via the drop. It's a lower quality product in terms of marketing and everything, as they don't disclose pH modifier, though that is usually the pH adjuster HCl, or NaOH so to avoid scaring people, they use 'pH modifier' instead; Evolve also has a gel without sorbitol. Evolve may work for some for use before antibiotic drops with toxic BAK, since HA makes BAK 3 times less toxic; I got this Revive, it was OK, pleasant actually, after the first 3 seconds of weird carbomer feeling, not as bad as I thought, pH 6.9 with my pH papers. I would not recommend this, due to sorbitol, but you got 90 days to try it and see if carbomer irritates or not; I believe it possibly contains some bacteria or microbes that cause eyelid swell, since after use my left eyelid got more swollen for a long time, like 7 weeks. The other Evolve product with borax is interesting since it has fewer ingredients, if you can trust this company, for determining if you're allergic to ectoine 2% (the chalazion dissolving drop that makes meibum oils more liquid inside a chalazion), which is the only extra ingredient in Hylo Dual, Hylo Dual Intense, and other similar drops, or allergic to borax (this will help you avoid borax drops if borax irritates your eyes), provided their HA doesn't cause allergy due to protein impurities, microbes. Bayer HydraSense Allergy (see below) provides ectoine with a non-borax buffer, so you may benefit from that lipid stabilization. However, some companies have EDTA or borax at 11 times others do, as shown below, so, just because one borax drop doesn't irritate, doesn't mean another won't if that has a higher concentration. Evolve is a minimalist drop for those who're afraid of sorbitol, phosphate (eye stones, cloudy cornea, blurry vision) in 100+ brands or who're allergic to other ingredients (or buffers, like citrate, Tris, etc), but who want HMW HA to use before BAK preserved drops (antibiotic drops) to reduce the BAK damage and help antibiotic hang around for longer than 5 min of closed eyes.

Also, from UK, we got a preserved drop *(using 100 times less polyhexanide preservative than other US drops), made by another company,* that, unlike any in USA, has vitamin E and A, so being preserved, it has no entry of its own, 7$ Boots A+E, I got it in 2 weeks from this. It's a nice package, pH 6 with my 5 papers, so use only mornings, it burns first 5 seconds, then it stings a little next 20 min, occasionally, due to low pH, when eye pH is closest to 6, it makes your☺☺☺ caruncle vessels very very red within 5 minutes and all big arterioles thicker due to the stress it causes to the conjunctiva and cornea, so I was very disappointed, since I noticed this all 3 times I have used it, thinking to no longer use it even diluted; the plus is that it is very watery and thin like Refresh Plus, so it won't cause the same type of eyelid swell like viscous drops do, but unfortunately, it does cause eyelid swell, like some antibiotic watery thin drops do too; this can only be used with saline drops before and after to dilute it maybe 5 times, all that EDTA and acidic pH is very bad; another issue is that it expires in 90 days after opening, so many people won't like that, but anything without a 0.2 micron filter needs be trashed in 3 months anyway,

as bacteria grow fast from air contact; it says to keep away from light, between 5-30°C, have more IQ than US Clear Eyes with vitamin E that uses a transparent bottle and has no warning to keep from light and high/low temp that degrade E, the Boots uses thick white bottle to block way more light, made in UK, distributed to EU too. Boots UK, sells it 5$ for UK people (Boots doesn't ship outside UK, so I had to use the Britstore). It has A & E + HA, borax, NaCl, boric, Na*CMC* (unknown conc, like in Refresh, irritating vs glycerin, *maybe not if 0.1% vs 1% in some Refresh*), 0.11% EDTA (11x > Vismed 0.01%; 0.01 was found to not damage cornea cells in vitro) irritant and 'undeclared preservative everyone uses in 'unpreserved drops', 0.0001% polyhexanide (7.6x < Vismed Light which didn't damage cornea cells in vitro), *polysorbate 80 (damaged 30% of cornea cells in vitro). Never use Boots at night or before some thick drop at night, as the redness will be far greater due to 100 times longer contact time with the eyes (no drain due to no blinks); overall, I would stay away from this, unless you monitor eye carefully at 20x, 3 times before (within 10 min to get a good average) and after (10 min too), for first 10 uses and notice no stings, redness, etc; presumably, 1 out of 100 may not react like me, due to acidic eye pH; I include it here since it's very popular in UK and people with totally 'destroyed' eyes can't even notice the difference at 1x, or feel anything anymore.* ☺☺☺

The only 2 in US with vitamin E are the Stye ointment and Clear Eyes Adv drops, which got issues due to phospholipids. No US drop has vitamin A. Many EU drops or ointments got A, and many lipid drops got E in EU. Novax Monaco sells Navitae A+E+HA, oxidative preservative ($NaClO_3$-NaClO, mild bleach), expires in 28 days. Lion Japan sells $16/2x15 ml A, E, B6 Smile 40, launched 2013, with 350 IU A/g + 0.75 IU d-E/g, redness reliever, antihistamine, menthol which 'hides sensations, is thus dangerous (probably acidic too like other Rohto or redness reliever drops): 13 inactive ingredients (+8 active, including bad neostigmine methylsulfate) that can cause allergies (BHT, polysorbate, PPG, Tris, EDTA, pH adjuster). Rohto sells Cool 40 E/B6 drops (ebay). Santen has almost identical to Rohto A/E products. Rohto also sells A, E, B_6, T combo (t=taurine, osmoregulator preventing dry eye, helps retina eliminate waste). I won't use Rohto or Lion that got neostigmine, redness reliever, antihistamine, low pH. Even in USA, there is an FDA approved Rohto, much safer than the neostigmine drops, with taurine. Boots is way better than vit E Japan drops with BAK, redness reliever, antihistamine, menthol pain blockers to hide stings.

14-15). Vismed Gel (ebay) (20 vials expiring 3 years from manufacture date, 1.5 years from time I got them 3-30-21, paper says vials can be reused if recapped within 12 hours, *9 mL total*, hypoosmolar 150 mOsm/L, unpreserved. Vislube says 140-160 mOsm/L on the box & hypotonic, but this leads to a weird grainy-itchy sensation in the first 2-4 seconds, similar (not as bad though) to distilled (and sometimes shower) water that has low ion count. This can cause osmotic stress leading to redder eyes for some, so too hypotonic drops may not work for all, it all depends on how much salt and ions are there to begin with and what our eyes are used to.

All eyes/dry eyes are different, so need try more until you find one that works best. The package paper has a German distributor address & lists contents as: sodium citrate, Na_2HPO4 *(not phosphate buffer,* hopefully *low PO_4 vs PO_4 buffer drops,* so some may dislike it*),* 0.3% HA, $MgCl_2$, $CaCl_2$, NaCl, KCl. Ca drops can form eye stones so *Vismed (or any drop that has both* calcium *and* phosphate*) drops are especially dangerous,* so avoid Vismed. The pH is 7.3 per manufacturer UK site which has more data, ideal for those with pH 7.3; pH was with my pH papers or *slightly* more alkaline than Hylo Gel *(which seems 7.25), so maybe 7.31-7.34*. However, JOPT 2016; 32(2):109-18 found 0.18% HA Vismed had pH 7.2, so my pH paper may be off or UK site off, though all can be right, since each lot may deviate from ideal and have a range; pH of Refresh Optive preserved was 7.2 in the study, so see how different it is from unpreserved which is 7.4. Vismed has a more grainy feeling, when I tested it right after 2 drops of 0.9% saline to dilute phosphate, less comfortable than Hylo Gel. The physical properties of the tears are different. A 2019 study found 500K < Vismed MW HA < 1000 KDa; on 4-7-2021 Vismed emailed me MW is 1100-1400 KDa; thus, Vismed HA may be more inflammatory than Hylo Gel HA with MW up to 2800 KDa. Vismed blurs more than saline+Hylo Gel too, being 0.3% not 0.2% HA. The Vismed preserved brand seemed in 1 study to damage no corneal cells, unlike other HA, citrate containing brands like Hylo. TRB Chemedica, 150+ employees, founded in 1980, reputable (see the Gel Swiss GMP manufacturing facility). They also got Vismed Multi for $25 (unpreserved, 0.18% HA, expires 6 months after opening, only 10 mL so more expensive, *since you get half HA/$*). Vismed Line brochure (many studies) is here. They also got an ω3 drop, not on Amazon, contents listed here: EPA ethyl ester, DHA ethyl ester, vitamin E acetate, glycerin, polyacrylic acid (also called carbomer in other eye products), NaOH, acrylates/alkyl acrylate crosspolymer, Na_2HPO_4 (thus, PO4 buffer), hypotonic with a physiological pH value (7.3?). ☺☺☺

Due to *the use of phosphate without warning of issues and synthetic emulsifiers* (not natural as in eyes) in the ω3 for emulsion creation, it's a little unclear how aware they're of phosphate issues. It's noteworthy that Vismed, 0.18% HA, in 2006, had a PO_4 concentration of 10.5 (way above 1.45 in our tears, see table 3). Comfort Shield however, the last drop (#17) had only 2.3 mM in 2006 and 1.2 mM (safe) in 2020 per the iCom CEO. In 2021 Vismed confirmed by email their PO_4, is 8-10 mM, which is average for unpreserved drops (8.5 mM), vs 32 mM preserved. Natural tears got 1.45 mM, so 8.5 is still 6 times higher, damaging to ocular cells just as citrate, Tris are at 8.5. When I bought it I didn't realize this eye stones paper had the 10 mM Vismed PO_4 concentration. I had to discard them, since they always caused distilled water like sensations upon instillation (too hypotonic), plus eyes were already responding oddly to it sometimes; try Vismed rarely, if you already bought it, once a week max, if it's comfortable, diluted with saline 0.9% saline to dilute PO_4 about 3x. Please don't ever use PO_4 drops with > 1.45 mM PO_4 after surgery or any cornea scratching (eyelash, etc) or when eyes are red on 20x mirror or stressed.

Vismed multi helped glaucoma patients, since HA, see Comfort *Shield* below, the only PO_4 drop with a safe 1.2 mM buffer, promotes nerve growth, *prevents nerve atrophy*. HA is the *extracellular* matrix of the *brain;* it prevents *optic nerve* atrophy *with* age, even in people who want to live to 120 and never had glaucoma family history.☺☺☺

16). Bion Tears (*$19*, made in *France*, designed by Alcon USA, 28 0.4 mL vials, bicarbonate (antiviral) buffer (the most natural), HPMC 0.3%, dextran 70 0.1%, $ZnCl_2$, KCl, NaCl, $MgCl_2$, $CaCl_2$, $NaHCO_3$. Leaves white residue on the eyelid, due to drops being 2-3 times bigger than other brands. This is a real issue, since if this white residue sticks to eyelashes, it will trap dirt, dust bacteria and possibly cause infection, so you need to wash eyelashes well daily if using it, very well rubbed with the fingers. Can get refund without returning, even if non-returnable, if issues exist, since Amazon ships it, chat with Amazon, explain issue and ask for refund. *Irritates eyes, causes stings quite often. I got stings and itches from 2 packs ordered in different years.* Identical to GenTeal *unpreserved* tears (below), except those lack $ZnCl_2$, $CaCl_2$ and use borate buffer. Bion has calcium, which can form eye stones, so I avoid it, I used GenTeal unpreserved tears once instead; GenTeal *preserved* do have zinc, but also preservatives and polysorbate that damage the eye, so Bion is safer for zinc. For more details about Bion, see the bicarbonate buffer section of the buffers chapter. Use Bion during daytime only, since if you semi-open eyes at night, the CO_2 will release and pH get too alkaline, as buffer section explains. During the day, every 5 seconds we blink and bring it the natural buffers, so pH remains around 7.4 or whatever our average is, but at night we don't blink, so pH is that of the drop. Drops are very big, so wipe out what you spill over, so the liquid doesn't get too alkaline for eyelid or nearby skin over time as CO_2 vanishes. It's the *only healthy drop* with zinc that *has no preservatives,* redness relievers *or toxic unnatural buffers*. It's also pleasant when rested, annoying when tired, indicating an issue. Zinc is key to ocular health, DNA/nerve repair, and general health. $ZnCl_2$ can be good if around physiological level, but some drops (that I used and had a similar annoying feel at times) have $ZnSO_4$ at 0.25% which is Zn at 150-1500 times above physiological level, physiological is variable. We need more transparency from companies before we use eye their drops. Too much zinc suppresses ocular immunity, ability to fight infections, leads to dryness. ☺☺☺

17-28). B12 drops unpreserved by Bausch & Lomb, made in France, 0.2 mg/0.4 mL (0.05%), 10 vials, has *only* H_2O+NaCl, *6$ ($7 shipping to US)*. Thea France makes 0.05% B_{12} drops too, with *only* H_2O+NaCl, 20 vials, 6$, half price of Bausch; vials can't be recapped, so it's a single use vial; like saline, don't use 2-3 drops at once as it causes redness; saline whitens if 1 drop; wait at least 5-8 minutes; I applied on 9-20-21 3 drops in each eye within 10 minutes and discarded the vial, and it didn't cause redness like 0.9% saline does usually if you use 3 drops; it felt different, so it may contain less NaCl than typical 0.9% saline, making it hypotonic. *These 2 are safest* B_{12} drops. I would not use more than 1 vial a week, meaning 1 vial used within 20 minutes (since B_{12}

oxidizes fast in the presence of light and air), due to the risk of getting too much red-orange tint or what may appear as yellow hue, to the cornea or conjunctiva; yellow cornea can appear due to antibiotics too. They don't use the natural forms of B_{12}, but the artificial cyano form, stable in solution, so there may be some side effects that are not explained besides those explained in the B12 section due to systemic absorption via swallowing drops that go into the nasal lacrimal sac, but cyanoB_{12} is in almost every *vegan* milk and endless foods today. What B_{12} level is safe, ideal for blood vessels and nerves in the eye, etc, how often, in what type of drops, besides saline, is not clear, but you can do more research. High B_{12} on face due to taking B_{12} pills causes acne bacteria to produce more porphyrins which cause inflammation and then acne; likewise, to be safe, with B_{12} drops, wipe out any excess B_{12} drop if it runs over the face. 4 human studies on B_{12} eyedrops are: GYZ 2016; 16(7):1329-31, GACEO 2015;253(3):425-30 & B_{12} spray: DDDT 2019; 13:2381-91, B_{12}+citicoline drops: AT 2020;37(4):1646-63; a rat study showed effects.

I include these B_{12} here since USA stores carry Rohto B_{12} drops and many are curious like I was. The 2 above take 2.5 weeks to arrive to US, 7$ shipping. Very nice pharmacy, a happy lady answered my call, they know English and the phone prompt is bilingual, they even told me expiration date (a year), and her English was perfect. Call them to ask which products can be shipped to US, before ordering. A site got 50+ other eyedrops I never heard about, many with plant extracts (see Antiox 2021;10(2):190 on plant polyphenols improving dry eye): chamomile, Bausch single dose plantain, blueberry plus ectoine 1% (Hylo Dual got 2% ectoine), eyebright 10 mL bottle unpreserved: 0.1% eyebright, 0.2% HA, borate, NaCl Bausch & Lomb (similar to Hylo Fresh, or single dose Bausch Vidisan that has povidone, NaCl, eyebright, boric buffer), B5+B12 from Densmore; use "eyedrops" in search to get the list, then google them and see some (Vidisan, Optone, etc) are available for online ordering via Walmart too. They often expire in 1-3 months after opening, depending. You can also get Thea via DHL from another pharmacy if you want them in 1-2 days, but it costs more, the item $10 and $20 shipping. Rohto makes B_6+B_{12} drops in Vietnam, sold at RiteAid or Amazon, but Rohto is very acidic (thus inflammatory), contains BAK, menthol, *redness reliever that can shrink blood supply to other eye areas,* MGs, plus less ideal borate buffer, polysorbate 80, chlorobutanol, EDTA. Omikron Italy makes $13 0.05% B_{12} + 0.2% HA+ 2% citicoline drop with BAK & phosphate buffer, that expires in *30* days after opening, see citicoline paper above (they used those drops 3 years to help optic nerve); pH 6.3-6.7. Densmore makes B_{12} + HA + Oxyd (SCO or Purite) preserved drops ($9 here). I included preserved to show it's common, not to suggest use. Santen makes 1. Soft unpreserved 0.02% B_{12}, ☺☺☺ with povidone, EDA, boric, pH adjuster, neostigmine methyl sulfate; 2. PC & DU preserved with BAK, menthol, immunosuppressants. Novax VisionLux (exp *90* days once open) has Purite (Oxyd), borax, EDTA, B_5, 0.3% HA, B_{12}, $8 here. Google names to find price. Novax/Densmore could be used for eye disinfection if needed. In Germany, Bausch makes 14$ Artelac Rebalance

(exp *60* days) with pH 6.8 (my 5 papers) B_{12}, (concentration unspecified) boric, 0.15% HA, 0.5% PEG8000, NaCl/KCl/$MgCl_2$/*Ca*Cl_2 (*Ca* drops can form eye stones) + toxic oxyd (in vivo toxic too): didn't like Artelac, one of the worst drops, sort of like Refresh Plus, very watery, dispersing fast; it lasts only 5 minutes of comfort, then dry; 1st time it caused itching near left eye nasal corner. It's not like the nice glycerin+HA Optase, Hylo, Clear Eyes Adv; however, page 107 has an Italian study suggesting B12 helps recovery of goblet cell density. Oxyd is gentle vs BAK, so 100s of companies use it under many names. If you don't use CEA PAPB preservative (least toxic), then Novax seems safer, due to cornea healing B_5; or use unpreserved Hylo Care (B_5) 30 min before.

29). Biotrue (9.5$/10mL if 2 pack) made in USA by Bausch & Lomb: *the only drop I found with pH 7.6* per my papers (7.2-7.8 range per Bausch when I called, range to protect trade secret maybe, but middle of range is 7.5); *7.6 is exactly the* physiological *pH of 5-15% of people, older usually*, so this may be their drop; pH rises 0.2-0.4 units in the evening, so this may be fine evenings for other people too. Since Bausch uses 902KDa MW HA in Artelac, and 1400K in Biotrue MPS Solution "Biotrue MPS is a sterile, isotonic solution containing 1.4 MDa HA (0.01%, w/w)" ► CO 2016;10:1945-52), Biotrue Boost HA MW may be 1.4 MDa too, i.e. high MW, even if it may be in % of 0.05-0.4% (the range in most OTC eyedrops), so it's not a huge concern if used only rarely. Since in Canada multidose Biotrue unpreserved has 0.24% HA, this US one may have around 0.2% HA, or similar, though Canada uses phosphate buffer, not boric and has no glycerin. Biotrue uses $HOCH_2(CHOH)_2CH_2OH$, erythritol < 1%, an antioxidant that is glycerin $CHOH(CH_2OH)_2$ with another CHOH group, which, like glycerin 0.5% already in the drop, protects HA from free radical damage, so drops without antioxidants (trehalose in Thealoz, etc) to protect HA may cause the split of HA into inflammatory *low* MW HA that is a known angiogenic making eyes red and inflamed; this is why perhaps Hylo Gel with antioxidant sorbitol is better than Hylo Care for naps and sleep since with time HA disintegrates, so when using Hylo Care, use Hylo Gel 20 min after too, since they share the same HA and buffer. You can use Biotrue rarely to be safe, until company *cares* to share MW of HA (*though I think it's safe*, being around 1.4 MDa) to help *customers*, (they told me it's proprietary info) not *profits*, since each type of dry eye needs a type of HA MW; Bausch products are high quality, they use low phosphate when using that buffer, decent HA MW in Artelac, Biotrue, etc, and had the highest MW HA☺☺☺ (1.4MDa, Biotrue multipurpose solution for contact lenses) of all 11 ocular products (from 0.15MDa to 1.4MDa) analyzed by OVS 2014;91(1):32-8. There are other companies far worse (making most products with BAK, menthol, etc), it's just the way FDA regulates these, we're the 1st century after millions of PubMed free papers era, *stone* age. Low MW HA 220K Thealoz can cause red eyes in the long term via angiogenesis, Biotrue 1400K won't. Biotrue is 0.5% glycerin, some HA, boric, borate, erythritol (like Refresh), free from sorbitol, preservatives, and *much more pleasant than Refresh* *(which forms thick films, gives irritating sandy feeling, forms ridges on cornea that*

trigger foreign body sensation, eyelash falling, itching often; it's the CMC (artificial lubricant) and polysorbate (which kills 30% cornea cells in vitro) in Refresh etc products, I believe, that causes a lot of irritation). Most Refresh drops have pH 6.5-7.1, except for Optive which is 7.4 and irritating due to CMC; all other ingredients are very similar to Biotrue, except Refresh almost never has HA in the US, but has trouble causing $CaCl_2$. Biotrue seems the best drop at CVS/Walgreens (cheaper on Amazon) for alkaline pH folks: doesn't have artificial lubricants, closest to nature in terms of lubricants & pH of severe dry eye patients (7.4 most severe cases?). On 9-13-21, 5 pm I tested it after not using any drops for 6 hours (except saline an hour before) and it did not cause redness at 1, 2, 4, 10 minutes, after sitting with eyes mostly closed to give a chance to any 'toxic' ingredients to cause redness. October 9:25 pm test showed whitening effect after 3 min of no blink, but it vanished after I tried to generate tears and washed Biotrue off 50% sort of, and then at 25 min, there was the grainy feeling of Clear Eyes Adv and Refresh from boric and glycerin that is obvious only when eyes are tired with lower glycerin concentrations than Refresh 0.9%. If your pH is 7.4, it will fit your pH. My average pH seems < 7.35, so when I want to get closer to 7.2, I used saline before to dilute the Biotrue, bring pH to 7.3 without the issues of Refresh. Since your pH can be 7.2, use with only if no redness noticed on a 20x mirror, 5 times, in case eye can't cope with pH 7.6 (confirmed by 4 papers). Don't use it 2 times within 7 h if your pH is < 7.1 on average. I returned it due to redness it seems to cause.

30). Retaine HPMC (ebay) (made in Germany, distributed by Texas OCuSoft company, 10 mL Hylo like bottle that lasts *3 months only*, contains same inactive ingredients as Hylo Tears: H_2O, sorbitol, buffer (citric/citrate). The active ingredient is *0.3% hypromellose*. Hypromellose is a short name for *hydroxy propyl methylcellulose*, a polymer similar to the common *carboxy methycellulose* lubricant, see more details in the buffer section. Same high tech bottle as Hylo, *Hylo lasts 2 times longer, better for alternating with other drops*. HydraSense (next) lasts *12 months*, arguably better ingredients too, hyaluronate is in the eyes.

31-34). Bayer HydraSense, HydraSense Night Therapy, HydraSense Allergy, HydraSense Advanced eye gel drops (*$18/10 mL US Amazon for Advanced),* pH 6.5 with my 6 papers, too acidic for most, but perfect for the minority with average tear pH 6.5, free returns *if eye dislikes it: mine did so I returned it, due to the strongest itch ever,* after the equally or more deadly Hylo Care, see above what happened, they got similar ingredients. Almost same as Hylo Care, read all about Hylo above, only use *provitamin* B_5 eyedrops at night after *daytime 5 min test and, if 5 min OK, nap use (1 hr no blinking)* indicates no redness or discomfort: $10 Canada Amazon or $8 Canada Amazon if 2 bottles + free Canada shipping 1st order). It has the same ingredients (except NaCl) as $17 Hylo Care, but ►►*lasts 12 months*◄◄, not 6: *0.15%* low MW HA, citrate, citric, NaCl, H_2O, unlisted provitamin B_5 (Bayer emailed me it's 2%, the same level as Hylo Care). An OD says on his website that Hydrasense HA MW is low and causes inflammation, so Hylo Care may

be safer? I wish Bayer would have made 2 versions (pH 6.5/7.2) or one that matches the majority natural tear pH. *The reason Bayer lasts 12 months, instead of 6 for Hylo could be that it has more citric acid which lowers pH. Shelf life is not important, but matching natural pH, no redness, no itch are.* 12 months is not a good time to keep an open unpreserved bottle anyway, 6 months is safer. If your tear pH is > 6.8 Hylo Care will do far less damage. Bayer ($43 billion revenue, probably the biggest manufacturer of the list, Allergan $16 billion *for* Refresh) also makes HydraSense (0.15% HA, citrate buffer, NaCl), *$13* (free Canada shipping 1st order) and HydraSense Night Therapy $*18* plus 10$ shipping or 14$ + free shipping to Canada 1st order (0.3% HA, citrate buffer, NaCl, for severe dry eye) these 2 are same as Hylo Gel minus sorbitol plus NaCl, HydraSense Allergy $*14* free shipping to Canada 1st order (0.15% HA, 2% ectoine, citrate buffer, *same as* Hylo Dual *except borate buffer for* Hylo, but HA is 0.15% vs 0.05% in Dual or 0.20% in Hylo Dual *Intense*). For more on the unpreserved tech, see a 21 min video about 100 products using it in 2016 or a 2 min video about a company making the bottles. *No shipping to US for Amazon.ca links, so choose the US links (Night & Adv) if in USA.* Made *in Canada by Bayer. It's available at Walmart sometimes in Canada.* Hylo HA *MW may be higher, healthier.* ☺☺☺

I tested Hydra Advanced on 9-11-21, it was very pleasant, but on 20x mirror, 2 right eye nasal area *arterioles became redder in 3 minutes*, so I returned it. On 9-18-21 I tested it 50 minutes after Hylo Care test (which was still lingering) and it gave a continuous itch (well, Hylo can itch too continuously sometimes, if applied without saline first) that didn't end fully until I used saline to wash it off. *This may be due to low MW* HA *displacing high MW* HA *in Hylo traces left over, so wait 3 hours before using different MW* HA *drops*. It seemed as if the effect of slight redness was there. This may be due to the combo of Hydra+Hylo leftover reaching too high level of B_5, or more likely, due to citric acid being too high (some was there from Hylo left over) or HA MW low in Hydra. It can also be due to Hydra being hyperosmolar (hypertonic), one HydraSense drop being 314 mOsm/L vs 280 in Hylo Forte, Gel, Care, etc. Dry itchy eyes have osmolarity > 305. Other studies found even 323 for Hydra, so maybe the eye was already a little hypertonic at 8:40 pm, and Hydra made it more so. Thus, it may be wise to be ultra careful and do tests of Hylo and Bayer 8-40 hours apart, to prevent any interference of citric, B_5 and see if Hydra or Hylo is better (for most people Hylo, since it's closer to 7.35 physiological pH), since they have same ingredients in different amounts. If Hydra has low MW HA, which causes redness, it damages more than Hylo most people due to acidity, MW, hypertonicity. Due to unpleasant experiences with both Hylo-Hydra, I'm now *hesitant* about provitamin *B_5* drops, so 2022 was last time used.

35). Refresh Optive (*20$ on Amazon for 24 mL, 30$ CVS for* 60 vials, *0.4 mL each*, 11$ for 30 vials, pH 7.4, contains 2 lubricants, 0.5*% carboxymethylcellulose (CMC),* 0.9% glycerin (known to cause eyelid swelling), inactive ingredients (seen on the box on Amazon): H_2O, KCl, boric acid (H_3BO_3), $CaCl_2*2H_2O$, (Ca can form eye stones: avoid Optive), $MgCl_2*6H_2O$, $Na_3BO_3*10H_2O$ borate,

erythritol $HO\text{-}CH_2\text{-}(CHOH)_2\text{-}CH_2\text{-}OH$ xylitol without a CHOH, (anti-inflammatory osmoprotectant ► CER 2015;40(7):657-67), levocarnitine (L-carnitine, antiinflammatory osmoprotectant per CER 2015), $(COONa)\text{-}CH_2\text{-}C(OH)(COONa)\text{-}CH_2\text{-}COONa *2H_2O$ sodium citrate dihydrate a food additive). Borate and boric are for pH buffer and antibiotic activity. However, borates are quite toxic, so it's better to use an almost identical product using lactate buffer & HA: Refresh Relieva UD PF. (see drop #17). Seems safer/better than many brands at RiteAid, I used these drops and they're a little *viscous*. However, Refresh Optive & Celluvisc caused my eyelids to swell often and are less comfy than other brands (Celluvisc is super annoying); irritation is probably because of CMC, since glycerin drops always work fine, as well as borate buffer ones. Optive forms a sticky film sometimes on our cornea that takes a while to wash off, so I stopped using it. Perhaps CMC reacts also with ointments, drops we use, but it usually happens when I use Refresh alone. Celluvisc is bad too, it dries on eyelids and eyelash roots, trapping bacteria there. Refresh Optive has an irritating sandy feeling no other drop has due to CMC/glycerin, so I returned it. ☺☺☺

36). Refresh Celluvisc (*$13 Amazon, 20$ CVS*, 30 plastic vials, *0.4 mL each*, so 12 mL total, contains: H_2O, NaCl, $CaCl_2$,(Ca drops can form eye stones, so I returned (too sticky, red eyes) & avoid Celluvisc) KCl, sodium lactate *humectant and moisturizer, $CH_3\text{-}CH(OH)\text{-}(C{=}O)O\text{-}Na$, a food and shampoo additive, 1% carboxymethylcellulose (active ingredient)*. ☺

Both Refresh Celluvisc and Optive have more lubricant (0.9% and 1.4%) than the cheapest [with NaOH/HCl] Refresh, CVS brands (0.5%), which helps to prevent tear evaporation and lubricate better. However, most people will be shocked at how thick (and sometimes irritating because of that) Celluvisc is (hence they call it gel), for just having a 0.5% extra lubricant, that they need to learn how to properly place eye drop in the eye so they don't place it outside; otherwise, the sticky drop around eyelid dries out and forms wrinkles if not washed right away with water; check your eyes in the mirror 3-5 minutes after you had these Celluvisc thicker eyedrops and wash the area if any was spilled outside the eye itself. *Refresh Optive is less thick than Celluvisc*, even if it has 40% more lubricant, and has different chemical contents. I don't suggest Celluvisc for first time users of unpreserved drops, unless you already tried many drops and are used to gel like drops, since you need more patience to let it clear the surface (can cause a slight blur). *Celluvisc* has fewer ingredients than Optive though, so some may love it. ☺☺☺

37). $12 Oculocin ebay (many nations, sellers) ($28 on Amazon for *10 mL*, expires *in 3* months, special bottle like Hylo Care, no preservatives needed, made in EU, Lithuania, origmed.com, contains: NaCl, glycerin, aloe vera extract, chamomile extract, propolis extract, boric acid H_3BO_3, sodium tetraborate $[Na{\bullet}(H_2O)_n]^+_2\ [B_4O_5(OH)_4]^{2-}$ (or borax), disodium EDTA. The borate buffer, EDTA can damage cells, irritate eyes, so discontinue if discomfort arises. The tetraborate listed on Amazon refers to borax probably, not to the toxic sodium perborate $Na_2[B_2O_4(OH)_4]$ (the

infamous DeQUEST preservative) or $NaBO_3 \cdot nH_2O$ or $[NaBO_3 \cdot H_2O]_2$. The boric-borax buffer is also in Hylo Fresh & Hylo Dual, Dual intensive. Hylo drops use citrate buffer, except Fresh, Dual, Dual intensive. The buffer section explains borate is sort of a 'preservative', so some may dislike Oculocin and 100s of borate drops.☺☺☺

38). Optimel (*21$ on Amazon, 10 mL*, or 12$ on ebay, is Manuka honey drops, rest is glycerin 0.2%, gum arabic, water (water not purified or for injection, package says sterile melcare.com): expires *in 2* months *once open*, proprietary medical grade honey, Australia made. It's much more watery than Refresh Optive, Hylo Gel, so maybe 10% honey, with the honey used being "98% purity" as label says, rest being glycerin, gum arabic (eye irritant, toxic, may contribute to its strong sting, besides ultra low pH), water. *Its pH,* with 2 pH papers, is ►►4.0◄◄, lowest of any drop ever, so definitely *be ready with saline before and after to dilute it* and don't blink much because it will sting and expose cornea to more acid. Manuka honey is reported in 100s of papers to have pH 3.5-4.5, just like regular honey, so 4.0 is not surprising. It stings like hell, 20 *times more than the 2nd stingiest drop;* I used 1 drop, 1 eye, returned it. It's the most acidic drop, the most toxic pH wise, it disturbs homeostasis too much, makes *every arteriole much thicker thank any drop* in 3 minutes. However, it may work to use on eyelids as antibiotic, wash it off with shower water in 1 minute or so (this method doesn't cause any sting as it doesn't get into the eye), otherwise, this is a NO NO, *stay away* unless you use plenty of saline before and after and monitor arterioles at 20x 3 times daily to make sure no redness develops that doesn't go away within 8 *hrs*. Honey is antimicrobial. Cornea 2006;25(9): 1012-9 says bacterial count (CFU) for dry eye patients is higher, due to water evaporating, bacteria not being flushed fully. After 3 months of using honey drops, the patient CFU level returned to normal, what a joke, but they forgot to say the patient eye redness went up 5 times too, new arterioles becoming permanent. *When an arteriole is thick, use cold compress 4 times within 20 hours, otherwise,* it may remain dilated permanently; the more often you use any drop that reddens eye within 3 minutes a lot, the redder the eye becomes, but since it's gradual and redness doesn't vanish fully. At 1x you won't notice it, only at 20x; that's why you need watch at 20x before you use any drop 1st time. We got pain nerve receptors for a reason, to alert us it's not good. Honey can have bee pollen, which itself is full of bacteria, fungi, viruses. An odd testimonial is at the manufacturer, no biomarker data shown. Be very skeptical, only 1 youtube subscriber in 2023. An OD made a 7 min Optimel video that reported the same hell like stinging (OD didn't use 20x mirror to see how bad it is). A 2nd OD liked it in an 8 min video, possibly because he has contacts and used so many drops his nerve fibers have been destroyed, no longer sensing the sting that much as it happens with a lot of artificial tears that contain nerve killing sorbitol, menthol, etc. Manuka is 10 times more expensive, contains 100 times more methylglyoxal, a compound that forms free radicals, AGEs that destroy the ocular surface, as shown at EBCAM 2011:295494. Since ODs promote this,

read on AGEs. A company could add methylglyoxal to 20 kg honey, resell it to make 900% profit, since it passes the "glyoxal test" in these CNN TV programs. It's a nonselective destructive chemical, like many antimicrobials that damage cornea, while attacking microbes. Manuka is not the cure all elixir, only a clever marketing by the New Zealand company making it.☺☺☺

39-42). Thealoz (ebay) (got an Amazon one, trashed it due to itch and no emails answered by the company ever) (*15$ on ebay, 10 mL*, 209 mOsm/L, pH 7.1 (HA MW 230K, very low) (6.95 my papers), expires in 3 months, the UK site explains Thealoz Duo got 0.15% HA, Tris + HCl buffer, NaCl, 3% trehalose, being *free from sorbitol*. Thealoz is the same as CVS Ivizia, same ingredients, made for Similisan in France by Thea as the bottle indicates and NIH confirms, same exact bottle as Thealoz, except it contains 0.5% povidone and less trehalose (maybe 20-30% less) or NaCl to reach a similar osmolarity, expires 90 days after opening, CVS 17$/5 mL, returnable vs Amazon $8/5 mL, or $12/10 mL non-returnable unless issue exists. Ivizia Thealoz equivalent is more acidic, about 6.6 pH, and burns eyes due to acidity or povidone pyrrolidine, or high Tris concentration, Tris being like an ammonia salt, so sort of like the feeling of window cleaner smell irritating eyes. You will notice that the eye is different, after Ivizia, when you use saline, it burns more right after this Ivizia. Tris is not a very natural buffer, vs bicarbonate, citrate, etc. Ivizia seems worse than Thealoz, perhaps it's due to replacing trehalose with povidone, etc. *However, Ivizia has a huge drop, like Thea, so that causes issues for people who need smaller drops, since with small drops, you can put 2 if needed, but you can't put half. Ivizia is very watery, so will swell eyelids less than other drops.* The Thealoz gel got carbopol, sorbitol (issue?), 3$ trehalose, 0.15% HA, NaOH instead of buffer; thealoz gel is almost identical in ingredients to Ivizia gel (by Thea, distributed by Similasan) with carbopol, sorbitol, trehalose, NaOH, low MW HA and no buffer. The reason Thea sells Thealoz as Ivizia in USA and adds povidone 0.5% (povidone, *without iodine, is a lubricant used in 15+ drops, such as Bausch Soothe, Refresh Classic, and many contact lens wetting agents (Bausch etc), etc*) to Thealoz Gel ingredients, is that the FDA doesn't allow HA to be the only lubricant listed, so even though HA is at 0.15%, they will list it without concentration as an inactive ingredient. This allows Thea to sell Thealoz to the US market. Wikipedia explains there may be some lung injury due to this thing if we inhale some of it when we swallow it or if a swallowing of tears gets some into the lung, and some may have allergic response to it, so avoid Ivizia if any allergy or redness appear. This is not a natural lubricant, like glycerin, so beware it may be very bad for some people, being used as adhesive component and being a polar compound able to interact with many of the 2100 eye chemicals, interfering with the ocular tear film normal function.☺☺ Duo has a very strong seal (plastic for the botle cap, unlike Hylo taped box), made by Thea French company with 276 employees, $0.4 billion in sales, that has been doing eyedrops for 150 years and also makes the famous "Blephasteam" goggles. Thea has a 66 page PDF about preservatives that damage eyes.

I tested Thealoz 9-6-21 1st time, after 6 hours of no other drops; almost as nice as Clear Eyes Adv, 1st 10 min, after that it started to feel weird, like Retaine MGD that also has Tris unnatural buffer – tiny sting sensations, thrice, but 5x less intense than Retaine. On 9-12-21 test, it didn't make eyes more red, after 2, 4, 15 min of eyes closed 2-4 min, open the rest, it seemed to diminish redness in most areas, increase it (tiny invisible as distinct at 20x arterioles, overall redness) on left nasal; 1x won't show anything usually and many drops, all good for your eyes (each eye is allergic to something) drops diminish redness in all areas on 20x mirror. 9-16-21, iris nearby area became red 2 minutes after and left caruncle 20 second mild itch. Some MDs love Thealoz due to being hypotonic. It's hypotonic, since it has the same sensation like Vismed 154 mOsm/L, but much less intense, due to being less hypotonic; it also has a grainy feeling, sandy, that makes you feel like it's abrasive and eyelid scratches cornea, sort of like Refresh Optive, Celluvisc and CMC drops do. Thea also makes Hyabak, which is Thealoz Duo with trehalose replaced by actinoquinol. However, Hyabak in 2006 had high 11 mM phosphate (Table 3), which raise doubts about Thea's researchers, but now they use Tris. EJO 2017;27(1):1-9 says trehalose+HA is better than HA alone, but the author is part of Thea. See Thea 3 min bottle video (& 4 min on the 30 µL drop and 0.2 µm micron filters for the drops and the air), as well as the 3 min video on the effects of BAK preservative on the tear film. HA MW< 300KDa is known to be *inflammatory*, even though it's less viscous. Our body as HA MW is 4-10 million, not 200K; in epithelial repair low MW HA can cause excessive inflammation, new arterioles, creating red eyes. It may be useful in some cases to provide a low MW HA to get a different response, but I'm skeptical of a company that provides so little info and where we need to dig in PubMed to find out MW of HA. Tris buffer is not in the eyes, has its own issues. They compared Thealoz with eyedrops containing toxic preservatives, Thealoz in vitro helped maintain cornea cell viability way better than the drops after 5, 15, 30, 45 minutes ► BRI 2014:292139. *At 30 min* saline *solution in* vitro *cell viability was* 0% *while* Thealoz *was 52%*. In vivo, it may be better, as long as the irritation and other effects are not worse than the benefits for the eye overall. What people forget is that, in *vivo*, we have maybe a half tear with 2100 nutrients that needs some water and that tear, diluted and imperfect, is way better than any man made tear with Tris + 4 chemicals. That's why often, eyes respond far better to saline alone in vivo, for me at least. ☺☺

43-44). Optase Hylo Relief: 1 day ship, 25$, pH 7.2, 0.25% *glycerin* (ultra common safe lubricant that many tolerate, as our body is full of it, but it can cause eyelid swelling in some people, for me, all drops with glycerin swell the eyelid), 0.15% HMW HA (Optase said so and I believe it since it's viscosity is between Hylo-Tear & Hylo Gel), borate buffer, borax, citrate buffer, salt, water. It uses the much easier to use with the eye guide great Hylo bottle (totally superior to the Aptar bottle used by 100s of eyedrops, including Biotrue, Optase MGD) and *has no phosphate, no sorbitol, no toxic preservatives, no irritating B_5, no ectoine,* released in April 2023, made by

UrsaPharma, Germany, so it replaced all Hylo products I used before for 6 months. You may think bottle doesn't matter, but it makes the difference between heaven and hell for some. For example, with the poorly designed dropper (designed in USA probably, since a US company makes the bottle) of Finland made Optase MGD, even with eye guide, it's hard to get it right and it splashes over the eyelid, then you need wash everything on eyelids away, can cause styes at eyelash base if it dries. I don't like pulling eyelid and touching so close with fingers to eyes so often, so a good bottle is key for me and others. Hylo Relief may work for a lot of people afraid of sorbitol. Not only that, but Hylo Gel or Hylo Forte, as UK calls it, can be a little irritating, due to high citrate. Hylo Dual has too much ectoine, which may cause issues in some, so ***HYLO RELIEF works as a savior, and possibly the safest nonsaline drop in US and EU in 2023***. If citrate doesn't irritate you but borax and boric irritate you, use the Allegro, the France made (paper insert says France, Amazon wrongly says Germany) ectoine 2% with citric acid and 0.35% hydroxylethyl cellulose, which has PEG (allergen). For people with irritated eyelids, who don't tolerate sticky drops, this could be better. It's always safer to try different drops, alternate, since that way, if in 100 years we discover an ingredient is toxic, we're OK. Hylo Relief may contain staph bacteria that give tiny (visible at 20x mirror only) typical yellow staph styes, since there was a correlation between the appearance of such tiny styes and the use of this drop within 24 h.☺☺☺

45). Optase Dry Eye ($25, 10 mL, 3 months, 0.2% glycerin, unknown % high MW HA, sorbitol (issue?), Tris+HCl (buffer), H_2O) sold by ScopeEyeCare UK, 38 million in sales, 62 employees, the same guys that sell Hylo. Scope Ireland 36 million sales, 10 employees. Optase is made in France, manufacturer unknown. pH 7.0-7.4 per company, pH paper shows 6.8. It's also at US Walgreens. I tried the drop and it's pleasant, surprised a Tris buffer drop can be so pleasant, compared to other drops. When eyes are tired, it is not so pleasant (no drop pleasant always when tired), but OK usually, so I returned it due to low pH and occasional irritation; ***has a huge sorbitol level***, so that's a red flag as that permeates cornea easier in the presence of high MW hyaluronate.

46). Refresh Relieva PF Single Vials $17/12mL has the same active/inactive ingredients as ***Refresh Optive*** drop # 8, except that it replaces the toxic borate buffer with the human tear like lactate buffer; however, the pH is 6.25-6.5 so I returned it, not 7.4 of Optive, being useless for most people with tear pH around 7.4; good for those 5% with very acidic tears though. First time I tried these, they were causing odd itching in one eye and a granular uncomfortable feeling (compared to Hylo Gel) in both. Customer service by phone as usual, avoided sharing pH when asked (it's already in pubmed papers for Plus anyway, and anyone can get a pH paper) before buying it, after being 30 minutes on the phone or days, they never answer except stuff you find on box label. Emails are never answered either; compared that with 10 emails, long ones from Hylo. Please don't confuse single vials with the preserved multi-dose bottle of Refresh Relieva $15/10 mL that says "it may have HCl or NaOH" for optimal pH, so basically a little borate

becomes boric acid or boric acid becomes borate. OVS 2009;86(2):E132-8 found dry eye patients tears had 3.27 µmol/L L-carnitine vs 8.94 in healthy tears; association is not causation, but dry eyes may be caused by something that lowers carnitine levels in tears, if such findings can be replicated for millions of patients. CO 2020;14:2951-63 found "Greater reduction of overall ocular pain/discomfort was reported in subjects using CMC-HA (hyaluronate) versus CMC (Refresh Optive)". CMC-HA is *Optive Fusion Unit Dose (UD) (ingredients as in Optive, glycerin 1%, erythritol 0.5%, plus 0.1%* HA (MW 1.178×10^6, pg 111*), sodium lactate, no borate buffer).* $20 Amazon, $10 shipping *(Optive Fusion with Purite preservative, Amazon US has no* Optive Fusion UD*, google "*Optive Fusion UD*" to see if in your area);* Allergan makes all Refresh products in US without HA (except $14/10mL Refresh Relieva MD (Multi-Dose) PF HA <0.1% with *borate* buffer and this new *Refresh Relieva PF single use vials*, HA < 0.1% with *lactic* buffer). Amazon UK Optive Fusion UD is better than Refresh Relieva UD PF due to more HA. Relieva PF UD is *better* than Optive for MGD, for low pH tear folks, since it contains hyaluronate of the MGs, HydroCell tech to maintain volume of cell, hydrate cell without NaCl, being hypotonic. In a small, doubtful *study (author Allergan links)*, "*CMC* & HA was found to be more effective in ... dry eye than eyedrops containing either ingredient alone" ► CO 2019;13:1011-7. ☺☺☺

47). Refresh Plus ($*53*, 200 vials, *80* mL, the best deal, or $9.2, 30 vials, 12 mL to try them, 6 of these are *72* ml for *52*$ if you subscribe, $55 otherwise, you get free 8 mL with 200 vials): same ingredients as *Refresh Celluvisc*, but much easier to use, not viscous, just like normal tears: CMC is 0.5% (1% Celluvisc), "may contain NaOH/HCl": 0.5% *CMC*, NaCl, KCl, $MgCl_2$, $CaCl_2$, (Ca drops can form eye stones), Na lactate. It has a pH of 6.5 ► MV 2018;24:305-14. HCl reacts with lactate to form lactic acid and this gives us lactic buffer. Refresh is made in USA. Refresh is the # 1 US brand in *unpreserved* sales. Everyone copies their formula: CVS, Family Care, etc. If you like these ingredients, buy *Refresh Plus*, not CVS or Family Care, since Refresh got way better caps, can reuse same day 1-4 hr later or even 8, drops come out easier too, so it *ends up being way cheaper than CVS, Family Care since you get 3 times the use of a vial*. Family Care is even at dollar stores unpreserved, 5 vials for 1$, so 50% cheaper than Refresh, but I took pH and it's even worse than Refresh Plus, 6.0, not 6.5, so it will be useless. *Refresh Plus* is basically by far the cheapest good unpreserved drop when buying 30+ vials. They "have a pH of *6.5* (too acidic for *most*) and an osmolarity of 276" ► CO 2019;13:1011-7. Try other Refresh drops for higher pH. I tried a CVS brand identical to this in ingredients and pH probably too (forgot take pH on CVS) and it has that acidic feel to it that causes discomfort. Refresh Plus is for mild dry eye, and those with acidic tear pH (*a minority of people*), no allergy to man made *CMC* and no severe dry eye.☺☺ Since I'm allergic to CMC and pH was 6.5 (my tears are 7.3), as in the paper above, I did the Amazon return procedure on 3-12-2021; I got full instant refund without returning it. I chose 'item doesn't work', writing "expires in 3 months, not 1-1.5 year, has acidic pH". I was quite

disappointed by the fact it did not whiten the eyes like other unpreserved drops did. Refresh gives free Amazon returns without having to return on some tears, *so people* try *tears that expire soon*. As tears reach expiration date, polymeric lubricants (CMC, HPMC, PEG 400) degrade; byproducts from them or preservatives (PHMB) can damage the ocular surface. Many are allergic to synthetic CMC not found in human eyes, so I suggest Allergan replace CMC with glycerin or HA like others did, bring pH to 7.3, to match that of most people; otherwise many will have issues, discard most (27 out of 30 for me, since nobody wants vials that expire in 3 months and acidic drops will damage most eyes) unused vials, as I did 3-25-2021, to avoid eye damage due to Refresh tears with 10 times more H^+ than eyes are used to. Not all Refresh products have this damaging pH. Optive, etc have good pH, 7.3, for most eyes, but Optive, etc got other issues.

48). GenTeal by Alcon (*30$*/72 vials): moderate dry eye, 0.1% dextran 70, 0.3% hypromellose 2910, KCl, NaCl, borate buffer, pH *6.9*. Cheap. Lasts *1.5 years*. Vials can be recapped to use 3 hrs later. These tears are not thick, don't have sorbitol or calcium, magnesium, phosphate, other problematic compounds. However, they cause eyelid swelling sometimes, like many other drops, unlike saline solution which never does. Several times over 5 months, using them before going to bed caused the eyes to produce extra thick mucus and to become red upon waking up 3-5 hours later, due to the strong reaction to the acidic pH and other irritants, since going to bed late means pH is way more alkaline; perhaps, it's safer to use only during the day, not 1 hour before bed, but again everyone is allergic to different things. Due to eyelid swelling, I discarded them after 7 months, having used only about half. GenTeal preserved has pH *7.4*, PolyQuad if you want to use it rarely to disinfect eyes (ask doctor for antibiotic drops for real disinfection) more than you can with unpreserved drops *(boric, citric and many ingredients in unpreserved are also disinfectants, but weaker).* GenTeal preserved has 0.2% glycerin as extra lubricant and extra inactive ingredients: $CaCl_2$, (see issue), polysorbate 80 (bad), glycine (amino acid, useful), plus $MgCl_2$, $ZnCl_2$. Made in France. GenTeal unpreserved is much more pleasant and safer, so can be used 30 times more often. I almost never use preserved, especially since I got free antibiotic drops (some details here) from the insurance that disinfect even better than preserved drops.

49-52). iGel by Agepha ($15, lasts 6 months, preservative-free 10 mL bottle, got *Tris* (same as trometamol), 0.2% HA, NaCl. They add either NaOH or HCl to the eyedrops to adjust pH, per i.com CEO, but Agepha didn't mention that on their ingredients list or bottle; perhaps in Germany, when they write "trometamol" it means "Tris-HCl" buffer, but other products in EU mention when NaOH is added, such as Agepha other products. I don't recommend these drops, but include them here due to discussing high MW HA. Agepha (from Age & Pharma) is in Senec, Slovakia, founded in 1947 in Austria (Austria is 20 miles from Senec). Listed as a $8 million sales company, 2 employees. It may be a distributor with more part-time independent sales people, so maybe 20 as per other databases, but only 2 salaried. It subcontracted to i.com Germany

company, which has 1 salary employee, or maybe 3 part-time, so drops are made in Munich, Germany as the box says (box has Dutch, German and English). The Slovak distributor relabeled i.com Comfort Tears like (HA MW 2 million) HA product as vitamin companies do in USA, so the "i.com medical GmbH, KaflerstraBe 15 81241 Munich, Germany" and Agepha Slovak address are both listed on the box (different areas). See the blog of the CEO (physics PhD in 1977) who formulated this HA drop and authored 24 papers, his recent papers (32 pages) Diag 2020, 10(8):511, *cornea nerve growth* via Comfort Shield was 51%, and 0% for other tear brands ► JCM 2020;9(12):3799 & JCM 2020;9(11):3536. Comfort *Shield* is a drop they make using the 1.2 mM phosphate buffer (*safer level, slightly below natural eye level, no other ingredients*) and HA with *MW* > 3 million (most eyedrops got 0.7-2 million). His HA has an 11 sec video on youtube on even distribution, 38 sec clip on viscoelasticity of HA with MW 6 times greater than Thealoz. Comfort *Shield sounds* like the most natural I read about (see Hyaluronic Symposium video with i.com CEO), but need find online store that ships fast outside EU. Even the Russian Ministry of Health has approved Comfort Shield (not iGel). ☺☺☺

The papers explain the CEO of i.com sells this high *molecular weight MW* HA. These papers are his promoting his products, so it's not clear how objective they are; i.com has many videos explaining the difference between HA brands, inflammatory short-chain, neutral medium chain, antiinflammatory very long chain, 2-3 million. HA inside our body can reach MW 20 million. I include iGel here to help people understand not all companies have the same ethics (recall Retaine MGD), *when it comes* to listing ingredients, some may list "Tris-HCl" as Tris or trometamol (people may think it has no "harsh HCl"). The websites of i.com, Agepha, many Amazon brands lack videos of manufacturing, facilities, professional web design, it's safer to use multi-decade established brands with huge sales that have better quality, so you get what the label says, not 1% of it. However, spies can replace the contents of even the best eyedrops or put odd stuff in eyedrops; spies can create fake papers and convince anyone odd ingredients/devices are best, if even present. Agepha never returns any emails, only the CEO of the manufacturer did (and gave conflicting info). I returned drops right after I got them, since I could not trust they contain what was written on the label. However, the CEO of i.com replied to 10 of my emails and sent me a total of 7 emails with PDFs. Most companies only reply once. Company claims pH is 7.3, but it seemed 6, so I returned it. Agepha website lists Raib Khan as author of some articles, perhaps i.com made the drops in 2020, but the CEO doesn't want to admit to it. Agepha also got Ocusan, made in Slovakia by Agepha, resealable, 10 mL *(20 vials of 0.5 mL, 0.20%* HA*, NaCl, Na_2HPO_4, NaH_2PO_4 – unknown PO_4 concentration), this may be a better product* if phopshate ≤ 1.5 mmol/L. *The PO_4* and NaCl are not listed as ingredients on Amazon, only HA, though the Amazon box picture clearly shows it contains *PO_4 and NaCl.* We can return Amazon Ocusan for free, like iGel. Ocusan, pH 6.5, has the best single use vials, with perfect

reseal; they say you can reuse within 12 hours. They also package well each set of 5 vials into a sealed bag, like Boiron, Mega-3. I did not use them, even if it has no toxic Tris since PO_4 may be high: Agepha facebook has no real followers. The only youtube on Agepha was the one of the Arshad Qureshi head of ecommerce. They had 2 sales people in Dubai. Are ingredients for Agepha and other brands from non-EU nations, just assembled in Slovakia or EU to sell it as "made in EU" at a higher price? iGel, Comfort Shield, *or* Ocusan may work for folks with naturally more acidic tear pH. Research more.

53-56). farmigea.it also has a big list of their many (Pure got plant extracts only, amazing, it's like Bausch plant extracts eyedrops mentioned later in the B12 drops section) HA drops, sold via various UK, etc sites online (google it) like HydraMed (0.2% HA, citric buffer, mannitol, 0.2% TSP – Hydramed Forte is same as HydraMed, except 0.4% HA – high MW HA both, mannitol is safer than sorbitol? It's an osmotic diuretic used intravenously at high doses to lower ocular pressure by drawing liquid from the aqueous humor, from eyes. Mannitol can also crystallize at 20% concentration, so if someone has punctal plugs and uses mannitol eyedrops and temp goes below 20°C during cold compress or shower and it's concentrating, they may form crystals that scratch the cornea or even deeper eye structures if it gets there and accumulates in a cellular compartment in high concentration; since it's C2 stereoisomer of sorbitol, we need pay attention with sorbitol, sugar containing drops too). They got Cellusan (1% CMC, lactic buffer, KCl, NaCl, CaCl2 issue?), Cellusan Light is same, except CMC 0.5%, same ingredients as Refresh Plus, different amounts of electrolytes/buffer.

11.17.3.8. The 19 (11 USA & 8 EU) ► LIPID ◄ Enriched Drops to aid all 3 layers of tears:

Please do 20x mirror tests before using any drop/ointment, especially if used during nap/sleep:

The 11 USA LIPID (L for *Lipid*) Enriched Drops:

► L.1.1. Systane Balanced/L.1.2. Complete same tear, except Complete has nanodrops of mineral oil and phospholipids to better cover lipid layer holes with HPguar, released 2018, 8 years after Balance; toxic *polyquad* 0.001% *preservative*. Complete is the latest version of Balanced.

► L.2 Rohto Dry Aid has *3 preservatives:* PAPB, menthol, toxic EDTA

► L.3 Soothe XP PF & Soothe XP has toxic EDTA, *PF* has no *polyquad*

► L.4 Clear Eyes Advanced has PHMB *preservative*, phospholipids

► L.5.1. Refresh Mega-3, L.5.2. Advanced & L.5.3. Digital: all 3 are very similar, got boric, NaOH, glycerin, erythritol, synthetic bad CMC polysorbate 80 lubricants, levocarnitine, castor oil (ω6:3 ratio 3:1, like Rohto, see issues here); *Digital has HydroCell tech; Advanced got carbomer*; Mega-3 got 5 extras: BHT food *preservative*, flax oil (with cyanogenic glycosides?) + 2 surfactants). All 8 USA lipid drops above use borate buffer, at 5000+x > natural tears, except for

the last 3:☺☺☺

► L.6 Retaine MGD has Tris buffer & toxic BAK component cetalkonium chloride preservative
► L.7 Optase Spray has citrate + Tris mix buffer plus Sea Buckthorn Seed Oil, polysorbate 80
► L.8 Optase MGD has citrate + Tris mix buffer plus Sacha Inchi Seed Oil ω6:3 ratio 1:1, L7 & 8 got polysorbate 80 lubricant, which kills 30% cornea cells in vitro

► The 8 EU lipid Drops are here ►► L.9 thru L.14. 6 pages later, right after L.8 ends ◄◄

There are also "Liposomal sprays are simply applied onto the outside of the lids, and the polar phospholipids diffuse from the lid surface to the tear film" ► JOPT 2017;33(9):647-61. If lipid drops don't work, recall HA drops can increase lipid layer thickness too (pdf page 61). Vismed EPA-DHA drops need to be stored at 2-8°C, otherwise they expires in 3 months; this is ideal for the 4 US drops (Rohto & the 3 Refresh) with 4 major unsaturated (less stable) fatty acids: ALA, LA, oleic, ricinoleic acid (due to castor oil they contain). DHA has 6 double bonds, EPA 5, ALA 3 the ω3 in flax (53%)/sesame (0.3%) /castor(1%) oil, LA 2 bonds the ω6 in flax(14%)/ sesame(41%)/ castor (3%), oleic in flax (18%)/ sesame(39%) /castor(4%) & ricinoleic acid in castor (90%) oil 1 double bond. The more double bonds, the less stable acids are, hence most companies avoid flax/EPA-DHA; Mega-3 uses BHT preservative to prevent flax spoilage, Rohto menthol/EDTA to prevent sesame spoilage, while claiming to be preservative free. All unsaturated fats need darkness, < 10-15°C for minimal degradation.☺☺☺ Soothe, Systane, Clear use saturated phospholipids/hydrocarbons to avoid issues. Thus, ointments with mineral oil (all are pharmaceutical grade)/petrolatum only (no reactive polyphenols, inflammatory ω3/6 ratio 1:8 wheat germ oil (Stye ointment) or reactive lanolin alcohols and esters or plant extracts) have way fewer oxidative stress inducing compounds formed due to cross-reacting.

ALTERNATIVE To Today's *Toxic* LIPID DROPS: *Ointments* & Moving Beyond *the Stone* age:

The eye ointments use 50x-300x more lipids than in lipid drops and are toxic too. The hope is that some day, we will have a much better eye drop with 100 natural tear ingredients, not just a few. Today we got to buy 30 eyedrops to get basic nutrients that we may need. We make a big deal about varicose veins in our cultures, but when our eyes get red on 20x mirror we don't notice it for 3 decades, and when we notice it, it's already so bad, that even at 1x we see veins. We call this 'normal aging', but it doesn't have to be, our eyes can be like a 30 year old when we're 70, if we hope to live to 120 on average some day. Our ocular health standards and practices are minimal. Likewise, instead of having to eat 900 chariot age foods, we can have eterni powder dissolved in water that has nutrients from 900 foods and saves time. We have 100s of toxic candy brands, etc, & 6 main US types of eyedrops, with lipids, needed by 86% of the half billion people with dry eyes who have some degree of lipid deficiency in their tears. 1-3

billion people, besides the 0.5, have undetected ultra mild dry eye, so subtle it causes red veins that our cultures take as 'normal after age 20'. Are varicose veins normal? No. Why in the eyes? Without wrap around sunglasses and clear glasses when outside or in AC buildings with draft, etc, eyes need tons of moisture when exposed to plenty of wind and dust to clear the junk that causes enormous oxidative stress and aging, redness. That oxidative stress damages the MGs (42% kids, 72% adults have damage), so most adults have potential dry eye, but it's so subtle, that it won't be felt for 30 years, but it starts very mild, nothing is felt.

►► L.1. *2018 released toxic* preserved $10.5/10ml Systane Complete, $20/20 ml unpreserved Systane Complete (new 2021 product, same ingredients as 2018), *the 2010 released toxic preserved* $10 Systane Balance (pH 7.0) that nobody orders anymore, since Complete is same drop with some improvements. All 3 are made in USA, contain the allergen *PEG* (see more below), and phospholipids, which contain phosphate group, which can form tiny invisible cornea crystals leading to cloudy cornea, milky cornea, blurred vision from a distance or even big stones that require surgery. Thus, I gave it 1 star on Amazon, after the stings due to polyquad. Because Systane doesn't state phospholipid concentration or share it by email, like the EU recommends companies do for phosphate buffer for example, we take a huge risk if we use this drop every day in the long term, or even 20 times, if after a cornea invisible scratch, etc. Systane Complete contains mineral oil (you can get way more mineral oil via a very chemically inert eye ointment, without the ultra reactive additives in this). Avoid Balance, since for $1 extra you get better coverage of damaged ocular areas and lipid layer holes in Complete, due to nanodrops and exact same chemicals. 1st drop caused itch and redness in one eye☺☺☺, so I returned it and washed the drops with 0.9% saline. Perhaps too acidic (7.0 vs 7.5 my tears) or too much *PPG*, so moisture masks are better than any drops. To better understand tears with lipids, you can watch this Systane Complete video (or the Systane Balance video); Complete got nano sized dimyristoyl phosphatidylglycerol phospholipid like Refresh got flax/castor oil that replenishes the holes in the lipid layer which lead to aqueous layer evaporation: see more on it in the 3rd layer of tears.

Since it had *polyquad* preservative too, I *avoided* Systane Complete/Balance, but I tried it twice to see it stings. All Systane drops got hydroxypropyl guar or HP guar (derivative used in foods/cosmetics, deriving from guar gum polysaccharide from the guar bean legume). Clear Eyes Advanced, Hylo Dual/Hylo Fresh HA (or CMC, HPMC or other polysaccharides in other drops) and *boric* form probably a similar bandage over damaged cornea areas like HP guar and boric acid do in Systane, HA being part of mucin layer that protects the cornea. The phosphate group in phospholipids in *Systane Balance, Complete, Clear Eyes Advanced* could react with Ca in other drops to form crystals as explained in the phosphate buffer section, so *I avoid all drops with unknown Ca, phosphate or phospholipid concentration*. I will make a detour from Systane lipid eyedrops to mention non-lipid Systane products: Systane unpreserved vials can be recapped

perfectly (better than Refresh), you can thus reuse a few hours later; Systane Original *(can't return them on Amazon) are one of the only 2 unpreserved drops (the other one being the much safer* Bion Tears*) with zinc (but both got calcium too;* Ca drops can form eye stones*), but contain the toxic boric,* toxic 0.3% *PPG*, allergenic 0.4% PEG 400 like all Systane drops do*, so if you use Systane* Original unpreserved *(safest Systane tear, only one I used 8 times before trashing them 3-25-2021 due to side effects, and* even eyes getting considerably redder *on* 20x mirror one day after 30 min of use with closed eyes at 4 pm*) for* zinc*, (though* Bion Tears is much safer*), once/week max may be safer; after only 30 min, I noticed eyes became redder when I used Systane Original (3-11 & 3-24-2021). The floaters became more visible, a slight blur existed, but far less than the Refresh Mega-3 effects on floater/blur.* Systane Original is uniquely bad*, unlike any other non-Systane drop, it sometimes (*when you keep eyes closed 25+ minutes after, not just 4 minutes, so its damaging effects are visible, so definitely, with any new drop, don't try them at night, since it stays for hours on the eyes; use 0.9% saline right after a bad drop to wash*) causes a slight headache, probably due to the blur effect (PPG & PEG 400 caused) that has same effect as looking thru a wrong* diopter *eyeglass or magnifying lens.* *PPG* *is a popular lubricant in many drops:* 0.25% Blink Tears, 0.6% in Bausch Lubricant PF (Bausch also contains hydroxy alkyl phosphonate which can damage the mucin layer). *PPG* is *teratogenic, allergenic* reportedly (perhaps at higher concentration than we get from drops). *Why is PPG toxic?* It*'s* on the Canada list of expected to be toxic substances, suspected of killing neurons (in the eye too?) if used long-term or at least oxidative stress. Even NIH admits that PPG irritates the eyes and it causes eye dryness, so after eyedrops are placed, water evaporates and *PPG* (found in many face and hand creams) may remain in some cells to suck water from the eye, cause more local dryness (like redness relievers which cause rebound redness, this is rebound dryness); Health Canada categorized *PPG* as a "moderate human health priority"; it causes allergic reactions in some. ☺☺

*Systane Ultra (*CO 2021;15:2421-35 *has more info on Systane molecular mechanisms: "free of preservatives… Systane Ultra (pH 7.9, unpreserved), (made in France like many Systane), is higher than ...Systane Original (pH 7.0).";* pH 7.9 in the preserved bottle (unpreserved is 7.9 too): COhal 2011;5:783-90*) & Hydration got aminomethyl propanol (*which can form carcinogenic nitrosamines *and is similar to* Tris which reduces cell viability*);* Systane Hydration *has* low *432K (read* paper *to see pH 7.9 and how they deduced 423K), pH 7.9 ideal for the 3% of people with pH 7.7-8.0 since no other unpreserved drop in US I know of has such high pH) MW* HA *(*inflammation causing*); Systane Hydration is basically same 7.9 pH as Ultra in contents, except it contains some 432K low MW* HA *to hydrate better and raise inflammation, so I would try* Ultra (returnable) *first if my tear pH was 7.9 perhaps, before jumping to Hydration which may be worse.* I noticed Systane Original is much better than Refresh Plus at removing redness (when it worked, not always), due to higher pH, better hydration and more viscosity, but unlike many drops, it has a

slight blur effect of 5 minutes (far less than Mega-3) due to PEG 400, *PPG*. How *safe* is PEG 400? Rashes, eczema, can happen due to topical ointments with PEG. When using oral PEG at much higher concentrations for colonoscopy, allergic reactions can become fatal events due to anaphylactic shock ► IR 2015;13(1):90-4. Death from anaphylactic shock happens, which is unacceptable in a Civilization of Immortals ► AACI 2016;12:67. Severe eczema can emerge within 12 hours of using certain cosmetic products with PEG ► ADV 2013;140(8-9):528-30. PEG is in foods, vitamins, vaccines. A PEGylated lipid (ALC-0159 in Pfizer, DMG-PEG-2000 in Moderna) exists in COVID19 vaccines; Canada issued warning, yet I got no bad Pfizer effects. However, the Johnson vaccine, with less side effects reported, also uses eye drop allergenic compounds, such as polysorbate-80 and HBCD, plus uses "fetal aborted cells" during production (like many vaccines everyone gives their kids, they all use mostly PER.C6 1985 abortion immortalized retinal cells (Johnson) and HEK-292 1973 abortion, 2 abortions). *All Systane drops got synthetic HP guar, PPG and PEG 400, so they all will irritate many eyes most likely, not just Systane Original.*☺☺☺

►► L.2. $20/30x0.5ml Rohto Dry Aid *unpreserved* (released *2022*), pH 6.3-6.4, too acidic for most people, OK to use rarely. Using it often causes eye redness; it also has a similar effect to the bacitracin-polymixin B ointment (see the antibiotic section), it makes the eyelid skin rougher, instead of smooth, due to the menthol probably (it causes keratinization of the meibomian gland orifice and the eyelid by activating the pathway for that). Due to this I only use it once a month usually, as a sort of mini-antibiotic, since menthol is that. It's a clear liquid, no blur or floaters, no thickness; the main drawback is the acidity and pain neuron sensing nerve fibers may be damaged; each 5 vials are in a sachet to prevent contamination; all 6 sachets are in a shiny metallic silver purple box that blocks light better, that's a plus to keep oils stable, they need make sachets opaque too to prevent sesame/castor oil oxidation, plastic leaching and reactions, like Mega3, Knoxzy got opaque sachets; Rohto has *menthol which hides other sensations and is actually a preservative*/antibiotic (good for those with styes or MGD *sometimes*, as MGD can be caused by bacteria infecting meibum glands not just chemicals in makeup, eyedrops, ointments, hormones, and studies show daily antibiotic for 2 to 6 months led to disappearance of dry eye) in addition to the PAPB preservative in the 2017 preserved version, but may work (twice/week?) for those with more acidic pH (use maybe some more alkaline drop 20 min before) and who tolerate *PPG* at 0.3% and *povidone* 0.68% (which may create adducts with various molecules, not just iodine, and is not in natural tears). Discarded it: has boric buffer, $CaCl_2$, (Ca can form eye stones), $MgSO_4$ (eye stones risk too?), Na_2EDTA preservative, menthol, PEG-10 castor oil, poloxamer, polyoxyl stearate, sesame oil with ω6:3 ratio of 138:1, versus antiinflammatory 1:4 in Refresh Mega-3 flax oil; both Refresh Mega-3 & Rohto got castor oil (Rohto as PEG-10 complex), but Mega-3 got flax instead of sesame. Refresh Advanced & Digital have only castor oil (90% ricinoleic, 4% oleic, 1% ω3, 3% ω6, 2% saturated); due to OH

groups of ricinoleic acid, castor oil is more polar, easier to make emulsions without 'toxic' emulsifiers. Emulsifiers can cause the fats our eye tissues are not used to, to reach areas they would not easily reach, cause chemical stress for those cells, but Rohto still has the emulsifiers.

Castor oil has ω6:3 ratio of 3:1 which is good. Castor oil, if contaminated with *ricin* or ribosome inactivating protein (a lectin with oral lethal dose 1 mg/kg) can damage our eyes and body thru systemic swallowing of tears via nasal duct. Oil is heated to destroy ricin traces after extraction. Using castor oil is only safe if purification is high and *ricin* is below 1 parts per trillion. Our eyes/bodies are not used to ricinoleic acid, so this casts doubt on *all Refresh lipid tears also*, in terms of eye inflammatory response. Due to EDTA (*binds metals of metalloproteases on ocular surface, blocking their function*), poloxamer, polyoxyl stearate (also called PEG 40 stearate, formula is $CH_3(CH_2)_{16}C(=O)\text{-}(O\text{-}CH_2\text{-}CH_2\text{-}O)_{40}\text{-}H$, also present in Mega-3 that blurs vision a little in Mega-3 but not in Rohto) emulsifier, sesame oil, *PPG*, PEG, menthol (see why it's bad: hides pain). I discarded the Rohto (1st version had preservative) and I got bubbles forming, indicating that this indeed is like a detergent or emulsifier solution, like placing soap into eyes. The unpreserved was not any better, same uncomfortable menthol sensation, etc. *I would avoid it if I were you, because it also swells the eyelids* and makes them slightly redder. ☺☺☺

►► L.3. $15/12 ml Soothe XP PF (eXtra Protection, Preservative Free) with pH 6.8-7.3 per my pH papers – fluctuating more than any other drop due to the thickest white emulsion of any drop (pH of shaken cloudy drop is 6.8 usually, the clear water on top after settling seems pH 7.25), that requires shaking before use (avoid preserved version, eyes are worth 2 extra $). Made in France. Bausch started in 1853 in USA. It has mineral oil 4.5%, light mineral oil 1% (issues here), boric, borate, toxic EDTA + polysorbate 80, octoxynol-40. Octoxynol-40 is a surfactant or emulsifier like PEG 40 stearate of Mega-3 and Systane Complete; emulsifiers create emulsions, increasing the surface area of contact between lipids and water, hence the name surfactant also; they're detergents that allow lipids/dirt from clothes to go into water and be drained; they allow lipids to mix with water, thanks to containing both nonpolar (hydrophobic) and polar (hydrophilic) fragments in their molecule; PEG 40 is $H\text{-}(O\text{-}CH_2\text{-}CH_2\text{-}O)_{40}\text{-}H$; in octoxynol, the polar part is the PEG, the nonpolar part is the final PEG group that replaces H of PEG 40, so $H\text{-}(O\text{-}CH_2\text{-}CH_2\text{-}O)_{40}\text{-}C_6H_5\text{-}C(CH_3)_2CH_2C(CH_3)_3]$; C_6H_5 is the phenyl ring; *it's possible that since* many eyes are PEG allergic, *this is what screws* Mega-3, Rohto Dry Aid, Soothe XP *eye comfort*. This is possibly what may cause floaters to be more visible too, as these things facilitate the entrance into the vitreous gel of compounds that may not be meant to be there – so don't use Soothe XP much at night, as contact time at night is 100x higher, due to us not blinking at all, versus 3-5000 times in a 8 hour while awake at least, which means washing drops fast with tears. *This is why at night we need use the least toxic drops.* These emulsifiers may also lead to issues with the Soothe XP PF; in 2020 during day, it caused me discomfort as I was not used to such drops; in

2021, computer work 1 minute after was not impacted (no blur at all, except a little milky first 10 seconds, since it's milky) and at night during sleep, it worked fine; however, when eyes are more tired and they notice bad things easier, they react to Soothe XP as if it has toxic stuff in it, with discomfort, which may be due to pH, EDTA, polysorbate 80.

Soothe XP is milky white (like Systane Balance/Complete, Refresh Adv/Digital) with petroleum derived mineral "Restoryl" oils that can irritate eyes, blur vision for 30 min 1st time use; however, since I already used ointments for months in 2021, my eyes got used to these mineral oils and when I tried Soothe XP again in 2021, a year after initial try, there was no blur (except a little milky white for 10 seconds) or irritation, on the contrary, it seemed, on better nights, to work better at night than some other drops I tried; I returned it due to occasional irritation; purification is not perfect, so placing tar/asphalt byproduct into eyes needs monitoring for side effects; need shake vials *before each* use. The blur is much less than Refresh Mega-3 and others. It's at every US store and the two mineral oils in it are in every eye night ointment sold globally, see ointment section on how to get those mineral oils without vitamin A or lanolin or other ingredients that may irritate some. Soothe XP PF is sort of like ointments that contain 20% "mineral oil" and 80% "petrolatum", so for people allergic to lanolin or high levels of mineral oils, this drop may be OK during daytime only, replacing ointments used during the day with almost the exact same oils; however, borate, EDTA, and polysorbate have their damaging effects, so be cautious with this one at night since at night we blink 4,000 times less, so damage is 100s of times faster as blinking doesn't rinse any cytotoxic ingredients. Overuse may lead to irritation and damage and the simple 20/80 Soothe ointment (9$ @ Walmart) is probably way safer in the long run both for daytime, evenings or night. See how your eyes respond and adapt, monitor with 20x mirror. If you like it, you may get 5-70 times better results with Hylo Night or other ointment or some non-lipid tears. Hylo Night got way more mineral oils, plus vitamin A, "cholesterol and *10,000 esters of sterols (mainly), fatty acids,* C_{18}-C_{26}", some present in our natural tears, less toxic reactive chemicals (trace impurities in mineral oil). Soothe XP just has some oil hydrocarbons, though *different* than the squalene hydrocarbon in the 3rd lipid layer of tears, but no cholesterol or lanolin wax esters as in our tears and eyelid skin. However, those ointments, when placed as indicated can overwhelm the eyes and blur vision a lot more than Soothe, so I see how people may love Soothe more than ointments during the day, unless they learn how to apply ointments in new ways that only introduce 10% of the manufacturer recommendation. The "mean LLT increase from Soothe (60.0 nm) was significantly greater than that from Refresh Dry Eye Therapy (23.6 nm)" ► ECL 2007;33(1):38-44, so that oil (no lipids in Optive) makes a difference? This was 2007, today Soothe PF is different from Soothe XP PF; this and another study showing Soothe is way better than Systane were funded by 2 companies with "partial ownership of Soothe". Soothe PF has 0.6% glycerin, 0.6% *PPG*, borate buffer, sodium

alginate, hydroxyalkyl phosphonate, no lipids. Oddly, "Optive and saline were not different between timepoints for LLT (lipid layer thickness)" (saline is 20x cheaper, Optive Advanced with lipids, described below, led to minimal LLT increase and little comfort) ► CER 2018;43(5):588-94. For more tear comparisons, see CO 2014;8:1419-33. ☺☺☺

►► L.4. $5.5/15ml Clear Eyes Advanced. Made in Canada, *the cheapest lipid tears on the planet, and possibly the most dangerous* (1 star on Amazon from me, *see* why below*) if phospho group in phospholipid is high concentration and can form tiny crystals that go inside the cornea easily,* due to corneal calcification, opacification that blurs images from a distance via phosphate. *Avoid*. Also bad, since it's preserved with irritating boric buffer and without a filter (like special unpreserved bottles) to prevent microbes from getting in, preserved drops are dangerous after just a few uses, microbes grow fast. Company refuses to share phospholipid concentration, since it can give us clue into eye stones potential formation. Contains HA: LMW-HA can cause angiogenesis, so since company doesn't answer, we risk getting redder eyes *(long-term, rebound redness as low MW (not high in Hylo, etc)* HA *causes new vessels to sprout)* with this drop if using it daily, or any drop with low MW HA, see list here. Even with HMW-HA, this would make the crystals more absorbed into the cornea, so even if its high MW not low, it's bad. Also, it does swell eyelids, especially if you use it during a nap, you wake up with a weird sticky feeling. Since it's a thicker drop it can cause foreign body sensation inflammatory cascade sometimes and red eyes at night, more mucus buildup etc, so test well before using at night, because 20x mirror test can tell a lot more; I did get very red eyes one night, 11-16-21, from this, but that was probably due to other things going on, since most nights this was fine; however now I never use anything at night, except saline. ☺☺☺

Choline in this drop promotes mucus production, tear production, meibum production, which is good for most, while too much for others who have too much mucus already, depends on whether your dry eye is heavily caused by mucin deficiency, which may be so for many. It's the only USA drop with vitamin E which helps prevent cataracts caused by naphthalene present in trace amounts in eye ointments perhaps: JOPT 1999;15(4):345-50. *This drop whitens the eye after 5 minutes of eyes closed better (short-term) than any other non-redness reliever drop or yawn generated tear I ever tried; it's overall the one with highest overall comfort at night and day, use it and leave eyes closed for 5-10 minutes to let vitamin E, etc do its magic, E kills many viruses too*. No other US lipid drop (I tried them all) comes even close, but this may be to choline, which tends to soften our pain perception, destroys our nerve endings sensation a little, so we're more accepting of the drop and other irritants and don't see the damage it/they do, like menthol (the company uses it in other Clear Eyes drops, as well as BAK in all Clear eyedrops except this and Sensitive) and other sensation hiding ingredients; don't overuse any drop and see if it's fine for you, since all drops can cause discomfort when eyes are too tired and we

overtest drops (even the same drop) without enough 1-2 hour or more for some, gap, between them. The mirror section explains the floaters test too which can be done with any new drop when doing redness and comfort (itch, sting, etc) testing: all thicker drops make floaters more visible for 10-20 minutes, including this one. ☺☺☺

There is one issue related to phosphate group in the phospholipids, but that is true for Systane Complete and any drop with phospholipids, *depending on how much of that lipid they put there*. Since we can't calculate phosphate concentration as companies don't tell the phosphilipid MW and concentration, I totally avoid phospholipid drops, being afraid that Ca in natural tears may form eye stones with PO4 group in phospholipids. Another issue with this and Systane, all phospholipid drops, is the polar lipids allow an increased cornea permeability "The ester group in these compounds increases their lipophilicity and enhances corneal permeability." ► Pharm 2012;4(1):243-51. *This allows the opacification of the cornea to proceed faster, so you fail the driver vision test.* This can cause various issues depending on the type of phosphatidylcholine in the drop, since cornea esterases could hydrolyze the lipid to its components; if polar lipids facilitate the entrance into cornea and other areas of phosphate in high amounts above physiological, etc and other compounds, it could cause opaque calcium phosphate crystals, that make cornea opaque, and even the penetration by the PAPB or other toxic ingredient or preservative into areas of the eye where it can do damage. That's why drops with a lot of phospholipids and preservatives may do damage if overused or used even just 20 times. pH is 7.0-7.1 when I measure it with pH papers, so for many with tear pH 7.3-7.7 it won't be ideal. Mega-3 is pH 7.0 too. Even the best has issues, so blinking often to produce lipids helps. Works very well at night to prevent eye dryness when waking up. The only drop on the market with antiinflammatory vitamin E in its much more stable acetate form, but you still need to keep away from light *(I use a plastic earplug box that I taped for opacity, you can find other small opaque plastic boxes that are even better at keeping light/air out, like first aid from $ store, tiny box, some plastic or aluminum case tight wallet, etc)* to prevent E degradation. It's preserved with far less toxic (than polyquad) *polyhexanide*. ☺☺☺

This may be the or second most alkaline (closest to physiological 7.4 pH, for most people) lipid containing drop in US (pH 7.0-7.1), but still I stopped using it for 2 months in 2021 (June, July, got a new bottle after, maybe bad lot #) and then stopped using it forever in Oct 2022, due to sometimes having weird reactions to it, perhaps due to its less perfect pH; it seems the borate or glycerin or the combo in this drop causes the same weird sandy feeling after refresh Optive (which has 4x more glycerin than Advanced) if used more than 3-4 times within 8 hours, especially if used at night, like when you wake up to go to the bath, etc, since eyes can't wash it off. Drops with lipids tend to be more acidic than those without, since pH influences lipid oxidation in the presence of oxygen and because triglycerides (triesters of glycerol or glycerin)

can hydrolyze (it's called saponification) to form soap in the presence of alkaline pH: R-C(=O)-O-CH_2-CH(-O-C(=O)-R)-CH_2-O-C(=O)-R (triglyceride) + 3 H_2O = $CHOH(CH_2OH)_2$ (glycerol or glycerin) + 3 R-C(=O)OH; then R-C(=O)OH (fatty acid) + NaOH = R-COONa (soap) + H_2O); drops with redness relievers are even more acidic, since they use hydrochloric acid complex of the relievers. It's likely that the toxic *0.5%* polysorbate 80 (present in Refresh Advanced/Mega-3, food, cosmetics, parenteral medicine solutions, flu vaccines, medicines), allergenic *0.5%* CMC in Refresh Advanced & Mega-3, the carbomer copolymer in Refresh Advanced, the 3 extra compounds in Mega-3 (BHT oil preservative (unknown to most), *pemulen TR-2, polyoxyl 40 stearate)* do more damage than *0.005*% polyhexanide in Clear Eyes *Advanced*. Clear Eyes got phospholipids present in human tears (compare that with ricin in castor oil, oil that has 90% ricinoleic acid, a fat our eyes never *had, traces of* cyanogenic glycosides in flaxseed oil, sesame oil, carcinogenic PAHs in petroleum derived mineral oils, *etc*) vitamin E of our eyes, glycerin (in our body), *hyaluronate* (part of eyes and mucin layer of tears), being, in my opinion, less toxic overall than an "unpreserved" *one with many artificial compounds not present in eyes or body, at 100-500 times the level of the only non-eye compound, polyhexanide, in Clear Eyes Advanced* (excluding 0.3% boric acid present in Refresh Advanced/Mega-3, Systane Balance/Complete). *Clear Eyes Advanced is closest to nature lipid drop in a way,* the only lipid tear on the market in the world I'm aware of that has minimal (0.001-0.01%) non-human body compounds (outside of boric acid) and doesn't fog vision or trigger 'foreign toxic compound' inflammatory response that makes eyes more red/dry with more use. Our eyes/bodies are used to certain compounds after 3 million years of evolution, *we don't adapt* overnight *to new stuff* from animals, or mineral oil.

However, Clear Eyes does *cause eyelids to swell when eyes are tired* or irritated, so it's not a good drop. It has phosphatidyl choline (a key component of membranes (skin, conjunctiva, cornea, optic nerve), thus present in creams under the name of lecithin, diacylglycerolphospho choline, $R_1C(=O)OCH_2CH(O\text{-}C(=O)R_2)CH_2OP(=O)(O^-)O(CH_2)_2N^+(CH_3)_3$ present in our tears at 194 ng/mL ► IOVS 2012;53(4):1773-82). Phosphatidylcholine prevents visual aging, glaucoma and keeps the optic nerve healthy: *choline "is involved in the production and secretion of tears by the lacrimal glands... stability of the cells and tears on the ocular surface...retinal development and differentiation. Choline deficiency is associated with retinal hemorrhage, glaucoma, and dry eye syndrome. Choline* (even via citicoline eyedrops) [may help treat] these diseases.. The parasympathetic system predominantly regulates the secretions of lacrimal glands..., releases Ach [acetylcholine neuro transmitter made from choline], which acts on *muscarinic receptors*... [which are] important mediators of secretions by the lacrimal ... glands... [& *are] present in the cornea, conjunctiva, MGs... [low choline causes dry eye by] reducing parasympathetic tone... Choline* is used exclusively in mammalian photoreceptor cells for phospholipid synthesis" ► IJMS 2021;22(9):4733; this paper explains in detail the role of choline in *preventing dry* eyes. If

you google any cholinergic drug, like choline from food, or neostigmine methylsulfate added to some eyedrops (not approved in US etc), the side effects are more "saliva, tears, sweat, mucus, nose running, etc" which is what people with aqueous or lipid deficiency need (100% of dry eye sufferers have either or both). So, if we find we tear more, have more mucus in eyes, nose, lower heart rate, smaller pupils, weaker muscles, more urination, etc after taking choline, it's natural: our meibomian, lacrimal glands finally produce more stuff; we can notice that even when we eat any food with more choline and other cholinergic *parasympathetic tone* boosting foods. PRER 2019;72:100767 is a 66 pg article explaining eye choline links; Ntr 2020;12(3):793 has more on *citicoline* and *optic nerve health*, in rat in vitro studies "citicoline reduced the number of apoptotic (dying) cells by over 80%". "patients receiving *citicoline* eyedrops (*OMK1*, Omikron, Italy, *2% citicoline, 0.2%* high MW HA, *0.01%* BAK) lost 1.86 µm of RNFL (*retina nerve fiber layer*) in 3 years, versus 2.99 µm in the placebo group" ► JG 2020;29(7):513-20. Diabetics using "*citicoline* and vitamin B_{12} eyedrops (*OMK2*, i.e. *OMK1* + 0.05% B_{12}) for a 3-year duration achieved stabilization or decreased rate of functional impairment, neuroretinal degeneration, and microvascular damage" ► AT 2020;37(4):1646-63. ☺☺☺

Densmore makes citicoline 2% drops, that expire in 30 days after opening and have HA & BAK. A phospholipid ubiquitous in the brain, playing a key role in myelination of optic nerve axons, etc, that prevents dry eyes, is part of tear fluid, is better (surfactant that can help our ointment lipids to emulsify better) than "mineral" petrol oil hydrocarbons in ointments (some don't even have lanolin or wool fat, closer to human lipids, etc or vitamin A), though lipid layer of tears contains different (not alkanes) hydrocarbons like squalene and carotenoids too. Perhaps it is even better to generate tears and blink often within 5 minutes while eyes are mostly closed, to allow the water to spread the lipids from working meibomian to depleted areas, tilting head, *providing 2000 lipids, proteins vs 1-2 in store tears.* Choline alfoscerate *taken orally diminishes eye dryness* ► Ntr 2020;12(5):1526, *improves visual acuity* VO 2016;132(2):73-6. ☺☺☺. Hylo Night and Hydramed Sensitive provided better results than Clear Eyes sometimes when used in small qualities for me (due to having more lipids), possibly due to vitamin A and wool fat (lanolin for Hylo Night), which shares some cholesterol and *10,000 esters of sterols (mainly), fatty acids, C_{18}-C_{26}, some like* those in natural tears; combined with HA tears, 0.9% saline, Hylo, Hydramed, etc ointments can be better than some lipid tears for some people. Seems safer if phosphate is high. Stye ointment, not for dry eyes, for styes, has some vitamin E, but also inflammatory wheat germ oil, ω3:6 ratio 1:8; in theory, it could be used monthly to get some vitamin E, if company shares E concentration and you think it's worth trying, but I didn't like it, made my eyes red. Stye may also have phospholipids from the oil, just like lanolin ointments.

►► L.5. $17/12ml Refresh Mega-3, $14/12ml Refresh Advanced both made in US. Refresh Digital PF has the exact same ingredients as Advanced, except it has HydroCell tech, so slightly

pricier; Advanced is basically problematic Refresh Optive (forms cornea ridges, too thick), with castor oil (see the dangers of it in L2 section), lower pH, irritating carbomer added; pH with my paper was *6.8-6.9 for Advanced & Digital, 6.7 for Mega-3* (all 3 may have pH 7.0, but due to emulsion, especially white emulsion in Advanced/Digital, real pH is impossible to determine correctly with pH papers), vial solution milky vs transparent for Mega-3. *Mega-3 uses emulsifiers pemulen TR-2 and polyoxyl stearate* $CH_3(CH_2)_{16}C(=O)$-$(O$-CH_2-CH_2-$O)_{40}$-H (PEG part O-CH_2-CH_2-O is hydrophilic, the alkyl part hydrophobic) *that make it transparent, but far more blurry on the eye. Pemulen can emulsify 50% oil by weight, making permanent emulsions at even 0.3%, so they often use it in cosmetics at 0.1% even; it is high MW, crosslinked copolymer of hydrophilic acrylic acid (*CH_2=CH-COOH*) and a hydrophobic* $C_{10\text{-}30}$ *alkyl acrylate so it's* -$[CH_2CH(COOH)]_n$-$[CH_2CH(COO(CH_2)_{9\text{-}29}CH_3)]_m$-. Both Digital & Mega-3 were blurry and floater magnifying; however, Mega-3 was 10x worse than Digital in terms of blur and floater magnification; yet Mega-3 felt less acidic and more normal, less 'slightly itchy' – so on 4-23-2020, when I got & tried Digital, I washed Digital with 8 drops/eye of 0.9% saline after 5 minutes to prevent irritation; it's possible the irritation is due to carbomer copolymer, since Liposic gives a similar sensation and they share carbomer. I didn't react well to Refresh Optive and these 3 are thick too, but not as thick as Optive, with similar lubricants (*0.5*% CMC, *1%* glycerin), plus polysorbate *80* lubricant *0.5%,* the controversial one that *reduces conjunctiva* cell viability by a third, the *Mega-3 didn't fare well either*; unlike Optive, *the Mega-3 has lipids so it blurs the vision slightly for 30+ minutes* (sometimes) like Celluvisc and thick Soothe XP do; Mega-3 is sticky, can dry off eyelash base and cause eyelid itching (even a very mild sting too, so cornea doesn't like it that much), so if that happens, need to wash eyes soon after, the eyelash base, with sterile q-tip and Cliradex or soap to prevent issues with bacteria lodging at the base and starting an infection due Mega-3. Mega-3 has a weird CMC feel after 30 min, similar to Optive, due to the 3 shared active ingredients, same buffer, etc; if you have any floaters, they become more visible for that first hour or two each time you use Mega-3, so I returned it, having quite acidic pH too; any drop that has refractive index different than natural tears will cause floaters to be more visible, just like when we wear a foggy pair of glasses or a new lens or a different computer background, we can see floaters more, due to the fact the neuroadaptation of the brain did not occur for that lens made of Mega-3 or new drop refractive index. ☺☺☺

Just seeing floaters doesn't make a drop bad, they just alert you you need sleep better, etc. T*hese are single dose vials, so if you use 4 you can return the other 26 to Amazon, so I did return Mega-3 in 3 days. Mega-3 may work fine for others, since we each have a different biochemical environment in the eyes*. Clear Eyes Advanced has lipids, but natural ones found in tears, so they never blur the vision or bring floaters into view like Mega-3 does. Refresh Advanced-Digital got a much more oily texture to the drop, having obviously more fat than Clear Eyes. Optive makes

eyes whiter too and eyes feel more refreshed. Mega-3, Digital & Advanced contain *NaOH, erythritol, levocarnitine, boric acid, castor oil.* NaOH and boric acid means borate buffer, just like Clear Eyes. The Clear Eyes 1 lubricant, natural one in MGs & mucin layer, *hyaluronic,* HA, *is better than* the 3 in these Refresh tears. Advanced *has 1 extra ingredient,* carbomer copolymer, *Mega-3 got 5 extra:* flaxseed *oil, pemulen TR-2, polyoxyl 40 stearate, trehalose, butylated hydroxyl toluene (*the famous BHT preservative in foods to prevent free radical formation in oils, playing a word game "unpreserved eyedrops with preservatives" like OCuSoft with Retaine MGD*).* OS 2020;18(1):148-57 found Mega-3 is better than Refresh Advanced, maybe due to flaxseed and trehalose (shown in many studies to help, hence *Thealoz* uses it). IOVS 2018;59(8):3755-66 found DHA-EPA eyedrops (not ALA as in flaxseed), like in Hylo EvoTears, lowered inflammation as much as taking DHA-EPA orally or using corticosteroid eyedrops. *An issue with new tears (Mega-3, etc) is that we don't know if how the* cyanogenic glucosides in flaxseed *could damage some eye parts or ricin poison in castor oil in tiny traces could damage the eyes or body; while some ingredients have 400 studies done on them, new emulsifiers often have no studies done since only 2 brands use them, so the risks taken long-term are bigger if the drop is used daily. So if using new eyedrops, check eyes 3 times daily in* 20x mirror. Actually that's a good idea to do every day for reasons explained here.☺☺☺ "There were no clinically significant differences in performance in TBUT, corneal staining, conjunctival staining, and Schirmer's test among the artificial tear formulations… ► CO 2015;9:657-64. They compared preserved and unpreserved Refresh Optive and Advanced, all 4 gave similar results, showing some may not need Advanced with extra compounds with long-term effects. Optive (see above) may be enough as source of carnitine for eyes, but I avoid it since it has unknown calcium, while Mega-3, Digital, Advanced don't have Ca. The paper says ***castor oil in Advanced (& probably Digital, Mega-3) is 0.25%***, versus 1.25-5.5% in other drops, which made Advanced comfier than other drops with castor oil. Refresh Optive pH is 7.4 > Advanced 6.9, which will help people who're sensitive to low pH causing damage seen only after 1 year (not 30 days in the study).

►► L.6. Retaine MGD: pH 7.1 per 1 study, has 0.5% mineral oil, 0.5% light mineral oil (see the issue with these oils), 2% (Table 1 for w/w %) glycerin, Tris (see issue with Tris and lipids of our tears) buffer, 0.2% tyloxapol to inhibit bacteria secreted lipases (bacteria break the tear lipid layer), 0.01% poloxamer 188. Possibly the worst lipid drop in the EU/US. The box lists cetalkonium chloride (0.005%) CKC as "inactive ingredient" of "unpreserved" drops, but it is a name for a BAK component (the most lipophilic), sort of like "water bottle is BPA free, it just has BPA derivative that is 10% more/less toxic"; the cetalkonium is BAK where the alkyl group is C16H33; cetalkonium (BAC16 as they call it) was found to be, in vitro, very toxic, making ***93% of corneal cells unviable, while BAK 100%***. However, in vivo, not all BAKs have the same toxicity (BAC8,10,12,14,16,18), so maybe that's why they use it, Cationorm (same product) uses it too.

"Retaine™ (marketed outside the US as Cationorm®, Santen, Osaka, Japan)" ► CO 2015;9: 235-43. It's made by Novagali Pharma, a French company acquired by Santen Japan in 2011. ***Rat*** (not human) studies can be funded by BAC16 makers so it looks BAK lowers ***goblet*** (mucin tear layer cells; low goblet=dry eye) cell count 37.5%, but Cationorm (in spite of or due to BAC16 use instead of BAC8-18 mix?) increases it 40%; BAC16 is 5% of the BAK mix usually per wikipedia. I tried it 9-5-21 1st time, after 8 hours of no drops/no saline showed some mild eye reddening on both eyes and irritation on left eye; no surprise, since BAK is world's most toxic, irritating preservative. I used Clear Eyes Advanced 5 min after, after washing with saline and eyes felt so much better. On 9-8-21 I tested it 4 times in 5 h; when I used 2 drops, eyes got a little red; all the white lipids formed a white clump outside the eye corner, due to blinking pushing it out; then 15 min later, there were tiny stings in the nasal corner, as it happens with other drops when eye is tired on 2nd drop; due to 4 tests, being 7 pm 4th time, the toxicity of BAK/Tris spoke? I did the return, Amazon gave full returnless refund & removed Retaine MGD from the Amazon delivered list of products. Only 3rd part sellers sell it now, at 20% higher price. It's worth mentioning the Retaine Liposome EYELID Spray, released 10-22-2022, made in USA, not France like the MGD eyedrops, that uses phospholipids (eye crystals) to enclose vitamin A, C, E and deliver them to the eyelids. People will see it and rush to use it with faith and joy, but before you plunge into the trap, think: it has Leuconostoc bacteria on the label, the only eye product with bacteria, ever, and radish ferment extract, so all bacteria from that will be delivered to your eyes eventually and cause ocular infections. It has the toxic propylene glycol and polysorbate (killed 30% cornea cells in vitro) too, so overall, a very risky product even for eyelids. It got too much A that can keratinize MGs orifices. Phenoxyethanol preservative in this "closed eyes" spray can damage MGs. In practice, long term, damage may develop, thru hyaluronate crusts too; HA may be low MW, causing arteriole growth and may deliver too much PO4 to the cornea, causing vision blur. Thus, eyelid sprays need to be used with extreme care, eyelid, eye inspection as they can cause styes at eyelash base. These sprays have no strong preservative, so bacterial growth will be fast, need discard in 3 months. The only safe use for this may be ***garbage disposal; to never buy it, someone may be trying to make products to give*** people infections to get more patients ***and try new treatments*** before aristocrats ***can try those treatments?*** Who knows? Read it. It's made by "Jove Laboratories", whose website doesn't exist. Only OCuSoft can sell such things? Keep eyes tightly closed, to avoid placing the MGs destroying phenoxyethanol on the MGs orifice whenever you use anything (98 creams) around eyes with phenoxyethanol. ☺☺☺

►► L.7. Optase Eyelid Spray (more expensive at Walgreens) that gets into eyes after blinking, has: Glycerin 1%, Citric + Tris buffer, Polyoxyethylenesorbitan Monooleate (IUPAC name for polysorbate 80 toxic preservative/lubricant that is used by almost all Refresh and other brand drops, that kills 30% of cornea cells in vitro), KCl, NaCl, NaOH to adjust pH, H_2O, 0.4% Sea

Buckthorn Seed Oil (ω6:3 ratio 3:1 in this oil), 0.02% Sodium Hyaluronate, Sorbitan (issue) Monooleate (food additive), Tromethamine (Tris). Polysorbate 20 is polyoxyethylenesorbitan monolaureate for example and is used in cosmetics. Placing HA that dries and sticks on your eyelash base is a recipe for crusty eyelids where bacteria gather, form new styes, so monitor eyelash base at 20x mirror daily. There is only 1 paper about this spray, in < 100 people, < 2 months, no studies on long term safety and effects; caution is wise, attention to 20x changes good, since there are 100s of chemicals in the pale yellow (*which may give your eyes a yellow tint and zeaxanthin crystals, since the yellow comes from orange lycopene and this lutein isomer that is known to form eye crystals and could turn your cornea into a yellow cloudy thing*) sea buckthorn seed oil that could cause long-term serious effects nobody knows in humans ingesting it it can cause palpitations, bleeding, swelling, so these effects may damage ocular homeostasis too and lead to glaucoma thru increased eye pressure, i.e. *swelling crushes the optic nerve leading to blindness*; thus, to be safe, you could use it 10 min on eyelids only, without blinking, so nothing gets into eyes, then wash it away with water and soap, and see first if *eyelids get swollen; if they do, don't ever use it again,* but make sure the swelling is not because of over soaping eyelids, so do this before your normal daily soaping of eyelids to finish allergy test. Buckthorn oil has many sterols that can turn into steroids that could cause cataracts, glaucoma, *due to the fact hyaluronate acts as a cornea penetrating agent used by Pharma to deliver drugs or chemical or bioweapons to the inside of the eye*; sterols got hormone like effects that could give acne and styes; 80% of sterols can be beta sitosterol precursor of an acne/stye causer that is used to boost sports performance and has wild effects; we need 10 year studies that this spray is safe for people who use it 4 times daily (insert says up to 4 times daily) or more.☺☺☺

►► L.8. Optase MGD, the newest (2022) lipid drop in the US/EU, *possibly* the safest, with: Glycerin 0.9%, Citric Acid Monohydrate, Polysorbate 80, KCl, H_2O, 0.1% Sacha Inchi Seed Oil (85% of it is ALA, LA the most essential ω3&6 in antiinflammatory ratio of 1:1, better than buckthorn L7 oil 3:1), 0.2% sodium HA (MW=1-1.5 MDa, so HMW HA), sorbitan monooleate, 2% trehalose, tromethamine (Tris), NaOH to adjust pH. The glycerin in it, being the same 0.9 as in Refresh Optive, causes massive eyelid swelling, so try products with only 0.25% glycerin or less. It has a clear liquid appearance, unlike many milky lipid drops, and pH seems to be around 7.0, hard to confirm pH for microemulsions, but the paper about the drop says neutral, which may mean around 6.8 to 7.2, or 6.9 to 7.1. My paper gave results 6.8 to 7.2 depending on which paper I used (US made Hydrion gave 7.2), this is typical for lipid drops, pH is very hard to measure. Because polysorbate 80 is lower concentration than in Refresh and sorbitol is only present as polysorbate and sorbitan oleate, the penetration of sorbitol to inner eye structures is harder than with basic Optase (made in France) and Hylo, Systane, etc products with sorbitol, *which is much smaller and easy to sneak in*. Due to lacking castor oil, which is 90% unnatural ricinoleic

acid, foreign to human body and eyes, Optase MGD is safer than most lipid drops in US that have castor oil. It's comfortable usually (except when it stings 10% of the time, like most drops do at night when eyes are more tired, pH sometimes 7.5), it has no blur after 1 min if you kept eyes closed 5 min after using it to absorb more oil, etc (no blur after 10 sec if you didn't keep eyes closed), way nicer than Refresh Mega 3 blur of 30 min and Mega 3 floater visibility enhancing. It's Made in Finland, totally sealed bottle (unlike Hylo products),☺☺☺ taped paper box, very nice seal, storage temp 41-86°F, Amazon delivered it within 12 hour, expires in 3 months from opening, like all unpreserved drops almost, and *generally it is safer to never go past 3 months with any lipid drops as the fats oxidize fast*. It's a Citric + Tris buffer, like the Optase Spray, which may have advantages over citrate or boric only buffers present in all other lipid drops (not to mention the toxic phosphate buffers giving opaque cornea), due to diminishing risks of high borate (sterility, it kills ants, damages some cells too much, allergy in some, etc) or citrate, while mimicking amino protein buffers of the eye via Tris. It gives us higher safety, since we can finally have another drop to use, with a different buffer, instead of overloading eyes with borate all the time, the most common buffer. AO 2020;98(3):244-54 explains effects of this drop with 0.1% sacha oil, 0.2% HA, 2% trehalose (popular in many drops today, like those made by Thea) vs a plain drop with phosphate buffer saline that has 0.2% HA of medium MW, 0.7-0.9 MDa. This paper and the other from L7 are the same research group in Finland; 0.2 micron air filter unpreserved bottle *is made in Germany* by Aptar (to adapt in Latin) Pharma (a US company) probably as in the Finnish study. ☺☺☺

L7 and L8 drops are almost identical, except different oils and L8 has trehalose to make it thick, lasting and to nourish cornea cells. The eyelid spray has to be watery, so it lacks trehalose and has 10 times HA, meaning it's far more watery. Thealoz got 3% trehalose. Research the trace chemicals in sacha oil, though Heliyon 2022; 8(1):e08780 says the one extracted using the same tech Optase used usually has 38% LA, 46% ALA, 9% oleic, the most important ω6 and 3, 9 fatty acids for skin, like cornea and eyelids are; given no current US/EU drop, ointment provides such healthy ω3:6 balance and essential to human biochemistry fats, or ointments, this drop os worth trying to complement the healing of the eyes for people with severe MGs atrophy on lower eyelids (0.3 billion at least). Studies show these 3 acids really help prevent dry eye when used topically, being better than those petrol hydrocarbons in ointments, Soothe XP, Systane, etc. Store this drop in a cool, < 77°F (25°C) ideally, dark and dry place, like all lipid drops to prevent oil oxidation and mold formation on the cap. I never tried L7, but L8 seems way safer as no hyaluronate crusts form at the eyelash base to give styes when we use it as a drop, though HA os 0.02% in the L7 spray, 10 times lower than most HA drops to prevent these crusts that could cause styes and chalazions etc. However, one deadly thing about these drops with surfactants and polar molecules (well, most lipid drops use surfactants to make the drop clearer, less milky

and the emulsion effective at delivering lipids evenly) is that they enable HMW HA to ease the transport of small molecules into the cornea, with microbes, causing infections of the inner eye, so be ultra careful which drops you use 5 hrs before/after surfactant and HMW HA ones, saline is safe, so may antibiotics be very safe before using these polar head (sorbitol), nonpolar tail (oleate) surfactants (*that increase cornea permeability*) when an infection exists to prevent microbes, small irritating molecules, etc from sneaking in. Don't use *drops with surfactants when you have a* stye burst *or anything like that as it can spread the infection to many more areas of the eyelids.* Read more papers on cornea transport. The HMW HA suppresses immunity, so use more medium and low MW HA when infections exist, don't go for ultra high MW HA all the time, like Hylo. HMW suppresses pain sensations, hiding effects. However, Optase HMW prevents inflammation; in special cases of high free radicals from high ocular stress or redness (due to work or microwave attacks etc), dryness, HMW HA breaks down into low/medium MW HA, providing immune stimulation, possibly faster healing of styes, cornea.☺☺☺ The use of each drop and combo is ideal depending exactly on what is going on with the eye at the time. For people with swollen eyelids, a lipid drop can help eyelids to recover, because lipids make eyelids glide a lot easier on the cornea, versus plain hyaluronate and sorbitol in many drops. ☺☺☺

Non-USA ► LIPID ◄ Enriched Drops: (google to find online sites/pharmacies offering them)

►► L.9. NaviLipo, (company PDF), pH 7.2, natural phospholipids (read eye stones issue), vitamin E, 'optimal' MW HA, polyhexanide PHMB preservative as in Clear Eyes, EDTA metalloprotease inhibitor (eye toxic), unstable chamomile + aloe vera 1% extracts, *expires 28 days after opening vs 1.5 years of Clear Eyes*; unsecure website, founded in 2008, quality = ?

►► L.10. Bausch & Lomb Artelac Lipids (official page) is on Amazon, it has medium chain triglycerides MCT (saturated fats, stable if exposed to light, room temp, hence easier storage), carbomer, phosphate PO_4 buffer (deadly), sorbitol (issue). Artelac Splash PO_4 is 2.1 > 1.45 mM physiological, 5x lower than Vismed 10.5, so Artelac Lipids, if same 2.1 mM *(probably same)*, may the safest lipid drop with PO_4, safe if used only once daily and 2 days apart from any drop that contains calcium, to avoid calcium phosphate eye stone formation. 1 eye drop contains 30-50 µL, versus 10 µL for a natural tear when we tear a little, so the amount of phosphate placed on the eye can be higher than normal even with drops near physiological level, and if calcium exists there on the dry eye, it will be more likely to form crystals.☺☺☺

►► L.11. Vismed Omega: see Vismed section. Unsafe PO_4 concentration, 7 times > natural. It needs 2-8°C storage due to DHA-EPA. Since Vismed is in Vismed section and dangerous, L9 is also for Emustil lipid drops with 3% egg yolk phospholipids, 7% soybean oil. The PO_4 section explains 3% can be about 27 times the PO_4 1.45 mM level of natural tears free PO_4. Phospholipid PO_4 combines with Ca to form eye stones, or invisible crystals that cloud the cornea, blurring the

vision. Are PO_4 buffer free drops with high phospholipid, 27x > natural level, posing a huge risk, even if lower than PO_4 buffered drops? Soybean oil has 94% unsaturated fats, so use Emustil fast and store in a colder room. EU lipid drops are described in JOPT 2017;33(9):647-61; the paper covers also less heard of products, "Liposomal sprays (Tears Again, Clarimist (Eye Logic), Vyseo Sensitive) are simply applied onto the outside of the lids, and the polar phospholipids diffuse from the lid surface to the tear film". The lipid layer improved after these sprays in CLAE 2010;33(2):83-7. Even US OCuSoft carried one of these Tears Again sprays (*soy lecithin, vitamin A, E, ethanol, phenoxyethanol, NaCl, H_2O*) years ago. They're less effective than drops of course.

►► L.12. Cationorm (ebay): this is the US Retaine MGD, just for the European market.

►► L.13. Bausch & Lomb Liposic (4 for 40$ ebay) ultra thick milky sperm like gel (tried it 9-6-21, 1st time felt odd in left eye, a very mild burning sensation *(same caustic sensation 2nd test on 9-9-21, when I noticed eye got red (as it does when a drop is viewed as toxic by the eye) after 2 minutes),* due to synthetic hydrophilic clump forming *carbomer 980* (viscosity @ 0.5%, typical for eye gels, is 50,000 cP; also called carbopol 980, polyacrylic $(\text{-CH(COOH)-CH}_2\text{-})_n$ crosslinked with ethers of $C(CH_2OH)_4$, pentaerythritol), *NaOH used to neutralize some free COOH groups and turn them to COONa* or *cetrimide*, so I put saline afterwards and half hour later, after a cold compress, I noticed due to blinking all of it came outside of the eye as a milky white thing, via the nasal corner (3x bigger left eye, since I missed slightly right eye application with Owen eye guide), it's a clumpy thing that doesn't spread like the EvoTears below L.13. does, expires 2 years after receive date, drops are gel like, small), tears are 8$ online. Returned it. Has no buffer (so less toxicity), "more toxic than polyquad" cetrimide preservative ► Opht 2008;105(6):557-62. *Due to cetrimide, it may be safe to use twice/month, perhaps unpreserved is safer.* Carbomer irritates some people's skin and cornea is like the skin a little, *since this industrial polymer is not found in eyes. It has* NaOH to adjust pH, sorbitol (issue?), MCT; Clin The 2010; 32(1):44-52 found it's better than Systane Balance, maybe because MCT (BASF myritol318*:* mix of capric $CH_3(CH_2)_8COOH$ + caprylic acid $CH_3(CH_2)_6COOH$ triglycerides) is more like tear lipids than *mineral oil + PDMG phosphatidyl dimyristoylglycerol (1% of tear polar lipids), because tear lipids are mostly more nonpolar like MCT triglycerides are.* Trimyristoylglycerol is the triglyceride of myristic acid, so PDMG is replacing one acyl myristoyl with phosphatidyl, which is more polar. It's not clear what concentration MCT is at though, versus physiological. ☺☺☺

►► L.14. $16 Lacrisek Plus Spray (also sold on ebay, or 17$ & 15$) and Lacrisek Plus drops made in Italy with a tentative pilot study, contains: vitamin A palmitate, α-tocopherol (Vitamin E), hydrogenated phospholipids (see issue with that), Na_2HPO_4, NaH_2PO_4, (phosphate buffer issue, concentration unknown, plus PO_4 from phospholipids), NaCl, L-proline, L-glycine, L-lysine hydrochloride (hence acidic pH), L-leucine. This has somewhat acidic pH, which may irritate

some people. This isn't the Lacrisert inserts (avoid them), it's drops or spray. In eye care, same or similar name, like Ocusan can mean 2 drops in different countries, 100% different in ingredients.

►► L.15. EvoTears (official) (arrived 9-16 ordered 9-4-21; exp Oct 2022, 1 year later, probably to prevent bacteria growth in bottle due to opening so much for 1 year; had stamp of PostNL from Postbus 7007, 3109 AA Schiedam, Netherlands, CEMA Pharma Spain sent it from their 28823 ES Coslada warehouse to Netherlands office, says store below 25°C/77°F) *(made by Novaliq Heidelberg, Germany,* distributed by Brill Pharma (08022 Barcelona, Spain) or UrsaPharma in EU) & NovaTears (by AFT in Australia), identical, no preservatives: same refractive index as natural tears, eons ahead of other drops, see 28 second video of how fast it spreads over the eyes in seconds and protects the eyes from evaporation compared to eye ointments which often remain where you applied them for hours. EvoTears Omega (official), *launched 2018,* 3 years after EvoTears, first emulsion-free blur-free ω3 drop with *EPA* + *DHA* from algae, ω3 in natural tears, with synthetic $F(CF_2)_6$-$(CH_2)_8H$ $C_{14}H_{17}F_{13}$ *perfluorohexyl octane* which penetrates the MGs and makes the oils flow out easier ► JOPT 2015;31(8):498-503 & JOPT 2020; 36(3):154-61. *While it may cost 30$, the thing is it contains 280 drops that can last much longer than conventional drops, so it can be way cheaper than lipid drops, lasting 5 months versus 30 days for one time use packs.* Company says it doesn't bioaccumulate, offers better drug delivery: it spreads (water based drops don't spread it), residual time on eyes up to *320-640* times higher, *4 hours* vs 15-30 sec, *4x higher* bioavailability of compounds vs water solutions. Thus, if you ever try it, only use healthiest drops around it, as it will *increase exposure time up to 640x* for the bad stuff or avoid any other drops *1 hour before and 4 hours after*. Perhaps others can investigate oily drops made of oil like lipids in our eyes, *at physiological concentration* (not way above to form eye stones). One issue is if bacteria or enzymes break $C_{14}H_{17}F_{13}$, (unlikely, since it was used for years in eye surgery, for vitreous gel replacement) the F may damage eye nerve endings after using it daily for 5 years; no 5 year study was done to evaluate all areas of eye health, see fluorine on retina like cells in the pineal section. However, *this issue is with all eyedrops, no 5-15 year study for an ingredient to prove it doesn't worsen* all other eye, body health parameters. ☺

They also got EvoTears without ω3, no preservatives. EvoTears have no water, so bacteria can't survive in them in the eye drop bottle (hence no preservative). These tears are extremely stable at high temp or cold temp during storage and shipping, unlike most eyedrops; they're also less contaminated with cancer causing PAHs or stress inducing mono-aromatic hydrocarbons (0.05-0.7% of mineral oils) like mineral oils, vaseline or petrolatum of ointments, so they do have some pros, besides unknown cons only time will reveal, as with any new technology. $C_{14}H_{17}F_{13}$ is saturated, very stable, *more stable than the chemically inert alkanes in mineral oil ointments*. C-F is the strongest single bond in organic chemistry (see table in kj/mol, 1cal=4.18j), 3rd after Si-F and H-F inorganic bonds: BDE (kcal/mol, enthalpy change at 0 K or D_0) = 166 F_3Si-F, 152 H_3Si-F,

136 H-F, 130 CF_3-F, 120 FCH_2-F, 115 CH_3-F, 105 CH_3-H, 83 CH_3-Cl, 72 CH_3-Br, 0.021 He_2 (van der Waals), C-F bond is stronger than C-other elements single bonds), no double bonds; if Si-F is stronger than C-F, then Si-F is favored to form sometimes. Si is present in hyaluronic acid in the eye (mucin layer, vitreous gel, etc), is that weird? UrsaPharm says animal studies showed all $C_{14}H_{17}F_{13}$ goes into feces. If bacteria can break it in humans is yet to be determined though, since where this interfaces with the water layer, bacteria could attack it or some of it will leak in a tissue where bacteria have access to it; can enzymes in humans break it? Can free radicals react with it and form dangerous new compounds? Maybe not, since F is electron donor (Lewis base), looking for Lewis acids. Who knows? Do free radicals react with alkanes? Not that much. F could react with Si in the body? Can biophysics effects cause the junction between cornea and vitreous gel, vitreous gel and retina, etc to loosen and allow unwanted compounds (that could impair inner components of the eye or even the optic nerve itself) to cross over easier? Is that bad? A risk exists with every mineral oil ointment: these unnatural hydrocarbons could get somewhere in the MGs or etc and block some enzyme from functioning; this is especially true since F can form hydrogen bonds with H from organic compounds and could slow the transport of some molecules taking part in some enzymatic reaction – some authors say mineral oil ointments get inside MGs. Some fluorinated compounds can stick to silicone, in some high temp conditions, so in theory, if silicone gets into eyes in trace amounts from the earplug seal or dimethicone in face/hand creams when we touch eyes, something could happen.☺☺☺ So, not everything is solved if $C_{14}H_{17}F_{13}$ doesn't bioaccumulate in studies done so far, it can just be there temporarily and slow the production of 5-600 healthy lipids and 2-100 proteins of the meibum or 1500 proteins of lacrimal gland or the production of new meibum producing cells, etc, leading over time to meibum dysfunction in more glands. Do we need to see a lot more papers perhaps, to be certain it's totally safe? A little unexpected molecule can sneak in a place and block an enzyme folding or something. It's complex. So, when using artificial lipids, like ointments, etc, drops with mineral oil, petrolatum we have questions. The ointment section explains more issues. Natural chemicals can be lethal; man made stuff gave us travel speeds 900x above nature via rockets, infection rate 10^6x lower from diseases now virtually extinct, so not all man-made is toxic, it could lead to discovering something better than any lipid the body produces to keep eyes wet at age 900, even if it's not $C_{14}H_{17}F_{13}$; we keep trying new things, one day we discover lifespan 100x longer than nature gave us. The advantages of EvoTears are explained here. I tested EvoTears 9-20-21 the 2nd time and it was amazing, the drop was so small, it spread so fast on the cornea and eyes became slightly whiter after 5 min (tried to yawn, but was quite dry) of closed eyes; the most discreet drop, the other ones are so heavy and huge, overflowing the eyelids and caruncle. After 15 min it feels like mineral oil ointments, being an alkane derivative, that same feeling we get after ointment for 1 hours, this one we get it too for a while, until we apply 1 saline drop to make it go away; the mineral oils though don't go away after 1 saline drop; not comfy, but not

too annoying in that 10 min period of 'ointment feel'; that's why I dislike ointments too; after 20 min, redness returned to normal level of PC use. I discarded it after 2 uses, since I don't trust UrsaPharma (that also sells it) after the Hylo Care experience. EvoTears provide an idea to design alkane liquid mineral oils like this, that would be 90 times easier to apply as 10 drop, than tube solid ointments. The 3 ml of solution in the bottle cover only 50% of the bottle, the rest being air that can trap bacteria, though bacteria don't grow in alkanes, see above. Cap back right away, though 3ml air above solution is similar to other eyedrops. Conventional bottles contain 10-15 mL and got 3 mL above, but these drops are 3-5 times smaller than others, so EvoTears can use a tiny bottle, puzzling people why so tiny, it's about ease of opening the cap, can't make it much smaller. ☺☺☺

11.17.4. Citrate, borate, phosphate, lactate, Tris, bicarbonate, NaOH-HCl, natural eye BUFFERS

1). Natural EYE buffers & how to determine your tear pH & choose eyedrops closer to your pH

2). Bicarbonate 26 mM natural (839x > citrate; 17x > lactate/PO_4) vs mM artificial; is it safest?

3). Phosphate PO4 1.45 mM natural vs 1-50 mM artificial (these buffers can form eye stones)

4). Lactate 1.5 mM natural (natural tears that is) vs higher mM artificial

5). Citrate 0.031 mM natural vs *100-1500x higher* mM artificial (bicarbonate 839x higher)

6). Borate 0.002-0.02 mM natural vs 30-97 mM in artificial (can be a 50,000x difference; toxic?)

7). Tris/HCl (not *in eyes*) 10-50 mM 8). NaOH/HCl added to tears – what does it mean?

1). Buffers keep tear pH (pH=-log[H^+]) constant; some have antiviral properties "citric acid... bicarbonate... boric acid". A 44 people study found "normal pH range was 6.5 to 7.6; the mean value was 7.0" ► AO 1981;99(2):301, but more recent papers say *7.2-7.7 is normal*. "a span of about pH 5.2 to 8.6 remains...a *population average of about pH 7.45* emerges" ► NIH book. "The physiologic pH of blood and tears is approximately 7.4" ► IOVS 2004;45(13):3913. "higher pH (pH 7.5) of the ocular surface and tears" ► CO 2008;2(4):973-9. Mean ocular surface pH in 133 people was 7.11 and "*Cell viability in vitro is best at pH 7.4-7.8. pH lower than 6.8 or higher than 7.6 slows growth... optimum growth of fibroblasts occurs when pH is" 7.4-7.8*. pH returned to its normal value 20-40 min after placing a more acidic (4.8 & 6.0) eye drop. 1 hour of eyelid closure led to 7.20 pH drop to 7.06; from 9 am to 5 pm, pH increased by 0.25-0.4 (7.05 to 7.45 etc); as night approached, pH increased ► BJO 1984;68(8):549-52. This may mean that when we use a drop much closer to our average, not 4.8 or 6.0 as in the study, it returns to 7.2 etc normal much faster. So, those with mean pH 7.3 could *use a* 7.1 drop first 5 hours after waking up, *7.3 next 5 hours,* 7.5 last 5 *to reduce ocular stress*. Product managers could design each drop in 3 pH

versions to use in each 5 hour shift, to maximize healing, reduce inflammation. "*The pH of healthy tears is reported to range from 7.3 to 7.7*, it is influenced by dissolved substances, especially by the bicarbonate–carbon dioxide buffer system. Tear pH is lowest upon wakening due to *acid* byproducts associated with prolonged eyelid closure. *When the eyelids are open, pH increases rapidly due to carbon dioxide loss*" ► Pharmac 2012;4(1):243-51. Solutions with a *higher* pH *seem to* increase *ocular* comfort" ► CR 2016;46(11):2055-63. "artificial tears… have buffers (e.g. bicarbonate, phosphate) to maintain the *normal pH (~ 7.4)* of the tear film" ► 160 pages CDSR 2016;2:CD009729. Choline salicylate drops had pH of *7.4-7.8* (see Table 3), except for the ones with polyvinyl alcohol, which had pH 5.65 and the *lowest* cell (Fig 3) viability *which* "may be related to their... low pH" versus the "*normal tear fluid pH of 7.14–7.80*" ► SPJ 2015;23(4):407-12. "pH-values of 20 … artificial tears … measured from 4.82 to 8.39. One sixth showed pH-values above physiological values. A remarkable proportion of commercially available artificial tears deviate from the physiological range of the pH. It doesn't seem advisable to apply those in eyes with damaged anterior segments (dry eye damaged ocular surface, what we see on 20x mirror)" ► KMA 1998;213(2):123-4.

"The pH value in human precorneal tear film was measured with micro- and semimicro-pH-electrodes; *the mean was* pH *7.6*. Stimulation of tear secretion and blinking led to a decrease in the pH value. When the eyelid was open, the precorneal tear film was alkalized by equilibration with the partial pressure of the CO_2 in the surrounding air. When the eyelid remained open for 60s or longer, an equilibrium value of greater than pH 9 was attained." ► GACEO 1982;218(3):168-70. *As you can see, these studies are so small, they give results all over the place as the mean: 7.0, 7.2, 7.4, 7.6, etc. So, with so much data, perhaps the true mean is closer to serum 7.35-7.45?* "The *pH value of tear fluid increases up to 7.9* in patients with dry eye syndrome as compared to pH 7.4 in healthy individuals… Na^+ ion concentration... increases by 2.2% from 133.2 to 136.1 mM in MGD, by 6.7% from 133.2 to 142.2 mM in LGD (lacrimal gland deficiency), and by 8.9% from 133.2 to 145.1 mM in the presence of both MGD and LGD…" Ca^{2+} 0.8 mM to 0.85-0.95, K^+ 24 mM to 25, Mg^{2+} 0.61 to 0.62-0.65 mM ► AM 2020;32(6):1906762.☺☺☺

From the studies above, we see that if eyes got used to a pH for decades, using store tears with a pH 1 unit lower/higher means H^+ concentration will be 10 times higher or lower, a *big* change that can spur *inflammation*, *redness*, *dryness*. Low processed foods vegans have higher pH for urine, saliva and tears, so each person is different. *Thus, to avoid dryness/redness, we choose an artificial tear brand that matches our natural tear pH. To measure our tear pH: 1. don't use any eyedrops of any kind for 1.5-4 hours of being awake and blinking; then, wash your eyes with pure water to remove traces of buffers and chemicals of prior drops that will introduce errors in pH measurement, be aware skin pH is 5.5, so this may lower our pH reading, since we lack the instrument to do it. 2.* generate tears *for* 5-10 minutes and keep eyes closed to saturate eyelids

and to wash off the pH 5.5 of skin and prior drops to get a really accurate pH measurement and then get a little on the paper within 3 seconds of a tear coming out by eyelid squeeze from under the eyelid to not lower tear pH by 'running over the acidic face' and immediately, in your bright light room with pH chart by your side, not 20 seconds later, read pH color (since if it's dark it can appear darker), since in 50 seconds it will often become very different color, much lighter giving you a reading 0.7 pH units lower or even lower. ☺☺☺ Gently avoid measuring the pH of the shower water you used to clean under eyelids, by perhaps showering 1-3 hours min before the test and not using any drop for 4 hours prior, nor generating too many tears that leave a mix of proteins, lipids, etc under eyelids which shift pH, though to cancel influence of junk under eyelids, skin pH, some prior tear generation (30-90 min before final tear generation) may lead to more exact pH. *Then, wipe lower eyelid and then immediately clean eyelid.* Tears have 3 layers so what you get is an emulsion of skin oils and tear oils plus water, and like Soothe XP emulsion, you may get sometimes lipids, other times more water, and this will give colors of pH paper not listed on the chart, like a sky blue or light blue green instead of dark blue or dark green blue of 7.6 for Hydrion; that's why I'm often confused whether my average pH is 7.4 or 7.1, 7.3 or 7.6 at times, since one part of the pH paper is bluish, another is greenish; this may be due to low ion count or other effects, so beware pH taking with papers is highly inaccurate at times, so use 3 narrow range pH paper brands to see what happens, since like with drops, sometimes one brand is off from textbook value; so my actual pH may be higher than what I see with the paper, and yours too, or lower if your skin or other drops influence it; I'm just *guessing* based on readings so far my pH is 7.1 or 7.2 or 7.3 on average *(6.7-7.5 under eyelash,* inside eye may be 0.2-0.3 higher often, since no 5.5 skin pH, 6.9-7.0 pH shower/tap water, 6.5-7.2 drop leftovers bring it down, *6.7-7.5 depending on day and time of day, low on high tear volume days, high on dry days and evenings, lowest by 2 pm and wettest days)*; try measure yours 200 times: mine is higher in evenings, that's true for most people, the drier the eye, the higher it is. ☺☺☺

When you squeeze eyelids after tear generation by yawning, tiny drops (smaller than a typical eye drop) will fall on the lower eyelid, so catch them with eyes super-tight closed, but don't place paper close to the MGs, wash eyes afterwards. Matching eye pH prevents eye irritation. **In a civilized world, *all tears list the pH so we can choose the right pH tear, without having to spend time and money to buy tears and test them at home. The* one color US made Hydrion 5.5-8.0 pH paper *(expires in 2 years,* lo ion Hydrion *for unbuffered is ideal, since testing DI water or unbuffered saline tear solutions like* Addipak *with some brands yields no results as strips were made for buffered saliva/urine only) is better for wide range of artificial or natural tear testing (or wider range 5-9 if testing 7.9 pH tears like Systane Ultra/Hydration to make sure they're not 8.5).* MN German made 6.40-8.0 is better for normal tear range *(below 6.4 is disease and using artificial tears with pH below 6.4 is not ideal if natural pH of your tears is 7.4; the best pH range***

is 6.4-8.0 for seeing if a tear you buy is 7.0 or 7.1). The Chinese 6.4-8.0 range one quality is unsure, due to Amazon pic showing wrong pH, 8.0 twice on color chart. ☺☺☺ All artificial tears have buffer usually. Use a white plastic to see true color when placing a drop on it and then pH paper nearby to absorb the drop, to see. The strips are very hard to use to test your tear pH since they require a lot more tears than the roll piece of 5-8 mm; strips are also very expensive, 5-10 times more per 100 tests done. Even 1 drop is hard for some to get outside of the eye on demand by generating tears, let alone 2-4. ☺☺☺

Store pH papers away from light or oxygen, even the ones that don't say so on the box. Our natural tears use phosphate and bicarbonate buffer, mostly bicarbonate, but also *protein* buffers:☺☺☺ lysozyme (alkaline) and lipocalin (known formerly in papers as tear specific prealbumin) (acidic). Tear pH rises with age. 5 pH papers *(Hydrion 5.5-8, Chinese 6.4-8.0,* MedLab 4.5-9 *(gives excellent results even a year after the 90 day expiration date), MN 6.4-8, &* Esee *1-14) I used* showed the (links indicate science papers that confirm pH findings) Refresh Optive unpreserved (preserved is 7.2) had pH 7.4 (Refresh Optive Fusion 7.37, same ingredients as Optive, except 0.1% hyaluronate), Refresh Plus 6.5 (same color/pH as Rohto Dry Aid + iGel + Ocusan), Systane Balance 7.0 (Complete, Original same color/pH) (Ultra 7.9, Original 7.0, Hydration 7.9), Vismed Gel and tears (company site) 7.3, Thealoz Duo 7.0 (7.1), Hylo Dual 7.1/Hylo Care 6.9 (hence in one study Care cell viability was 36% vs 73-77% for Hylo products with pH 7.2)/Hylo Fresh 7.3/ Gel (also called Forte) 7.2, Biotrue 7.6, Optimel 3.8-4.2 (avoid it), Clear Eyes Complete 5.9, Clear Eyes Sensitive 6.6, Clear Eyes Advanced 7.0-7.1 (some lot # more alkaline) *(*company said 7.0-7.4*, since sitting with air above, pH decreases as CO_2 enters, so you see* Vismed 0.18% 7.2 *in a paper vs* 7.3 company*, as it sit a long time and plastic plays a role too, reactions*, etc), Artelac Rebalance 7.3 (papers show 6.8, due to no buffer present in Rebalance), Artelac Splash 7.1, GenTeal unpreserved 6.9, GenTeal preserved 7.4, *Refresh Mega-3 6.6-6.9 & Refresh Digital/Advanced 6.8-6.9 (may be off slightly, due to lipid emulsion, possible around 7 for all 3 Refresh lipid drops),* iGel 5.75 via MedLab pH, Refresh Relieva 6.3, Optase 6.8. This study says Cationorm (same as Retaine MGD), pH is 7.1, but being white cloudy emulsion pH papers register random numbers ≤ 6.5 for me. For normal drops all 5 papers agree, but for white emulsions, they always disagree wildly. Oasis may be 6.7-7.0 since it has similar ingredients to Ocusan. My and most people's tears have pH 7.1-7.4 (varies with time of day or week too), like many vegans with negative PRAL score. Advanced was much more comfortable than the Clear Eyes Complete with redness reliever I used in 2015-2020 (it's fine if you use it rarely), one explanation could be Complete pH is, per customer service 5.7 to 6.3, 5.9 with my 5 pH papers, while Advanced is 7.0-7.4 in theory, my papers show 7.0-7.1. The reason knowing this is helpful is that you can use a more alkaline drop brand 30 minutes after a more acidic one, in order to prevent irritating the eye for 60 minutes with the acidic one, if the acidic one has an ingredient

that is very rare or lacking in the alkaline one.☺☺☺

When trying new tears with new buffers, inactive ingredients or lubricants, try them mornings when rested or afternoon, since it washes out faster, you're more awake to notice after effects 1-3 hours later, while if you do it before bed, you can't see blurriness and redness or any odd sensation, until morning and then you don't know if it was a little red because of buffer or sleep, etc. It also diminishes risks, since at night, you blink and discharge in nasal cavity a lot less, unless you spend 1 hour to blink a lot after tear application. This allows you to see what one extra ingredient does, for tears that are very similar except one chemical. **☺☺**

2). Bicarbonate: HCO_3^-, 26 mM in eyes, the highest natural concentration of any major buffer present in artificial tears; 26 mM is *839 times higher than 0.031 mM (citrate), 17 times higher* than phosphate/lactic (1.5 mM) eye concentration, so bicarbonate buffers are the most natural and safest, see why below. Surprisingly, few tears use it, e.g. Alcon's Bion Tears (US design, made in France) unpreserved which says all 4 vials have to be used within 4 days of opening the sealed plastic pouch and the tears only used right after opening; indeed, unlike dozens of tears I tested, this Bion Tear is unique, since it has only HCO_3^- as buffer, so pH paper becomes very blue within 2 minutes when the drop is exposed to open air on a plastic, meaning very alkaline, like the paper above explained not blinking causes tear pH to become 9, very alkaline and how dry eye patients when eye gets dry due to less blinking can have such high 8.5 pH for a few seconds; so unlike phosphate buffer drops where it says contents can be used within 12 hours of opening vial, in this case, you need use it within 1 minute if you don't cap it back within 2 seconds of using it, since it becomes too alkaline after that to place directly on the eye.

For this reason, many companies say "discard after use" on their vials, since pH can change if people don't recap properly. If you want to wait longer than 10 seconds and reuse same vial, but it seems safer and ☺☺*lovingly gently* kinder☺☺ to recap within 1-2 seconds of use, to prevent CO_2 from changing pH; I recapped it and *even hours* later the pH was still the same 7.0 initially as with the 1st drop after opening. Even though pH is only 7.0 or so initially, I feel safe using it, since it changes quickly in contact with the air, due to releasing CO_2 fast which is not possible in a sealed vial. Our natural tears also become more alkaline in contact with air, since the protein etc buffers of tears are not there to stop the release of CO_2. Bion package says "may contain NaOH, HCl or CO_2 to adjust pH", because they add CO_2 to bring pH to 7.0: $CO_2 + H_2O = H_2CO_3$, carbonic acid that gives beverages that feel; $H_2CO_3 + OH^- = HCO_3^- + H_2O$. The OH can be from NaOH or any other bases in artificial or natural tears. When we bake, $HCO_3^- + H^+ = H_2O + CO_2$ (the gas that causes bread to rise), H^+ being acidic stuff in the bread mix, reaction catalyzed by heat; that is why they call is baking soda, it's an alkaline 'soda', though soda comes from sodium and NaOH name. People say 'we drank soda', because they drink carbonated beverages that contain

bicarbonate or baking soda. This is the only drop that mimics natural tears pH behavior, because when I take my own tears, the paper also is more green-blue first, but later becomes more blue since HCO_3 is a huge component of tear buffer, besides proteins. It's always good to discard vials fast due to possible bacterial contamination; recap only for other buffers to use later, if you feel confident, or the manufacturer says you can reuse vial within 12 hours.

Bion Tears contain zinc, unlike most, no toxic buffers or preservatives or additives, the artificial dextran 70 (on WHO list of essential medicines, polymer of glucose, found in wine, so our body is used to this chemical over eons of wine drinking) lubricant, artificial hypromellose 2910 which is also HPMC (chemical formula is here). To be safe, it's better to use more drops, and not rely only on one buffer system, one drop all the time. Dextran 70 is also anti-clotting, like Hylo Parin eye drop, so it prevents formation of red clots. I loved Bion Tears, when I tried them July 2021, they soothed my eyes, like most drops do when you use them when eyes are rested. However, when eyes are more tired, like most drops, they cause discomfort too at times, having irritating chemicals; I didn't find any artificial drop (except saline) that never causes issues when eyes are very tired, thus more sensitive and reactive to chemical stress. GenTeal tears are identical, except borate buffer. ☺☺

3). Phosphate (and phospholipid/*calcium/magnesium* issue): PO_4^{3-}, HPO_4^{2-} or $H_2PO_4^-$, 1.45 mM total free PO_4 in natural tears; using a drop with unknown concentration of PO_4 is unsafe, especially if you take high vitamin D or use cold compress and also had some scratch of the eye due to some foreign particle entering the eye and causing a scratch of the cornea that allows $Ca_3(PO_4)_2$ crystals to attach and grow on the cornea, even some eyelash scratching it during the night and you waking up with red eye, etc; GACEO 2006;244(8): 1010-4 has a table with PO_4 levels in many EU brands (many removed PO_4 though by now), 44% of the brands had > natural tear *1.45* mM, Lacri had 68.8 mM or *47 times* > 1.45. ASOE 2016;91(8):372-8 found many high PO_4 concentrations (average 18 mM, *12 times* higher *than in tears; 32* mM *for* preserved, *8.5 unpreserved*) in the 24 brands with PO_4. Oasis and other companies say "trade secret or proprietary info" (a lie, since anyone can send tears to a lab and get PO_4 concentration) and then we get fast calcification that makes cornea opaque (can't see well) or even requires surgery ► BJO 2006; 90(3):285-8 ► see eye damage due to PO_4 concentration being 50.9 mmol/L, 35 times above the *normal* level in tears, very frequent use after a surgery, and 100s or 1,000s of times higher in 2006 in Hylo Comod than Alcon eye irrigation balanced salt solution using PO_4. Not sure if this paper is fake or real, but in 2006 Hylo Comod may have used phosphate. In recent years, Hylo uses citrate only. ☺☺☺

Other papers claim avoiding PO_4 in eye irrigation solutions (much lower PO_4) is best. TJO 2019; 49(3):123-9 is a free paper with a table listing PO_4 levels of a few tear brands, plus which ones

are hypoosmolar (most chosen in the study are so, < 100mOsm/L). Cornea 2017;36(6): 712-8 Fig 1 *makes it clear that* PO_4 *at 10 mM (common in many brands), 7 times above physiological level, is highly toxic in vitro to cornea HCLE cells, just as 10 mM of borate, Tris and citrate are, with Tris and citrate being a tiny bit better. No wonder companies hide the concentration on labels. Scary charts, means most tears damage the eyes, unless they use much lower levels of these compounds. We can only hope in vivo it's much better as cells get help against the buffers. That's why I like* drops without buffers or maybe with bicarbonate (synthetic concentration is closer to natural). Would calcium carbonate cause issues? Just like in the USA, Oasis, Hyalogic, Thera Tears, unethically never warn people about cornea tiny crystals damaging or clouding cornea or eye stones requiring surgery, "Despite the EMA (European Medicines Agency) recommendation, none of the phosphate-containing medicines (Vismed, etc) mentions corneal calcification as a potential side effect." ► JOPT 2014;30(10):800-2. Even when you go to do meibum expression, like I did, doctors use the PO_4 buffer, BAK preserved saline solutions for eye wash 15 sec/eye, not ideal, in case forceps scratched cornea ► Burns 2019;45(8):1871-9. ► "*2 min lasting irrigation with a phosphate-buffered saline itself... (standard eye doctor practice in USA) triggers corneal calcification. Ongoing application of artificial tears containing physiological 14.6 mmol* Ca^{2+}*/l led to macroscopically visible calcification*, but only in areas of induced corneal erosion... it is crucial to *legally restrict*" PO_4 *buffers* in some situations. Because natural tears got PO_4, the *overuse* of $CaCl_2$ *containing drops* (present in *SO* many brands) may cause eye *stones* too if one has a cornea scratch (due to a stye or punctal plug) or had some recent eye procedure. ~*~ We need extra *care* with *Ca, phospholipid* and PO_4 drops. ~*~

The *only* drops whose PO_4 I know is < 1.45 mmol/L are Comfort Shield (use Ctrl+F "shield" to find) 4 pages above. To prevent eye stones, never use calcium ($CaCl_2$) tears (Refresh, Genteal preserved) same day with PO_4 or phospholipid drops (e.g. Cl Eye Adv) to prevent precipitation of $Ca_3(PO_4)_2$. Likewise, drops that contain $CaCl_2$ usually have $MgCl_2$ and Mg can also form $Mg_3(PO_4)_2$ crystals with PO_4, so it's best to minimize $MgCl_2$ drops, unless Mg (magnesium) is at a safe level. Night ointments with lanolin contain phospholipids at times, so avoid using calcium drops right before bed when you use lanolin ointments (lanolin alcohols don't have phospholipids). As the dental section explains, teeth, bones and arterial plaque (*#1 cause of* death *worldwide*) contain $Ca_5(PO_4)_3OH$ or hydroxyapatite; when PO_4 is used, we can increase the chance of atherosclerotic plaque in eye arterioles, which would diminish nutrient supply to the eye; it can even cause cornea calcification, similar to heart calcification, in people using phosphate eyedrops frequently or people with damaged corneas (most don't know if theirs is damaged).☺☺☺

Clear Eyes Advanced seems one of the most comfortable drops with lipids, maybe due to pH, glycerin, vitamin E, HA, phosphatidylcholine, which is a phospholipid; it seems far safer to not use drops (Refresh) with calcium within the same day you use phospholipid drops, unless you

know the concentration of each is equal to that of natural tears and are 10 hours apart, as it may trigger calcification, though phosphate buffer forms $Ca_3(PO_4)_2$ crystals (*eye* stones requiring *surgical* removal) far easier than a phospholipid: "calcium binds primarily to phosphate groups of all phospholipids… such binding caused reorientation of the POPS headgroup towards the membrane interior" ► SR 2016;6:38035; it's *very hard* for a crystal to come out of a phospholipid, but once in the eye, tons of odd reactions may occur we don't know about. Systane Balance & Complete also contain phospholipids. So do other lipid containing drops, like Lacrisert, Emustil with 3% phospholipids, or 30 g/L. If the phospholipid is a common one, MW is 760, so since 1 lipid mole=1 PO_4 mole, it would mean 30g/L*1mole/760g= 0.03947m/L or 39.5mM (milimolar). This is 39.5/1.45=27 times higher than free tear phosphate. *Can this* phospholipid *phosphate* become *free and* form stones *in the* eye *also*? Of course, it can. See the papers above. Systane has mineral oil, phospholipid, maybe < 40 mM PO_4. But we don't know how many g/L of phospholipid in any drop except Emustil (written on package).☺☺☺

4). Lactate: plus hydrochloric or lactate+HCl is used by Refresh Plus (#16) to reach pH 6.5, by Refresh Relieva PF Single Vials (#14) to reach a different pH. Lactate is higher in the dry eye and too much lactate has side effects. Lactic acid is formed by the reaction of lactate with HCl, lactic pKa (which is -logKa) is 3.86. Ka=[lactate][H^+]/[lactic], pKa = pH - log([lactate]/[lactic]), so we need (ignoring the pKa of CMC in Refresh tears) 436 times ($10^{2.64}$=436) more lactate than lactic to reach 6.5 pH, just a little HCl. 6.5 – 3.86=2.64, enter 2.64, press Exp or 10^x button on calculator to get the 436 ratio, if not familiar with log: log436=2.64; log10=1; log100=2; ln2.73=1. Since carboxymethylcellulose CMC its own pKa of 4.3, we need to take that into account too to get the best answer. Carboxymethyl is CH_2-COOH, so CMC is cellulose (glucose units with 1,4-β bonds) with 1-3 OH replaced by 1-3 OCH_2COOH or OCH_2COONa if the sodium salt (which is named "CMC sodium"). CMC is in many drops. The pKa depends on how many OH groups are replaced with o-acetate. Hypromellose 2910 or hypromellose (lubricant in Bion Tears, Retaine HPMC) or HPMC (hydroxypropylmethyl cellulose) is identical with CMC, except O-H is replaced with O-CH_3 (O-methyl) or O-CH_2-CH(OH)CH_3 (O-hydroxypropyl). 2910 means average content of O-CH_3 groups is 29%, O-CH_2-CH(OH)CH_3 groups is 10% ☺☺

5). Citrate: 0.031 mM in eyes. Synthetic? [Na^+]=132 mM in Hylo Gel, which has 0.2% HA hyaluronate $(C_{14}H_{20}NO_{11}Na)_n$ (contains 23/403 Na) and Na citrate. 2 g NaHA/L, so 2*23/403g Na or 2/403 moles/L or 4.96 mM. Thus, 3*[Na_3Cit] + 2*[Na_2HCit] + [NaH_2Cit]=132-4.96=127mM. The equilibrium constant K_{acid} = [H^+]*[base]/[acid], so $\log_{10}K_a=\log_{10}[H^+] + \log_{10}$[base]/[acid], pH =-$\log_{10}[H^+]$, so pH=$pK_{a3}$ + log[base]/[acid]. ☺ Since Hylo Gel pH is 7.2, then 7.2=6.4 + log [$Citrate^{3-}$]/$HCitrate^{2-}$], so [Cit^{3-}]=6.3*[$HCit^{2-}$]. To see how much [H_2Cit^-] we got, we use 4.8, pKa2, so 7.2=4.8 + log[$HCit^{2-}$]/[H_2Cit^-], or [$HCit^{2-}$]=251*[H_2Cit^-]. So, [Na]=[H_2Cit^-]* (3*6.3*251 + 2*251 + 1)=127, so [H_2Cit^-]=0.0242 mM, [Cit^{3-}]=6.3*251*0.0242=38.27 mM, [$HCit^{2-}$]=6.07 mM. Since H_3Cit

is negligible, total [Cit]=38.27+6.07+0.0242=44.4 mM. Hylo Tears has 149 mM Na, so citrates [Na]=146.5, so [Cit]=(6.3 *251+251+1)[H_2Cit^-]=51.2 mM; these are rough calculations, because the hyaluronate contributes to pH too, as well as sorbitol. 44.4 *mM is 1430 times higher than physiological level and a level at which papers, see below, indicate,* very damaging effects in vitro. This makes sense, since natural tears have 26 *mM* bicarbonate alone, plus some protein buffers, besides phosphate and lactic. The actual level will be slightly different, but still high, since we got 127 mM total Na; other drops use buffer combos, so then they got way less citrate. pK_{a3} is closest to our pH, $pK_{a1,2}$ (3.1, 4.8) < 6.4. This tells us what types, concentrations of citrates are in the artificial eyedrops.

Interestingly, some Hylo brands (the rest use borate), Retaine, Hydrasense (Bayer), Clear Eyes, and Refresh Optive/Optiva PF use citrate (buffer or sodium citrate), so since all major companies use it, it may be pretty safe. It's not yet clear what effects *it has regarding* calcium *deposits of a smaller nature if sodium citrate would somehow form* calcium *citrate, given that its water solubility is 0.1%, vs 4.3% for sodium citrate; calcium chloride,* $CaCl_2$, *the main* form of calcium in natural tears has a solubility of 74%; *if highly soluble (74%) chloride becomes citrate (0.1%), then it could form tiny crystals in certain cases of evaporative dry eye,* all depending on how much the calcium is concentrated. BJO 1977;1(8):539-43 says $CaCl_2$ level of tears is 0.005-0.01%, so 10-20 times lower than solubility of calcium citrate. If tears evaporate fast in some areas of the eye, some crystals could form that are not washed by the tear film if tears concentrate 10-20 times in one area, and all chloride is turned into citrate; the least likely (or impossible perhaps depending on whom you ask) event is chloride turning into citrate in high %. Will *they find 40 years later that citrate is bad too, even if obviously, far safer than phosphate at large concentration?* The preservative section explains some citrate containing brands like Vismed Light didn't cause any corneal cells to die in vitro; so maybe citrate is fine usually, even if some studies (see below) found issues with citrate buffers (toxicity depends on the citrate concentration, pH, cells used in vitro studies, etc). Cornea 2017;36(6):712-8 Fig 2 *shows that for* conjunctiva *HCjE cells in vitro* citrate *buffer was* more *toxic than borate, Tris and phosphate at 100 mM.* Is it because of lower pH? *See how all buffers destroy our eyes, when they're at way above physiological levels?* Citric acid concentration in natural tears is only 0.031 mM. Even 10 mM is cytotoxic. Citrate is part of citric acid cycle, so if we swallow drops via nasal ducts, it's fine, however, that is not true for borate (or Tris, which can become strange compounds, so petri dish 24 hour studies on cell viability are not same as 5 year eye studies, since they don't monitor all eye areas and effects of Tris, borate), which can turn into toxic compounds, accumulating in organs, so while eyes are fine, Tris or borate may damage other organs: ☺☺

6). Borate: The EPA 2004 PDF on toxicity lists 1 mg boron/day as good for health; anything above 10 can bring unwanted effects. "Normal levels of boron in soft tissues, urine, and blood

generally range from less than 0.05 ppm to no more than 10 ppm" ► EHP 1994;102(7):113-7. MW boron is 11, boric acid 62, so since boric acid is usually the form in human body, its ppm values would be about 5 times higher. What is in blood is in tears often, so tear boric acid levels may be *0.1-1 ppm, which is very low vs 3000-5000 ppm* in artificial tears; *here is where toxicity comes from, not boric itself, but concentration*. Oddly, boric can have some beneficial effects too on ocular tissue. CDC says in kids serum boron level is 1.25 ppm max. Borate buffer is the most antimicrobial of all, followed by bicarbonate, so for people with acne or styes issues, (borate kills *staphs and pseudomonas*, the main *bacteria* that cause styes: AAC 1986;29(5):803-6, *while phosphate doesn't do much at all for pseudomonas, bacteria grew) the borate is the buffer to use.* Drinking water boron was found to vary 1000 fold from 0.03mg/L to 29 mg/L and this seemingly influenced reproductive outcomes in humans. The pregnant rat studies showed severe birth defects, stillbirth, etc at doses 900+ times higher above we would get from 10 eyedrops/day. However some ointments and gels that stay in eyes at night increase exposure and absorption beyond what eyes can find healthy, even if sperm may not be affected. Borate buffer is often a mix of 0.3% boric (3g/L or 48.4 mM) and 0.3% borate (NaH_2BO_3); pKa1=9.24; 7.4=9.2+log[$H_2BO_3^-$]/ [H_3BO_3], but pH is influenced by other components too, or max 0.6% or 97 mM total boric acid (free or salt) in many solutions or higher, which is about 0.15 mg of boron ingested (tear electrolytes go to nose and then we swallow them) if you place 1 drop/eye 5 times a day, and 1 mg if you use tears with more boron (perborate as preservative etc). ☺☺☺

Refresh Relieva PF bottle (multi-dose) uses borate, while Refresh Relieva PF 30 vials uses lactate buffer; the reason is that borate is antimicrobial preservative in reality, so a bottle used over 30-100 days needs stronger defense than a vial used 3 hours. This may be toxic since most people only ingest 0.87-1.35 mg/day per NIH from food (on average). NIH established upper intake levels of 3 mg for toddlers and 20 mg for adults based on *reproductive and development defects in animals*; however, unless one uses tears with high boron 10 times daily in both eyes, one can't really eat more than 5 mg/day, but it may damage the nose, eyes or lungs: the preservatives section explains more on borate eye toxicity. That's why it's safer to not place all money into one basket, and use other buffers too. Borate is more effective at wiping bacteria ► AAC 1986;29(5):803-6, having been used as antibacterial for decades. JOMT 2009;4:27 has many references to toxicity of boron compounds, when it accumulates in the body, so it is best to not use drops with borate buffer only, but have different brands if using a lot of drops. Boric acid and borate are on the EU 'Substances of Very High Concern' List, for their reproductive toxicity, so if you had your kids it may not do much collateral damage, though that is unclear even for the eye. Odd thing is borate drops go into the nose and stomach, as we swallow the nasal tears and then get inhaled partially, and may damage our lungs even. Since our eyes have individual osmolarity, pH (6.5-7.8), properties, generating tears is way better. Recall how all so called

sterile (un)preserved tears are loaded with bacteria?☺☺☺ Then would borate come on top due to its antibacterial properties? Well, to be safe, you can take 20-100x pictures of eye redness (easy way to monitor dryness) with a phone camera and lens, to see which one is better; if equal, rotate among several brands using 5 buffers (citrate, borate, Tris-HCl, bicarbonate, low phosphate – if company tells you level of phosphate is ≤ physiological 1.45 mmol/L) and different ingredients, since it may take 400 years before they know which brand is safest for your genome, requiring way more complex tests of all ocular tissues daily (over 200 days = $5 million) to see what is best even today. The pictures (or you looking at 20x mirror) before and after repeated after each brand (1 brand/day max) can tell if one is very irritating or not at least, if confounding factors are accounted for and the redness if not caused by something else: see why the mirror is worth $1 trillion. *Because each dry eye has a different pH and cytokine problem, there is no single drop that will work best for everyone, so try more drops*. Drops with vitamin E, choline or HA work for those needing them, while others need more carnitine to turn off inflammation. ☺☺☺

7). Tris: HCl/NaOH without Tris is less safe per some papers, Thealoz, Optase, Retaine MGD use Tris. The Tris-HCl buffer, trometamol-HCl, has side effects, as *borate, citrate buffers do*, but Cornea 2017;36(6):712-8 found Tris-HCl had less damaging effects in vitro on 2 types of epithelial cells (not all): conjunctival (HCjE) and corneal (HCLE) ► 15 to 60+% "decrease of viability in both HCLE and HCjE cells exposed"; 2 authors work for Croma that made eye products, so they may be biased due to formulating those Tris products; they go on saying citrate is less ideal than *borate*, so perhaps, the best eyedrops are those with borate buffer or Tris, because citrate can chelate calcium and cause issues that way. One paper is not enough to make a choice, we need way more papers, and in vivo. Tris MSDS says eye irritation, too little data exists to decide if Tris-HCl is way safer than borate or citrate buffers (since Tris alone, especially without HCl added can also bind calcium etc), but other studies seem to support the "Tris is safer" hypothesis; Tris-HCl is not like HCl added to eyedrops without Tris, it's more like NH_4Cl (which can be called ammonia hydrochloride, as they call Tris-HCl trishydrochloride). Tris = 3 or tri;☺☺ Tris is $(H_2N)C(CH_2OH)_3$, tris(hydroxymethyl)aminomethane, also known as THAM, or ammonia with hydrogen replaced by $C(CH_2OH)_3$. Easy to recall tris, due to 3 hydroxymethyl groups, like citric acid is ci-tri-c, got 3 pKas for the 3 acidic hydrogens of the 3 carboxylic groups (HOOC-$CH_2C(OH)$(COOH)-CH_2COOH, it's the glycerin 3 carbon backbone with 3 COOH groups; easy to recall the citric acid cycle and the 3 carbon for proteins and fats). Tris can scavenge more hydroxyl free radicals than phosphate in vitro: JMBR 2016;6(1):52-7. "Primary amine groups preferably react with the ester to form covalent amide bonds. Currently, protocols strongly recommend replacing" Tris ► BC 2021. R-NH_2 + R'COOR" = R-NHC(=O)-R' + R"OH. Due to the electronegative OH group, the electron density on NH2 of Tris is less than if H was there, so the nucleophilic attack of N on the carbonyl

group of esters (phospholipids of lipid-aqueous layer interface are esters) is weaker. Granted, tears got many amino groups from amino acids, proteins, where COOH group weakens NH2 reactivity, but those are in small concentration and lack the same reactivity.

Since most tear wax esters are the less polar (versus tear phospholipid esters) of tear lipids, they may not be under direct attack after we place eyedrops and blink to generate more meibum, since phospholipid ester groups interface mostly with the water layer of Tris. What effects would Tris have on many esters (triglycerides, diglycerides, cholesterol esters, wax esters, etc) in the eye 3rd lipid layer, *would it disrupt the lipid layer, polar layer first and then nonpolar one, by making exposed inner layer esters (unprotected by polar lipids) of lipid layer holes react with Tris*? Since it's protonated as TrisH (91% of Tris is TrisH+ at 7.1 pH of Optase, Thealoz, Retaine), we got 9% as amine form only (see below), but still could do something. In vivo the probability for Tris-phospholipid etc reaction can be *very* different than in vitro. Does it make sense to use it in Retaine MGD to 'enhance the lipid layer', the only US lipid drop with Tris and only Tris EU (under Cationorm name) lipid drop? Tris is very common in many drops without lipids too: Optase, Thealoz, etc, so because these drops are for more aqueous deficiency, Tris may not do a lot of damage, since there are fewer lipid holes, but for people who buy lipid drops due to MGD (lipid deficiency, lipid holes, in 86% of those with dry eyes), they look at only enhancing the lipid layer, not also undermining it slightly. I don't know, but these are the questions that arise when we use something the eye is not used to last billion years. See what happens when using Tris drops and then decide. Few USA drops use Tris, it's the only buffer that mimics a little some protein buffers in the human tears, though most buffering in tears is done by bicarbonate; Tris is the only buffer with an amino group. This reminds me of redness relievers, who provide white eyes for just a few hours, but come with rebound redness effect and other side effects that cause redness. So, the paradox can be, we buy a lipid drop, it has some unnatural mineral oils as lipids (Retaine MGD) that enhance nonpolar layer of the lipid layer, but may also undermine the lipid layer made mostly of esters. Everything is complex when we have 2100 chemicals in tears alone, not to mention those on cornea, meibomian orifice surface.

Tris is used as buffer in biology and biochemistry or intravenously in some diseases, like acidaemia, though some claim US doesn't use Tris/THAM for that anymore. So Tris-HCl is more like tetrahedral NH_4^+ ion and Cl^- ion, a weak acid, with the pKa of 8.1 for $(^+H_3N)C(CH_2OH)_3$ vs 9.3 for NH_4^+. pKa (8.1) = pH (7.1) + log([TrisH$^+$]/[Tris]), so Tris is 10 times lower than TrisH. Due to the electronegativity (tiny negative inductive effect) of $C(CH_2\text{-}OH)_3$ group (-CH_3 is EDG, -CH_2-OH and -$C(CH_2OH)_3$ are EWG) that pulls electrons from nitrogen (compared to hydrogen in ammonia) as an EWG (electron withdrawing group, not electron donating group, EDG), the free electron pair on nitrogen is more tightly bound to nitrogen, less able to form the TrisH bond, so TrisH$^+$ is more able to dissociate, making Tris-H^+ more acidic than NH_3-H^+ or ammonium ion. Some think Tris is

safest, after phosphate at ≤ 1.45 mmol/L, but a similar compound, TEA, $N(CH_2CH_2OH)_3$, similar to Tris which is $N(CH_2OH)_3$, is quite toxic, possibly causing allergy at times in cornea/conjunctiva cells. TEA SDS says avoid contact with eyes, it's mutagenic. Tris SDS says to rinse with water if you get some Tris into your eyes. The BAK preservative, the most toxic, has a similar structure, being $NR_4^+Cl^-$, just as Tris-HCl is $NR_4^+Cl^-$, with one R being H and the other 3 being CH_3.

8). NaOH/HCl: Current eyedrops are like chariots, Immortality Capitalism eyedrops are like latest space rocket, there is no comparison, 1000 times faster and better. One 'issue' with some eyedrops is that it says "may contain sodium hydroxide (NaOH) or hydrochloric acid (HCl) to adjust pH", which seems bad as those are corrosive for eye cells (in high concentration), or is that so? It may be if they're used alone without a real buffer, but that is very rare. A formulation doesn't reach $[H^+]$ ($pH=-\log[H^+]$) of natural tears or $[HO^-]$, and if you recall in chemistry, H^+ or HO^- can come from the reaction with water of many chemicals. So a tiny amount of HCl or NaOH added to a tears is not as bad as it sounds, since those same H^+ would come from another equilibrium; our natural tears chloride concentration is 120 mM. What often happens is they list boric acid and NaOH or lactate/Tris and HCl, which basically are borate, Tris and lactate buffers, since HCl reacts with lactate/ or Tris (often listed as trometamol not Tris to trick people) to give lactic or $TrisH^+$ and NaOH with boric/citric to give borate/citrate. HCl and NaOH can't remain free, they always react with some weak base or acid or conjugate. *The FDA allows these people to say it "may" contain, without stating when it does or doesn't, which would protect the consumer,* while revealing a trade secret. *Unfortunately, this is the world we live in, peace doesn't exist yet*. We don't know if "HCl or NaOH" are better or worse (if no buffering acid or base exists) than *pH adjusters like borate, citrate, EDTA*, or other ingredients like polysorbate 80; usually they write "HCl or NaOH" to indicate lactic or borate buffer when writing only lactate or borate or boric as ingredient, or that they added a little extra to shift buffer pH by altering the ratio of borate to boric acid, so there is nothing toxic or dangerous about it, it's as if they would have put more borate to start with. Just because something is not HCl/NaOH doesn't mean they can't be worse for the eyes, since not being HCl/NaOH, they're used at much higher concentration. For many some chemicals in food, cosmetics, etc, thought of as somewhat safe, FDA doesn't require companies to list them, so citizen scientists or medical researchers trying to do real nutrition, exposure science can't know what's in there even when the company knows. Just like we will have Eterni foods, that help us to live 10-50 times longer, due to eating them since fetus stage (pregnant mom), we will develop eterni *eyedrops* that help us in the transition period to keep our eyes healthy (like those of a 20 year old) for 200 years. To do that though, we need far more advanced chemical analysis equipment as explained below.

Some may say that we perhaps need a President (with some nice "Immortality *for* All" *(*so all have Eternity to become sweet, like loving kindness*), or IFA written on his suit, shirt or T-shirt, or*

cap, sort of like MAGA or MAIF, Make America Immortalist Forever, "Immortality for All" or IFA would be the slogan of Immortality parties worldwide*) and* government in almost every country that tweets (talks on TV or social media, allow some nice twitter colorful fonts to make Immortality *for* All *stand out) daily*☺☺☺ *about chemistry of food and medicines, challenges of 99.99999999% chemical purity and chemical synthesis in general, physics and engineering of chemical analysis equipment and how hard it is to build those, and arouses the interest of millions of people to recreate the chemical testing, food and medicine industries, so everyone knows with a phone scan of a barcode or entering a number in an app, the amount of top 90,000 chemicals in that product, in decreasing order, from highest to lowest. To do that, we could give free tuition to redundant restaurant workers who, in some businesses, often sit idle in off peak hours, consolidate restaurants and transform our cities from places with 100 restaurants, many half empty hotels and 0 chemical longevity and* Immortality *research centers or parks, to something with fewer restaurants and* all totally transformed into high tech educational ones*, 0 casinos, 0 strip clubs, 0 vape stores, 0 liquor stores and 50* Immortality*-Longevity research and* eterni food science parks and businesses *that create*☺☺☺ *attogram level precision food/medicine products for really* precise nutrition and eyedrops, medicines science*.*

Why attogram? See the attogram and atomic tracing *section. Free tuition is* to get chemistry, physics, biology, engineering degrees to create millions of jobs in the new testing industries required to test everything, and eventually also build by year 2190 a more 22nd *century analytical equipment: place a juice/medicine drop in an instrument and in 30 minutes it lists how many mg* (10^{-3} g) *or* atto(nanonano 10^{-18})grams of half a million chemicals are in it; today it takes weeks, 900 instruments, and 80 million dollars, *and low level is not even possible with hundreds of people working*. We can eat at home far healthier than at restaurants due to automatic pressure cookers (10 food appliances into one) that do all cooking for us (faster than waiting in drive thru or eating at restaurant), but we can't build in dining or living room a $700 million lab to discover best food or eyedrops. *Why take so much space with Paleolithic food businesses?* Some eyedrops have many inactive ingredients and some may have *unknown long-term effects*.

When you go to the store and buy eyedrops, under active (not inactive) ingredients you will see some chemical name and on the right saying it is a *lubricant, astringent or* redness *reliever*. ☺☺

11.17.5. How redness *relievers* cause *rebound* redness, inflammation and *dryness* long-term

1. Before going into how redness relievers damage the eyes, being highly acidic, here are 3 *alternatives* to redness relievers *(that require some eyelash curling explained next paragraph, just as warm compresses do)* for *instant whiteness* of the sclera, the outer white eye area:

1.1. White sclera and less *dark* circles via cold 'compress'; gentle cool slider ziploc type (30/1$ @

$ store, replace often, wash daily or wipe exterior daily where it touches eyes with alcohol pads) water bag will protect your MGs from cytokine storm from dilated vessels that destroys meibocytes and gives dry eyes, so dark circles need be prevented to prevent dry eye via MGD of the lower eyelid (what 90% of people first have is lower eyelid MGD). Few girls know a natural way to use far less dark circle creams that can cause MGD: cooling, better sleep and eating more watery produce. A safer way to cool eyes is not via freezer compress, but using a slider ziploc bag you wash daily (the best sliders are easy to open and close, don't leak much so that they prevent filtered (always filter water before placing in the bag) water from entering eyes, and have thin (not the thick type, meaning most) plastic that adheres to the eyelid far more perfectly than thick ones that require more pressing to cover the whole eye and thus thick ones (most zipper bags) can damage the eye; the only thin safe brands I know of are these 3: 25/3$, Tuff 'n strong brand which opens/closes far easier than most, ziploc bag from Dollar Tree of 4 colors called SureFresh 40 bags/1.5$, thinnest and best, or clear SureFresh too 40/1.5$, the best as clear allows you to see dirt better and replace/wash it with alcohol inside. Canada has SureFresh too. Don't buy the thicker SureFresh that are 20/pack as those are not good for eyes, damaging them due to inflexibility and inability to release weight; while pricier than other brands, these last longer without leaking from the bottom (almost all leak from the top where the slider corner is if you place the water near that corner and bent it too much, so place your 40 mL in the corner opposite of the closed slider), so you save more $ in the long run and is superior in every way to the cheapest; check local thrift dollar store or Amazon, though Hefty bags leak a lot and are too thick; other brands can be thicker than Hefty or ziploc; only one out of 30 brands is really thin; thin slider ziploc style conform to the eye shape, while thick ones (such as ziploc brand) are *inflexible and damage the eye* by *pressing hard* in one spot where it bulges, so only put a little water to prevent any pressure) that gets tap water inside that is cooled via the iced water inside a round container or via ice cubes (half full; let it ice, then pour tap water on top of the ice, wait 2 min, then pour the cooled water into a ziploc bag). 1 million pharmacies worldwide sell cloth warm and cold compresses that increase risk of infection 1000 fold versus these bags that you can wash before each use with soap and water. Cloth can't be washed well☺☺☺, it just traps bacteria, microalgae, etc. The MDs with all their PhDs could not design anything smarter; buy a light color cloth (not green) one and see how green it gets so fast, even after washing, the tap water has algae. Even without algae, after 1-2 month it gets a little grey in some areas if used daily. Cooled fridge/freezer (in a steel thermos to avoid microplastics) filtered water is much better than using tap water+ice cubes, because your ziploc bag will stay dry, not too cold, the cooling effect lasts long as you can (but not ideal to keep thermos clean) repour the water into the containers that have the ice to recool it before inserting back into the ziploc bag. If you use ziploc bags in the fridge, they're so warm so quick, that they will be useless without ice cubes.

For those who want to use ice cubes inside the 2 ziploc bags (one per eye if you need it), here are some suggestions: *place 3 drops of liquid soap* in the round container*, then add 40 ml water and shake it with lid on until it foams. The water bag can be washed separately with just some soap and rubbing it against itself.* Clean exterior of container too; can empty bag first to wash it easier, less cold that way, then refill with fresh chlorinated tap water to prevent bacteria growth in the bag water; discard water after cooling, to prevent algal growth. The cubes can be placed with the ice tong in a ziploc bag directly before each use, then add cold tap water. The ice cube way uses no container, but uses the sealed ice cube tray (it's the same thing, just different shape of ice), just a bag you keep in the bedroom and fill with water & ice cubes. Normal 6" long (XL), 2 cm top 6/7$ ultra easy to clean tongs (unlike most in stores that have handles whose inside is impossible to clean well, allowing bacteria to grow and then crawl on your ice cube and eyes) are easier to clean than ones with 'teeth'. Opt for a simple tong easy to clean with soap, since teeth allow bacterial films to develop, are not going to be cleaned well by 99.99% who won't take the time to get into every crevice, so over time they reinfect all ice cubes with junk. This gentle cooling doesn't inflame the eyelids as bag surface is 55-72°F in the worst case, not 35-65 like a warmed up (via water sprinkling) freezer compress. You can use 40-50 ml (g on kitchen scale) H_2O in the bag (it's best to use ≤ 60ml), as it's more flexible and easier to cover the whole eye with least pressure, just barely touching. Small volume enables you to avoid cooling the nose (by accidentally touching the upper sides of the nose side for the eye you cool once), as it lowers the immune function of the nasal cells, key to protecting the lungs from bacteria and COVID19. Since you can put tap water over frozen H_2O in the round container, to cool while you use the first 50ml, there is no need of ice cubes or 60+ ml. It *cools eye fast without the shock of such low temps*; you can also insert ice cubes if bag water got warm.

How to use on the eyes: while looking towards Earth center, relaxing on the bed on your belly with a normal folded pillow under the opposite to the eye being cooled cheek to support head slightly and another small pillow to support the cheek of the eye being cooled (for more room for the *bag to rest on the daily cleaned container lid*, lid that you hold in the hand to barely touch the eye, lid which holds the bag to avoid contaminating bag by over touching it). Gently allow nose to breathe between the two pillows (or just use one pillow and rest one cheek or the chin on it☺☺☺), and the bag to be there held by both hands, as you lie 98% horizontally meditating on World Peace in 3 months and cooling eyes gently, *placing* gently the bag from above the eye first, so that, as you roll the bag on the eye sort of, you don't bend upwards your upper eyelashes, as that would remove eyelashes or create a stye at their base due to excessive movement there and a falling eyelash that got infected at the root, creating a rhombus with your upper hands and lower hands between your heart and eyes, to support the head at almost horizontal incline and you *hold the bag in the 2 hands gently to barely touch one eye at a time*

for maximum dexterity and minimum pressure, without any pressure, so no gravity of water presses on eyeball. When cleaning the container and the lid, use *gloves* to avoid too much dry skin from chlorine and wash the bags with soap, then use bags to rotate in the *round containers*, to wash container too and then rinse both. For good thread cleaning, use a 70% alcohol pad to *wipe strongly, while folded in 4, the threads of the container, lid at least once every 2 weeks, not just wash the container and lid with soap, but getting the threads very well washed with the sponge dedicated to this or isopropyl pad, since the threads are forgotten and can get greenish due to green algae with time. Clean the container weekly if you use it often.*

It seems far safer, and ☺☺*lovingly gently* kinder☺☺ to avoid leaning on elbows because you will damage, pinch the elbow nerve, just rest the 2 cheeks (without ever pressing on the eye with the pillow opposite to the eye being cooled) on the pillows and relax, with earplugs on for 10 minutes, meditate, or listen to peaceful music. Or sit on your chair if you don't use one pillow and change its position. Use some XL like cup mask without much inner foam pad as that pushes on eyeball, if you're a side sleeper who presses on eyes, since you don't want to get a genetic change that causes inheritable predisposition to glaucoma and its 1% of cases result, blindness in old age. *It will take 5-8 minutes or so to make eye way whiter, like after a redness reliever drop ODs/MDs prescribe and insurances cover, drop that damages the internal eye structure thru toxic preservatives, chemicals, and more inflammation since the sudden contraction of blood vessels takes seconds, not 5-8 minutes, etc.*☺☺ Kindly*, please don't* do any water bag or cold/warm compress *horizontally* while looking at the *sky* (as some do sometimes with the encouragement of ODs and MDs) *without* having a clue how dangerous it is, since when tired you don't realize how much gravity of water will push retina; to avoid any major gravity from the bag if you forget this, place only 70 g (kitchen scale) or less. 1g=1 ml water. Store each bag in a separate, easy to seal, small round container like this screw on lid, plastic is best, quiet, leak proof, Vietnam made one. You can use the lid interior to hold the cold bag to avoid tranfer of hand bacteria to the bag, because the lid, once flipped, can rest on the round container and make it ultra easy to hold the bag without touching it, so your hand doesn't get cold like with classical cold compress. Use *finger to make a cavity in the bag to position eyeball into and rest there. You can rest the plastic container lid on the bed too and not use container to support the inverted lid (the clean inside part in contact with the clean bag), it all depends how tall your eye position is from the bed, how tall the pillow or support is, your position. Write* a smiley face on the left container to know which is which, *to prevent infecting one eye with the other's stye*. The freezer takes hours to form ice, so you can keep the bags in the freezer for 40 min to cool them faster or simply use freezer ice cubes to place in your bag water to cool it in 5 min. Try use 2 separate small, maybe 8×8, kitchen towels for each eye to use after daily shower, if any stye present, to prevent cross infection. Use towels on orbital area only, not forehead or any face

part *that has way* more P. acnes bacteria from *acne that destroy* MGs *and give* styes.

Amazon has many sealed with lid (lid is absolutely required) ice cubes trays to keep ice free from *food* microbes, since bag water leaks. I prefer lighter in color trays to see dirt; flexible on the bottom *silicone* may trap *bacteria* far more than *plastic and* increase risk of cross contaminating all ice cubes with ever more bacteria stuck to the soft silicone, *giving styes, chalazions and* MGD. A safer alternative for ease of pushing ice out, with less silicone to water contact, may be this double tray type, to minimize *bacteria* contamination. Use an ice tong, used for that purpose only, *to avoid ANY hand contact with the ice cubes. The safer types* may be 100% plastic, 0% silicone that is sticky and can over time trap bacteria films that are impossible to wash (*mold,* algae, microbes stick to tiny crevices in the soft material) vs hard *plastic. Try replace bag(s) every week to prevent microbe growth;* replace H_2O often and trash bags as soon more than 1-2 drops can leak at a time to prevent harsh chemicals in even filtered water damaging eyelid; wash bag inside and outside with soap before 1st use and often after that. For 14$ you get 3 trays: *this is the one I used sometimes when container is full of warm water due to me forgetting placing it in the freezer;* this tray is way better than 99% at Target, Walmart, etc since you can close and open it without making any noise if you're gentle and press the sides where the white rubber is down when opening and closing before pulling it sideways, has perfect seal. This one got a best in class seal, which is hard to find. I ordered and immediately returned Jytee due to a lid so loose, all crap can get in Jytee Korea made ones. I place 2 trays, the ice tong on top of the 2, to avoid contaminating it with fridge air, then I simply invert the full tray onto the lid and slightly bend the tray to make 4 ice cubes fall on the inverted lid (inner side up to prevent contaminating the ice cubes with fridge microbes), then I place the cubes in the bag(s) to make it as cool as if it stayed in fridge 3 hrs when bags are warmer due to using them again or longer. 3 trays don't allow for the ice tong and are too bulky and makes it hard to seal, so store one in a cabinet. It's all white, easy to see hair, tiny food particles if various colors, dirt, yellow from algae or any mold. There is a big temptation to try silicone tray due to being a little easier to bend, but it can suppress ocular immune system (silicone) and trap more bacteria. Trays with bins and pins are not sealed well at all, dangerous. Opt for much bigger☺☺☺ cubes (2 per width instead of 4), so once you pour some water or wait 1 min, it's super easy to take out with a tong in 20 seconds instead of having to scoop 3 times more cubes to get the same ice volume. Avoid the ultra unsafe, small cubes, with plastic (not silicone) pins to push it out, with bin and scoop 16$ twin tray because cleaning the plastic pins and places in between is so hard. Any ice cube tray with pins is usually a poor seal, while the plain ones with normal no pin lid offer a better seal. The food mold, microbes soak the pin side in 100s of layers and then you use that to push the ice and infect your eyes, so be aware of all possibilities of contamination if you buy anything fancy from Amazon. If you get a pin one, try plastic or ultra hard silicone that can't trap bacteria, when

stored in the freezer the seal is perfect and pins point inwards like this one, not outwards. You still risk allowing bacteria to hide in the base of each pin which is impossible to clean well. You may save 20 seconds to get some comfort when pushing out ice with the pins, but then have to spend 20 months dealing with a stye from the pin base bacteria... antibiotic drops, etc. Always think of the long term too. If left outside the freezer for more than a minute, the ice cubes will melt into each other, becoming bonded slightly and be impossible to easily scoop or grab with a tong, so move cubes into bag fast and place tray back in the freezer.

On bad days, if you watch your under eye and eyelid daily at 1x or even at 20x, for smaller changes, hard to see at 1x, if you're not *vegan* and eating more fat as a result, you will notice the swelling more, just as eyelids can swell during bad days, bad nights. This is how ziploc bags *can do wonders to return the eyelid, under eye to its normal shape, avoid the permanent vascularization and fat deposition that happens when it remains swollen a long time*, leading to swollen eye bags or eyelids that then become like belly fat under the eye and acting as a source of permanent inflammation of the eye. Cold compresses are helpful when you wake up with ocular mucus due to some attack or reaction to a bad drop, since removing it with a sterile q-tip moistened in sterile saline is not going to remove all, you need to blink for 10 minutes to push more in the corner and then to cool it with cold bag for it to become more solid, precipitated and easier to move to eye corner where it's ultra easy to drag out by "pulling on the one outside the eye corner, which drags the stuff within the eye as they're one blob of white-beige mucus."

The cold ziploc bags are placed so that water first touches the upper eyelid, then the under eye gently, to thus cause far less eyelash falling and stye formation from frequent eyelash falls by cloth dragging them too close. The soap from the bag washes away, while on cold CVS compress, toxic soap chemicals and junk from other compress uses remains even after washing and irritates eyelid skin, reinfects eyes with stye forming P. acnes, accumulates green algae/water sediment. CVS is expensive and they tend to press on eyeball, even if you try to make a valley inside the compress: CVS means a new compress every 3 weeks to avoid infections and green algae, sediment etc from daily soap washes, 8$ vs 15 cents. CVS stores water sediment from washing it daily, etc, while water bag is soft, matches eye shape perfectly. A compress needs be pushed against the eyeball to make contact pressing thus on the optic nerve. Don't bend eyelashes, *since otherwise,* eyelash will point towards cornea over time *and scratch it, causing big* redness *and* needing cornea pointing eyelash trim. CVS type is on Amazon as gel beads mask (Walmart pharmacy sells those for 5$). Try sit on your belly and face the pillow, while barely touching eyelids, preventing bag form falling on the bed, avoiding any pressure on eyeball, with the bag to cool, 0 pressure to avoid gravity pressure that damages your optic nerve. ☺☺☺ Bag is way better than CVS/RiteAid Amazon compress, since your eyes won't get wet with dirty tap water full of chemicals and crap from the compress, tap water after you washed it and won't fog

your glasses or silicone seal glasses afterwards if you use that instead of scleral lens, eyedrops (except some sterile unpreserved no buffer 0.9% saline sometimes) or punctal plugs to avoid dryness. Cold bags shrink the pupil, just like pupil shrinks in complete darkness and when we sleep, it sends signal to brain to diminish awareness and to go to sleep, so we fall asleep fast, these bags are ideal for those having a hard time to fall asleep.

The cold compress (even if just like cold water temp) helps water condense and this water sticks to eyelids and ocular area; once we put silicone seal glasses on, (a pair worn loosely, to avoid too high moisture that ruins coating, for 5 min to blink after cold compress to simulate rainy weather, to speed hydration via easier blinking due to moist air), this water vapor hydrates the eyes, as lysozymes etc come to destroy any bacteria in the vapor, as they did for millions of years we lived on the beach or humid climates. Only do cold compress after yawn tears or saline, since some drops can clump at low temps and scratch the cornea or conjunctiva or create thicker films that produce cytokine storm, inflammation via 'foreign body sensation'. Forehead and under eyes, nose need to be free of creams, powders, etc as these can get on the bag/compress and then into eyes drying them. Nose often gets stuffy after cold bag if you touch nasal areas or sinus above eyebrow areas (don't do that, touch only the eye with the bag), so use simple exercises to unclog nose (see youtube "how to unclog nose"), like alternating between tongue touching mouth roof and thumb pressing between eyebrows above nose, cheek-ear exercise.

►►*How to curl back eyelashes and/or trim them*◄◄: after using wrong size foam night moisture mask or cold compresses, *eyelashes* can *become* straighter and *need to be curled back*, so we use fewer drops. If using a lot of sticky drops etc, they can fall by gravity on lower eyelid, dry during night and then when eyelash moves uproot eyelash faster, so you may notice fewer eyelashes on lower eyelid; clean eyelids often to avoid sticky dried lubricants (HA, etc). Search youtube for "how to curl eyelashes" to get clips on doing it in 30 sec with a 7$ curler. We don't need curlers, we can just use a clean washed hand to slowly bring them up once/week, hold it up 2 minutes. Curlers work on upper only if they fit your eyelid shape well. Most issues are with lower eyelashes, so you could use a tiny piece clear tape, a tiny but to tape the end, the third lowest end of them to have the few wrong pointing ones point down again, instead of trimming them. Leave the tape on for 2 hours and then take it off gently. This way you never have to deal with trimming.☺☺☺ Or if only 1 upper is pointing down and all nearby are pointing up, use the plastic tube of a clean q-tip to slowly move that lash behind the correctly aligned ones, so they will force that one to be as low or as high as the normal pointing ones; just don't touch eyelashes next 5 hours so the good ones force the bad one to straighten. This only works if most nearby eyelashes are pointing correctly, not if all 5 in a row are pointing towards the eye and are very thin; upper lid has way more eyelashes, so this technique works way easier there, since lower eyelashes get more bent by silicone glasses, compresses and masks. We shed 1-5

eyelashes daily and it takes 1-3 months for an eyelash that was trimmed to grow again to normal size; it's best to realign them without trim, since frequent trimming weakens them; correct your mask foam, your silicone glasses, stop tossing at night, discard eye masks that bend eyelashes and do cold ziploc bags only when absolutely needed or with extreme care to not bend lashes. Curlers don't match eyelid shape exactly, so they can lead to mixed results, so with your finger it's much safer. Girls first curl it at the base to make them point upwards, which is all we need; girls like to squeeze the curler a few times in the middle and even top once, to make them curled (you can do that too if being long and straight up touches your glasses too much), but all most guys need is to have them point upwards, as guys don't use mascara to damage the MGs, guys just bring eyelashes out of the field of view to avoid touching the lower eyelashes too much causing irritation of eyelids, to avoid touching the silicone seal lenses, as that ruins the antifog coating and contaminate eyes with that soap of the coating. They also have 7$ eyelash trim sets that include a curler, but only trim eyelashes if you absolutely have to trim some stubborn lower eyelid one perhaps or to save time, since if you don't trim them fully they can pinch on the upper eyelid or trimmed eyelash may be harder to feel/remove if getting inside the eye. We don't want trimmed eyelash or eyelash pieces inside the eye, causing redness/infection without us knowing it's there: wash eyes very well after each single trimmed eyelash.

They got safe *round* eyelash/eyebrow scissor like *1.*. 4$ set with a bent pair & ultra round 1 for 30% group trim (good mostly for the eyebrows and minor trims to reduce size to 70-80% of original) or *2.* ☺☺☺ *the 1 I use*: 4.5$ round top thinnest top of any on Amazon to get to that 80-95% trim, for highest precision leaving at the base 5-15% of original (this gets only 1 annoying eyelash trimmed without bending nearby ones; be ultra careful to only open a little bit and see well, to avoid trimming skin, especially on upper corners where it's hard to see and get good angle). I would never pull eyelashes, since that could cause an infection or stye, just curl/trim them and trim foam inside mask. Use 20x mirror for this, not 1x mirror, so you see very well, do it only on the most rested mornings, not tired, so you do it correctly and safely. 1st time, using a normal small scissor it took me minutes to trim, 2nd time, with the 4.5 one, took 5 seconds, since it was center of eyelid and lower eyelid where it's ultra easy. We need to trim it the right way 1st time, because if we trim it only 50% instead of 90%, or only 70% instead of 90%, it will be very hard to trim that left over 30% to 10% if it's on upper eyelid corner where it bends due to side sleeping with mask; don't rush, buy the correct tool first, trim it 90% the first time. Trimming a 100% to 10% is ultra easy, but trimming a 30% to 10% is 50x harder in upper corners, even with the best scissor. After you get the eyelash scissor, trimming is done with precision 50x easier in any area versus using a thick blades at the top, round top scissor (not made for eyelash). Guys don't have these tools, so they can ☺☺*lovingly tenderly gently kindly*☺☺ spend 4$ to save eyes.

A reason cold compress makes tears sometimes (besides making eyes whiter) is lacrimation

induced by stimulation of cold sensitive primary afferent neurons of the cornea. On bad days when a bad sleep caused red eyes or whatever, many cold compresses can help the eye to return to normal to prevent permanent dilation of arterioles. Good sleep is key to returning to normal whiteness of the sclera, so get good sleep, generate tears, do a few cold compresses (much safer than using acidic redness reliever drops) on those bad days to avoid ever increasing redness. Our eye whites need be white and clear of redness and inflammation, since otherwise many vessels will cause over decades a super high inflammation and more opaque cornea, no longer crystal like, but reddish due to so many arterioles, introducing blur that is undetectable due to the huge span of time this occurs over. Cool with bags only one eye at a time, to bend eyelashes less. Try look the opposite direction, i.e. left if I do right nasal corner, etc to avoid overcooling the iris as that may not be healthy. A side benefit of cold compress, besides white eyes in 5 minutes, is hydrating the eyes indirectly slightly, though this hydration is mild compared to saline drops if not followed by efforts to generate tears; the cold compress allows the reset of ocular stress and induces lacrimal discharge, just like cold shower induces peeing; it is by this 2nd mechanism, aided by voluntary yawn simulation, that full hydration can occur, bypassing the need for drops; once we learn how our lacrimal nerves work, we can train them via Pavlov like mechanism to act the way we want. The ideal way to avoid redness is regular sleep, checking eyes with a 20x mirror daily to see tiny invisible redness before the big one at 1x is visible and address what caused it, avoiding very warm showers (unless doing a gentle *eyelid massage using the* small *finger of the* left *hand (if* right *handed), since that finger is the* cleanest *of all 10*, wash it well before massaging) that acts as a sort of MG expression for a max of 1 min).

If you wear moisture mask day and night, your eyes will get warmer than usual (sort of like moving to Hawaii or some tropical area perhaps) and maybe a little redder, since you try to avoid tear evaporation. As such, a few mild cooling sessions (cold compress, colder showers) a day to reduce inflammation won't really solidify MGs oils or impact ocular health, but help reduce inflammatory cytokines brought by enlarged vessels on bad days when you strained your eyes too much without blue light glasses, moisture masks, computer breaks, tear generation, drops, etc. Recall to wash hands before handling cold compress and to wash cold compress often, to avoid dirt getting near eyes. I was shocked how much a ziploc bag with cold water made my eyes from red to bright white in 4 minutes, way brighter than the methods below did. I use them on my neck sometimes to feel better as if I took a shower, makes me feel I slept 10 minutes. You want to reduce inflammatory cytokines immediately by restricting blood flow for 30 minutes, apply drops, generate drops, rest, with eyes closed and take immediate measures. Monitor eyes 10 times daily with mirror near computer, to tell you when it's time to take a break and maybe get 2 20x mirrors, one near computer, one in the bath. It works better, faster than any redness reliever on the market. Better than cold compress alone, on the worst 5

days/year, seems to be the combo of saline(daytime) + cold bag + yawn tears or, when needed, thicker than saline drop you like: prevents strong redness on exhausting days more than any artificial tears alone. Ointments are better avoided, due to many toxic chemicals, but silicone wrap around glasses to prevent moisture loss are key to preventing redness, as well as frequent computer blinking, breaks. Recall to also wash your ziploc bags daily and clean them, since they get dirty due to hand contact; always wash hands before doing warm/cold compress, to avoid messing up your bags with hand bacteria, even if freezer temps can inactivate most bacteria, once bag gets warm, they're back to life and populate your orbital areas with joy. Avoid any eye drop that needs to be stored above 15°C, since gel like drops like that could form crystals damaging your cornea until temperature returns to normal. ☺☺☺

1.2. White sclera via cold shower: you will be shocked just how fast your morning eyes (a little redder than during daytime, since gravity pulls blood down, while when we sleep a lot more blood goes to eyes and head) become way whiter with just 1 minute of cold water from sink or shower (run it against nearby areas, so the eye gets no jet pressure, only cold water; if weather is warm, your shower water trickle will be warm and useless). Cold shower is not the best idea to cool eyes, as chemicals in city water can ruin and swell the eyelid, degrading collagen by chlorine, etc. I was shocked 2 min of cold water whitened the eyes 50 times more than 6 minutes of *Refresh* Plus with eyes closed. Since shower filters degrade faster if we turn water off when warm, it's a good idea to turn last 30 seconds of a shower with cold water to bring temp to cold in the filter and to rebring eyes to normal whiteness before the shower; otherwise, eyes will accrue redness over time due to warm showers that induce oxidative stress in the conjunctiva. End warm showers with a cold mini eye shower, so eyes are whiter in 20 years.

1.3. White sclera via *cold* water in a thermos (collected at night, when water is 50-67): same method as the first one, *use ziploc bags but no longer need fridge*; this can work in remote areas without fridge if you go camping, etc. 8 oz bottles/4$ *with* cap *to prevent air fungi, dust mites, viruses, bacteria can be used to store/wash the bag exterior with cleaner water, in case clean water is sparse;* thermos keeps water cool 24 h, 50-65°F (fridge gets there in 3 h, freezer in 0.5).

2. It's better to not overdo eye cooling *if not* using moisture masks that *warm* eyes back up slowly, due to risk of solidifying meibum in our eyelids for people with thicker oils:☺☺☺

When a drop artificially constricts the vessels and the gravity causes the constrictor tear (typical Visine, etc) to fall on the lower eyelid orifice, it could cause the orifice of the MGs to be nutrient starved and to close since nutrient supply shrinks; the blood vessels that feed the MGs are, like the glands themselves, located on the inner eyelid in contact with the eye and they get constricted too, meaning glands and orifices get nutrient starved, gland atrophy sets in: chronic shrinking (using the usual CVS drops) of the vessels will deprive meibomian and other ocular

lacrimal accessory glands of orifice renewal and oil/tear production, which will cause tear evaporation and underproduction, bacteria growing on the dry ocular surface due to no longer flushing them (staring at screens, etc), infecting the MGs and closing them, creating styes or chalazions; a negative feedback loop starts where the MGs get less and less oil produced which leads to more glands closing due to bacterial growth and nutrient starvation; that's why it's best to address the real cause of redness, not the symptom with redness drops or 2 min cold water trickle (carry a thermos with colder water ziploc bag inside, place on eyes 5 minutes before an interview starts, so you don't destroy your eyes, lungs, nose, vascular system with chemicals, to 'look good'). When doing cold water ziploc, eyes are closed, so the orifice remains quite warm and doesn't get the nasty chemicals in preserved drops or the unpreserved using man made (never before experienced by eyes) lubricants, emulsifiers, etc; on top of that, redness relievers can get into the blood stream and reach areas far beyond the surface of the eye (they could shrink arterioles in other eye areas damaging them, causing glaucoma and blindness via the starving of back of the eye retinal ganglions of nutrients, optic nerve atrophy increasing by 5-10%), since tears travel via the nasal duct into the stomach and sometimes can get inhaled, damaging the lungs by causing nutrient deprivation via arteriole shrinking and easier (since vessel is narrower) venule/arteriole blockage due to plaque forming after a high fat meal. Most watery tears (without redness reliever) have 0 effect with 5 minutes closed eyes on severe redness, while cold water bag does wonders in 3 min; these 3 cooling methods give us 4 months to heal MGs and not pour chemicals into eyes when red.☺☺☺

3. Why do doctors warn against redness relievers? How do they damage eyes?

Zinc is in many cheap preserved toxic redness reliever tears as astringent at 0.25% $ZnSO_4$ (2.5g/L or 15528 µM, or about 300 times *above physiological* level, lowering immunity and inability to fight off bacteria (more styes), spiking inflammation. High zinc can make eyes dry. Many MDs recommend *avoiding* redness relievers, like tetrahydrozoline-HCl 0.05%, common in Visine, Clear Eyes, Rohto. These brands are acidic and thus eye damaging for most people, having pH 5.7-6, while natural tears are usually 7.2-7.4. On every bottle, Warnings say "Ask doctor before use if you have narrow angle glaucoma"; the US Academy of Ophthalmology says redness relievers "shouldn't be used for more than 72 hours… use them only occasionally and for a short period of time (such as before an important meeting)" and those made from decongestants (most on the market, even Lumify (pH 6.2 probably) is bad for *glaucoma*, since antihistamines are bad) can lead to medical emergency for those with *glaucoma*. All redness relievers out there, except Lumify (which shrinks mostly venules), shrink *both arterioles* (that bring *oxygen* and nutrients to the eye) *and venules* of the eye, making the eyes drier in the long term due to *diminishing* nutrient supply to the tear transporting cells and causing allergy or *diminished function* of the *oil producing* glands of the eyelids (oils key to the lipid layer of the eyes). OVS 2018;95(3):264-71

explains brimonidine tartrate in Lumify caused *minimal rebound redness* after being used 4 times daily for 1 month (short-term study, rebound redness usually takes 6-24 months to develop) and that "Current ophthalmic decongestants are *adrenergic receptor agonists* and include the sympathomimetic amine phenylephrine and the imidazolines naphazoline, tetrahydrozoline, and oxymetazoline. These agents are α1- or mixed α1/α2-adrenergic receptor agonists and reduce ocular redness through vasoconstriction. However, their use is associated with tachyphylaxis (tolerance or loss of effectiveness) with continued use and/or rebound redness upon treatment discontinuation, which restricts their long-term use. These adverse effects are likely related to the actions of these agents at the α1-adrenergic receptor. Tachyphylaxis is thought to be due to a tolerance-related dampening of the α1-adrenergic receptor response, possibly through internalization of α1-adrenergic receptors and subsequent down-regulation of surface α1-adrenergic receptors. Because of the predominant vasoconstrictive effects of α1-adrenergic receptors on arterial beds, rebound redness is thought to result from a generalized ischemia (*insufficient blood supply, the tissue doesn't get enough nutrients and oxygen, so then new arterioles emerge making the eye redder or existing ones dilate more than before so next time the constriction happens, they're so dilated that the constriction doesn't cause* low nutrient or oxygen *anymore, so the eyedrops don't reduce redness; new arterioles created then can dilate further when they're constricted and the cycle repeats itself, leading to a lot more dilated old and new arterioles*) brought about by vasoconstriction with secondary *activation of an inflammatory cascade* and/or loss of basal vascular tone due to receptor down-regulation", i.e. redness relievers increase inflammation.

Lumify (recommended by many MDs vs typical redness relievers) 0.025% redness reliever is selective, affecting only the venules *mainly* (not reducing oxygen/nutrients to eyes so much like all other brands) as the company and many studies explain. Lumify seems safer (though they use BAK toxic preservative), as it doesn't seem (in short-term studies) to cause as much rebound redness as all the rest, when the *arterioles* get wider to supply more nutrients to compensate for the constriction done prior. While we avoid ischemia caused inflammatory cascade better ☺☺☺ (since arterioles are less constricted), we can get inflammatory cascade from the additional accumulation of toxic metabolites (*now more than before, since arterioles are allowed to bring in enough oxygen and nutrients to produce metabolites, so a* Lumify rebound redness *occurs where new venules (purple venules, instead of the red arterioles, emerge since now Lumify constricts venules*) appear to take out the metabolites not taken out by existing venules. *Who has proven this* additional *inflammatory cascade (and associated rebound purplish redness) is not as bad or worse long term than the traditional redness reliever ischemia caused inflammation and associated rebound redness*? It seems *best to* avoid Lumify too*, since it constricts arterioles a little bit too (see* company video where they admit it does*) and it's not*

healthy to constrict venules that take CO_2 and metabolism, energy production, lipid production, or toxic byproducts out. Many unpreserved *drops work fine to get the eye or eyes whiter, without the constrictor (redness reliever) or toxic BAK preservative, since they address the* cause, dryness*, not the* symptom *(*redness*).* Or generate tears, retain moisture and fix MGD to prevent dryness, ideally, since no drops are perfect. The eyes can get used to the Lumify constrictor too, so the cell receptors won't bind to it and after a while they become far less effective, requiring drops 4 times daily, not one a week as initially. ☺☺☺

Most eyedrops that non-chronic users buy contain these non-selective problematic redness relievers or vasoconstrictors tetrahydrozoline-HCl or naphazoline. These redness relievers cause dry eyes in the long run, plus weird side effects in some people; google it, so much so they say don't use them in kids; these redness relievers are toxic if ingested by accident, another reason to avoid redness relievers; tear drainage means they partially drain into the nose and then we may ingest tiny amounts; they say to never ingest eyedrops, especially never those with redness relievers, meaning these are too toxic and nobody would be allowed to ever use them. Regular preserved eyedrops in bottles often contain the bad preservative BAK, which is thought of as the most toxic preservative. If you want redness going out, the unpreserved ones usually work just as well as redness reliever ones, just don't start using computer right away, wait with eyes closed for 5-10 minutes after the eyedrops were put, and meditate and relax ☺, or listen to some tranquil music, give your eyes and brain a break. If it's still red after simulating yawns for 2-3 minutes (we waste 2-3 minutes to put eyedrops anyway, same time but natural better eyedrops) or, if no yawns, after using lubricant only unpreserved eyedrops placed in the red eye, perhaps you can try Lumify *(after all, it's a purely cosmetic product that only addresses symptoms)* only rarely (10 special days of a year maximum), as it is only available with 0.01% ultra toxic BAK preservative, not in unpreserved versions. ☺ The least toxic drop with preservatives for using on special occasions (if all other drops or cold compresses fail, so only once a week/month max) is the most alkaline 'redness reliever drop out there' with pH 6.7, unlike the rest which have pH 5.8-6.2, the Canada made Clear Eyes Sensitive (a new "gentle formula" product available at Walmart for $6.5, bought it 9-14-21, which contains the least toxic ingredients: citrate buffer, hyaluronate (the only redness reliever drop with hyaluronate in the US, *company doesn't share if* HA *is low MW, since low MW* HA *can cause long-term more* redness, via angiogenesis it stimulates; can use redness reliever drops mornings, to be able to avoid systemic effects, have 10 minutes of closed eyes, 10 hours of blinking to wash it off later, use more cold compress for more effect that day), PAPB preservative (least toxic of all), glycerin (natural ingredient) 0.25%, NaCl, phenylephrine hydrochloride 0.2% (0.08-0.2% is approved for OTC use, 2.5% used at eye exams to dilate pupil, can cause severe eye issues in some: Fed Pra 2017;34(2):41-4) as the redness reliever. Phenylephrine is in $ store nasal decongestants 10 mg

phenylephrine pills, but some studies found they don't work, so it is safer to stick to centuries old hot steam from boiling water of a warm humidifier like Honeywell HWM440 for nose. Oddly, adrenaline or epinephrine is phenylephrine with an extra OH group and that adrenaline (secreted during stress) is a known destroyer of MGs (2% epinephrine drops for 6 months lead to MGs *plugging* and duct keratinization, free pdf, IOVS 1989;30(5):936-45) leading to dry eyes in rabbits (humans probably too); *therefore, if we use 0.2% phenylephrine, daily for 5 years,* we too may get full MGD, *if we got only tiny MGD or aqueous deficiency;* thick drops, like this one, with hyaluronate, can make phenylephrine stick to ocular surface 15 times more than in the rabbit study. *If used during naps or sleep, exposure, absorption increase 900 fold, leading to* catastrophic keratinization of the eyelid, gland orifices, caruncle, etc *as you can see with* some of the really sticky drops that temporarily keratinize the caruncle and eyelid margin at 20x. ☺☺☺

Thus, it may be safer to use redness relievers twice monthly max, during awake state only. I tried this one 9-16-2021 and I was blown away, it's way more comfortable than any drop with redness reliever I have ever used, due to HA, much healthier pH and it whitens the eye much more without even having used cold compress after. Just keep eyes closed 5 minutes to give them some rest. *The incredible pleasant feeling of this drop versus the ultra sticky Celluvisc,* Hylo Gel*, Refresh Optive or ultra watery Retaine* MGD*, Refresh Plus, Artelac Rebalance, saline was mind blowing*; it's almost as comfy as Biotrue, Clear Eyes Advanced. Unlike Clear Eyes 7, the eye felt no stinging and burning, and no arterioles became redder, all areas became whiter. *However, after 45 minutes, the eyes returned to normal redness after computer use; after 1 hour it seemed some areas were redder due to heavy computer use, so upon using 1* saline drop*, that extra redness almost vanished away (tiny tiny arterioles that appear when eyes are dry or tired due to computer use; a 2nd drop of 6.5 pH saline made things worse on nasal right corner, but they improved dramatically 3 minutes later after 1 drop of 7.0 pH* Hylo Care*, all that redness gone).* This one dilates pupil, while most redness reliever constrict it. (See below) Other typical redness relievers, which I would stay away from, which are not too toxic and don't have BAK toxic preservative *(like most redness reliever drops have)*, besides the extremely toxic acidic pH are: the Rohto 8 in one pH 5.7 & Clear Eyes 7 in one pH 5.8, which are similar in contents (both got synthetic irritant 0.2% hypromellose lubricant, 0.25% *zinc sulfate irritating astringent*), except Rohto has menthol as preservative, Clear Eyes citrate, guanide preservative, more polysorbate; both menthol (AAC 2005;49(6):2474-8) and *guanide attack bacterial cell wall by the same mechanism they can damage healthy eye cells, though they say guanide only attacks bacteria (unicellular)*; both Rohto & Clear got sketchy borate, toxic preservative $EDTANa_2$, toxic polysorbate 80 (killed 30+% cells in vitro); Rohto got redness reliever tetrahydrozoline 0.05%, Clear naphazoline 0.025%: which is less toxic? "repeated instillation of menthol induced ocular surface damage"☺☺ ► CER 2018;43(5):580-7. There are very few 'not found in natural tears'

chemicals that are safe with daily use multiple times in a drop, maybe none if safe is a stringent term for you. Clear Eyes Complete pH is 5.7-6.3 per manufacturer, 5.8 with my paper.

Rohto is very dangerous, as well as all eyedrops with menthol, because "Menthol affects Kappa Opioid receptors (weak binding to them), blocks the transmission of pain signals, and reduces pain" ► EBCAM 2020:7480204; it essentially hides *(so more customers like the drop?)* the damage done by menthol itself (nondiscriminating destroyer of microbial and cornea *cell* membranes, like BAK, unlike PAPB that destroys membranes of unicellular microbes only with perhaps 10-20 times less damage than BAK overall) and other ingredients *by not letting you feel it, while other drops will tell you if something in it doesn't mix well with your eye biochemistry;* "repeated instillation of menthol (artificial tears in rat eyes) induced ocular surface (cornea is skin tissue, like the inside of throat too, so cough drops are bad vs honey) damage, resulting in increased tear LDH activity" ► CER 2018;43(5):580-7. Well, *most eyedrop ingredients do damage* due to high concentration and eye not being used to foreign chemicals, the question is if it's greater than the benefit of antibiotic effect in some cases where menthol can help more. However, in case of ocular infections, a little menthol may be good, since all antibiotics also indiscriminately attack molecular structures and damage healthy cells too; but for healthy eyes, menthol is not good, as pain can alert you if another drop ingredient causes severe allergy and left unchecked at 20x daily could cause huge damage, swollen eyelids, etc. While it could be useful if pH was higher and if used rarely to kill some microbes nothing else may kill well, regular use seems a bad idea. After 15 minutes with eyes mostly closed, Rohto didn't work better than drops without redness reliever, but it did shrink some arterioles, while others remained identical and one became about 10 times redder/5 times thicker than usual (normally barely visible, white-pink) due to allergic reaction to menthol or acidic pH. The cooling sensation of Rohto is very pronounced even after 20 minutes, it could annoy some (feels like placing essential oil, Cliradex or peppermint oil in your eyes, though at a much lower concentration), while others may like it. Eyes were redder next day after buying and trying it, so I returned it to RiteAid next day. Others may feel it all night if using it before bed, not letting you get a good nap during the day either if taken too close to it; it's that strong; this strong mint sensation masks other burning sensations we need pay attention to when trying new drops, so that's bad; first hour or so, normal sensations that alert you to take a break, wet eyes, etc are 2 decibels like while Rohto menthol is 70 db like – so it works well to hide from us the eye saving sensations (certain mild burning or itch), being thus very dangerous if used often; we have eye receptors for a reason; on top of that it hides perfectly for hrs the dry eye sensation (similar to weak menthol sensation, not first 1-2 hrs) we're used to which alerts us on when our eyes are dry and we need wet them.

Menthol being a new preservative in the US, hardly any pubmed paper exists compared to ultra toxic BAK. The acidic pH makes both of these brands (most with redness reliever have acidic pH,

they contain naphazoline, etc*HCl) inappropriate for minimizing inflammation of most eyes (eyes used to alkaline tears). All redness reliever (vessel constrictor drops) got BAK except Clear Eyes Sensitive, Rohto 8 in 1 and Clear Eyes 7. Avoid Clear Eyes with BAK instead of PAPB, as BAK damages eyes way more than PAPB. ☺☺☺ Some redness relievers also shrink the pupil, since they *get* into the nose and then swallowed, so they get into circulation. On 8-31-2021, I used Clear Eyes 7 drop for scientific research only once before returning (for the 1st time in 16 months or so), to see what happens, monitoring effects on a 20x mirror for the first time ever and I was blown away that 50+ small arterioles (red) and about 30+ tiny venules (purple) vanished; *but this was only with cold compress and less than Clear Eyes Sensitive could deliver without burning feeling of acid.* Clear Eyes 7 uses naphazoline and you can feel the acidity of the drop, pH papers show 5.8; *it's toxic, never use it. 5.8 is too low for all people*. I used cold compress right after to enhance the effects and some arterioles got thinner than in 11 months prior (only used 20x mirror for 11 months prior); however, *with Clear Eyes sensitive, they got even thinner.* if a chemistry teacher shows Clear Eyes Sensitive to people with a projector magnifying his eyes before and after (or some volunteer teen with more veins) and explains stuff below, teens will be more interested in chemistry, as they will see what dramatic change happens within 3 minutes of using a drop (though same thing happens with cold compress, without so much damage) and having eyes closed to let it work on the vessels; it's so dangerous, because it reduces nutrient flow by 50%; it seems safer and ☺☺*lovingly gently* kinder☺☺ to try it when you can generate tears (morning), and rest eyes afterwards and not stress them with computer use a lot. I washed the Clear Eyes 7 off after 7 minutes or so with saline, due to acidity and then used Biotrue drops with pH 7.6 to rebring to normal pH (should have used Hylo perhaps since it's 7.2?) and then used compress again. It's like a surgery, people don't realize it. Clear Eyes 7: 98% of vessels shrank, but 2% became thicker near the main left arteriole 5 min after probably as a response to need of nutrients. 80% shrank, 20% became thicker 8 hrs later *(not due to the drop, but mostly due to me doing a huge amount of cold compresses that 8 hr period to see how long I can make it last, since without cold compress the redness returns very fast in 1 hr for me, since I became insensitive to it after using it a lot)*, tons of small arterioles were gone, but some small-medium ones were more visible now since small ones were gone, so it doesn't work as the textbook says 'everything shrinks' – on the left eye, since right eye after 8 hrs returned to normal. Most people examine eyes at 1x and these relievers shrink the 1x visible thick arterioles, but they don't see how the medium-small arterioles can become thicker – since overall the eye looks whiter since 100s of tiny arterioles are gone. So it's an illusion that there is no rebound redness effect, pH effect. So, after 10 hrs all was as usual since I stopped doing compresses.

Companies know that most people don't use 20x mirror. Anyway, we want to shrink cornea arterioles and venules to avoid cytokine storm that dries eyes, but not if we shrink unwanted

vessels inside the body or eye, so we use cold compress to achieve same effects with 10-50 times less redness reliever being absorbed by eyes and body via nose. It's a fine balancing act of tricking the body to return to a younger state to heal the cornea. *We give eyes a state of fasting/healing, less food once a month, to do repair they can't do for cornea when eating so much* via ultra thick red arterioles fed by computer use; eyes need a vacation and being closed too sometimes. To do that we can use the safer cold compress though, as the acidic pH, 6.5, can sometimes do more damage than the fasting heals. That depends on our average pH too, some got average pH 6.5, so for them Clear Eyes Sensitive seems OK once/month for some special event when using a cold compress is not feasible. For the rest, rare use when eyes got really red, to enhance cold compress seems fine to avoid permanent dilation of arterioles.

It seems better to figure out the dry eye or MGD *cause(s) and address them, not focus so much on* Lumify *or other symptom (dry or red eyes) addressing or hiding (*menthol*) drops*. It's helpful to recall many people became disabled for life due to mercury preservatives in vaccines, due to inability to eliminate mercury due to low Glutathione. Preservatives have side effects. ☺Eye function is more important than looking like a supermodel daily and overusing Lumify, etc or cheap toxic makeup that may get into the eye if not careful. *Dry eyes allow debris to not be washed away the tear drainage canal on the corner of the eye (near nose), so this causes* inflammation *which them leads to* floaters *and other far more serious issues*, so dry eyes need to moistened immediately with yawn made or *"preservative redness reliever free"* eyedrops. Most people get floaters in 20s-30s, some even at age 4; but they often disappear within weeks or months due to neuroadaptation or dissolution if younger; floaters get bigger in 40s-50s and whenever we let our eyes get dry by not simulating yawns and addressing MGD. The bromelain in pineapple is known to dissolve proteins of arterial plaque and hypothesized (based on some studies), to dissolve type 2 collagen bundles or eye floaters. ☺☺ If there are too many and too big vessels they can bring a lot of inflammatory cytokines making things worse (IPL tries to reduce cytokines by reducing the amount of arterioles in the MGs), so cold compress can shrink only a few vessels, being good. However, the chemical reliever constricts in areas we don't want constricted perhaps, so it's the problem of non-specificity we always have to deal with in medicine and life: is the constriction doing more good than bad, is IPL getting rid of only unwanted blood vessels or some wanted ones, is the good bigger than the unknown bad? Once we treat body with radiation, light or pill, it affects all nearby systems, killing/damaging healthy cells and tissues, some in bad ways unintended, exactly like unintended collateral damage in war. Perhaps, some would argue that we can't let *one* day/night pass by constricting eye blood vessels again and causing rebound redness and dryness. The decision to avoid redness relievers has more to do with other eye areas that may be affected, which are more important than appearance. Once you realize drops without redness relievers work just as well, there is no

incentive to use redness relievers. Oils that form the tear evaporation preventing lipid layer of tears can become thick due to allergic response to chemicals in artificial tears, clogging the glands; lack of nutrients can also make eyelid margin oils soft, so they harden and clog the gland; this makes our tears evaporate fast, as the lipid layer is thinner.☺☺☺

11.17.6. HOW TO PUT eyedrops & Ointments (2nd paragraph) easier than ever before

NIH has a page on how to put eyedrops in the lacrimal sac, though some optometrists show videos with eye guide too, with or without pulling eyelid; pulling eyelid too often can cause eyelid to not sit flush against cornea, causing keratopathy and dry eye, eye redness, etc..., or scar of that area if always using that area there for drops, though not being subject to dryness it heals faster. The sac method allows us to see toxicity of drops easier by monitoring that area after each drop via looking upwards to expose the white of the eye there. So, it's not yet clear, for dry eyes, what is the best way to put drops, it may depends on the frequency and what the ocular issue is. 10% of preserved eye drop bottles can be contaminated with bacteria even before opening, 30% after just 2 weeks ► CEJPH 2001;9(3):162-4. How do we know that unpreserved eyedrops are free from bacteria? People touch their face many times/hour, so it's good to wash hands frequently ► AJIC 2015;43(2):112-4. ☺ Generally, we're meant to not blink and keep eyes closed 5 minutes after instilling a drop *(just as we do during yawn tears generation to heal ocular surface, so eyes become whiter than with many 'dry eye' drops),* otherwise, most of the drop is pushed out of the eye or drains into nasal duct "Patients should use NLO or ELC (eyelid closure) for 5 minutes following eye drop treatment with topically applied... medications" ► TAOS 2008;106:138-48. They got ***Owen*** eye drop guides on Amazon for $5 (squeeze too, but most don't need it) that are described also in the Review of Ophthalmology, or Peermax eye guide $7 or $10 Remedic drop guide or Droppy guide + squeeze $10 if you don't ***want to waste drops or wear your eyelid by pulling on it multiple times a day (bad for collagen fibers of eyelid and for having the eyelid perfectly on the eyeball).*** To avoid placing drop directly on iris (even if eye drop companies make videos about placing drops directly on the eyeball), you can adjust the guide and look up, so the drop falls below the iris.

This **Owen** like tech (recall to disinfect plastic often) is really good because if you don't place drops correctly, you may not wet the eye well and think you put drops because you felt some weird thing on eyelid margin (and then 30% of it went into the eye only) and that's bad; it will pay for itself fast, since you will no longer waste 50-80% of a bottle with missed drops. Drops are easy to miss when tired and you forgot to lie in the bed and the light is not bright. This is increasing safety, because when people are tired, they could theoretically scratch their cornea if not careful (never happened to me in 5 years of drops), while this prevents that. Extra care is needed with with atypical bottles, since their tip is longer, but not long to reach eyelash usually.

Just place Owen on the eye, with pinhole towards the eyebrow, lie in your bed and perhaps, if easier, close the other eye or cover it with the hand; then look at the pinhole with eye wide open and press on the bottle, you will see the drop forming; over time you can learn how to position it so the drop falls in the center temporal area, so less is wasted into nasal duct. It works even with Hylo Care type of bottle, in total or partial darkness, look with left eye to the right and vice versa, up, and it works fine, no need of pinhole, as there is no light. You will be blown away how easy it is to place drops (with a normal bottle, individual vials or unusual bottles like Hylo) at night in total darkness without missing; *this is really helpful since at night it's impossible to generate tears almost, as our brain is asleep. Close eyes and don't blink much for 5-10 minutes, relax, reach cosmic bliss. Our eyes these days desperately need a break, as we're glued to digital screens, not blinking much.* ☺☺☺

While the classical AAO method is to pull eyelid, frequent chronic use (3 times daily for years) may lead to keratopathy due to eyelid no longer sitting perfectly on eyeball. I never do that. AAO suggests the eye corner method (which I used until 2020) if eyelid pulling is annoying (they got guide for eyelid pulling that damages the nose skin and eyelid skin which I don't like, so I use the *Owen* brand, where you look at pinhole and then your eye is positioned to place drop, can adjust it so you drop it near the temporal corner so it doesn't drain into nose, I always lie down on the bed when placing drops). Avoid putting eyedrops in the eye corner outside of the eye hoping it gets into the eye (with makeup bacteria); if you missed it, don't tilt head to make the drop enter the eyes, as it brings skin/cream/makeup bacteria or allergens, etc into the eyes; avoid touching the eyes with the tip of the bottle, as this allows contamination of bottle contents, multiplication of bacteria inside the bottle. There are several ways to deliver eyedrops, the classical one explained on youtube in 7 minutes or one I used before discovering I can generate tears (it's a variation of the classical): *You can buy a* small mirror for a dollar, relax in the bed and put an eye drop with eye open (look left, up or right to make it less stressful and to avoid placing on iris) exactly in the center-temporal area of the eye or towards the lower lid or outer corner (not towards the inner nasal corner, since it will drain ultra fast into the nose). This way, you don't mess with semi-dirty hands around the eyelid trying to place eyedrops there by stressing the eyelid tissue and stretching it as it's not meant to. Wash hands before putting eyedrops. Even after washing, hands are always semi-dirty. They say you can place finger on eye corner to prevent drop from draining in nasal ducts, but don't do that, you can just tilt head towards the temple while in bed, to avoid infecting eye with semi-dirty hands.

For irritated eyelids and eyes, the thing we don't want is to further stress the eyelid/eye by pulling on the skin under eye downwards, so it's better not to perhaps. If a little liquid spills off on the eyelid, let it be, the HA, vitamin E, water, vitamin B_5, sodium chloride can hydrate eyelid (spread it around eyelids or face), nourish the body's thinnest skin and diminish dark circles;

you'll wash face 2 times daily anyway, with soap for best eye hygiene. It's ideal to store the bottles in a clean place, away from light 100% (paper box that came with eyedrops doesn't block all light if eyedrops bottle is not 100% opaque, but transparent or white, so use something ultra thick, maybe 3 rolls of tape, last one capped, or a cabinet to store/enclose it) to prevent degradation/oxidation of ω3 (oxidized fats by visible light in eyedrops are toxic for the eye, as they induce oxidative stress), vitamin E, etc that are in some eye tear brands, to diminish contamination from air (wind or vacuuming can bring dust, pollen, microbe that can die otherwise in hours or days, but if bottle exposed, it gets it and you may touch eyes after bottle); before putting drops rest the bottle cap on a disinfected surface. If you want to administer saline drops, there is no need of Owen guide (I never use it for that), the vials made of plastic have so much water, that a miss won't matter and plus, it's way easier to always hit the eyeball, because you only squeeze and can hold it easily 3 inches or more away, while with preservative free vials, you need two hands, one to hold vial and another to push the end, so it's far harder to focus eye and both hands, etc... For preservatice free vials that require push (Hylo and many others) an Owen guide is a must, to prevent misses and also prevent getting too close to the eye.

WHAT ABOUT OINTMENTS? Owen guide is useless for placing exact small amounts☺☺☺

Ointments are a major headache when it comes to placing into the eye. The manufacturer idea of daily pulling eyelid is not really that great and could damage eyelid, meibum glands, etc. We need alternatives, especially for gels that come out from tube ultra fast even before we even blink. Optical soap is used to wash hands before handling contacts, so basically millions of people stick their hand into eyes indirectly; with an alcohol prep pad (70% isopropyl alcohol, 50/1$ @ $ stores) we can clean and kill 99.9% of bacteria (they sell those 70–75% wipes that say 'it kills 99.9% bacteria), and even use an opaque box and a UV lamp (some are sold at $ stores even for 4$, the ones Amazon sells for 9$) inside to disinfect the silicone q-tip sometimes to reach 99.999%, make it cleaner than contacts touched by fingers, and use it to put 5% of 'paper instructions amount' of ointment into the eye via temporal corner. To get some of the snake fast on a silicone sterile q-tip is easy or on some meibum expressor you sterilize with CaviCide, autoclave, etc; I did that sometimes, before realizing how deadly ointments are, even 2-3 times daily to get mineral oil without toxic ingredients in lipid drops with mineral oil (Systane Complete, Retaine MGD, Soothe XP PF, Cationorm, etc). Cap off the tube within 3 sec to prevent waste if snake comes out fast, as you want to start with 0.5 mm of ointment first, and put into eyes only 30% of that (I even wrote on my silicone q-tip case "0.5 mm & 30%"), to get eyes more used to it or test allergy and 'foreign body sensation', eyelid swelling threshold, etc. The amount of ointment medical companies write to put in eyes is insanely high, about 25-75 times above what you find in a typical eye drop with lipids and even 400 times above natural. This is simply not needed for everyone, they need update tube design to make snake much thinner or use

more liquid oils like EvoTears that dispenses 10 *µL only, instead of 40 of the typical snake placed inside.* Natural tears have 3 layers: mucin 0.035 *µm*, water 8 *µm*, lipid 0.1 *µm*. So, in a natural tear of 10 *µL, we get about 80 times more water than lipids, lipids are about 1.2%.*

When we place 50-75 µL of mineral oil ointment, as paper instructions say, we place 400-600 times more *lipids into eyes than natural tears (*artificial tears are 30-50 µL, vs 10 *max for natural)*, so it can be overwhelming and even bad, clogging tear drainage, clogging MG orifices with more solid fats; the worst MGD patients have solidified oils, so when mineral oils mix with our oils they can clog the glands, offering short-term relief in exchange for long-term MGs damage; like redness relievers provide short term relief in exchange for long-term damage etc. We want in life and medicine quick instant solutions, but the easy path often leads to catastrophe 10-40 years later. While in dire cases of extreme dryness or styes we can use more, but on a daily basis and during daytime, less is better. This is especially true because mineral oils (vaseline, petrolatum, etc are all mineral oils) have their own issues. Present tube design makes using less impossible if you try use Owen guide or traditional eyelid pull method; this results in ocular damage due to too many hydrocarbons damaging homeostasis for those who need much less lipid. Companies could design each product in 2 tube snake diameter versions: one for severe dry eye, present type, and one for mild dry eye, 3-5 times thinner. Once we got 0.5 mm or 1 mm on q-tip, without touching the tube with q-tip, ointment by ultra gently place the gel on the q-tip (avoid finger, even if cleaned with alcohol) at the temporal corner of your eyes, since nasal would drain too quickly and cause too much fuss (or even redness sometimes) due to slightly clogging the drain duct (*that's* why full (not partial) punctal plugs often don't work, *since they don't allow the flushing of that area and it causes inflammation, which makes eye red and dry; so when using ointments and sticky drops be very careful, especially if used at night, as they can cause traffic jam on the ducts and lead to bacteria overgrowth*) and that area is very vascularized, more sensitive to 'foreign object sensation' stimuli, so nasal *corner* (or nearby) is best avoided; it seems 1 million times safer and ☺☺*lovingly gently* kinder☺☺ to not let *q-tip touch the eyeball or the* MGs *area, only allow eyelid touch by the* upper part of the ointment on the edge of the eyelid *in a way that minimizes* 400 fold the possibility of sterile q-tip or washed disinfected finger bacteria from ever touching any eye tissue indirectly via the q-tip held with fingers, *except anything we may touch anyway, or wind could touch with bacteria anyway, like corner of our eye; now obviously, our eyes are used to wind and air we walk thru bringing endless bacteria on the eyeball itself, but we don't want to bring extra if we can help it, to prevent infection*. Use left fingers or designated (for this purpose alone, not using it to touch any eye area) silicone q-tip for spreading antifog gels on glasses and right hand for placing ointments to avoid cross contamination of your eyes with antifog gel in case you didn't wash properly your finger tips that handle the q-tip or ointment. Avoid *cotton* tips at all costs for this, since fibers

get into eye and make it red. You can however use meibum expressor forceps that have a very round edge to place ointment or massage eyelid exterior with ointment, if you want to express meibum, treat a stye or simply put ointment around the eyelid, just use a 20x mirror and be careful, disinfect the tools at 320°F, sterilize, and also with alcohol pads (free ship if buying 4000/38.2$: ReliOn from Walmart online or blood glucose section). Like for silicone q-tip, wash with soap and with various cleaning agents optometrists use like Cavicide, Amazon has it, kills bacteria, fungi, viruses in 3 min, etc. Make sure hair near eyes is short so it doesn't cause red eyes by getting into eyes; wash with optical soap and then perhaps 70% alcohol wipe if reusable silicone made.☺☺☺ This way you don't pull on eyelid and risk touching eyeball with the tube as in the traditional 'eye drop and gel placing' videos; *before you do this, you may consider washing hand & q-tip with OPTICAL SOAP that leaves up to 22 times less residue on hands than regular soap; made for contact lens handling:* $15/L Leader optical soap, by Hilco (USA, since 1956), can be used to wash tips of fingers before touching ocular area or applying ointments. MSDSs for antifog and soap, etc Hilco products are here. *Simply place the ointment on silicone sterile q-tip without touching the tube, by pulling the q-tip (avoid using finger) away from the tube as it grabs on the snake of ointment; make sure that you get enough snake there so when you go near eye only the top of the gel ball gets into the eye ideally to avoid touching eyelid with the silicone; I find this 90x easier than using Owen for ointments, while Owen is ideal for drops; Owen causes the snake to touch the eye guide and to get stuck on eyelash as we blink; Owen use on tubes leads to wasting most tube really fast; they need design ointment tubes with much thinner snakes, but that won't happen overnight, so we can't use Owen easily for ointments without wasting 70%-95% of the tube until they do rethink the snake thickness in all major brands to be 3-5 times thinner.* Clean fingers you use to clean silicone q-tip, hands you use to handle tube. Do this in a bright area, while sitting so you can be very stable, not move head and avoid touching eyeball with too much gel from the q-tip.☺☺☺

11.17.7. High Tech MGs Imaging and Dry Eye Treatments

11.17.7.1. Taking pics of the eyelid Meibomian Glands, MGs, and basic ideas on treating MGD

11.17.7.2. How to express MGs at home safer than at the MD, unblock MGs *to save $*900,000

11.17.7.3. Useful LipiScan, LipiView & the dangers of LipiFlow, MiBoFlo, TearCare

11.17.7.4. NuLids (vibrating eyelid/cornea too much, gentle massage at home may be safer)

11.17.7.5. Osmolarity 11.17.7.6. IPL (the pros and cons, dangers of Intense Pulse Light) & LLLT

11.17.7.7. Q device: vibrate eyelid + LLLT, eye closed, cornea shield 11.17.7.8. Warm compress

11.17.7.1. 35$ Taking pictures of MGs (done every 3 years since age 3)

At the doctor we see for $40 how meibomian glands look (pics: upper eyelid ► Cornea 2019;38 (2):256-61 Fig 1 or lower eyelid (most issues) ► JO 2020:3275143, Fig 1 showing 4 degrees 0-67+ % of MGs loss on the meibograph (LipiView, LipiScan, MiBoCam, Keratograph 5, etc): maybe lower lids have some clogging (or atrophy), usually in the eye corners and central areas, the *worst areas for most people*, now what? *The* stye section has a 2 page explanation on the *pimples, and 440 nm light used to kill P. acnes in* MGs, *P.* acnes *which* can *cause* MGD. 42% of kids have MGs atrophy ► CO 2018;37(4):426-30 due to parents allowing kids to play in cold weather without protective goggles/wrap around glasses to keep eyelids at 75°F temperature. The cold air thickens the MGs oils, clogs the glands and begins the 20 year process of eyelid gland destruction that will give dry eyes later, dry eyes can cause blindness if many infections happen as a result. So, don't let kids play in below 60°F weather too much without glasses to keep eyes warm. Likewise, if kids go out to play in snow, their feet and lower legs, knees must never get cold (use IR thermometer when they come inside home and make sure feet knees are 78°F, not 54°F, otherwise, buy thicker pants) as that can damage joints and give them pain 10-20 years earlier than usual, causing systemic inflammation that affects the eyes too. There are 4 things we need to do every day without which nothing will improve many times, even if we use endless artificial gels, ointments, tears and go to doctors weekly: 1. blink often to express lipids while using screens and in general, do a strong blink once every 5 minutes to squeeze meibomian oils. 2. do seal check of silicone moisture day glasses throughout the day to make sure eyes won't get dry (mirror or using some little paper roll, q-tip tube with no cotton, etc); seal check of night mask before going to bed, see if any light is visible (air gets in) and tighten the strap make new knot, since tranquil eyes type masks get loose every night (poor design). 3. twice daily (maybe after meals), wash the tips of your fingers with a little soap (right hand if using that hand) and very gently, using a sterile saline moist sterile q-tip or *using the* small *finger of the* left *hand (if* right *handed), since that finger is the* cleanest *of all 10*, massage for 20 seconds/eye your eyelids to eyelash area (upwards for lower, downwards for upper eyelid) to express meibum and stimulate fibroblast and meiboblast growth, with closed eyes, without pressing on eyeball, but pressing on the end of the eyelid only gently (just two minutes daily is way better than none); or do it 1 min max in the shower after you use warmer water to open eyelid oil pores. 4. generate tears every time you need extra wetness. Besides these 4 daily things which take big self-discipline to do and nobody can do for you, you can do professional meibum expression once every 3 weeks, and there are many options: one is the slower method, do it yourself at home, and the cheapest: warm compress or eye mask, daily, use drops with lipids, followed by gentle massage of eyelids, the 20+ things in section 1, maybe using the $495 Q device if you got corneal shields that fit your eyes (otherwise don't use it, it can damage eyes),

$295 NuLids device, or $30 Cliradex foam for people who suspect some bacteria play a role in their MGD (it always does, that's why they clog usually).

11.17.7.2. HOW TO DO MGs expression at home:

(scroll down 3 pages fast to forceps 2.1.6. if you're short on time, a little forceps of 29$ can effortlessly remove styes before they become 100 times bigger, without any antibiotics, warm compress and the like, forceps which can express MGs (meibomian glands) and also save you millions of dollars in trying to fix vision impairment caused by antibiotics)

First and foremost, before anything, you need to clean the forceps: 1. wash the forceps with alcohol wipes perhaps to remove any debris if any present or rinse under a strong tap water jet. 2. sonicate 5-10 min with alcohol 70% 3. sonicate with CaviCide 3 minutes *(skip this step if cleaning cannulas, those need to be flushed well etc, since they only have saline solution if used to flush puncta, just rinse with DI water)* 4. wash with tap water again to remove CaviCide 5. wash with distilled (DI) water 6. if little confidence in CaviCide, you can sterilize in autoclave or the only pressure cooker that reaches 15 psi for 1 hour (see below) - but it's only 1 patient, you, so this step may be less stringent perhaps, use Instant Pot Max 7. dry and store in a sealed box. *Recall to* sterilize *your stuff* properly, not with most electric pressure cookers. *We can* sterilize these forceps in 274°F high pressure steam (steam reaches 274F at 30 psi, which is not achievable in pressure cookers from Amazon, autoclaves can reach 44 psi easily) or 15 psi steam, which is 121C/250°F for 60 min, the only Amazon or online electric pressure cooker that reaches *15 psi is* the Canadian 150$ Instant Pot Max, so this is what you need to sterilize on the steam rack all your forceps, cannulas (etc, for puncta irrigation) for 1 hour (because a pressure cooker is not as good as an autoclave that may do it in 20-30 min) to kill all spores and microbes.☺☺☺ If you read manuals, all other pressure cookers reach only 6-10 psi (10 psi steam is only 240°F, 5 psi is 227°F), sometimes 12, which is not hot enough for the steam. 12 psi steam won't reach the 250°F needed for steam sterilization; to sterilize buy Instant Pot Max, the only one that reaches 15 psi (see Manual & this) if pressure is set to Max in the Canning program, see study on pressure cookers sterilization - 15 min for spatulas, 30 min for scissors; a visit to an OD/MD to do a dangerous (all glands open at once to cross-infect each other, using bare hands not very clean, etc) MGs expression is $70 to 400, so an autoclave or Instant Pot Max (the only Instant Pot that reaches 15 PSI) is not that expensive, a special ultra clean autoclave for medical tools only (some optometrists use CaviCide disinfectant, followed by rinsing with DI sterile water, etc), (Amazon delivered CaviCide in 2 days, kills viruses, bacteria, fungi in 3 min) to soak or sonicate stuff into. Amazon/ebay has a 170/200$ that operates at 18+(127kPa+) psi, mostly 18-24, steam being 258-262°F, releases pressure if 0.145-0.165 MPa (21-24 psi, 1 MPa=1000kPa=145 psi=10 bar=10 atm atmospheric pressure), it will sterilize in 45 min vs 60 min for Instant Pot 15 psi. Some 175$ Amazon ones are 220V, OK for EU; or 200$. ☺☺☺

As you can see, these autoclaves are nothing but a pressure cooker that has an analog timer, vs the fancy 150$ instant pot with buttons, memory, etc so you don't need press anything. Online, many US universities have articles, PDFs, etc on sterilization and they show these antique old style autoclaves like the 169$ 110V USA warehouse ones, *that are nothing but a pressure cooker.* However, these special cookers reach 21 psi, so they can sterilize a little faster simple tools like forceps. Another method of sterilization is dry heat, using devices like 120$, but you need raise temp to 360F/182C for 1 hour or 320F/160C for 2 hours, and *if you didn't brush, scrub, sonicate, rinse tools well*, the organic mater will stick sometimes, so the wet method is way safer and better, since few remove all organic stuff, even if we use alcohol sterile pads, brushes, soap. The reason Instant Pot is better than the 19$ extra analog pressure cooker autoclave is that the water in instant pot can be just 40 ml and DI, clean, etc, dumped each time, but in that one you need 400 ml of DI water that can get contaminated by the vapors that carry organic residue, so you waste more water, while you save some electricity. Depends on what you want to waste. With Instant, everything is automated and you can actually let it vent on its own, faster, etc; plus many of those don't have a timer, unless it's 230$, so if you forget it on, it's a real hazard. I included those for those curious on the use of pressure cooker devices for sterilization. ☺☺☺

Once done with cleaning the forceps, kindly be well *gently* rested, very careful, sitting on a chair with stable, fixed to some support 20x mirror in front, phone off, focused and undistracted by anyone or any noise, etc after warm compress (only 75$ at some ODs), antibiotic drops (minutes before and for 3 days after) and be ready to use one of the 4 'forceps' methods *(store these expressors in an air tight box, such as $ store first aid white boxes, easy to clean, 3 by 4 inches):*

1. Mastrota 64$ paddle, 9 mm diameter, 1.7 mm thick, the original shape, thickness as invented by Katherine Mastrota, used with *sterile saline moist q-tip* of cotton or silicone or an ultra round 2.1. Tauber inverted with the ultra round side (finger in some videos, but not a good idea without sterile glove or being 100% sure you disinfected that finger extremely well) *on eyelid* exterior, *paddle* on eyelid interior. A higher quality 50$ one here. Here is a video about Mastrota, the OD does a terrible job, not wiping meibum with sterile q-tip after each squeeze, not cleaning the paddle after each squeeze, risking infecting lacrimal, nasal ducts, other glands. This offers less conjunctiva or eyelid abrasion than other tools, the method of the (sterile saline moist, if too much friction) finger allows you to slide finger or round side Tauber or silicone q-tip from bottom to top of the gland and achieve a far less abrasive and gland damaging effect than with some of these forceps. Mastrota, if done well, may be the very safest of all, being the gentlest of all, hence it's the first one, but reading about all and watching videos will allow you to understand exactly why, though the 2.4. cylinder forceps is pretty gentle, yet unable to achieve the pushing of the lowest meibum as the finger/q-tip can do, so this wins over cylinder, though cylinder can achieve Mastrota performance, or better actually, by using the q-tip for the

2 mm where the round exterior cylinder doesn't reach; Mastrota, due to being so round and thick won't allow the very very most bottom oils to move up, while cylinder with finger can allow that to happen, being thinner; this paddle is included here also for those curious what this Mastrota is when reading papers; try both Mastrota, cylinder 2.4./Tauber and see which ones work better for full expression from lowest place to the top, mini expression of top only or etc). Always choose safest roundest Mastrota paddles, if you plan to do a full expression from the very bottom to the top, not rough $30 ones that scratch if not careful, due to their rough scratchy hard to clean handle; the 30$ is thinner, but can be more useful for doing it at an angle or bending eyelid less, etc, depending on dexterity. However, thinner ones are worse if you want to do real expression, not mild one, since in real expression, finger would push hard and the eyelid tissue would be damaged by the sharper thinner Mastrota as it wraps and hugs it, which is impossible with the gentler curve of the classic original Amazon Mastrota where the angle change is more gradual.

2.1. Typical Arita Tauber flat forceps *the* most *effective to unblock the* MGs *orifice* (always buy blue titanium ones, they're lighter (thus safer) and oxidize far less over time)

***Ideal to unblock** MGs **of the styes and chalazions located away from the eyelid margin, to enable draining after** warm compress + the 2.4. cylinder type to drag pus to the orifice; 2.1. **and** 2.4 **can also be used at the same time by 1 or two people to avoid the** 2.1. **unblocking of a stye that is near the eyelid margin pushing infected meibum down, as** 2.4 **or a 2nd 2.1 prevents that pushing; this enables ODs to no longer refer** millions **to needless MD excisions (eyelid surgery) of the**☺☺☺ **stye/chalazion, especially today with** 5.0 **MGP that can open even the most keratinized** MGs.

2.1.1. $14 Popetpop, 3x5 mm paddle, shorter and rounder on exterior than Prettyia, thinner by 0.3 mm, better for eye corner MGs that can't use eyelid lifting much 2.1.2. lower 2.3 mm width is safer, due to less oil pushed down: 9$ Prettyia, 2.3x6 paddle oxidized fast, holes developed on the inner side that grabs eyelid, thus useless, as bacteria grow and no way to clean well (sonication not enough etc) 2.1.3 $29, 3x9 smooth finish, very round exterior, quality steel may be good for a corner if using vertically, if you want ultra smooth. 2.1.4. 25$ 2x2mm (round) or 2.5x3/3x4, 13.5$ blue 3x3mm (ships from US), 42$ blue titanium 2x2 round (Nimisha Enterprises Indian company, oxidized upon arrival like Chinese titanium ones though more than Chinese, rust only visible with 30x magnification lens, this 2×2 mm is best for picking up eyelashes and dandruff at the base of eyelash, the only pro is these blue types have less rust visible after 3 years), 32$ blue 2x5 mm (bad company, came rusted on the inner side that grabs the eyelid interior, rusted even in picture, and the one that came was 8 g, so indeed hastitanium, vs 13 g for most stainless steel of same size; steel is 8g/cm3 density, titanium 4.5g/cm3) (blue can be 80-100% titanium alloy coated in blue by anodizing, if they weigh 40% less than steel) blue is ideal,

as most stainless steel oxidizes and rust creates holes inside it where bacteria can grow, after 0.5-3 years, so blue rusts less; inspect all of them with 30-100x magnifier to see if holes develop, stop using (except for to pick up ticks or etc, not eyes) if rust or holes develop as wiping with alcohol pads or sonication doesn't remove the bacteria deeply attached to the hole rust. See the only Japanese titanium one google gave, finer quality versus the Chinese or Indian Amazon/ebay ones (that's why China imports bearings/steel from Japan they don't know how to make). $11 blue 2x4mm forceps, cheapest blue coated Amazon pic shows 2 rust sports 2.1.5. ebay $25, 4x9; wider, longer is not good if you want to do 10% of each eye/day. Soak all tools in vinegar if any rust develops, as rust can get bigger, eat the metal and make holes, making it impossible to clean the forceps well, due to groove bacteria biofilm in the hole. Sonicate them.

2.1.6. THE BEST FORCEPS FOR ANYONE WITH DRY EYES are 2.5x3 usually:☺☺☺

2.1.6. 29$ 2.5x3mm (25$ on ebay), is ideal for expression, really smooth satin finish (visible with magnifying lens, 30-200x) to protect eyelid, unlike the cheaper Amazon trash, whose inner finish is not satin or mirror-like, but has lines like the outer part of the paddle. However, even this rusts after 1-3 years like all cheap stainless steel ones on Amazon, see on magnifying glass, the grooves. 2.5x3 mm (if satin finish and blue coated to prevent oxidation in 4 months) is *the* best multi-purpose *one and the only one worth buying if you're short on cash,* ideal for *expressing only* 2-3 glands at a time, when only one needs unblocking; this one is by far the highest quality and smoothness I've ever purchased, so shiny, go it Dec 16 2022, it came from New Panvel and it allows, when used vertically, to express glands without pushing meibum downwards, since the end is narrower. Ebay sells it for 22$. This is very good for gently scraping your eyelid, so that those tiny domes of yellow liquid, called styes, that you see months before they become big, due to daily inspection with the 20x mirror, cause the yellow domes to gently come off the eyelid and stick to your forceps, without you needing to even squeeze anything, so effortless, so elegant, you cure a stye months before it becomes 100 times bigger, thanks to an ingenious cheap tool. After this, you can see a tiny circle (0.7 mm wide) on the eyelid, the base of the dome, where the staph yellow liquid bacteria created a dome of liquid and it will heal on its own. Just wipe out the area with a sterile q-tip and wash the forceps with alcohol pad, or other strong antibacterial solution; the body's immunity will heal it and no need of antibiotics, so toxic anyway, antibiotics are known to cause blurred vision, nearsightedness "Despite the prevalence of broad-spectrum antimicrobials, vision impairment is still a serious sequela in many cases that is caused by immunogenetic inflammation" ► JCM 2022; 11(14):4195.☺☺☺

This 2.1.6. is the most *versatile* forceps *for* anyone with *dry* eyes, as it allows you to pick fallen eyelashes that are on the eyelid margin or half touching the *cornea, and it also allows you to gently close an eye tightly and then gently remove the* mucus you see with the other eye with a

20 x mirror, the soft gel like mucus in the caruncle nasal *corner that forms after certain eyedrops, and then discard it by wiping it with a sterile alcohol pad*. However, 2.1.6. is the best for MGs expression at home, not for eyelash picking. For eyelash picking, mucus removal any of the 2x2mm round forceps in 2.1.4. are much better. The whitish mucus and sometime eyelashes that are hard to see, due to being ultra thin and hiding on the border between cornea and eyelid, can come out easier by just flushing the eye with 10 drops of saline: you will sometimes see eyelashes come out with the mucus stuck to them in the eye corner, so tilt head with nose down, so gravity forces eyelash to fall towards the nasal corner with the mucus and then you can gently pick it with the forceps, since it's 50% out. Eyelashes need to be removed immediately, otherwise, they might slide and hide under the 2-3 mm angled eye corner edge, called plica, that sits next to the caruncle (that triangle at the corner of each eye where mucus accumulates). If you tilt head gently to the right, the plica gets small (2 mm instead of 3.5), as the caruncle slides on top of it. Eyelashes can hide between caruncle and plica, or under the plica, see it both with 20x mirror. Eyelashes can slide upwards, and will be visible to you only if you use your 2.1.6. to gently lift the eyelid and see the end of it. Try to bring the eyelash on the plica with saline solution or gentle eye massage and then, when it lands at the edge between caruncle/eyeball and plica, use one end of the tweezers (which is ultra soft and round) to pull eyelash towards the eyeball, as that will make it go on to the lower eyelid with the next blink and you can quickly pick it up to remove it. Don't try to move it towards the caruncle as it can slide under the plica or the caruncle, I tried that and it ends up wasting so much time as you when have to wait for it to show up visible again. Eyelashes have microbes and you want them out fast, to prevent redness, eyelid swelling, styes, etc. That area is not flush against the eye, but has a slight gap that allows eyelashes to hide there. Eyelashes can also dive deep on the lower eye socket and hide there very well, invisible unless you pull the lower eyelid to look at it, and not just a little, but more, to see the very end of the socket. Use saline to get them to shift or gentle finger guiding with eyes closed. Other times, if you already removed the mucus, it is hard to see, so you need to focus your gaze at the corner in bright light with the 20x mirror and you will see 20% of the eyelash, so to get 20% out, put more drops with head tilted so eye corner is down and drops fall there pushing eyelash gently out a little so you can finally grab it by the 20% part that is outside the eye. The 2.1.4. 2×2mm is better than 2.1.6. if you try to gently catch the mucus balls or ovals at the base of eyelashes and remove them fast, without having to use sterile cotton swabs that irritate the skin and are rubbed in videos by doctors or patients against the fragile eyelid skin, increasing the risk of infections and permanent collagen damage with frequent ultra macho and abrasive wash using cotton swabs and some cleanser they sell, like Cliradex, etc which I no longer use due to its harshness. 2.1.4. is so tiny and has the perfect shape to make a valley on the eyelid when you try to get an eyelash hanging there, which means you get the eyelash the first time. With the other ones, the rectangular shape makes no valley

below the eyelid and it takes 2-5 attempts to remove the same eyelash. So for fallen eyelash, hair, debris, styes, etc, 2.1.4. beats all the rest 100 to 1. 2.1.4. will save you big money, as you don't buy sterile q-tips to moisten with water, you simply use this and it will be better for the environment than wasting 2000 q-tips every 5 years. The 2.1.4. is so useful, 2 of them will help you, one to hold the eyelid up (upper or lower if need to gently flip it to express a stye right on the inner margin of the eyelid) and the other to express it, as the bigger ones don't have a good grip of the eyelid, due to their rectangular shape, this small one holds the eyelid in position with far less force, allowing you to get rid of styes easier than using your dirty hand to access the area, which is not easy, as hand is big and you need free access for the 2.1.4. that actually will remove the yellow stye pus. 2.1.6. is 5 times easier to use than any other one in this list for gland expression, and also safest due to smoothness. This 2.1.6. is similar to the 2.2. Tearse expressor (see 4 pages below), except this one has the huge advantage of being only 2 mm wide when used vertically, vs 8 mm for Tearse, so we only express what we really need to, nothing else; an OD on Amazon explains that he found 2.1.6. to be much better than others he used before, since it allows easier sterile evaluation of specific glands and expressing deeper only a few, by not pushing on eyeball with the hand as unsafe (or unethical) ODs/MDs do to try evaluate or unblock a gland, damaging the eyeball if no Mastrota used as support to avoid eyeball press, and infecting it (if not using sterile one use gloves) with microbes from other patients whose eyelids they touched before, this is the only Amazon review I found for this type of tool from an OD on Amazon where he stated he's an optometrist doctor (OD).☺☺☺

2.1.7. $29, 1x2 mm paddle this one is very different, hardest to clean, the least recommended to use for anything ocular, has a little scoop inside the paddle interior (not flat), to allow the tissue to get some relief from the press, and enable less push down of oils, but it's too sharp to use on MGs expression. 2.1.7 is by far the *fastest (but not the safest, so I never use it anymore, because one single mistake and you could touch something and scratch it, while 2.1.6, is so round, nothing will happen if you move slightly by 1 mm or 2 mm due to a startling sound or whatever)* for eyelash picking when one end of the eyelash sticks out and you can pull it without touching eyelid at all, without catching/bending the other eyelashes. *However, if the eyelash is in a position on eyelid and requires touching the eyelid, 2.1.6. alone ought to be used, being softer on the edges, far safer* (sharp edge of 2.1.7. will create collagen tears and then styes) *easier to clean and more hygienic as a result. So,* 2.1.6. is truly the best one for eyelash picking, *and the only tool you ever need for eyelid expression, eyelash picking, etc. Initially, it may take a while to get used to 2.1.6. due to its slipping, but it scratches the eyelid collagen far less and that's the most important thing, in order to avoid small styes that form in the collagen ruptures caused by 2.1.7. sharper tips. The* main drawback of 2.1.7. is that the edges of the paddle are sharpest of all 8 I bought and the 2 paddles are not identical, one is done well, the other rusts fast when sterilized

in steam unprotected and it very irregular, so it requires more cleaning of rust after one big sterilization. So, over time, I gave up on 2.1.7. entirely, due to its low quality steel, and use only 2.1.6. to remove mucus in the corner with eyes closed or remove eyelashes. So you can perhaps use CaviCide and 70% alcohol pads, though for years I use now only alcohol pads: 100/pack/1$ Walmart. Due to its sharp edges and extreme difficulty in cleaning, 2.1.7. is therefore only for fallen eyelash pick or bursting (if 2.1.6. can't gently slide it or burst it) the *smallest of eyelid styes* that you see at 20x, before they become 20x bigger and are visible at 1x in the mirror, by squeezing the top 0.1 mm of it, tiny *yellow* pus transparent *yellow* styes on eyelid margin or the white head type on eyelid margin, where it is hard or unwise to use typical forceps that glide and can push down that pus, which we don't want; *please don't ever do* MGs expression with 2.1.7., it's too sharp and hard to clean to get so much eyelid contact. For tiny yellow eyelid margin stye burst, see the stye section. For bigger styes you didn't catch due to failing to watch eyes in the mirror daily at 20x, you need one of the other ones that are much softer and rounder, since you will place it behind the eyelid. Overall, 2.1.7. is pretty useless, since 2.1.6. can pick up eyelashes too, but without scratching the fine eyelid tissue. The reason I mention 2.1.7. is it shows up on Amazon searches for eyelid tweezers, so I didn't want all to waste their time ordering it. Scarring the eyelid is a big no no, as it could lead to recurrent styes in one location.

To *minimize* eyelid damage, for MGs expression 2.1.6. is far better than all others. It's the most ergonomic, as it won't force eyelid to be so straight as really long ones, unless you rotate the 2.1.1-2.1.5 when using them at 90 degrees, but then you can't see well and is much harder to use that way if you do your own glands and clean the eyelids of infected meibum with one hand, while the other hand is holding the eyelid with the forceps, slide it to the right/left slightly to allow you to see if oil came out, though you can just remove forceps and hold eyelid away from eyeball, then clean it moist q-tip prepared nearby before you squeeze; 2.1.2. is thin, so less pushing down, it may be OK for newbies. Sometimes only one gland is blocked so only that gland needs more force, which you can't do with really long and wide stuff, without damaging the healthy glands that don't need that much force since they're unblocked.☺☺☺

With a 30x-200x magnifier (list here), you can see which ones have small scratches and may need to be polished with an ultra fine paper, before sterilization (usually Medi Inc Amazon Mastrota or cheaper forceps). Tauber *is* the way I did MGs expression thrice, got Prettyia Dec 2021, a 2nd Prettyia pair in 2022 *to remove eyelashes partially stuck into the eye, partially out; this type is ideal for bursting yellow pus styes at the top of the* MGs *orifice (save 400$ doctor visit) with a* specific procedure detailed in the antibiotic stye section. *The forceps you use for* MGs expression *or stye burst needs be sterilized between uses and* use the other one for eyelash picking only to avoid sterilizing it and have separate storage boxes too.☺☺☺ Always use antibiotic drops *before and after* and have 8 moist sterile q-tips ready *to pull out meibum as it*

comes out, one wipe per tip to avoid reinfecting any area, exactly as in the stye procedure, otherwise, all that gunk coming out will infect your healthy (now more open due to warm compress or due to expressing more glands) glands; it is safer and ☺☺*lovingly gently* kinder☺☺ *try* do *only* 1-3 *glands* expression (2-5 *squeezes*) a *day* per *eye* (even tiny forceps are going to express at least an area of 2-6 glands), *over 10-20 days* (consecutive days or, ideally, every other day to give eyes some rest, 6 glands in left eye one day, 6 glands in right next day etc for 20 days to cover all 120 glands, if you do it all at once with OD after visit, MiBoFlo, TearCare, IPL you will induce severe ocular stress by having few lipids left for 2 weeks, since all was squeezed and do more harm than good vs doing it slow), *slow, over 3 weeks, a little each day, to also prevent* infecting *clean glands (*lacrimal *glands,* nasolacrimal *duct where tears drain via* puncta*) with junk from a more infected one; you can never know which one is more infected by appearance, so do it safer than all doctors, over 20 days, to decrease cross-infection chance 90 fold, since not only do you spread it over 480 hours instead of the typical 0.25 hours (15 min) after IPL, MiBoFlo, TearCare, etc* but the sudden release of 20 times more bacteria and the sudden need to repair *everything* 1920 times *faster* will provide a deadly shock to the body immune system, and the eye for weeks (no lipids left) and maybe for life, irreversible damage.☺☺☺

We are in the 1st century after the Internet and they only discovered MGD in the 1980s; we can't assume if an MD/OD said it, it's true; we need video, like cops wear cameras, to see what he does, to make sure he does it correctly, cleans the eyelid and forceps after *each* squeeze and, after removing the forceps and still holding the eyelid away slightly, WIPES EYELID WITH STERILE MOIST Q-TIPS BEFORE RELEASING THE EYELID UNTO THE EYEBALL to prevent infection, patient gets video after visit, at 20x or more, to compare with the correct way shown on Immortality *Nurturing* Agency website so patients act as government's police force and eyes to check every video, notify gov if any video is odd and ensure MDs do things right, and this becomes *national* and global standard, video for all procedures, to prevent MDs from rushing, wrongly doing some parts of the process, in any medical procedure intentionally or not*; moreover,* the deadly idea of whole eye 'warm' (110 is hot) compress (recommended by most MD/ODs) is extremely dangerous if overused, since it will induce cornea keratitis, damage the iris, vitreous gel (causing floaters), lens, etc*; so, by doing only 10% of one eye at a time, you can do warm compress of that 10% of the eyelid section with a* simple eyeeco.com insert held on that eyelid section or semi warm water ziploc bag and eye closed if you do the corners of the eye and eye semi-open or open if doing the central eyelids (just blink a lot and be careful to never touch the open eye, only the eyelid) *to avoid heating the 80% of the central cornea that should never be heated daily or even monthly at* 110°F (as LipiFlow makers know, LipiFlow is the only safe heating of eyelids by MD office gadgets that doesn't heat the cornea)*, to* avoid damaging the iris.☺☺☺

Never use anesthetic, as that can allow OD/MD to completely destroy your eyelids without you

knowing; pain will enable you to tell him he's squeezing too hard; even when you feel little, an MD can still destroy your MGs, so be safe, try it at home, after studying for 3 months all literature, youtubes, etc, some doctors are evil; our immune system can only cope with so much stress all at once and you need to give body time, energy, nutrients to repair one set of glands well first, etc. MGs that need the most expression can be seen by *gently* pulling eyelid (lower usually) and seeing which one is more yellow towards the top; *those have more solid yellow meibum, while clean meibum is clear and those glands only produce clear oil, being healthy; always* do a warm water ziploc bag or eyeeco insert warm 'compress' before expressions to increase effectiveness, for at least 2 min over the 10% of each eye area you will express that day.

Ignorant or evil MDs/ODs never use antibiotic drops before and after, *never have many sterile q-tips lined up, ready to remove the bacteria rich meibum coming out* after each expression, right BEFORE *releasing* THE EYELID to *TOUCH* THE EYEBALL☺☺☺ (you need pull eyelid out for 1 min to express and clean, wash hands before, after)*, etc, so they make eyes prone to massive infection. The q-tips are Medline brand cotton swabs for example, sterile, removed from the 2 pack seconds before use:* moist with sterile saline or much better, with antibiotic drops, get some for 20$, free from teladoc.com or your doctor, use it before and after meibum expression, say you got a stye and blepharitis, half the people have blepharitis anyway, doctor can even take LipiScan to prove MGD and give antibiotic, i.e. chronic infection of MGs, without knowing, 42% of kids, 70% of older adults, this is because yes are the only moist mucus membrane directly exposed to millions of microbes daily; we don't have 5 million eye doctors to do 50 expressions a day to 50 people on all 200 million Americans who need it every 3-12 months (*and spread over 10 sessions of 10 (takes time to prepare all q-tips, wipe out, etc on that 10% of each eye done that day) minutes each to avoid cross-contamination, so basically 50 visits a year for preventive eye care, especially for the 50 million with severe MGD*) in order to live to 200 with really healthy eyes, so the only solution is people doing it at home by learning from various youtubes, books).

2.2. ultra smooth 300$ Tearse flat forceps (sold only to ODs, but patients can order alone an even better $185 blue titanium identical one from Titan) made by Rhein Medical, James Tearse the inventor, this one is wider at the top and narrow at the bottom to prevent pushing dirty oils down the gland (or ebay 17$ blue titanium*: a very good idea for design to prevent oil pushing down for these flat type non-cylinder 2.4. forceps,* though you can use a Mastrota paddle 1.0. on inside and a 2.1. Tauber inverted (with the smoother rounder side touching eyelid on outside) to *achieve the cylinder 2.4. forceps effect* or better, since Mastrota is rounder than cylinder 2.4. inner end, unless you buy Epstein rounder version. The disadvantage is you need pull eyelid more to avoid touching the eyeball. However, this Tearse is not ideal for top of blocked gland expression when the blockage is pretty big, as it will slide and that does need a good Tauber grip with the paddles parallel. Tearse is very wide 8 mm (I would have made it only 4-5), 4 or 5 mm

deep *(so may be too wide and cause by this too much damage to the eyelid collagen elastin fibers, since eyelid is used to being concave, not straight)*, and *the* 9 min video shows you how unsafe irresponsible*, clueless or "compassion lacking"* OD/MD doing this is*, he's allowing that thick yellow super infected meibum (*it is super infected, you can see it from the color, healthy meibum is clear*)* to infect less infected glands, puncta, eyeball, without wiping it off the eyelid and expressor after each expression, and even doing gland probing with all that infected meibum floating around after his prior mistakes *(more on probing 2 pages later, probing can only be done by OD, since nobody sells probes on Amazon)* thereby increasing infection risk 90 times, but this is typical of most ODs, ultra bad expression and probing technique; many people will be victims of clueless ODs who forget meibum is loaded with 1000s of microbes; Tearse is not as good as cylinder 2.4. for going from bottom to top of the gland using your finger as a helper from the very bottom unreachable with Tearse (since it's too wide at the bottom) or cylinder 2.4. exterior; issue here is the slipping for doing the very top only for a superficial expression will be 3 times higher than Tauber, but it is helpful to have one like this too (Amazon/ebay has some like this) perhaps, to go from bottom to the top, since 2.1 doesn't allow going from bottom to top without pushing down.☺☺☺

2.3. *$14* round flat forceps 5-5 mm diam or ebay 20$ 8-12 mm diameter (huge), $16 titanium blue ones (New Jersey) rust/weigh less 6x6 mm, definitely go blue if price is close

I got the small 5-5 *(I avoid the huge one, also called Collins forceps or chalazion clamp to try drain chalazions after warm compress, as it expresses too much at a time and can damage too much, deprive eye of too many lipids at once)* Dec 2021, in theory could be used for expressions, though *Mastrota with finger is 50 times safer to avoid pushing anything down* (Tauber can push stuff down too, but Tauber is only 2.3 mm wide, vs 5 mm for this one, so this one will push stuff down way more, being dangerous vs the cylinder 2.4 type; this can be used though to rub off some antibiotic ointment on the outside of your eyelid, just as you can with the Tauber exterior ultra round side, as a designated too for that purpose alone; *this could be used for beginners who want to do the gentler 'training' mini expression where nothing is squeezed, only placed there gently, being 4 times thinner than roller types,* about 35% thinner than the Tauber forceps above*, so you need pull eyelid less, meaning damage ligament tissue etc by stretching it less;* I used this for about 25 min to do some ultra gentle ultra *mild expressions to avoid pushing down junk; like all flat forceps, it has its own issues* of *pushing* meibum down and causing damage to MGs if *you press too hard*; however, it's not as effective as the Tauber at expressing the top only or a smaller amount of glands, the Tauber allows you to bend it to 45-80 angle, instead of parallel to the gland, and go well under the top of the gland without squeezing so much of the lower end and pushing dirty crap deep down, so I no longer use the round one as I did before a few times when I did useless ultra gentle squeezes. Flat forceps are easy to use vs rolling.☺☺☺

2.4. *Cylinder expressor* (one side flat, one side *fixed*, *not rolling*, cylinder):

the safest to* remove all oil from bottom up (push 0 down) *+ get styes/chalazions drained

2.4.1. Optik 95$ **2.4.2.** half cylinder, round inner paddle vs rectangular, so less scratch of the eyelid if you're rushed Epstein $190; the main issue with Epstein is that being round plate, it will push oil down for the glands that are not exactly in the center of the round thing where length is maximum, so this is a useless device for maximum safety, but many devices are described with their pros and cons, so it's easier to decide when you see one online. However, this may be of some use for corner stuff where rectangular would not work well. **2.4.3.** Amazon (avoid, too rough, too wide, see pic: plate is much wider than the middle vs equal+smoother in ebay/Optik version) $29 wide plate means more damage to eyelid used to concavity, we want max 5 mm, not 9, especially when we talk about placing it so far down **2.4.4.** ebay (softer rounder, safer than Amazon/Optik ones, has 15 vs 12 dents, $29, 20 day ship. *This type, if used gently, since its* edges on the side that goes inside *are not very smooth, is* 900 times safer than roller types*, since it's easy to clean well, wipe, wash, inspect for rust, etc and allows you to roll from bottom to the end, easier than the traditional* 9$ **2.1.** *Tauber ones and safer than Tauber for bottom to top.* This last one seems the best for getting all of it out from bottom to the top of the MGs, due to allowing a gentle sliding and not having to do it several times as with the 9$ ones, as long as you use q-tip to help push the very lowest bottom up, since the thing itself is kind of short vs the very end of the inner side. However, the 9$ **2.1.** Tauber is better for small/medium stye burst and more useful for picking up eyelashes stuck near the eyelids (use 1 for each purpose to avoid contamination as mentioned above, very important). Each has its own pros and cons, maybe get some and see which ones are better for mini expressions, but you need ultra smooth if you want to go from bottom to top of the gland, so 2.1 is not for that purpose; in this book only the main types, the most common ones are presented. ☺☺☺

3. The *rolling* forceps *(very risky due to dirt accumulation, too thick)*

***These are the least recommended (super-*deadly, avoid *at all costs) forceps for regular* MGs expression and at home users without the most high tech sterilization, cleaning tech. These are safe only for once in a decade chalazion for draining it downwards for upper chalazions (to drain the pus out) or upwards for lower eyelid ones *(prepare like* for styes*, with sterile q-tips to remove any drained liquid off eyelid MGs orifice before you blink and allow eyelid to touch eyeball, to prevent infections).* However, cylinder 2.4 can work better. These are rotating roller types (safe for frequent use only if the 2 cylinders are fixed, not moving, never seen a fixed one): **3.1.** *the $95* rolling forceps (full cylinder rolling, smooth, with smooth end) This is the smooth *roller* type *the doctor used on me (and himself at home), (it was the one I liked the most of all devices in 2020, he ordered it for me; however, now I no longer use it, I only used it 40 minutes*

total, about 5 minutes maybe 8 times, since it is extremely hard to clean (the hidden area on which cylinder rotates gets black and rusty after 1-2 years even for this 100$ roller from India, the inner cylinder, etc, unlike the other forceps which are 900 times easier *to clean perfectly;* thus, when you roll it to do your monthly MGs expression, little particles that didn't come off during steam pressure 320°F sterilization or 5 min sonication with CaviCide/70% alcohol, wiping with 70% alcohol (alcohol doesn't kill spores, so wiping is before anything else), then washing again, etc... will fall into the eye and reinfect you with the staph bacteria of former styes, chalazions etc. ☺☺☺ *Additionally, the rolling part slips too much to be able to express the top part (where solidified oil exists) and requires pulling on the eyelid too much*; while this roller type allows better sliding, rolling from bottom to top, it's 4 times thicker than the rest, so it can't go to the very bottom of the gland, like the cylinder 2.4 can and will thus cause MD to push upper meibum towards the bottom causing serious infection; however, for a small expression this may be fine, provided you sterilized it at 320°F 10 minutes before use and wiped it well with 70% alcohol before 320°F steam pressure sterilization, otherwise, the rust/dirt at the junction will allow bacteria to grow and move on the roller itself and you would reinfect eyes with junk; it's very intimidating for beginners who don't want to pull so much on their eyelid, which can damage it as you got to leave a huge space for the thick roller; *there is no way to really reach the gland root without damaging the eyelid and eyeball, it's simply too thick*; it slips too much and doesn't allow you to really squeeze the top, being the least effective for a good expression of the blocked top of the glands; *since it can't be cleaned properly, roller forceps are deadly and basically a one time use, especially if you get some of low quality metal (like the one I got) that rusts fast with just minimal use in between the inner cylinder and the support (hard to see unless you look carefully to see the black there). The* edges of the cylinder are not really spherical as they could be to some degree, so this presents further challenges since it could create small MG damage if not careful by pressing against super thin skin inside. ☺☺☺

On 12-22-2020 he did *my first ever* MG *forceps expression, after applying numbing drops and it felt painless, sounds a lot safer (since you can disinfect it with 70+% alc*ohol) than using silicone sterile q-tip (do not use nonsterile from $ store that come in a bag of 1000 with a tiny circle hole on the bottom allowing all bacteria to enter) *and pushing with your finger against the q-tip or with another q-tip. After 12-22-2020 makes more sense to try* the Q-device with corneal shield again a few seconds*, as the old lipids came out, but the doctor forgot to bring the warm up mask. H*e was very nice and ordered for me the rolling forceps and I used it on 3-14-2022 in my first mini expression on the lower right eyelid only; it was painless even though I did not use numbing drops; there was little pressure applied, and tons of lipids remained there, so the *eyes didn't get red like after the doctor did both eyelids both eyes (when lipids are not left in their sacs, we need use* artificial imperfect lipid tears *to replace the lost lipids and maintain a "fake 3rd*

lipid layer" made of 1 phospholipid (instead of 600+ natural) until the meibum glands restore their lipid reserves in 10 days); so when doing it at home, *it's best to do it on one eyelid (upper or lower) at a time, to test your eye's response*, very little at a time *(to squeeze only 10-20% max of the lipids to stimulate more growth*, because these glands die when oversqueezed, but new ones spring up, they're holocrine), to *avoid triggering high lipid tear deficiency (which causes temporary redness and new arteriole springing up due to ocular damage if you forgot to wet the eye* with tears with lipids), or only the lower one (that has issues usually), since it's much easier. *You may need to try gently to pull eyelid and grab it and press the gland area many times before you get really good at it, so you leave the orifices open and don't grab on the orifices*. Right lower eyelid is easiest for right handed people. ☺☺☺ 3.2. the $144 rugged rolling forceps – pyramids are not very smooth (full cylinder rolling and the end tip is sphere like for less eyelid-conjunctiva abrasion, I would not use it ever) 3.3. the smooth rolls "3 mm tip only" rolling forceps which allows a far smoother inside the eyelid experience, the tip being all like a sphere instead of a regular or smooth cylinder end or 3.4. "whole cylinder rolling" *$21* texturized (each pyramid top is very flat with a tiny valley to avoid scratching the eyelid) rolling type, *$25* rugged rolling with smooth end type (can't see how flat the pyramid tops are from pics, one pic shows one end of the thing being off-center, carefully examine pics before ordering) or 3.5. 70$ less rugged roll with smooth end type (among rolling ones, the flat or smooth pyramid top or with a small valley there are safer). 3.6. *139$ kit that is not a rolling forceps but uses disposable roller that can't be cleaned easily;* 1.0 Mastrota paddle is safer than the less round end of the clear paddle of the Gulden kit, which you have to spend 500$ over time to get new white rollers and things, plus finger allows you to feel the bottom of the Mastrota or of the cylinder 2.4., that roller doesn't, the small soft finger, just like a soft cotton moist swab, can be far gentler than a plastic roller. How easy is to clean the roller support? Roller support, plastic piece can't be disinfected before expression, plastic too rough (blurry 2013 video, pic pretty clear) to reach bottom of glands without scratching eyeball? ☺☺☺

4. The final and most *dangerous* way to do it, which I would never even try is moist (sterile artificial tears, saline or hyaluronate or oily that glide super-easily) silicone q-tip plus doctor finger (avoid it, even if IPL inventor Dr Toyos does it, *the q-tip can't be thin enough to go to the bottom of the gland, so it pushes some infected meibum* downwards *as you move q-tip upwards, creates too much of a gap between eyelid and eyeball that irritates both eyeball base and eyelid, swab being too thick, and spreads infection from top areas, doctors don't disinfect hands well either) or* another sterilized silicone q-tip (US tested/designed silicone tip, more comfy than any cotton disposable applicators, so soft on skin, so hard to sterilize properly though...) or STERILE silicone q-tip (not $ store nonsterile cotton swabs people use to remove ear wax), *which is often used to enable going from bottom to the top of the gland, but cotton will get fibers inside the*

eye, so bad idea; to make the q-tip less bulky, one could buy a flattened silicone q-tip (they got them on Amazon) to use like a disposable "Mastrota paddle" that is tinier, smaller diameter and easier to work with without having to pull eyelid so much out of its normal alignment, without being so tough as a metal, enabling higher gentleness with the tissues; doctor or genius researcher could try it experimentally for 3 seconds first, then if fine, do another 3 seconds next day, etc, develop new protocol and tool, like a mini Mastrota made of plastic easy to sterilize with ultra soft round silicone (or new material that glides easier than any now) – *not cotton since fibers get into eyes*, 50-80% thinner than q-tips and thinner than Mastrota, with another such special tip used to press exterior maybe to allow far more flexibility than a forceps allows, and give an option to those with big fingers or who want higher sterility than MD hands).

5. MG Probing or MGP☺☺☺ is the most invasive and scary procedure using 76 micron probes used only to pierce keratinized orifices of 100% skin blocked glands with special needles, but this is a lot better than referring people to excision for chalazions because the OD didn't want/know to unblock the MGs first using 2.1. to allow easier drain of the chalazion/stye located far away from eyelid margin, or using 2.4. or 3.0 in combination with 2.1 if the stye is near the eyelid margin to prevent infected pus being pushed down the gland. MGP is only needed for very rare cases of keratinization due to various forms of vitamin A acne products or A ointment/eyedrops with degrades vitamin A, that facilitate MGs orifice keratinization. MGP can be upgraded to high tech to see exactly the gland that is the stye or chalazion and unblock only that. MGP is done by MD drmaskin.com or his mgdi.com Tampa, FL for $6000 (probes are cheap, see below, so you don't need Dr. Maskin) for both eyes, physician assistant of MD Ragen does probing: new or Enegren (MMS PAC, *not MD or OD*) in Camarillo, CA (Ventura Eye Institute veiurgent@gmail.com for questions, they charge 250 for consultation, 600 for meibum expression and more for probing, so 10x what others charge), or 10 min with MD/LASIK Surgeon Gulani in Jacksonville, FL (2 min clip). MD Maskin got clinical evidence for probing. MD Maskin explains in this 1 hour video how he does the MGP and how meibomian glands produce oil and oil tries to come out, but patients develop fibrous tissue that blocks the gland orifice, and then the eyelids become painful due to this pressure buildup and patients feel amazing when the 'needle' probe is removing the fibrous tissue and oil starts to come out, leading to equal pressure. Dr. Cremers explains the MGP use for regenerating regrowing the meibomian glands using stem cells inside of the glands and 30 other methods to treat dry eyes. She does MGP too, and her channel has more videos for the curious, she charges $460 for dry eye consultation, 4x more than others.

The one odd thing about Dr. Maskin and the other 30 MDs who follow this probing protocol is that there is no standard clinical way to take a pic of the orifice and see the fibrous tissue and know like black and white that this is blocked or not blocked, or "expression won't unblock it", etc, it's more of a Wild West, so there is always a risk of too much probing and infection of one

clean gland from a "dirty" one, etc if they don't sterilize the 1,2 or 4 mm probes between the 20-40 glands they probe. So, only the glands that are dead in LipiView meibography make sense to probe and maybe add your own serum stem cells, etc platelets etc, as Dr. Cremers/Maskin say. MGP as done today by most has 4 steps: expression of glands done after 15 minutes anesthesia first (this is not a 30 second expression doctors do with q-tips, takes 1 hour), then gland probing 30 min, then gland dilation, then gland expression with forceps, then steroid use for the most extreme cases where the simple expression doesn't work. Well, having seen above the catastrophic way they do even MGs expression, we can be certain those doing this will often combine the worst MGs expression and probing to infect all clean glands; thus only do this with someone you trust and that projects what is being done on a screen and uses no anesthesia, so you know when they probe in vain (off the orifice) and are not careful. They need to use this to drain styes and chalazions caused by MG swelling, MG blockage, when regular MG expression fails to unblock and drain the chalazion/stye, instead of excision of the inner eyelid that does so much damage. It's good, if you ever have a stye that you never can drain (after trying warm compress, etc) etc cure yourself, to ask OD to get the probes to drain it himself after unblocking the gland. They need a better hi tech camera to magnify the eyelid more and show where the probe needle is going with needle the size of a human finger on a computer screen behind the patient that the doctor can see perhaps, so they only puncture areas of the orifice, not anywhere else, since going around will only cause damage to nearby orifices and new infections.

The needle of the special tool, the probe, needs to be clean, so who will line up 20 clean such probes, sterile and do it correctly? Nobody.☺☺☺ You need to wipe out everything too right away before going to the next probe. We have yet to see, online, I have never seen, a really clean and safe probing done; you can probably do it much better at home after you study everything, but need those tools only MDs gets. Florida MD S. Maskin developed this ► BJO 2018;102(1):59-68; this is a very risky procedure (especially for people with severe blood vessel proliferation in the eyelids, inside or outside, the typical ocular rosacea patients who benefit from "eyelid only with corneal shield IPL", since the Maskin probe is not sterilized after each insertion into the 25 orifices fully and bacteria from one gland could infect a burst blood vessel that invaded another MG (you can see blood in some videos coming out, because it's not an advanced AI guided tool that is flexible and adapts the shape of the MG (as it may become in 150 years, like LASIK, ultra computerized) to make sure no blood vessel or other tissue is destroyed, recall how IPL treats and closes blood vessels that invade the glands?) and cause some serious infection in the eye and body; it's probably more like IPL, the one method tried after all the other 90 methods are exhausted and only feasible for people with minimal vasculature inside MGs to avoid bursting and then local bacteria infecting the eyelid (even if they would sterilize the probe after each insertion, it's still risky, since antibiotic used afterwards

may not work). The reason I wrote about this about the scary probing method (done even in Beverly Hills) is to understand that MGs expression is not as simple as it sounds if there is serious fibrous tissue blockage; one MG expression after warm compress may not unblock, one may need many expressions to avoid the scary probing method, see the 30$ devices (OD can order it for you if he trusts you, but probably they won't order these for most patients) used to probe (76 microns). Attach phone to microscope to record video. ☺☺☺

11.17.7.3. LipiScan, LipiView reviews; MiBoFlo, TearCare methods damage cornea via heat, and the OD does a rushed MGs expression that induces vast stress (all lipids gone for 2 weeks almost), is 20 times more likely to cause infection than doing slowly an at home (over 2-3 weeks) MGs expression since one infected gland can infect all the other open ones, many ODs don't even use antibiotic and some love to kill, this being their job, as military (disguised as civilians) doctors of a noneterni military; the safer LipiFlow alone doesn't heat the cornea; yet, LipiFlow can infect eyes, if OD doesn't clean hands, needs to be done 50x at 600$ each, 30,000$, before real change happens in mild MGD, LipiFlow can push infected oil into the lower MGs end, so even LipiFlow is not safe. Before you do risky IPL/Q etc and spend 8000$, more than a car, try MG expression, because doctors don't know/tell all, as the video series on heart stents explains.

1. LipiView or LipiScan + LipiFlow, 2. MiBoFlo + MiBoCam, 3. TearCare + Keratograph 5, 4. iLux + any Meibograph, 5. IPL (red light or Q) + meibograph are 5 tech based ways to cure dry eyes due to low lipid tears ***without artificial tears toxic chemicals, these techs are described below.*** **Red/dry eyes are often caused by meibomian gland dysfunction MGD (MGs were discovered by Heinrich Meibom in the 17th century, MGD was discovered in the 1980s, meibum has 600 lipids). MGD is present in 86% patients with dry eyes (being the main or only cause for a large % of this 86%), the oils get thick (due to reasons listed in the first section) and plug the orifices of the glands. MGD causes the tear aqueous layer to evaporate, as the lipids no longer protect the aqueous layer, so the eyes get dry. CO 2018;37(4):426-30 shows shocking pictures of MGA (MG atrophy) in kids; they found 42% of children have some degree of MGD, while other studies found 72% of adults have MGD; you know, we're taught that atherosclerosis starts at 40-50, but it starts as a fetus, same with MGD, it starts way sooner than 40; perhaps, eating oxidized cholesterol, high AGE diet, can increase oxidative stress from sunlight and increase chance of MGD. Eye care starts at age 1, if we eat bad, we get MGD as a kid faster. This is bad news, since MGD can cause severe inflammation of the eyelids and eyes over time, going undiagnosed for 20-30 years (it's not a routine thing to check MGD, some never have an eye exam in 30-40 years); this is the first study of MGD prevalence in kids, showing a way higher incidence than assumed for decades; the authors suggest screening kids for MGD,** ***(since 2009 this is easy, using LipiView for the first time in history) which makes sense,*** **if we want to live to 200,** ***we need to detect MGD decades before it's so severe the atrophy is irreversible; so perhaps, LipiScan would***

be required for every eye exam and green card medical exam (to inform people of eye issues, for productive citizens of Eternia). Kids are not always wearing sunglasses, allowing UV to completely destroy meibomiam gland orifices, increasing eye oxidative stress, destroying the glands and ocular surface too. 1.5 billion people have some form of MGD, but they won't know it until it's so advanced that it causes dry eyes, with glands harder to regenerate as explained at reversibility..atrophy. 620-770 nm "red light (penetrates) up to *6 mm*... LED blue light (*400-480 nm*) (penetrates) *1 mm*" ► PO 2016;11(6):e0157898.☺ See this penetration nm table. Blue light damages MGs*/orifices*, being near the high energy UV; we stare 11 hrs at screens daily, screwing our eyes, as no blue light filtering is used.☺☺ The skin cancer section has UV link to short human lifespan. Even UVA 341 nm light penetrated 0.135 mm into the skin, *enough to destroy the gland orifice* ► JBO 2008;13(4):044030. Healthy MGs stem cells will help regenerate atrophied glands.

11.17.7.4. NuLids *(high magnetic , electric field,* not safe, I would not use it)

Some use NuLids device at home (295$ on Amazon, 15 seconds per eyelid, upper, lower, left, right, so 4*15=60 seconds daily maximum; turns off after 15 sec to avoid damaging the eyelids, if using silicone sterile q-tip at home*, also do 15 seconds only, to avoid damaging eyelids*), especially useful in avoiding paying $150 for each visit to do a BlephEx treatment, this way you do 300 treatments for only $500, not $45,000. Please DON'T USE *NONSTERILE* $ store cotton swabs, wash hands first, moisten with sterile eyedrops only or a foam cleanser like Cliradex, *not tap* water. Avoid cotton q-tips as tiny fibers get stuck on eyelashes and hen get into eyes making *them red*. Avoid stuff like Medline 6 inch 200/8$ or 3 inch 2000/40$, or 6 inch 2000/41$, 3 inch 200/10$ Dukal, *even if optometrists use them today at those 4x visits a year, but you do this many times daily, not once a year, so* you would get endless fibers into eyes. For most people 3 inch (the only size for silicone q-tip anyway) is more than enough since it allows being much more precise *(you can hold the whole tip in your palm, you can rest your hand on the face to diminish unwanted moves that may scratch cornea, allowing perfect dexterity, while that is impossible with the 6" which has to go outside the palm, limiting the angle of rotation and making it harder to rest hand on the face)*, gentler and safer. You can use the one with ridges (not the bumpy one since that one is impossible to clean easily with an alcohol pad) to do meibum expression and massage and the all smooth one to place ointment or clean eyelids with eyelid foam like Cliradex. *For self-cleaning 3 inch is easier, for a doctor cleaning with 6 inch is often easier, if he uses microscope too and 3 inch is clumsy being too short or for some non-eye applications; that's why the doctor often has 6 inches q-tip.* The Q device also uses sonic vibration and the Q device section explains why the NuLids indirect method may be unsafe, and why I don't think I plan using either indirect NuLids or Q device (I used Q device 4 times before I realized this potential issue). NuLids indirect (exterior) is going to be very harsh on the blood vessels on some people's eyelid margins, so then the direct NuLids method (interior) is the only

option *(this requires extreme attention, sitting may be best, to avoid touching the eye with the tip, a see thru corneal shield can make it even safer to use the direct method, without ever running into the risk of touching the eye)*. NuLids could just sell some corneal shields that are reusable and washable to get around this issue, same for the Q device manufacturer. *These shields would have to have ultra rounded and comfortable edges and be custom for the use eye size, which means the use would be getting a custom shape based on a 3d printer that takes picture of the eye for perfect fit, or at least create 500 types of corneal shields, for the main 500 types of eye sizes and shapes, if creating individual one each time is too expensive for some people (still can be an option)*. Q device is sort of an indirect NuLids with Light combined, but far gentler than NuLids, because it doesn't rotate and agitate the glands too much, causing them to dilate and bring inflammatory cytokines (*Dr. Toyos explains in his "Dry eye disease" book that lid scrubbing (thus NuLids too, which is even worse than lid scrubbing in terms of agitation and pulling at collagen there) is not recommended by him for people with abnormal vasculature around eyelids, since it can make things worse, increasing inflammation and* MGD. ☺☺☺

The $295 price sounds high (see why here), but all techs come down in price over decades, the 1970s solar panel was 400 times more expensive than in 2020, the first customer acne light device was expensive, now it's $20 at RiteAid more on Amazon, the Q is now $495, but it may be $50 if they perfect it, make it safe, etc. That's why I bought the Q device myself to check it out, and not NuLids, since NuLids sounds like being so rough with ultra fine gland orifices; but Q has its own issue to vibrating the conjunctiva and cornea slightly, because instructions say 2-6 minutes, but NuLids 15 seconds per eyelid. Then upon reading about this, I'm even more skeptical of lid scrubs (always thought they're too rough for the fine tissue without a good oil that can't BLOCK or damage the glands, but how can you find such an oil or scrub solution, it's all a guess game, since we're all different. Just be aware there are risks with NuLids for people with ocular rosacea or abnormal vasculature around eyelids, better seen with a 30x magnifying glass or 20 x mirror. *NuLids with $180 treatments (tips) is only $369, versus paying $24,000 for 180 visits.* NuLids was released in 2018 and it led to discontinuing eyedrops in some cases, it's maybe a good device after using LipiFlow or iLux to unclog glands professionally, see NuLid video for more. Sterile q-tips on outside eyelid, pressing a little downwards or upwards to get oils moving towards orifices is fine, but inner eyelid requires extreme care to not scratch the cornea or the gland orifices, so avoid q tips over MGs orifices.

The cheaper alternative to *NuLids (can be as effective if you rotate q-tip manually a little, and way safer as no electric/magnetic field to destroy the whole eyeball and no light) is to buy on Amazon a* reusable US tested, designed amazing ultra soft (way softer than the cotton ones or our finger) medical grade silicone or cotton (pack of 2000) q-tip *(round shape for easier use) if sterilized in 65% alcohol, sterilize it, use the flat (not rugged one) to clean eyelids. These*

silicone/cotton swabs made moist with sterile saline, can also be used to gently do meibomian expression, by gently gliding on the eyelid downward and upwards on the eyelids to help oils push the clogs, after warm compress; *although if you lie down in bed, and your hands are clean, you can express a little too the glands with eye closed,* touch the eyelids and exert almost no pressure on eyeball, as you focus on the edge of eyelid; *the advantage of silicone q-tip exterior meibomian stimulation (unless you figure out how to sneak it small finger without lifting the goggle and compress much) is that it allows you to sneak the q-tip under the rubber goggles (that still got the warm CVS type compress on top) while the moist heat remains there, while if you do it with the hand you lose all moisture in seconds since you lift the goggle too much; this prolonged heat and moisture allows easy gliding and when finished on lower lid, which is the worst in all people, you can do the upper ones in a few seconds, using the fingers, as those are huge and the cotton tip will take eons to cover and stimulate the whole upper lid, plus* cotton is the *worst* idea as little cotton fibers get stuck into your eyes making them red*, mixing with ointment and taking a while to notice or remove sometimes; the* eyelids will be totally wet when you do warm compress the "goggles in between for huge air moisture condensation" way I use*, which is 100% different than dry heat of electric masks or semi-moist of normal CVS-Bruder compress that "tortures the eyeball pressing it"; because of this, the* sterile *silicone q-tip would glide very easily on the closed eyelid and allow to express just like finger does,* perhaps much better with practice *than the* classical meibomian massage *as it applies far less pressure on eyeball than the much bigger finger. Presumably, with practice, using little finger, you can get closer to the minimal pressure a q-tip* would *do. Silicone swabs are way safer, because* cotton pieces can get stuck into MG orifices and clog them. *NuLids silicone tip can't do that clogging. NuLids or silicone swabs can clean the inner or outer eyelid. NuLids may be better because conventional eyelid scrubbing can be too much pressure on eyes (even if you do hand massage on eyelid trying to mimic NuLids or do 1 minute meibomian gentle expression by gentle strokes upwards and downwards, more pressure may be applied on eyeball, not a good idea) as it's not timed and you don't realize and too much pulling of eyelid off eyeball to get that silicone swab can happen if not careful which may cause serious issues: eyelid no longer sitting perfectly on eyeball. But* sterile silicone q-tips *a*re fine on the exterior of eyelids, which are far dirtier, since the lysozymes that kill bacteria, present in tears, don't wet the outer eyelid, only the inner one. Silicone swabs are better for those who can't afford NuLids for inner eyelid, the ultra fine area that has the gland orifices and which we don't really want to mess with with dirty cotton swabs or clog with cotton. ☺☺☺ We apply a foam *(*Cliradex for example*),* on the NuLid tip or sterilized silicone swab *(disposable cotton swab is way safer, use only once to avoid infecting the eyes, unless you find a really super effective way to sterilize the silicone ones, hard to confirm without a super microscope you really did a good sterilization job, since you need to see all viruses too, way tinier than bacteria)* like doctors use Cliradex on the tip *with BlephEx, and* we clean the

inner eyelid, which normally we never clean once in our lifetime, *just like for millions of years people never did one deep dental cleaning until recently to remove stuck bacterial biofilms.*

NuLid or silicone or cotton swab is not really going to unclog anything major though, just keep the top of the glands unclogged (perhaps unclog a tiny clog close to the orifice if we preheat with warm compress, not a major clog that is long), since to unclog big clogs, we need a lot of heat and mechanical pressure from the bottom of the gland to the orifice, like meibomian expression with STERILE silicone q-tip against the finger or doctor's office expression. NuLids or silicone swab can keep orifices unclogged once the doctor unclogged them in the office, if we do it daily or at least once a week or two, when our MGs health is improved. Silicone swabs have another advantage, they use far less Cliradex foam, as they don't suck 30 times more as cotton swabs do. But you can just use a round MG forceps set for that foam massage, and those are 100 times easier to sterilize properly than silicone swabs. And they're gliding easier on the eyelid, being less abrasive and irritating than cotton swabs. For these reasons, NuLids or silicone swabs are way better, since the purpose if to move stuck oils, not to destroy the collagen skin layers by abrasion. 1 min NuLid session is like blinking 1000 times, so it really stimulates the MGs.☺☺

iLux device was released by Alcon (Novartis subsidiary) Feb 2019, (actually in 2018 by Tear Film Innovations which was acquired by Alcon) 7 years after LipiFlow (they got 510(K) FDA clearance in Dec 2017), possibly in response to the failures of LipiFlow and its 5-10 times higher cost (10 times if LipiView comes with it); LipiFlow has one main disadvantage: it applies one "size fits all" which doesn't work since eyelids are of different thickness and oils melt at different temps, some at 41.7°, others 42.0° others 42.2°C. iLux is more work for the doctor, but it allows doctors to see when oils come out and if they really unclogged the glands; one can do 10 LipiFlow treatments and still not apply enough pressure to unclog a gland, missing the chance to save a gland from atrophy; LipiFlow is like the first car, which was almost like a chariot, it's not the LipiFlow of 100 years from now. So don't expect a huge thing to occur; buy a 20x mirror and gently press with sterile silicone q-tip like the doctor does when expressing the glands in the office and stimulate them gently, make sure oils are clear, not milky and do warm compress and eye hygiene, etc. With LipiFlow, the doctor has no clue what happened, he just walks away while the patient is there. But LipiFlow is currently perceived as the safest and as some MDs called it before iLux came "the only sure fire way to treat evaporative (lipid layer gone, so water evaporates) dry eye". COh 2020;14:405-18 found 5K Feb 2019 iLux is as good as 30K 2011 released LipiFlow (iLux results are highly dependent on the skill of the doctor, has slightly more adverse effects, which is not a factor with LipiFlow, doctor can adjust where to express gland in areas of highest blockage with iLux giving iLux an edge perhaps in terms of fewer treatments; but iLux is more painful and requires a lot more work from the doctor). We can't wait for glands to unclog in 3 years at LipiFlow #4 (since they will atrophy by then), since at home you can't do it

well and safely without heating the eye a lot (not good) and pressing on the eye (not good), unless you got a doctor friend who has medical grade tweezers from Amazon and does some gentle expression for you, or you use sterile q-tip behind eyelid and then finger to press against it (not easy to do on yourself, since you need head to be very fixed (chin sitting on something and also the forehead needs to lean against something, while allowing mirror view, as in the doctor's office), see Dr. Toyos doing it on others, which is a lot easier than doing it on yourself).

Another heat based tech is MiBo ThermoFlow (or MiBoFlo in some pubmed papers), official 2 min clip and 3 min from mibomedicalgroup.com, 5 sessions for $500 (vs $500-900 for 1 LipiFlow session), usually, but I called an office and they do 26 sessions of MiBoFlo, 1 year every other week of 10 minutes per eye meaning 26 sessions of 20 minutes each for only $900 (no gland expression afterwards), ☺☺☺ so you can actually focus on the eyelids (lower usually temporal-central) that are most affected. With warm water in ziploc bag, you can reach the same temp as MiBoFlo treatment reaches, so I'm not sure if it's really worth $500-900, at least LipiFlow squeezes also the glands without heating and damaging cornea by extreme heat, so if you do it for $600 you did some squeezing when it's really warm. The ultrasound gel (propylene glycol used in processed foods, cosmetics, antifreeze) of MiBoFlo is a known allergen, what if it causes irritation of some MGs and cancels the benefits of heat which we get from home massage after 5 min of heat and during electric warm compress? MiBoFlo is by far the cheapest/greenest among the "expensive options"/session, nothing disposable (except the ultrasound gel), see 5 min testimonial of Dr. Kislan talking about LipiFlow failing at times, and 4 min testimonial showing thick paste coming out (instead of clear oil), and 3 min clip showing for 2 seconds that the device was actually used to massage/heat the inner eyelid too, (the single unit used here too, *so they could heat the inner eyelid and then use a forceps, Q-tip or finger to express gland at the same time against the heating paddle, achieving the same level of expression or even better than any of the existing devices if the doctor doing it is careful, since he can focus on trouble spots way better than* iLux *even*) unlike TearCare, for lower eyelids being very easy to heal the lid, if doctor really wants. Many doctors do BlephEx first, before the 3 sessions of MiBoFlo (1-2 weeks apart) each followed by MGs expression with the forceps, blephex.com explains it's a cleaning of biofilm on eyelids (inner and outer, that has accumulated over years); sort of like deep dental cleaning. You can clean eyelids at home too, using Q-tips, washcloth, water, or Cliradex, etc. MiBoFlo is similar to TearCare (the official 5 min video), both sort of similar to iLux and LipiFlow, but with Mibo and TearCare using exterior heat only (unless the doctor is creative with MiBo, external only is not ideal, iLux is much better as it heats the inner eyelid also). TearCare uses forceps (smoother forceps than the Amazon ones), as pictures show on tearcare.com, to manually express the MGs, so that oils come out after heating, the issue being that expressing a 25 minutes later means many oils resolidify and won't come out in some "thick oil patients". ☺

Another device, least known, used in conjunction with the heat based LipiFlow, MiBoFlo, iLux, TearCare, etc is the Holbar Medical Group made EyeExpress, an FDA approved device for warming eyelids; this "warm mask" heats up to 110°F/44°C and then doctor manually expresses the glands, sort of like TearCare, MiBoFlo, just higher temp as it doesn't touch eyelids. CRO 2017;8(1):7-12 explains only LipiFlow (in 2017, before iLux *which heats up inner eyelid came along in 2018) heated up the interior of the eyelid in 2017, i.e. melted oils effectively (*Bruder mask, MiBoFlo failed to reach the 42°C required to melt oils: 38°C was max of Bruder, 37°C max for MiBoFlo, vs 42° for LipiFlow*), but after all, what matters is if it cures dry eyes or not, and* MiBoFlo allows using the single device to warming the inner a little too if doctor really wants, being WAY cheaper and possibly, for many, as some doctors say, way better than LipiFlow. Since the paddle is heated to 108°F only, the inner eyelid where meibum is won't reach that temp (due to the loss of heat in the gel and blood vessels and skin of eyelid), unless they take special care to use it on inner eyelid (most never do that, not the techs, only a doctor would do it). Because of that, for some patients, who have stuck oils that melt at 108°F, not 100-106°F, MiBoFlo, TearCare will be less effective, while for others, due to custom ability to focus all session on one area of the lids, e.g. temporal lower lid, it will be much better the LipiFlow. So, each tech will be best for one situation, depending on what the issue is, what the pic of the glands is like, what the oils coming out are like (thick or liquid, etc). If temp sensors are bad for LipiFlow or iLux, we're out of luck, so MiBoFlo allows the doctor to see in real time, while heating the inner eyelid, if known to be clogged glands produce meibum *(if they would ever use forceps, Q-tip or finger in conjunction with the paddle, few doctors would do that, paddle on inner eyelid being "half of forceps" and a forceps/Q-tip or finger would be the other half on the "outer eyelid" to create a gentle pressing while heating)* and achieve superior performance in extreme clog or atrophy cases where thick paste comes out at normal temp. If oils are usually liquid and atrophy exists, it may have been there for many years and unclogging was achieved at even 40-41°C, one has to avoid the chemicals, makeup, creams, EMF, artificial tears, stress, etc, UV, etc that caused the clogging first and maintain gentle heat daily perhaps to prevent further clogging or atrophy. Even with iLux doctor can see meibum coming out, but it's harder to warm for an extended period one tiny section with iLux, vs MiBoFlo. That's why a good eye clinic has all of these and uses a variety of tools when one fails. ☺☺☺

Don't really need numbing drops as they're so toxic, pH so low. MG expression ought to always avoid numbing *so if MD makes mistake, you tell him to stop*. Good doctors will use these special round edges tweezers to express glands *(*similar ones are 12-26$ on Amazon*) after LipiFlow, MiBoFlo, as in the TearCare protocol, in case the LipiFlow failed to unclog all glands (happens so often.,* the LipiFlow doesn't image eyelid like iLux does, doesn't allow doctor to see which glands had oils come out while it is pressing and heating, doesn't use AI to calculate its effectiveness at

expressing, and comparing automatically Lipid Layer Thickness, Tear Break up time, Tear meniscus height before and after 12 min treatment and at 1-3 month followups, etc, images of which glands expressed and which did not, high resolution image of oils and things in the gland, etc – LipiFlow has a long way to go*), since only iLux machine allows perfect manual expression without tweezers.* iLux is improving, getting meibography like MiBo and LipiFlow too: "Alcon recently received clearance from the FDA to market the new Systane®iLux2® which will combine: high-resolution digital visualization, recording and media storage; (thermal pulsation system) a built-in near infrared meibography camera; and, white light surface imaging into a single, handheld, portable device" becoming better than LipiFlow LipiScan combo, presenting serious pros over LipiFlow without any cons existing now (less imaging). If your doctor won't do that special forceps *($15 on Amazon) manual expression (not the Q-tip 5 second one of pressing on the eyes, but the much more involved one with tweezers or finger pressing on outer eyelid against silicone q-tip placed behind eyelid) to see before and after effect of LipiFlow, it's not even worth doing LipiFlow for many cases.* The 2009 released 30K LipiView has superior imaging of the glands (500x magnification, measures if tear lipid layer thickness is unhealthy 10-60 nm or the more normal 70-150 nm, see this 8 minute video with the thickness,(do not pinch eyelids as the Berkeley optometrist lady shows, since it may damage the glands, only do regular massage; pinching eyelids can stretch eyelids and cause them to not sit perfectly tight on the eye, leading to exposure keratopathy; *even blinking often releases oils, since this is what glands do, they release oils upon blinking; so can blink a lot when eyes are super warm from compress to hydrate and lubricate, you will notice tears often form during warm compress massage and blinking fast, without even yawning*). LipiView, MiBoCam, LipiScan and other similar imaging devices they use with *iLux*, TearCare, *IPL*, etc *(there are a few fancier or as fancy as LipiView, like 20K* Keratograph 5 for topography and dry eye analysis used by IPL offices, see 2 min youtube on it here*) are the* scientific ways to diagnose MGD eliminating doctor (*not hacker placing fake pics*) errors (all who have LipiFlow got LipiScan or LipiView too). There are 70 small+big glands/eye, 25-40 on upper lid (5.5 mm) and 20-30 lower lid (2 mm)). "LLT < 60 nm was classified as thin and compromised, 75 nm as marginal, and > 90 nm as adequate and thick" ► IOVS 2005;46(13):4444.

Many people don't know all these things in this chapter☺☺☺, *so they waste time and $ on LipiFlow, MiBoFlo, TearCare, BlephEx* not knowing about NuLids, Cliradex, warm compress, moisture masks, gland expression, and the Q device, and if all the 20+ things in section one failed, they don't know about IPL, *which may be, if done safely, with corneal shields, etc, more effective than LipiFlow, MiBoFlo, TearCare heat based treatments (the heat methods can be mimicked at home via warm shower, gentle eyelid massage using the small finger of the left hand (if right handed), since that finger is the cleanest of all 10), warm compress + gentle eyelid massage 'expression' using sterile q-tip moist with sterile saline).* My first and last ever LipiScan

(same as LipiView, just 25K cheaper, without lipid layer thickness) picture looked scary with heavy real blockage of MGs of the lower eyelids (upper eyelids fine)*; the lower eyelid having more damage is standard for most people, and easy to explain, since gravity causes junk that is caught by the tear film while we walk to be pulled downwards by gravity and settle on the* MGs orifices of the lower eyelids (plus shower water that is warm massages and heats mostly the upper eyelids, while lower eyelids are shielded from warm water by the eyelashes and closed upper eyelids, with only nasal third of the eyelid getting more warm water as it runs from the nose downwards, and that's what we see in *all people,* lower temporal and lower central MGs *die out first,* being 2.5 times smaller than upper glands and easier to atrophy, *much less warmed/massaged by shower compared to the rest, warmth essential for unclogging solidified oils due to hormonal or diet fluctuations, stress, etc; that's why when in the shower, you can let warm water reach lower eyelids too and massage them a little upwards to express some oils and let them come out if you ever saw picture showing clogging; however, be careful and only do this a little, 1-7 days a week, and after doing before and after evaluation of eyelid, since too much playing with it could cause eyelid to swell);* this was actually first time in my life (2020) I went to an eye doctor and they looked at my eyes with those big lenses, since I never had issues, except very dry eyes in 2020; since 42% of kids had MGD of some degree, per that paper above, if genuine paper, MGD may be very common after age 30; it's also possible that some artificial tear ingredients I used 2015-2020 may have sped this up (redness relievers contricting blood vessels, starving the glands of nutrients and atrophying them, or causing irritation that closed the orifices; *I'm like all, first I used eyedrops twice a month, then twice a week, then daily, then twice a day, then gave up and did what is in this chapter after researching, as drops stopped working)*. For countless people, LipiFlow, MiBoFlo, TearCare didn't make any difference on lower eyelids atrophy after 1-3 months, as seen on LipiScan or other meibographs, due to people not doing the warm compress home perhaps with peculiar intensity, not using moisture retaining masks during day and night, not scrubbing eyelids with Q-tip or NuLids, the 20+ things in section 1; the doctors often don't take pics of upper eyelids the 1st time, only 2nd visit when asked to, but some are nice to let you take pics with your phone of the meibograph images; doctors may forget things and you can remind them to take pics of both upper and lower eyelids. ☺☺☺

LipiFlow (but all other techs and warm compress can do it too) was reported in other small studies to even help atrophied MGs to come back to life, something unheard of before (once dead on LipiView, they were thought of as dead, sort of like "no new neurons" or no "new fibroblast" myth; it probably depends on how long it has been since "death" of glands). These techs or even warm compress at home can help even when *meibograph* shows glands are OK or so-so (still could be partially blocked even when lipid layer thickness is OK), because *meibograph* can't magnify 10+ million times to see which of the 700 components of the meibum (gland

secretion) get stuck and which get out in every one of the 140 glands, and it's the lipids, proteins eaten or blocked by bacteria or dead cells or whatever chemical systems abnormal stuck in there (needing mechanical dislodging) that could be the key to downregulating the inflammatory cytokines and ending red eyes or dryness These are all new techs (2000s onward), MGD was discovered in 1980s only. Water tears, the aqueous layer with nothing else, are easy to make,☺☺☺ via drops or yawns, but those 700 chemicals in meibum we can't buy and those are vital to eye health, not just preventing water evaporation. LipiFlow depends on doctor aligning the eye stuff properly and gadget heating it up at the right temperature (if software error and it is below that it's useless). If that thing doesn't grasp the eyelids very well, it may be only 20-70% as effective. Make sure that the pulses are felt on both lower and upper lid, maybe ask for no numbing eyedrops so you feel better if the LipiFlow machine works properly. Not all doctors want to do a very good (rushing to get some place, etc) job, so it's good to know what he's supposed to do and make sure he does it if he forgets or avoids doing it. The dead bacteria and gunk coming out after LipiFlow, MiBoFlo, iLux, TearCare, IPL can increase inflammation if not removed fast, so it seems safer and ☺☺ *gently* kinder☺☺ to generate tears, so they carry junk into the nasal drainage duct, if MD doesn't wipe eyelids with a sterile q-tip after a treatment.

IMPORTANT ►►► Try, *before* leaving *office* from your $30-60 consultation or $500 MiBoFlo, LipiFlow, iLux, TearCare or IPL *you get from the doctor* *7* things: for each eye: *1.* TBUT (*Tear Break Up Time*), longer times would be for the drier eye usually, so you can know if doctor is making numbers up or not), *2.* TMH (*Tear Meniscus Height*), *3.* LLT (*Lipid Layer Thickness*), see info/pics on TBUT, TMH, LLT at BMCO 2020;20:394, *4.* meibograph pictures of each eyelid (blow up the pictures from his screen, and take clear pic of the 2 halves of the upper and lower lid of each eye, so about 8 pictures total). *5.* oil color (clear is ideal, whitish/yellow bad, thick toothpaste like worst, liquid ideal) during expression of glands (this you can see at home a little too) with finger/silicone q-tip *6.* position of gland orifices that don't secrete oil *(because this is not always the clogged glands only on meibograph pics, it can be some that look healthy)* *7.* movie of gland expression if possible. *Some pics you can do at home by using a* powerful Amazon lens 30x and placing it in front of your phone back camera while you look in the mirror, with camera pointing at your eyelid (light turned off): this is especially useful for IPL to see how many blood vessels are on the lower eyelid causing inflammation cascade out of control, since IPL is meant to remove those after 2-4 office visits. Others use warm showers to soften stuck oils (they melt at 42°C or 108°F), but not always working well if you heat eye too much and it doesn't really heat the back of the eyelid easily, plus chlorine, junk in water can increase eye oxidative stress; but a brief 1 min shower can be good for the eyes, like a warm compress, I do massage eyes gently with each shower, at least due to needing to wash off soap. ☺☺☺

Perhaps *every RiteAid and CVS store will have these techs, so as people monitor their blood*

pressure, they can take picture of their MGs once every 5 years (so no abuse of meibograph) and also LipiFlow (or MiBoFlo, iLux if LipiFlow fails to unclog), good free electric warming eye mask replacing stone age compresses that bend the eye, night moisture retaining mask, daytime moisture goggles for severe cases, IPL for free once every 5 years, *included in every California insurance plan for those who ask, meibograph pics required at any physical exam, since meibum secretion is critical to long-term (200 year) eye health and quality of life, job productivity*. If iLux, IPL, LipiFlow and warm compress reverse blockage and atrophy well in many people, FDA could give a 1 billion grant to USA iLux, IPL, LipiFlow, etc eye *doctors to bring iLux, IPL, etc (see advatages above vs LipiFlow) or* LipiView LipiFlow (require Johnson & Johnson, Alcon, etc to recycle 100% of disposable eye warmers, sterilize them properly and be green, cut costs, allow same patient to reuse eye warmers 40 times even after sterilization at the office) *to millions of Californians who have poor eye health (dry eyes at least) since they don't know* their MGD starts at age 5, getting worse with time; we can do it without artificial tears (4 chemicals are electrolytes from lacrimal gland: NaCl, $MgCl_2$, $CaCl_2$, KCl; 2-3 may be from meibum: phosphatidylcholine, carnitine, etc; 2-5 may be synthetic chemicals not in tears that irritate), *treat the cause of dry eyes and many eye diseases ► the lack of meibum with its genome custom made 700+ lipids, proteins, antibodies*. If glands are 90% blocked or atrophied, temporarily using some non-preserved drops with HA (hyaluronic acid), fats and B5 could be good (if not allergic to the tear brand you got) if you don't make yawn tears often & blink often, so lipids from OK glands can protect the whole eye, via tears spreading the lipids. HA may prevent meibomian atrophy.☺ Immortality *Nurturing* Agency would ban the sale of any makeup, cream, eye tears that got no 5 year safety study that it *doesn't cause* MGD. ☺☺☺

11.17.7.5. Osmolarity

The TearLab Osmolarity System device is a way to measure osmolarity of the tears (50 nanoliters of tears used only) to add another scientific marker of the severity of dry eye disease. When tears are isotonic they have physiological tonicity (or osmolarity), about 280-295 mOsm/L or so, so the solution has about *the same amount of dissolved particles as natural tears which surround the eye epithelial cells and therefore neither detracts water from them nor leads to their swelling*. Hylo Gel is isotonic, 280 mOsm/L. I tried hypotonic Vismed 150 mOsm/L and it always causes 'distilled water into eyes' sensation for 5 seconds. The 3 min video explains how a 300 mOsm/L measurement is taken for each eye tears: tearlab.com explains a reading > 300 mOsm/L indicates loss of homeostasis (300-320 mild dry eye, 320-340 moderate, 340+ severe dry eye, 360+ very severe) while the inter-eye difference > 8 mOsm/L indicates instability of the tear film. It's more precise than glucose or cholesterol tests. "smaller corneal cell viability (of PVP artificial tears, see Fig 2) may result from their hypertonicity (319.7 mOsm/L)" ► SPJ 2015; 23(4):407-12, so be careful with eyedrops with Osm values > 300, if there is irritation, stop using

them. The effect of hyperosmolarity on the health of ocular surface is explained in this 140 sec video. Sensors 2017;17(12):2840 ► "tear salinity (NaCl) *contributes to nearly* 90% *of total tear osmolarity*", no wonder saline irritates eyes the least, it *mimics* the *natural* tears the most. 0.8-0.9% NaCl in natural tears or blood plasma is 8-9 g/L or 0.154 moles/L *(9/58.5=0.154)* or 0.308 Osm/L or 308 mOsm/L or isotonic: ***intracellular and intercellular fluids are in osmotic equilibrium when blood cells reside in such blood plasma, no influx or efflux of water occurs***. This 0.9% is a rough number (may be 0.80-0.85 in some) since "Normal tear osmolarity is equivalent to normal blood osmolarity, which ranges from 280-295 mOsm/L" ► IV 2018;32(2):403-8. That's why Refresh Relieva PF comes with HydroCell tech, to hydrate cells and maintain cell volume without NaCl as ingredient, since that way the added tears are hypoosmolar or hypotonic (like Thealoz Duo, irritating due to being too hypotonic?, with 209 mOsm/L vs HydraSense gel Bayer 314 mOsm/L, while the 7 hypoosmolar, <295, drops had an average of 253) and bring eye osmolarity down from the unhealthy high of dry eye. Dry eye patients like hypotonic (low ion count) eyedrops: HydroCell allows them to remove NaCl and lower mOsm/L value to below 286 of the "isotonic" or isoosmolar (286-306) drop brands ► TJO 2019; 49(3):123-9 ► has a table with some Refresh drops being hypoosmolar (<286mOsm/L). When lipids are few due to MGD, tears evaporate, concentrate, becoming salty or hyperosmolar. Osmolality of some common eyedrops "ranged from 154 to 335 mOsm/kg" while Refresh Optive Fusion multidose was 335 (unit dose 276), Refresh Relieva (formerly Repair in US) was 276 ► TVST 2019;8(6):2. Tear comfort is not depending on osmolarity only though ► BJO 1987;71: 161-4. Among drops with 0.4% hyaluronate "hypotonicity showed better effects on corneoconjunctival epithelium than the isotonic" ► BJO 2002;86(8):879-84. A 13 min panel of 4 MDs discuss tear lab osmolarity. mOsm/L means milliosmoles per liter, number of osmoles of solute particles, different than molarity or moles/L. 1 molar (m/L or M in chemistry) of $ZnCl_2$ is about 3 Osm/L. Osmolarity ($\Sigma_i = \phi_i * n_i * C_i$) is the sum of osmolarity coefficient (ϕ_i) * number of ions (n_i) a solute dissociates into (e.g. 3 for $ZnCl_2$) * molarity of solute (C_i, e.g. 1 molar or $6.022*10^{23}$ molecules of $ZnCl_2$ per liter). $\phi_i = (\mu_A - \mu^*_A)/RT \ln x_i$, where μ_A = chemical potential of solvent in solution (μ^*_A of pure solvent), R is the gas constant 8.314 $J \cdot K^{-1} \cdot mol^{-1}$, (R=PV/nT), T temp in Kelvin, ln logarithm, $x_i = n_i/n_{total}$, molar fraction. ☺ Osmolality is mOsm/Kg, osmolarity is mOsm/L, they're about the same for tears. Distilled water is 0 mOsm, so it's very annoying, causes severe eye stress.☺☺☺ Some MDs got the MGE (MG Evaluator), a handheld blue-white plastic piece used to evaluate gland secretions as in this 6 min video. The clip makes it clear a manual expression with forceps, as some doctors do after MiBoFlo treatments, or LipiFlow ones, would be far more useful in clearing clogs and evaluating gland function/state/oil thickness, since some solidified oils won't come out with MGE, only with forceps. MGE applies a specific gentle 0.8-1.2g/mm^2 pressure to the outer skin of the lower eyelid while seeing the secretions through a slit lamp biomicroscope. Ask offices, when you shop around if they got the above things, it shows if they're well-equipped.☺☺☺

11.17.7.6. IPL (intense pulsed light, 590-790nm, not laser, *not gentle pulsed heat of LipiFlow)*

US FDA has approved only one device, OptiLight IPL, for dry eyes, oddly from Israel itself, not USA company, indicating that FDA is 100% in Jewish hands, which is not surprising, given that 80% of males are circumcised in USA, while none in many equally white nations where Jews don't run every government agency, medical school, university, court, state and company. Clots can form due to IPL, so for A blood types, this is very dangerous, if you don't hydrate and thin the blood first with vitamin E, omega 3, proteases, ginger, water, movement, due to A being the thickest, most prone to clots blood type. Avoid taking doxycycline the day before IPL and next 3 days to avoid skin burns. Before you try IPL, try the way safer LLLT: There is also LLLT (low level laser light) Equinox machine that is way safer than IPL. Technically, they just use 630 nm and 850 nm or so light around eyes *(see acne mask section for 3 eye masks that mimic 9000 times more expensive MD treatments, heal by proximity, the mitochondria near eyelids will help eyelid mitochondria; make sure no light goes to eyes, while you keep eyes closed of course)*, with a mask, to try achieve same effect without the risk of blood clots from IPL. Dr. Silani uses a typical Amazon mask wavelength of various lights, his device is 30000, but Amazon ones are <50$. You know these ODs make Big $$$ with their dry eye clinics, but knowledge allows you to do same things for 30$ or 300$ not 2000-900000$. Optometry times talks about LLLT too. Google lists endless optometrists that got LLLT on the first pages. The LLLT sessions are a form of aristocratic oppression of the slavering working class, since really, for 25$, the US gov can mass produce amazing masks for this 630-850nm with goggles and optimized controls. Never forget one thing: most become doctors to get rich or have a very good salary vs the average. We need a reform in this "disease profiteering management" healthcare. LipiFlow is a scam by the Big Pharma/Device conmen, whereby the patient can't reuse the eye probes 150 times or 900 times at home as it should be, with a simple at home kit, instead, they give 600$ one time treatments where they trash those eye vibrators, trashing USA for insane Pharma profits. The whole medical industry is run by frauds, parasitic aristocrats who team up with corrupt MDs who never have a hunger strike to protest the grand theft of trillions from the working masses of slaves, the 90%.☺☺☺

The main companies in IPL dry eye clinics are Lumenis (Israel) and E-eye (France). Most US uses Lumenis, or other small companies and in EU, E-eye is more common (see it here). Canada has a French connection and one site says E-eye is IRPL, or Intense Regulated Pulse Light, which controls the nature of each pulse thruout the treatment, being allegedly "more effective than IPL", but no studies show that difference, unless it's classified "*in IRPL, each flash of light delivered by the device is divided into sub-pulses. Each sub-pulse is then managed individually, with different durations and light intensities possible. The energy level delivered during each pulse of light is uniform from the* beginning *of the pulse to the end. This makes IRPL much more efficient and effective compared to IPL. In IPL, the energy of each pulse gradually decreases from*

the beginning to the end of the pulse, reducing its effectiveness." See a 5 min clip on IRPL of E-eye clinical trial, showing much better outcomes than at home compress, etc treatments. The E-eye website loads slowly, a red flag. E-eye was made for dry eyes from the get go, while Lumenis was made for skin cosmetics and then adapted an instrument for dry eye. What if latest OptiLight also has regulated pulses, since obviously Lumenis now has a lot more features and regulation of pulses than the first version in 2021 after FDA approval in April 2021? Not sure what to believe, here is E-eye site claiming to be world's first (2016) and only IRPL machine (the other 20 companies use IPL), oddly FDA only approved OptiLight IPL by Lumenis for dry eye and MGD, possibly due to US-CIA-Mossad link between Israeli Lumenis and FDA, CIA's ability to spy for Mossad-CIA on all doctor offices with the IPL machines hidden mics, cameras and software (and to regulate (override) pulse intensity remotely to damage eyes), and the joint hate of France, plus the desire to control market via CIA controlled Lumenis. Military decides all in business, academia, culture and everything in society, so sometimes you need to dig deep in the tiny details. What we need is a randomized placebo controlled study to compare fake IPL (just random light), real Lumenis OptiLight IPL and real E-eye IRPL and see in 1000 people who gets better results, and if indeed IRPL is 20% better. Right now it's hear say, French/ or English clinics promote French or English (Israel speaks English) made IPL machines. British-French empires rivalry lives on. You choose who is going to spy on you: Mossad/MI6/CIA Lumenis or DGSE E-eye. Jokes aside, or perhaps, spies truth aside, here is a 3 min video on how IPL and IRLP work. ☺☺☺

Lumenis came up with a new pen device to use directly on the eyelid itself and a new cornea shield, called OptiShield, one size fits and scratches all, that is flexible. The main issue here is that the founder of IPL said in OPRS 2012;28(2):155 that all shields need to be OPAQUE, nontransparent and this one is very transparent, allowing one to see the fluorescent light shape, etc. Thus, this is truly bad, if we have data showing Lumenis is selling this with knowledge of their potential harm to the retina, as Mossad terror plot. There is at least one reported case of a patient developing a macular hole—a permanent defect in the center of the retina—after exposure to IPL during a hair removal treatment, due to thermal damage to the retinal pigment epithelium, BESIDES SHRUNK IRIS (photoablation damage to the iris muscle caused DEFORMED & SHRUNK IRIS, HORRIBLE PAIN FOR YEARS, need to tint car windows due to pain from sunlight, 20/20 vision turned into 20/40, etc) ► OPRS 2011;27(4):263-5. This is enough grounds for us to take Lumenis to Court and get 5 trillion out of them, if those shields are proven by retina scans before and after to damage people doing a regular IPL. Given the fact many doctors are terrorists in disguise, it is perhaps safer to do IPL with the shields on top of the eyelid (the traditional IPL, even if less effective in removing bacteria inside the eyelid glands or rosacea on the eyelid), not with shields under eyelid, not cornea shields placed on the cornea, because doctors can do less damage to your eyes that way: many will pretend they're low IQ or don't

know how to place a cornea shield to scratch your eye and give you a red spot on your eye, trying to place cornea shield 5 times, the new plastic Lumenis one, like many do with support from the spy agency/military freemasons happy to co-kill 0.25 billion since 1914 with aid from British, French, etc empires aristocrats). Another issue with IPL is that they damage the nerves around the eyelid, by causing eyelid twitches right after the treatment for weeks. This is in sharp contrast with the claim it restores the nerve function that produces meibum, it simply also damages the nerves in other ways. The new Israel designed cornea shields give Jewish doctors (some were, per Israeili newspaper, allegedly involved in illegal kidney removal from children) worldwide, and many others, a plausible deniability route to avoid malpractice lawsuit, by creating these clumsy shields and having them try to put them all, pretending to be low IQ, to scratch gentile or other eyes to terrorize people. The new plastic OptiShields can be bad compared to the metal shields (that fit your eyes, not too big, as that could scratch the less visible edges of the eye) that cover the corners of the eyes better, the areas outside the iris size plastic OptiShields are not protected and this could lead to damage of the eyeball of course, though *it could also benefit it by removing extra blood vessels (that fuel ocular surface inflammation)* from cornea faster than regular cornea shields. However, the risks probably outweigh the benefits. Lumenis didn't even provide doctors with a training video to show in August 2025 how to place these shields, with patient being horizontal, as with the other shields, etc. The truth is shields with a handle, metal shields, are far easier to place as shown in the Q-device first paragraph, so avoid using the ones without handle as the ODs will cause subconjunctival hemorrhage, due to the shields' awkwardness and OD lack of experience or bad intent: the shields bend easily and the natural eyelid closing reflex will push them away, super easily, which never happens with metal ones as OD holds them by the handle. Shields are used to treat the eyelids directly. Not surprising for the Jew run FDA (whose priority is trimming everyone's penis) to approve such shield without optometrists learning how to install them and trying 5 times in office to place them and then scratching the cornea (well, actually these are paid by spy agencies to role play they "don't know how to use the cornea shields in order to scratch the cornea and create a subconjunctival hemorrhage, the red spot that forms right under the conjunctiva, where diffuse red blood cells create a red spot seen at 20x as very different than the clearly defined blood vessels on the eyeball). USA needs to sue Lumenis for 1 trillion for damage done to Americans' eyeballs and potential damage to retina from these tiny OptiShields. This new flexible OptiShield is described in a 3 min video, made by a clueless guy who didn't read the PubMed papers on the IPL light dangers if the whole eye is not protected, showing the new pen that replaces the bulky machine with a special guide they used on the eyelid with metal cornea shields before. Essentially Lumenis can make a LOT more money by selling disposable cornea shields instead of the reusable metal ones that need to be properly sterilized. Sadly, in our world of decentralization, these dry eye clinics are run by ignorant mom and dad teams

often times whose standards are from the 4th century BC as far as patient safety. Let us think about the future: an AI camera takes a pic of an eye and then recommends one out of 50 metal cornea shields to fit perfectly with 0 risk of injury, the eye of the person. Today, some clueless doctor uses a cornea shield a customer bought online or he bought online, that won't match well and cause damage or even subconjunctival hemorrhage if too big or concave, etc. The standards today by Lumenis etc are as catastrophic as with the walnut industry packing walnuts in clear bags to oxidize all fats, at room temp, instead of fridge or freezer to give 1 billion mini-strokes worldwide every 3 months.☺☺☺

They make this extra money at the expense of Americans, these 'plastic shields' are a blue tint shield that allows you to even see shapes, fluorescent light fixture above ceilings, quite see thru actually and they don't cover the whole eye, which is criminal and genocidal. How can they allow such shields to be sold in USA? Is it just because FDA is run by Jews loving the Israeli Lumenis company? Lumenis makes only 1 size fits all plastic-gel like shield, while all other companies have several sizes, Cox II has 4 sizes. Americans are too distracted to realize Jews run the USA, look at the quotes they tell our kids are the "Word of God". Even if these flexible 'rubber like' shields covered the whole eye, they're not really safe, since too much red light passes thru. OptiLight is the newest version of IPL, comes with a smaller hand piece to get under eyelids easier, it's FDA approved for dry eye. IPL *with cornea shields (examples here) is 900 times safer from some points of view. ODs use IPL with cornea shields to treat styes within 12 hrs. IPL* compliments at home warm compress, MGs expression, which can be *more effective* (MGs expression done ☺☺*lovingly gently* kinder☺☺ at home, without risk of infection in speed after MiBoFlo, IPL, TearCare) *than* MiBoFlo, TearCare, LipiFlow *if done correctly with eyelid hygiene daily. The only thing is that most people are not aware before you even can visit the office, they send you some consent forms which basically say they're not responsible if you go blind (due to the laser shield adhesive not sticking well or you accidentally opening eyes a little while adhesive is on or laser shield being improperly manufactured and allowing some light thru, enough to damage eyes or make you blind); they also are not responsible if blood clots form around the face and they travel then to heart, lungs or any body area, giving you stroke, heart attack or death. That's why this treatment is unlike all others, it's not only the most powerful, but can be also the one with the worst side effects, since nobody can correctly estimate who forms blood clots at the usual dry eye IPL intensities. Nobody knows if blood clots form, if they're tiny and cause what Alzheimer specialists call "white matter silent strokes", which have no symptoms, but still diminish blood going to various brain areas and can cause Alzheimer long-term over 20 years. By the time you read this, you probably will say "thank you, but the cure can't be worse than the problem, dry eyes"; I too said the same thing, minutes after I read the consent form they emailed well before the deadline to cancel appointment for free. ☺☺☺

Even if this is not for you, at least you're aware of the real risks with IPL and understand why Q device seems much safer blood clot wise, as you only use it a few seconds or, if you built tolerance, 2 minutes max on certain eyelid areas (though I doubt 2 min is safe given how much vibration happens, maybe 20 seconds max for some people). *See the* Q device section *(similar to IPL, but less intense) for the device which can be used for skin* types 5-6 *(which can't use IPL).* IPL is often used to treat MGD when the 4 above fail, or even before, *if* doctor *thinks the person has* acne, demodex or *ocular rosacea, because* demodex can easily cause ocular rosacea, MGD, dry eye: demodex mites*/10 mm² =* 44 in papulopustular rosacea, 15 in *erythemato**telangiectatic* rosacea, 3.5 in controls ► AJD 2017;58(2):e26-30. Erythema comes from red blood cell or erythrocyte from *erythros* (red like *ros*e in Greek) cytos (container in Greek), the red spot due to vessel dilatation during irritation. Cornea 2018;37(12):1566-71 is a good IPL study. An MD explains IPL and how important manual expression with forceps is after LipiFlow, MiBoFlo, IPL, TearCare. ☺☺☺ IPL is different than all techs above, since it's based on light, not on heat, it's based on the same ideas as the laser techs used cosmetically since 1960, except it's not laser, but diffused light. FDA approved the first IPL device in 1995 for lower extremity telangiectasias (telos= end, angio= vessel like angina angiogenesis vessel, sanguis=blood in Latin like sanguine, angio=blood related, ectasia like Greek ektasia=dilation, widening, stretching, extension: so it means the end of vessels is dilated or extended, mnemonic; *telo*mere, the *end* of chromosome; ecstasy is the widening of normal happiness to cosmic levels) *"the goal of treating vascular lesions with IPL is to raise the blood vessel temperature high enough to cause its coagulation, leading to its destruction and replacement by fibrous granulation tissue"* ► JCAD 2012;5(6):45-53. IPL however was used *in dermatology since* 1996 *for* port-wine stain (*Port*ugal *wine* red color) removal ► LSM 1997;21(2):203-8 and telangiectasias removal (similar to ocular telangiectasias causing dry eye) ► DS 1997;23(10):941-5, for rosacea since 1998 (JCLT 1999;1(2):95-100) and *for dry eyes since 2010* (after Dr. Toyos perfected it in 10 years) ► PLS 2015;33(1):41-6. They used lasers for telangiectasias for 10 years before using IPL for that in 1997, so it was logical that if inflammation, clogging, atrophy of MGs is sustained or increased by eyelid telangiectasias, removing them improves dry eye – hence the "IPL for dry eye" emerged.

IPL is the "*atomic* bomb" for dry eyes used "when all else fails", as Carlsbad eye clinic 2 min video explains (due to its power to heal dry eyes and also cause side effects like atomic devices are powerful but have unwanted side effects when used, like chemotherapy for cancer works, but has side effects sometimes); they got a 1 min video explaining IPL too. Price: 4 IPL sessions were $680 in 2018 in Australia, 4 sessions were in 2021: 1200+ with Dr Lorin Vogel (in a youtube interview with Dr. Ziegler he explained he gives patients a bottle of eyedrops with antiobiotics after MG expression (after IPL maybe too) to use for next few days to *prevent infection*, he also takes video of the expression to give people which everyone likes), $1020 in California in El

Segundo and Texas, Austin with Dr. Barbarino published 15 (some on pubmed) papers (Dr. Toyos has 6 on pubmed too) who has a 1 min youtube showing her doing IPL for dry eyes, an amazing free "must read" paper on IPL (CO 2017;11:817-27 which has a 4 min video on IPL) with IPL famous Austin Dr. Dell she worked with; Dr. Barbarino uses the Dr. Toyos disposable laser shields method, not the corneal shields method; this method, even if used by maybe half of IPL doctors, increases the risk of accidental light entrance and damaging the eyes if the shields are a bad lot number or replaced by some USPS spies or any spies who secretly enter a doctor's office and replace laser shields, IPL machine filters, components, etc at night (you can bring with you a roll of aluminum tape from the dollar store to place between eyes and the shield, to be 100% safe, doctor would be OK), or adhesive peels itself off due to bad lot # (well, tape aluminum tape to your eye socket, you know yours won't come off, practice at home, to get over the fears, can even tape forehead, temples to overcome fears that neocortex, temporal lobes will be damaged, also tape the inner orbital area where lacrimal and eyebrows are, etc, tape a*ny area of concern*), so keep eyes tightly closed always; corneal shields not made of metal can also leak light if a bad lot, and metallic ones that are not super smooth or quickly inserted by doctor without care can also cause abrasion of the conjunctiva or other eye tissue, no method is free from risks; corneal shields method has other risks the Dr. Toyos/Barbarino method doesn't have: corneal shields direct eyelid treatment means placing the device closer to the forehead, which may increase risks of strokes, neocortex damage, Alzheimer via silent white matter strokes. A hybrid method may exist: cornea shields used under the normal disposable laser shields to provide higher safety and the eyelids direct flash can be done at the end of the normal procedure to magnify the effect of rosacea elimination and eyelid swelling-inflammation reduction.

IPL is a little scary since if those shields are not working well, the retina will be damaged; so metallic cornea shields on top of disposables or permanent eye cups (that sit on top of the eyelids) provide 100% safety – vs disposable or reusable laser shields only; *IPL is almost like a real surgery, due to blood clot risks which theoretically could end our life decades early (*maybe 1 in a billion (or less or more) chance, but it could exist,☺☺☺ and you will never know or be able to prove you lived 20 years shorter or got heart disease or Alzheimer or endless organ failures due to an IPL blood clot that traveled and got stuck somewhere and damaged that organ; *this century* IPL will probably not be advanced enough or maybe next one too, to only close the abnormal blood vessels of the MGs and form "disappearing" clots only there, so it's a HUGE RISK, some may prefer to not take and wait until next reincarnation *for a safer* IPL; is "living to 100 and using moisture retaining mask every night and often during the day" more important than "having no dry eyes, living to 90 or 95 only, or even 75 if unlucky due to 1 in a billion side effects"? Nobody knows what the impact can be; simply because nobody may have had (the real data, not the public papers on pubmed, you know how Pharma companies sometimes publish

only what makes their drugs/devices appear safe) a blood clot (with symptoms) after IPL so far, doesn't mean you couldn't be the first one to have due to peculiar biochemistry.

"IPL treatment promotes the formation of blood clots in dilated blood vessels according to the principle of photocoagulation, leading to the occlusion and disappearance of the expanded capillaries" ► ETM 2020;19(6):3543-50. IPL is a little like redness relievers, IPL won't constrict a blood vessel for 5 hours like redness reliever eyedrops, IPL closes the blood vessel entirely (in the official 2 min IPL video we see eye arterioles disappearing too). "A full-thickness or third degree burn would be the most severe adverse event that could occur to the skin through misuse, error or malfunction of an IPL or laser" ► LMS 2017;32(8):1927-33. Perhaps it's better to try everything else to cure dry eyes first, before trying IPL (that's why it's the last method I wrote about in this series of technologies). May take us 5 years full time of reading all papers on blood clots and IPL like techs etc to get an idea about the real risks and even then it would be limited knowledge and incorrect. The cure can't be worse than the problem, so weigh all known risks accordingly. *So, it's not something to do on days when you're not ultra rested, ready and super aware, so eyes are always closed during treatments and protocol is followed during, after treatment, etc.* ☺☺☺ Dr. Dell uses Cliradex. We need 4 sessions to see real change, 1 session doesn't do much, they say. See another 23 min video about IPL, *one I like (min 17 to 21) since this doctor uses corneal shields* and changes the light guide to a smaller one, changes wavelength and then does it directly on the eyelid (although I don't like that it gets too close to the forehead and doesn't use shields for forehead, one could use corneal metallic shields even if not treating the eyelids, but doing the 5 passes around the face) (many doctors use both the 4$/pair disposable eye pads and $135-400 reusable corneal shields, corneal shields or severe MGD cases or all patients; precise fit key to avoid cornea abrasion, also, some are rounded around the edge and are becoming the standard for cosmetic procedures) and treats the eyelids directly with a smaller tip only available recently; *the metallic corneal shields allow superior eye protection (retina, etc) and 5-10 times higher dose per eyelid; dose*=Joules/cm^2, dose=power density (how dense per area is the power or watts, also called *fluence rate*) in mW/cm^2 * time (seconds); dose is also called fluence in some papers, *fluence* comes from *flux*, because fluence is the time-integrated flux of some radiation or particle stream; 3600 J (Joules) = 1 Wh, watt-hour, due to 3600 seconds/hour, 1 J = 1 Ws; higher dose can be equivalent to 3-10 "traditional" (eyelid covered) IPL treatments of the eyelids, so doing it this way, as opposed to most youtube IPL videos techniques may yield 3-10 times better results than covering the eyelids (which can allow some unwanted light to get into the eye, while not treating eyelid well); however, this "direct eyelid treatment" method also increases the risk of blood clots in the brain forehead area, in practice, since the brain shape is such that the 5 passes around the face are very far from the brain, while the eyelid passes are very close to the brain, so the eyelid IPL direct treatment may

literally be 5 times riskier (to shorten lifespan or quality of life by months) and why many MDs (even Dr. Toyos who invented IPL) stay away from "direct eyelid pulses", unless the person had severe MGD and it doesn't work the "non-eyelid" way.

Doctors could put flyers at CVS in the eyedrops section about a free IPL treatment☺☺☺ to help develop an improved protocol for evaporative dry eye. The thing is they could change the treatment to cover the entire face with aluminum or some light shield, and leave only eyelids exposed, with metallic corneal shields under eyelids, and treating only eyelids; would this be enough or would it require too many treatments, say 12 instead of 3 to see results since eyelids can only take so much? Then, the IPL would only affect the eyelid blood vessels, not anything else right now, would this work better and safer and lead to 2-10 times less unwanted clots (undetectable)? No wonder IPL has such varied results, it's the parameters and technique that make the difference between night and day; it's basically the difference between trying something that doesn't work to cure dry eyes or doing something about dry eyes in many cases *of* severe MGD; the eyelid is swelling and red in these people whom IPL can help the most, as Dr. Deom says in the video, they got abnormal vasculature or "ocular rosacea like stuff", easy to see in the mirror with a magnifying glass. When using this technique, due to higher dose, to avoid eyelid skin damage, the period between treatments would probably have to be 4 weeks, not 2. Of course, it is hard to know since little data exists to compare the two techniques since this new smaller head device only was released last year, so it's impossible to accumulate long-term data and have 100,000 dry eye treatments to compare, studies with 50 patients are quite small. Thus, there is no way to know, with exact precision, how much less retina/eye damage due to cornea stronger shield and more eyelid healing (MGD regression, dry eye healing or adverse effects) due to higher dose. Dr. Toyos explains 7 J/cm^2 is often insufficient when covering eyelids, so they do more, *but direct eyelid flash at lower intensity with the new smaller head may work 5x better*. ☺

PSI 2015:429367 found 15 J/cm^2 helped wound healing in mice, but 25 and 35 did not, with 35 causing damage, so it seems that 15 used for dry eyes and some home-use IPL devices is safe. LSM 2009;41(7):534-9 explains IPL is now part of home devices too, they found it is reportedly safe (per current standards) if used for 26 ms (vs 6 ms for dry eyes) at 10 J/cm^2, but unsafe for retina heat at 11 J/cm^2 and 16 ms, i.e. delivering a high amount of light in a short period (the Q device delivers a high amount of 3 J/cm^2, but over a longer time). LSM 2010;42(2):93-104 got the settings of different IPL devices for treating abnormal vasculature, acne and skin lesions. IPL used for cosmetic reasons frequently, may use higher intensities sometimes (not Dr. Toyos or his Optima device) and be riskier, but dry eye treatments are often 3 in a lifetime and it's not about cosmetics, it's trying IPL after all failed. People use "nukes" (M22 IPL instrument name even sounds like the M22 gun and M22 tank) when all options were exhausted, so what could be the side effects of IPL on frontal cortex, vasculature, facial nerves for people using IPL often for

cosmetic purposes (acne on the forehead, etc)? Why not do it right near eyelids only to treat MGD only, are there not enough chromophores absorbing the light to cause conjunctiva and eyelid blood vessels to disappear as in the official IPL video of shrinking vessels? Laser hair removal using home or in-office devices uses selective thermolysis, as light is absorbed by the hair follicle chromophore, IPL can use different nm to target different chromophores of various skin layers or "unwanted" skin formations. "Melanin and hemoglobin (the MGD or vascular chromophore) absorb in the ...530-950 nm .. in target lesion such as... telangiectasias" (that invaded MGs)... the light is absorbed as heat that denatures key structural proteins closing those abnormal blood vessels (see pictures of IPL treatment right after and 1 month later, etc) ► JCLT 2013;15(3):133-42. They do it in the 10 positions *below eyes because those blood vessels supply the eyelids and they will try to remove the tiniest vessels in the eyelids that invaded* MGs. ☺☺☺

People use light of tanning beds and sometimes get cancer, could IPL overuse have unwanted effects, increasing risk of Alzheimer or blot clots or atherosclerosis if overused for vanity and looking perfect, at higher intensity than dry eye 10-15 J/cm^2? *It's not clear, we may be getting* more clots in 4 months of being anxious, paranoid, AGE eater and irregular sleeper, *than we would ever get by 4 "dry eye" IPL treatments in a lifetime*.☺☺☺ Could it negatively impact some neurons or tissues, while helping MGD disappear? How can we help doctors optimize this? In medicine, it's often the case that fixing one issue with a strategy, creates another issue in ways we won't know for 100 years. Doctors placed lead in people's cavities and said it's fine, nowadays mercury. What if we discover in some people, MiBoFlo, LipiFlow, TearCare, NuLids, IPL or Q device version 1.0 is not unsafe, in year 2100? Worth researching it, since red light can penetrate deeply into the tissues. Before you jump, research more maybe, email the experts in this field, the doctors in the videos here, call them, talk to them, understand the process, address and remove any fears of side effects, etc. The $75 Pulsaderm red light LED, like many red lightbulbs, emits 80 mW/cm^2, 670 nm when I called in 2020, 650 nm in 2016 on Amazon, so the 3 min treatment they suggest thrice weekly to boost collagen, reduce wrinkles, fight acne is 0.08*3*60 = 14.4 J/cm^2. Dr. Toyos uses a 6 milliseconds 6 ms pulse of 10-16 J/cm^2 (10-11 for dark skins, 13-16 for light). This means power density is 16/0.006s = 2670 W/cm^2 or *2.7 million* mW/cm^2. Now, normally, in the sun we get *50-100* mW/cm^2, so we can see the difference between common light sources (*0.1-50.0* mW/cm^2) and IPL (*2-5 million* mW/cm^2 ► AD 2007; 143(3):363-6) and why IPL achieves dramatic changes impossible to achieve with 'acne masks' or lightbulbs that use 20,000-90,000 times longer exposure periods than IPL, to deliver the same dose (J/cm^2) and why they call it the "nuclear bomb method for dry eyes". It's this sudden rise in energy that causes sudden absorption of energy by hemoglobin, then blood clots to remove telangiectasias (or threaten our life if clots travel) with IPL and can't do so with red light bulbs LED. After the 0.006 s pulse, there is the Thermal Relaxation Time (TRT *the time required by skin*

to cool down to 50% of the initial temperature achieved) of 50 ms takes place (150 ms or 0.15 s for darker skins to avoid burns). Risk still exists from hackers changing TRT to make it shorter and increasing intensity, without MD knowing, so you get burns and a screwed face for life or you get too low of an intensity to have any effect except anxiety that disturbs sleep), then skin absorbs that energy, relaxes and then 2 other pulses, for a total of 3 pulses usually. ☺☺☺

IJPS 2008;41:S101-13 explains better than most papers chromophores, has mind blowing pictures of how appearance improves (or *worsens in some very rare cases*) and makes *severely* affected people *feel/look way better (perhaps living longer, if the gain of lifespan is greater than any clot damage, as a result of the joy of looking normal)* and how critical correct TRT, *dose* and *wavelength* (easy to hack) *are* for not damaging skin, tissues, vessels ► "*Hemoglobin* has absorption coefficient curve with peaks at 418 nm, 524 nm, 577 nm and again at 1064 nm [Fig 1]. At the first and second peaks the melanin absorption is also very high and therefore these wavelengths can not be used. However, the spectrum between 580 nm and 590 nm is useful clinically. Pulsed dye laser (PDL) with a wavelength of 595 nm is at present considered as a gold standard for vascular lesions" hence *590 nm and above used by IPL doctors for meibomian abnormal vasculature.* "IPL uses Xenon flashlamp to emit wavelengths of light from 400 to 1200 nm. When placed on the light, a filter restricts the wavelength to the visible light range of ~500 nm... When applied to the skin, this 500 nm light causes *the blood cells in the abnormal telangiectasias to* absorb *the light,* coagulate*, and, finally,* to close the blood vessels... Abnormal blood vessel growth from chronic inflammation called telangiectasias surround the MGs and secrete inflammatory mediators that cause malfunction of the glands... IPL treatment intensity ranges from a *low power* of 8 J/cm^2, and increases sequentially to a *high power* of 20 J/cm^2, with higher power levels indicated as *age and lid margin disease severity increase...* Patented [4$ adhesive] disposable IPL eye pads (Sperian Inc. [division of Honeywell]) are placed over closed eyes to cover the area completely… Ultrasound gel (Parker Laboratories) is placed (to help IPL glide easily and keep skin cooler, so it doesn't burn) on the patient's face from tragus to tragus including the nose… [after the light flashes] while applying gentle continuous pressure with both the q-tip (silicone tip, no cotton swab, cotton fibers enter/redden eye) and the finger, the gland is expressed for 30 sec…☺☺☺ procedure is repeated over the length of the lower lid on both sides… [and upper lid if finger pressing not enough]" ► PLS 2015;33(1):41-6. "All patients received active treatment consisting of four treatments spaced no fewer than 2 weeks apart and no longer than 4 weeks apart. The IPL therapy was performed with a Lumenis M22 (Lumenis Ltd., Yokneam, Israel) xenon-based micropulsed IPL utilizing a 590 nm filter with a 6 mm clear SapphireCool cylindrical lightguide for the upper lids with a fluence of 10 J/cm^2 across the upper eyelids, including the tragus for two passes. Patients then received expression of their MGs using *two* cotton-*tipped applicators*… (on inner eyelid, so patients got cotton fibers in the eye, making

them red and swollen?) This pilot study suggests that a new specialized 6 mm cylindrical handpiece for the M22 Lumenis IPL machine is safe and effective" ► PPLS 2019;37(9):527-31.

The light is *590-800 nm* if using a 590 nm (2015 paper above used 500 nm filter) filter in the September 2020 R. Toyos 33 min video. Rolando Toyos, rostar80@gmail.com, from Toyos Clinic, 1365 S Germantown Rd, Germantown, TN, 38138, *(Germantown is a few miles from Memphis, part of Memphis metro area, not sure if they still have a clinic there or they moved it 5 miles to the Quail Road address)* is the inventor of IPL for dry eyes, having discovered it by accident while treating people with acne, rosacea, etc hearing from patients that their eyes were no longer dry. ☺☺☺ He uses the Keratograph 5 for dry eyes, see him and his wife talk about it, how it can show patients the MGs coming back. For more on the non-IPL procedures of Dr. Toyos clinic, see this clip. See also the clip about running for the US Senate in 2018. IPL warms the glands and dissolves oils, improves MGs pumping mechanism, removes the blood vessels (around eyelids) that feed the inflammatory cytokines to the MGs that inhibit normal function. What if they remove blood vessels we don't want removed? Create blood clots in the frontal cortex? ☺☺☺

Obviously, heating and getting oils out by the doctor performed forceps (or q-tip against finger) expression (right after MiBoFlo, TerCare, LipiFlow) helps many people, as we know during showering, warm compress, MiBoFlo – but it doesn't address a CAUSE of MGD – cytokines due to abnormal vasculature near the glands, which block secretion, even when oils are very liquid and orifices not that blocked. In these cases (eyelid veins, etc), IPL may offer the only solution, as warm compress and daily gland expression via massage is not enough. *The Optima IPL* 2 min video has the best graphics to explain how abnormal eyelid vasculatore invades the glands and saturates it with cytokines (place 30-90x Amazon lenses in front of phone camera, take pic to see how many vessels are there before and after IPL) forms and clogs the glands and how IPL reverses the never ending inflammatory loop. This video also shows better the anatomy of the MGs and telangiectasias. Based on what we know about biochemistry, it makes sense that to unclog glands clogged for a long time (not atrophied yet), heat is useless, since pressing won't remove all dirt in the glands out and restart inflammatory cycle right after, causing blockage again in just 1-3 months. IPL gives the glands a chance to break the cycle of inflammation and reclogging for good, for 5-10 years, if lucky. We need a total revamp of the area, which is only done via IPL in a deeper way than heat methods. It's mechanically impossible to clear all debris via forceps, even if done 10 times in a month, but who does that? At most 4x/month MiBoFlo.

This paragraph's videos/links help us understand why forceps expression of glands (not using Q-tip or MGE) is ultra critical (not just me saying this, but many ophthalmologists I called) after any of these treatments (ideally even before IPL to get the maximum out of it), even LipiFlow which applies ultra gentle pressure to squeeze the glands. Thus, for best results, one can do a heat

treatment with forceps expression after, then days after, IPL, after gunk was expelled by the doctor with forceps days prior (or express glands at least prior IPL and post IPL), so the post-IPL forceps expression leaves so little junk there, that the inflammation doesn't restart wildly after vasculature is revamped. This frequent forceps (or silicone q-tip+finger) prior IPL is to prevent the post-IPL reinflammation that occurs in severe cases, where vessels again invade MGs, due to the microbes that are stuck in the clogged glands and were not fully removed by mechanical squeezing, etc. Now, perhaps, we can understand why LipiFlow often fails, it's just not capable to remove the junk, too soft and most importantly, doesn't change the abnormal vasculature so common in many, which often takes 15 years to develop and LipiFlow doesn't touch it, IPL gets it out in 2-9 weeks. 65% of patients have evaporative dry eye due to MGD, affecting the lower lid mostly. IPL gets to the root of facial hair follicles and destroys Demodex/bacteria there, Demodex is very difficult to diagnose in subtle cases, where it's deep under the skin. The IPL way of working is explained better in the yawn section on the trigeminal nerve. ☺☺☺

80% of rosacea patients suffer from MGD. The M22 Lumenis Optima IPL website explains the effects of IPL ► "The MG microstructure indexes, including the MG acinar longest diameter (ALD), MG acinar unit density (AUD), and the positive rate of inflammatory cells (ICs) around glandular structures were significantly improved in the IPL group" ► CER 2018;43(3):308-13. See this 2020 33 min on IPL use for dry eyes (upper and lower eyelids, you can ask doctor to do upper if it gets inflamed always, indicating abnormal vasculature there that may lead to upper lid MGD later) and how the famous Dr. Toyos expresses the gland with a finger and the cotton Q-tip. I've seen so many doctors use their hands I wonder how sterile the hands are, and if q-tip cotton can get stuck inside the eye, but they got silicone q-tips now, which are better; some people will like his method a lot more than forceps though, perceiving it as gentler and safer; Dr. Toyos explains in the 1 hour video above that he *does* hand *meibum* expression *because he wants to go to the* bottom *of the* gland*, push* meibum upwards, while the forceps *will* squeeze the gland midway usually (unless you use the angled Tearse forceps, less known by MDs, see meibum expression section or the link to buy it) and not get all gunk out of the gland. ☺ In one segment Toyos flashes the light (this is a recording, so it's probably low energy or fake video editing) while eyes are only half covered, wouldn't that contradict Dr. Toyos words on nontransparent eye protection in OPRS 2012;28(2):155? Amazingly, in 2010 about 380,000 IPL cosmetic IPLs were done in the US alone and nobody ever heard about it, probably, except those doing it, much less for dry eyes. This huge number means poor eye protection can screw eyes big time ► CJO 2012; 47(4):e13-4. The reason I include these studies is to make readers aware of the need for caution *when using light devices,* even acne face masks. We pulse the light to avoid burning the thin skin of the eyelids. The best energy for MGD healing is 600-700 nm red light, so the most popular filter is 590 nm that blocks all below 590. ☺☺☺

11.17.7.7. The Q (*quantum*) light device for $495

For IPL or anything with bright lights on eyelids, you need to use corneal shields, *to avoid damage to your cornea, iris,* retina, optic nerve, *etc.* Below are 4 videos on how ODs you give your cornea shields can put them into your eyes, so they treat directly the eyelid, not the IPL around eyelids which is far less effective. Metal shields with round edges and handle:

1). shields on after placing numbing and then artificial tears (for lubrication and less abrasion)

2). 2 min insertion with antibiotic chloramfenicol gel inside for less abrasion, more comfort

3). 1 min 1 insertion with numbing drops only: lifts eyelid and places the shiled gently, easy

4). 13 second insertion and removal

5). 50 sec removal of a handle free metal cornea shield, don't buy *handle free* shields, as those are very hard to insert without causing damage to cornea (subconjunctival hemorrhage, breaking the fine vessels under conjunctiva, leading to a red eyeball spot visible for 1-5 weeks)

You can use Hylo lubricating eyedrops or your favorite ones before insertion on the eye and on the shield itself to make it slide easier (many ODs place numbing drops and artificial tears in the eye before insertion) be way gentler than this at home, as you lack the experience of doing it 500x like ODs, don't get the eyelashes bent, stuck on the inside like in 30+ videos showing rushed ODs; always use lubricating safe eyedrops to increase comfort, maybe 1-2 drops, and can even disinfect cornea shields with sonication in 70% isopropyl, CaviCide, antibiotic drops etc prior to insertion; shields are there so cornea doesn't get light, just like LipiFlow avoids heat to the cornea. At home do one eye at a time, with the other eye monitoring your insertion. After insertion, you simply place the other shield on top of the eyelid to prevent any light or some goggle on there and then you do your Q device stuff or other light.☺☺☺

The Q device is sold by Dr. Toyos to help people complement the IPL treatment or use without IPL. It's 900 times safer to always use cornea laser shields to prevent red/yellow/green light damaging retina. Having shields on and vibrating them with the Q is a bad idea, so you can simply place Q near eyelid, without touching eyelid, and then turn the light on by touching the q-against some clear plastic, so that the plastic doesn't touch eyelid and lights get to the eyelid, without vibrating it, since vibrating the shield can damage the cornea, so can cornea be damaged by vibrating directly on the eyelid too much. Q doesn't seem safe, as it vibrates cornea a little. Thus, one may get better results (plus *9000 times* lower risk of blood clots) with Neutrogena non vibrating light "Neutrogena® Light Therapy Acne Spot Treatment" 30$, with 445 nm and 633 nm wavelength, because then cornea shields won't vibrate, I describe this here. *Buy ultra round edges cornea shields* that fit your eyes (measure your eye length and width using a

paper piece) like the 55$ (in 2022) a pair ebay cornea (23x26.5, which is a medium-large, the roundest smoothest of all online I saw, made in USA by some medical company) shields; 445$ (high quality), even $647 ones; or bar type (23x28), $180 (not very smooth though, not my choice, 4 sizes, don't use these, too rough, hard to clean handle to shield connection), or $270 (no handle, 4 sizes, need buy suction cup to remove it, not my favorite, as placing suction can press/damage eyeball), etc (autoclave 5 min at 270°F or pressure cooker used for eye tools only 320°F 15 min, press reset to go to manual, 320 default temp), 105$ reusable pair plastic (this rubbery thing may be safer, as it bends to fit eye shape more, metallic won't bend, however, call companies that sell plastic to ensure they're safe for lasers, since some plastic ones don't block all light and are not for lasers); they usually come in 4 sizes or more. Avoid using *Q even with* closed *eyes and no shields, no safety studies are shown on long-term effects; avoid it with* open *eyes and* without *metallic cornea* shields*, like* you would avoid the plague*; they use Q to* get some light treatment (since skin type 5-6 can only use Q, not IPL, due to skin burning), avoid going to IPL treatment twice a year (go only once maybe or less, maybe never after the first 4 treatments, keep the bugs at bay with 3 Joules/cm² intensity red light (IPL uses 10-16 Joules), by killing microbes with light and the cells rejuvenated, oils liquid) or replace IPL if IPL isn't available nearby or too expensive. ☺☺☺

Red light penetrates up to 6 *mm* into the skin, blue one only 1 mm ► PO 2016;11(6):e0157898, *so this means that red light and green from Q device if it's 500+ or 590+nm will penetrate past eyelid into the eye and have effects on the eye* without a corneal shield *(corneal shield thus which seems the only 100% safe way to use the Q device or any visible or IR light device on eyelids, see* why in this 118 page pdf*)*. What are the consequences of that? Q device is sort of like LipiFlow, it provides heat and pulsation due to sonic waves, and also provides light. One issue with sonication or vibration is that of unknown potential chemical changes and disruptions of ocular tissues ►☺☺☺ "Generation of toxic degradation products by sonication" ► NT 2013;7:1272-81. LipiFlow is special among heating devices, because it places a protector behind the eyelid, so it heats only the eyelid, not the cornea or conjunctiva; likewise, we need a Q device that vibrates and lights up *only the eyelid, not the* cornea *and conjunctiva, for maximum safety* (likewise NuLids indirect method is not safe as it vibrates the conjunctiva and cornea); until such a LipiFlow like device appears, the present Q device and indirect NuLids use can't be regarded as safe, due to the lack of studies to clarify its effects on conjunctiva and cornea via vibration – *will some of those tissues be disrupted, broken apart, while the* MGD *is healed*? As the NuLids paragraph explains, the Q device and NuLids *both need corneal shields* (at least 70-500 sizes and shapes to fit all eye types) to overcome all these safety concerns.

The people who really want to use these before they include corneal shields with the devices, could get a corneal shield that fits eye perfectly, learn how to place it properly from their doctor

to avoid damaging the eye and then use those perhaps, if they trust the device to restore MGs. Being at home use, it can be the best investment, if used properly and safely, and if it's working the way it is supposed to work, but again, the safety is unknown with long-term use, even short-term may cause issues. Of course, many people will be skeptical about IPL, and Q, since they only had a few papers on IPL released since 2015, and the studies don't show the before and after meibography of hundreds of patients whose improvement was reportedly due to IPL alone (when it could have been due to things people did at home too). There is no paper on Q yet (a few on some of the older techs like MiBo, LipiFlow, etc), and also skeptics will say if this really works, wouldn't Dr. Toyos or NuLids makers share the design with all the wavelengths (light of Q is very typical of a broad range maybe 500 nm and up, has tons of antibacterial blue light too, so avoid shining it into your eyes) so everyone can cure dry eyes for only $20-50 (lots of companies would make it) and build positive karma by increasing human lifespan on average? ☺We can ask: what is the intent, *just to optimize a beginner prototype tech and not go mainstream until they're sure it has no negative side effects? Want to be the guinea pig?* So, then be cautious in using it? It's very easy to be biased and write a paper drawing a conclusion, in any field, by any researcher, so this skepticism is natural and would introduce a healthy dose of caution in using the Q device for the 2 or 6 minutes from the start, as video states. Most dry eyes disappear with wrap around safety glasses that can trap moisture better via foam, silicone, etc during night and day. Try that first. I would start only with 5 seconds, because NuLids says to only vibrate eyelid 15 seconds per day with their device, so 30 seconds each eye and even that doesn't vibrate cornea or conjunctiva if using direct method, not the indirect NuLids one. *Do it only when very rested, and when eye looks good and inspect eye [take picture too with a magnifying glass before and after so you eliminate subjective "red vessels" perceptions by using a 100 x magnifying glass on the phone (no flash though as light must not go into the eye)], monitor eye with 20x magnification mirror thrice daily to confirm phone pics and only increase from 5 seconds per eyelid if you feel there is no redness created (i.e. no new tiny blood vessels showing up when eyes get a little red as they may do when we do warm compress or any eye intensive activity).* If it's such a revolutionary tech, skeptics would argue that they would want everyone to know about it, publish before and after meibography of 900 eyes improved due to IPL alone and show how they determined it was not other things that led to improvement.

The NuLids device agitates eyelids too much perhaps due to rotation, the Q doesn't rotate like NuLids. Tear Break Up Time increased from 3.62 to 5.87 with the Q *device*; the use of the Q LED device for less dryness is explained in this 11 min video: First of all, it's odd he chose a 2017 video with a lady who still has the red blood vessel in one eye very visible (meaning on 20x it's gigantic), as if trying to say the IPL (which in the official videos shrinks these vessels in the ocular surface too, you know, the marketing part) doesn't work like official videos portray. Many

suggest you don't jump to these time periods in the video, but start ultra slow and ultra careful, and if all is fine, after 100 days of small increments, maybe get to 1 min: ***6 min daily on central (not nasal) part of the lower eyelid (the*** **Q is 100% below** ***the lower eyelid edge, patient looks up,*** **Q edge is below** ***the edge of the lower eyelid*****, so no light can go into the eye,** ***open eye in video, but I would close eyes tightly anyway to be safe, you don't ever want to open eyes by accident and get that light in), 2 min on the corner of the lower eyelid, 2 min on the central (*** **central only,** ***not the corner where lacrimal gland is nearby or the nasal area) upper eyelid (eyes closed, all*** **LEDs are 100% above** ***the upper eyelid edge*****, the device edge is above the edge of the eyelid, so no light can go into the closed eye by sneaking in between the eyelids that are closed tight*****). For extra safety, one could do mostly the lower eyelids first, as those have most damage anyway and place the Q device pointing away from the eye, i.e. not perpendicular to the eyeball as in the videos, but away from the eye, towards the outside of the eye, sitting more on top of the MG orifice nearby area, the wet eyelid, instead of on the outside eyelid, to avoid shining red light on the retina, since red passes thru the eyelid. Recall to look up and to the left when working on the right lower, up/right when lower eyelid, temporal, always have iris go the other way to be as far as possible. Avoid shining on the eye and close eyes if possible slightly when using the angle method to shine on the eyelid vertically at 10 degrees instead of 90 degrees, to diminish back of eye (optic nerve) exposure; avoid touching the cornea or shining light on eyeball if slightly open (if you got cornea shields to protect eye you work on, the eye can be open slightly the first 2 seconds when using this shine totally away from the eye method, when you place the thing closer to MG orifice, however, you can do it with eyes closed 100%, closed tightly for max safety, just place the light at the different angle and try to aim it away from eye), the light faces your feet or top of head so to speak, as you do upper or lower and you squeeze slightly the eyelid as eye is open to cover all meibum gland there without having to place it ever to face the eyeball – this ensures 20x less irritation of cornea and retina, since we vibrate the eyelid ONLY this way which we push with the Q away from cornea slightly to move as far from center of eye as possible as we shine up or down instead of perpendicular, so as to never vibrate the cornea or conjunctiva itself as they vibrate them in the videos; use only 10 sec max for each eyelid area first, and take a break, wait days even, etc.** ☺☺☺

This is why it's better to never go sunbathing without wrap around sunglasses that block most light (red included, which no current glasses block, unless you tape aluminum tape to a cheap 1$ pair for sunbathing), because while the sunscreen protects skin (see dramatic pic), eyes from UV damage, the intense red light penetrates deeply thru the eyelid, damaging cornea, optic nerve, retina and studies in this chapter explain how much damage that can do; it's not 10 seconds, but 3600 if one hour, insane (easy study, just find beach goers, and group them in those who go in areas and times with UV index 11 (don't tell them what you measure, so they don't have

placebo effect), vs 1 or 2, and monitor the aging of retina, etc – and realize how much damage happens from just 30 min without ocular full spectrum protection. ☺☺ You don't want to irritate the eye and get them red with light, EMF or sonic vibes. Are the sonic waves safe long-term for the cornea or conjunctiva? Have not seen any in vivo (measure goblet cell mucin production on alternate days, when Q used and not used) or in vitro sonic safety studies from Dr. Toyos on sonic effect on goblet cells producing 1st layer of tears, and on iris structures. That's why NuLids use via indirect method (well, you can wash hands and gently quickly massage eyelids like the tip does with the tip of your finger, what's the point of buying that to flood eyes with ?unsafe? EMF (need $5 billion to see if EMF of any device damages any of the deepest layers of the eyes all the way to the optic nerve, not just conjunctiva; recall how LASIK was really primitive 1st time, then 30 years later it's way better? ☺☺☺ Imagine in the future, we take a pic with a $ 25 microscope and we see an image at home of the eye as a $25,000 Keratograph 5 offers now, or carotid artery plaque monitored at home, how many nm it increased/decreased depending on what we eat in a week to make nutrition *decisions far better than these primitive nutrition studies with* 1 million confounding factors*, etc*), when indirect method does so little extra versus finger in agitating the stuck glands and "reactivating them"?) may not be very safe for goblet cells and iris, people need to be very careful with goblet cells and vibrating conjunctiva and build up slowly after careful monitoring with 20-100x magnifying glass and ideally goblet cells status. We don't want to help MGs and destroy other cells, TBUT time can increase short-term 50%, but what are the long-term effects?? In medicine and life, many things work short-term, like redness relievers, but long-term, rebound redness occurs and eyes get dryer, due to lack of nutrients and trying to compensate for being constricted a few hours so enlarging; other times, medical therapies or life strategies treat one issue, but create another (noticed years later). So, here is a pic of my eye with aluminum on top of it, so the q device is applied only to the lower eyelid, since if it works, it should first restore the lower MGs, which are the ones damaged or clogged in most people (me included).☺☺☺

You can even press gently on upper eyelid (not eyeball) so it pushes lower eyelid lower, so that lower eyelid is totally outside the eyeball and when light hits 'eyeball area', it hits aluminum and reflects. If Q worked on lower eyelid and you saw dramatic improvement un*clogging and gland restoration on meibograph or* no longer using drops or using them 3-5 times less, then I would say, it's safe to go to the upper eyelid which would expose 900 times more the iris and other eye structures to unproven *(safety wise)* sonic, EMF and light without a corneal shield; make sure that the q lights don't go above the lower eyelid upper margin, that the lower eyelid is not moved up, but stays low (to avoid exposing the iris), *look up, keep eyes closed to avoid exposing the lens, and central eye structure,* start with 10-30 seconds and monitor eye appearance, sensation before and after (generate tears before and after to keep it wet). As the eye gets used

to it without any discomfort and you manage to kill more bacteria in the clogged MGs, *you can slowly increase time,* making sure to stay clear of iris, i.e. to keep upper eyelid shut all the way to the bottom of the orbital eye socket, *to not lift the boundary between the closed eyelids by mistake – so to keep it ultra low (since iris could get exposed if you forgot to look up 100% of the time)*, and treating only lower eyelid *first* few months (or *years*) until proven (by *meibography* and you no longer needing moisture retaining masks during day and night) it works; *there is no need to treat upper eyelid*, since 90% of people don't have issues there, or big issues; if you ever treat upper eyelid, AFTER you proved to self it fixed lower eyelid, look left when you treat right area of any of the two upper eyelids, so the iris and nearby area are not in the path of the light/sonic vibe, though with cornea shields the light issue is minimal; the iris is the ultra important stuff that allows light and vibes in and that's the stuff we want to avoid.

Not even $4 billion can fix some eye conditions that lead to blindness, so be gentle and prudent. The eye has 1 billion parts: it's like a super sensitive computer or analytical instrument worth $4 billion, easy to break, hard to fix. Any human studies done long-term on the effect of red light that penetrates past the eyelid into the conjunctiva and iris/cornea? Will exiting tiny arterioles and venules becoming more visible on 20x mirror or will iris change color on the edge due to chemical changes? It's not a good idea to use it at night when tired, as Dr. Toyos says some people have it by their bed in the video, almost like suggesting others do the same; only use it during the most rested mornings after you take pictures before and then take pics after with 100x magnifying glass (no flashlight, unplugged, room light is enough, since light could damage eyes) – so you can pay attention to any change and be fully awake to sense them. Since the safety of these devices is not clear (you know how centuries later we discover something, etc), it may be best to start with a few seconds in each area (10 seconds or less, not 2 minutes or 6 minutes), barely touching, eyes always closed, and wait and see how the eyes react, because each person is different; if atypical redness (not a typical redness from tired eyes, but new tiny red blood vessels, only visible on 20-100x magnification, that never *show up when eyes are generally slightly red)* appears *(easy* to see with 20x mirror, which is a logical buy if you want to use Q at home, you spend 495 on Q, spend $10 on a mirror to monitor eye condition morning, afternoon and evening), then the amount of seconds you did is too high. The video says 10 min/eye will be good to be done twice a week at least to see any results (for people who gradually built up the amount of seconds without any redness). This light, since it contains red light, warms up the glands without warming the whole eye area and provides the best "10 min" warm compress some patients had, per reports Dr. Toyos received. I measured the magnetic field of the device and I got conflicting results with my 2 meters ☺☺ (not sure how precise they're though), one background level, one close to 20 mGauss, which is kind of high, EPA suggests staying away from monitors, anything above 2 mGauss is not that safe, but it's just 2

min, so OK.

***It's probably safest to have eyes tightly closed all the time*, while treating both upper and lower eyelid, even if the lady in the brief demo video on the lower eyelid forgot to close her eye, or to even place a Pulsaderm like goggle or aluminum taped pulsaderm or opaque shield (aluminum foil taped in normal tape) on the lower lid partially while doing upper eyelid and upper eyelid while doing lower one, with the eyes totally shut, with the opaque shield covering the area where the eyelids are tightly shut (to avoid even the slightest light in) and only the eyelid area moved totally or slightly up or down for treating the lower and upper eyelid in a way that minimizes invisible or red light entering the central part of the eyeball (some light can sneak in, unless you buy a reusable corneal shield like many people wear during IPL, since Q is sort of mini-IPL), yet still exposes the 2.5 times longer upper glands to the light. The real issue with the Q, unlike IPL it uses sonic vibration which is meant to stimulate dormant glands, but can also redden and irritate the conjunctiva – so that's why you need to be ultra gentle, and increase slowly, from 10 seconds up to what is safe for you. Be extremely careful with it, to avoid irritating the conjunctiva which has the goblet cells that produce the mucin layer of tears, you don't want light to reach the eyeball by accidentally opening the eyes slightly and you want to avoid getting close to the lacrimal glands (situated under the outer part of the eyebrows, the corner of eyebrows), to avoid irritating them (avoid the upper eyelid corner). There is no good way to do 100% protection without a quality round edge corneal shield, those are $100+ usually. The Q device has "Made in China" written on it (some Canadian company designed it apparently), so we don't know what the quality of the components is, if it is really made in China or the Chinese subcontractor got parts from somewhere else. One other thing is that sonic vibration motors generally do create some EMF and there is little talk about the safety of this sonic vibration too. I contacted the clinic to get more info on the Q, the Toyos clinic, and got no reply back, after I bought it (yes, anyone can buy it even if not a doctor, they didn't allow me to talk to Dr. Toyos before ordering the Q device as he was too busy to talk with those not having the Q device), not a very good customer service perhaps or they're swamped with calls from curious people who just got the Q, not sure. Perhaps you can volunteer to help them answer more calls. ☺☺☺ It's kind of odd how his 2017 video says only doctors can order it, but in 2020 anyone can order it by phone (website ordering didn't work so I had to call).**

They definitely needed some help there, in 2020 at least, with fixing website bugs, etc. Dr. Toyos, like all busy doctors, kindly replied very briefly to my email one time before I ordered it saying that the video explains its use and that he can send the free book with the device; I got the book and Q on November 9 2020; used it for a few minutes November 11-13 (and then stopped using it as I think the device irritates the eyes and might return it, if they allow it, I asked them if I can return it and no answer received in 3 months, they only replied when they

wanted me to order it), as the video explained and the eyes got a little red: the most obvious new redness was near iris edge, which seemed to have become a lighter blue color for 0.2 mm (only 20% of the iris edge circle, most of it in the exact middle of the iris facing the other eye, both eyes, thinning afterwards as it goes up or down), the new tiny vessels, 30 times thinner than the big vessels that were there for years, are visible only with the 20x mirror (1x it just appears redder than usual, but 20x you can see the vessels), which I was using daily since September 30th. Because of the fact the iris and central eye is most important, it's safest to only do the lower eyelid while looking up and lower temporal area (corner) while looking up so iris is not exposed to this red light, blue light, etc and the sonic vibrations and heat; *doing upper eyelid central 2 minutes or less would directly expose iris to this yet to be perfected device*. It didn't affect vision in any way, it's just some redness that indicates some stress the Q caused and abnormal change around iris on the part of iris edge facing the nose on both eyes. It's not possible for anyone to notice it (other than redder than usual sometimes). ☺☺☺

After 28 months, the iris edge change is still there and when tired, I can see venules, since they're purple, while arterioles that have been there and 5-30 times thicker for years are all red in 20x mirror. Since the other existing vessels were redder too, I discontinued using it afterwards for 11 days until the redness disappeared to some degree around iris on 20x mirror (well, it may take months, since now I will avoid iris neighborhood); next time I used it was 20 seconds on right lower eyelid only on Nov 24th, using the aluminum method described above, no change detected in the 20x mirror; not used it since then; make sure though you look at a bright screen before and after and see how your floaters and vision behave before and after, keep very meticulous tracking of what goes on and stop of anything odd; if atypical (new tiny vessels only visible on 20x mirror) redness doesn't disappear in your case too (after a few hours, days or weeks) after using it only a few seconds even, *(eyes closed, not keeping it too close to the eyelid, only barely touching it, since it vibrates conjunctiva too much)* don't use it again, it could mean it's not good for you, doesn't work properly (bad lot #), spies swapped it by intercepting mail, components replaced to harass your eyes, etc or you're allergic to the EMF, sonic waves and/or light it creates; once again, different people are allergic to different foods and EMFs, etc, so you need listen to your body, you can even return the device to Toyos clinic if they allow it. *This is not a device that has tons of papers published, so it's more like you're a guinea pig for optimizing it, so be ultra careful.* What if the Chinese components aren't up to par or meeting specifications fully if it's made in China as the label claims? What if a manufacturing mistake, unintentional or not, does more damage to MGs or another eye component than it helps? ☺☺☺

An IR wave or laser can penetrate deep inside beyond eyelid and could in theory have damaging effects. See Dr. Toyos in Moscow. I emailed Dr. Toyos about the device and got no reply for a while, except after 4 days of heavy torture designed to make me tired and easy to manipulate so

I order the Q device, even if there were clear 'red flags' about Dr. Toyos email reply, website, phone interaction (only 2 lines, name 'rolando toyos' without capital letters, same for the office). The torture was mostly during sleep hours, etc, most torture described in here I went thru at various times 2018-2021, besides cars with one headlight on around me often, since same spies (they framed the KGB, since some 'Russian guy' activity happened right around this time, so it may not be KGB, but PLA or Mossad, since Optima IPL is an Israel company, Israel got > 1 million Russian 'Jews', 1.5 million Russian speakers) who tortured me control Dr. Toyos and other IPL doctors (any doctor they want to remotely control) too. It was a typical thing they *do to* pressure via synthetic telepathy *to make* a decision when tired. This and similar mistakes we make in life can be prevented if we make a new habit to not decide when tired, just rest for a few days and decide in a few days; breathe softly, filter walking tone, thought+emotion+vocal tone, so that we don't get impulsive or excited to try new things when tired, so we go into fight-flight mode less and make better decisions in a tranquil state not one of confusion, so we're gentle with ourselves and all beings, helping all to live to 5 trillion, especially when it's important and involving trying a new tech, unknown things with risks, etc. It's the possible malicious intent of Israeli Lumenis IPL that is is a red flag for anyone trying IPL. Dr. Toyos book suggests to add balm after Q device used, but you may not need to if you do 10-20 seconds only or generate years before and after. Ensure the balm or artificial tears you use are not going to irritate the eyes or eyelids, since the you can get red eyes too and then how are you going to know if it was Q alone that caused it? Balm components can diffuse on the conjunctiva and cause redness too, but in my case redness was there even when no balm was used. Likewise, make notes of any drops you use, so you know if there is any odd interaction between drops and eyes in the presence of Q device that is absent without Q device. Balms got tons of chemicals that may cause redness if Q is used due to unknown processes. ☺☺☺

I received the free book with the Q device, also on Amazon, sharing some of the experience of Dr. Toyos from 20 years as an eye doctor: buy/read the book before ordering the Q device to see if this is for you; it talks about many products he sells to improve dry eyes, about surgeries that his clinic does in helping those with dry eyes, various techs, a healthy diet, NR (B_3 riboside, NAD^+ precursor, like B_3 or NAM) and cycloastragenol (from astragalus herb, like TA65 from the same herb that some believe slows aging, because the telomeres lengthened instead of shortening for older people taking it RR 2016;19(6):478-84), a chemical that activates telomerase, delays aging of eyes and body, but can also help cancer cells survive. Since cancer patients are often treated with telomerase inhibitors, there is a risk in some people astragalus may shorten lifespan if cancer develops. Telomerase activity is high in 85% of cancer cells (not in normal cells), offering cancer cells "immortal" lifespans as telomeres shorten far less during cell division. MMR 2019;20(4):3701-8 explains astragalus extract (16 mg) can increase telomerase activity in vitro 4

times when mixed with vitamins (vs 2 times TA65 alone), while oleanolic acid 6 times (present in 1600 plants, like garlic, olives (olea), hence the name, IJMS 2017;18(3):643, Mediterranean diet gets 25 mg/day, but mice became infertile after eating it), gotu kola extract 9 times. Obviously, we saw one biomarker (HDL, telomere length?) increasing (to optimal levels) doesn't increase lifespan, it can shorten it when human models don't match reality i.e. when lifespan is longer because of multiple unknown biomarkers going up or down, not just one. ☺☺☺

Dr. Toyos is ultra busy, so the book is not perfect (91 pages only, excluding references and table of contents), has some typos (easily caught by a grammar spell check) and no page numbers, it's more like a 1st draft, takes a ton of time to write a very big book and edit it and also treat so many patients; he needs some volunteer editors probably to help; if you live in metro Memphis area, contact them at (901) 683-7255 to see if Dr. Toyos accepts volunteers for dry eye research (or clinical studies) or maybe email him for email online remote volunteers to help improve his book, research presentation on the website, before and after pictures showing Q device restoring MGs, etc; when I called the number, the caller ID says some dental implants aesthetic center, but it was Toyos clinic, one of them, not sure how many. Dr. Toyos specialized in eyes, but also ran an aesthetic section of his clinic since he was one of the few first laser surgeons in the country, and discovered IPL for dry eyes while treating rosacea patients. In 4 weeks, IPL helped lower IL-17 80% and IL-6 70% (inflammatory cytokines that clog the glands) ► AJO 2017;183:81-90; to use the Q *you need to barely touch the eyelid at least, otherwise the light and vibration won't turn on;* there is no need to press at all, but it is CRITICAL *to be* ultra gentle, to barely touch it, as close as to barely have it turn on, so only the eyelid vibrates, *not* the *conjunctiva* or cornea (*we don't want to destroy the conjunctiva* goblet *cells making* mucins, *the 1st layer of* tears), *especially since you want this to be different than a traditional CVS warm compress* that presses on eyeball and can give glaucoma long-term if too much due to increasing eye pressure; it's better to generate tears before and after, to keep everything ultra wet, since this is slightly drying and you want lipids and water there, and overflowing tears can be used to massage eyelids afterwards for moisturizing, very different than acne mask techs that cover eyelids with goggles. See a 1 hour 2019 video on dry eye healing with IPL: he explains why he thinks Optima Lumenis M22 IPL is the best (could be if they're the 1st to optimize it for dry eyes and got ahead of the other companies), why we need 43°C for toothpaste like oils to melt (20% of people; IPL reaches 50°C, without heating cornea. LipiFlow 3 days before IPL produced no oil of the glands (42°C), then with IPL the toothpaste like oils came.☺☺☺ IPL kills microbes; hospitals use IPL now robots to disinfect rooms. Q device may be only $90 one day, but now we support the research. LipiFlow makes $ for Johnson & Johnson, if people use it a lot. Neutrogena (Johnson & Johnson) sells an acne (described here) laser at CVS (out of stock, instacart says it's there), 28$ (22 if 4) ebay, 12$, low profit vs $495 for Q.

11.17.7.8. WARM COMPRESSES (to unblock MGs, drain chalazions, styes)

Use these only when needed for MG expression of 10% of the glands, or for chalazions, styes, blocked glands, etc since overuse they can damage the cornea via heat. You can simply use a ziploc bag and fill it with warm water, as explained in the next paragraph. Another simpler way to warm eyes is to place eyes closed above a Honeywell HWM440 or other safe warm mist humidifier that uses DI water only and no ultrasound, with eyes closed, to get a gentle WARM COMPRESS with 0 pressure on the eyeball. For MG expression of a section of your eyelid/day due to partial blockage etc, you can avoid extreme discomfort and redness coming from whole eye warming (which leads to people avoiding warm compress altogether, not knowing they can do only 10% of the affected eyelid per day to make it far more comfortable and lipid rich) if you do them with eye closed for eye corners glands and eye semi-open or open for the central eyelid glands (blink, use saline, and heat only 5 min, go slow, start warm, don't jump to the 110F hot, can use eyeeco.com inserts, see below, that are warm, remove insert/bag to blink each 5-10 seconds, and add saline if needed, etc), only one 10% of an eye section/day at a time as the MG expression section explains, to avoid heating the central 80% of the cornea in too many places at once daily that causes high oxidative stress and damages the eye, vitreous gel and iris, so look away from the warmed section of the eyelid to protect your iris, and protect your cornea, as with LipiFlow, where they do MGD treatment without heating the cornea and damaging the eye; we can't fix one issue, blocked MGs, by destroying the eye; to avoid damage of cornea, after a warm compress was used to express meibum, you can use cold water ziploc bag to bring it gently to a more normal cornea temp 10 times faster without such wildly dilated vessels for 10 hrs afterwards or 3 days leading to cytokine storm and an inflammatory cascade for the cornea; by doing this and the partial warmth and partial expression of 5% of the MGs, the daily damage to cornea is lowered 200 times; it seems 90 times safer for cornea and ☺☺*lovingly gently* kinder ☺☺ to use really warm compress only for needed cases, softening oils with a stye or etc, since overheating the cornea, like with daily 10 min whole eye compress, TearCare, MiBoFlo, etc can damage it. If we want to live to 200 and have healthy eyes, we need to be way more careful and update our traditional decades old practices of "daily 10-20 min 110°F (cornea temp actually, where MGs touch, the compress can be actually warmer) warm compress for the whole eye".

Compresses that are moist (like warm vapor of a warm humidifier) are the cheaper and perhaps safer way to provide heat 5-10 min sometimes *(too much causes angiogenesis, new red arterioles in your eyes, so be careful to not overdo it),* produce lasting change instead of 12 minutes for $500-950 LipiFlow once/year; however, due to the fact it warms cornea, and that some wear wrap around air sealed glasses to prevent dry eye, which warms the eyelid glands, some may not need warm compresses weekly. The simplest warm compress is using ziploc bags with warm tap water inside (then you can replace it with very warm water when you're ready to

move to higher temp), that are pre-wet with saline solution to provide hydration of eyelid skin (eyes can be pre-wet with sterile saline too), using the same technique of looking towards the Earth while gently holding ziploc bags as for cold compress; this provides a far cleaner warmth than CVS dry compresses, as ziploc bags can be washed daily and create a gradual warming that reduces inflammation, a warm compress that doesn't cool in 2 min or press on eyeball. Other warm compress methods involve the eyeeco (see below) easy to warm blue pack that enables warming only a specific area (which you can also do with a tiny area of a ziploc bag that you morph into a blob to touch a tiny area), 7% of the eye, if you wish to deal with a stye, etc and warm that area 5 times daily. Make sure warm/cold compresses and night masks don't press on eyelashes and distort the direction in which they point, since they could point towards cornea and make your eyes very red and you'll need to trim those wrong-pointing eyelashes, which is not ideal. Some people do a 1 min mini-warming and massaging 'expression' with eyes closed while taking a 5 min shower morning and evening, (or without taking a shower, just let warm water run and place eyes in the path of water for 2 min to provide a wet warm compress any time needed, while gently massaging eyelids to express oils). I don't recommend this, since warm/cold water contains many chemicals that damage eyelid skin, inflames and swells the eyelid skin, such as chlorine, and a ziploc bag protects your eyelid skin a lot more. ☺☺☺

To 100% avoid any eyeball pressing and do a mild warm compress (safer than CVS, described below, since no eyeball pressure), you can try a cheaper "totally wet eyelids modified warm compress with goggles in between" which I used before I bought XL in July 2021. Unlike dry Q-device one, it is super-moist, even wetter than normal Bruder/CVS compress, and far wetter than electric masks, meaning ideal for the dry eye; TOTALLY WET when done right, really wet like in the shower, nicer wetness, since it's more oily, sterile, since skin oils are still there, they came out a little due to heat; after shower, the skin oils are gone due to so much water; this wetness is far oilier than shower one, allowing perfect massage afterwards; due to this extremely oily moisture the modified warm compress is best prior to doing meibomian massage or expression as it allows fingers or silicone q-tips (see NuLids section on meibomian massage and why IPL inventor Dr. Toyos doesn't recommend traditional (not the modified compress I use where we don't touch eyelids) warm compress/lid scrub to patients with abnormal eyelid vasculature (rosacea, acne, etc) due to potential to increase inflammation), for "exterior only eyelid massage" silicone (not cotton since tiny fibers get into eyes, if not moistened with sterile saline) tips seem fine, for inner eyelid or meibomian expression silicone seem safer if you can clean them well) to glide easiest. The Q (like IPL) tends to dry the skin, so avoid drying the skin in any way prior or after the Q device, to avoid excessive dryness; since warm compresses (traditional, electric mask or others) can dry the eyelid skin or eyes a little if not done right, it's better to not do those before using the Q device. The synergistic IR heat and improved

circulation of modified totally wet warm compress, done many hours before using the Q (if you feel it's right, some days your eyes may be more tired or the eyelids didn't get super wet due to condensation, so then don't do Q treatment those days), can combine with the light of the Q and provide a real boost for the MGs, without creating skin adverse effects due to the dryness the Q brings in people with already very dry or dried skin due to some prior activity. But even Q device "dry warm compress alone" (see above, one time price, lasts a lifetime) is way cheaper than doing LipiFlow every few months. ECL 2003;29(2):96-9 found lipid layer thickness increased 90% from 58 to 106 nm after a 5 minute 40°C compress. ☺☺☺ Warmth is far/near IR (infraRED) radiation, that compliments the red light of IPL, Q, RED light devices in keeping cells younger, alive, the oils flowing, mitochondria active (cytochrome C oxidase). Amazon got the typical "microwave oven heated" $9 CVS compress like: Bruder many eye doctors like or other similar ones Medical King (I like it more than Bruder, since it doesn't press so hard on the eye, being much wider and reducing the risk of glaucoma as the center of gravity is not on eyeball center, but widely distributed and even off the eye too, Bruder is a tight cloth very spherical vs Medical King, a clump that damages eyeball shape if left to sit, since the gravity center is on the eyeball center; ideally, any warm compress is kept gently with both hands while facing the earth to avoid gravity pressing too hard on the eye) to help our eyelid MGs unclog; they got tons of types, some use electric heat, far IR, etc but if a malfunction exists, they overheat the cornea being too dangerous, so some doctors recommend the ones that are not electric, but MiBoFlo doctors use electric heat. You just have to test it first and use common sense, if it gets hotter than a warm shower, it malfunctions. ☺☺

I would not use the electric ones more than 1 min daily, as they produce some electric field of higher intensity, just like we would be exposed to near an electric pole or near a socket or light switch or appliance, which is fine, 50 V/m, (magnetic and radio field of masks are background) but just to be on the safe side of extreme caution. Some people go overboard and sleep all night with the electric ones, which is not smart as you can't sense if it overheats and could literally permanently damage the eye big time in one night; we all get exposed to 50 V/m sometimes during a day, so no big deal. Amazon has $10 heating masks too, I tried the $10 carbon nanotube one far IR heat, electric field 50-80 V/m and it works to heat half of it to 107-104, the other half to 90-94 after 3 minutes (not 20 seconds like microwave) (mask didn't reach 35°C on one half day 2, even if set to 40°C or even 60°C); this makes it very cold versus the 40-48°C for Bruder exterior in some places, but better since it doesn't press on our eyes giving us glaucoma. If you buy one that works, it's nice to be able to use the 40°C setting, do massage, not go to microwave oven again when it cools down, it stimulates oil production, as tears are very oily, in short, it works at helping MGs expression at home; I used IR thermometer and on all 3 settings, 40°C, 50°C, 60°C (these temps are often for the electrical element, not the mask surface that touches

eyelid) the mask never becomes hotter than 107°F, let alone the eyelid.

If you *don't* trust *these, it's fine. I* don't either, because I don't think they did 20 year safety studies on them, every manufacturer out there, since there are not even 100K people who used these new masks every day 10 minutes or more for 10-20 years to assess long term brain and eye safety from a large population to eliminate confounding factors. BJO 2002;86(12):1403-7 found the cornea seems to warm at the same temp as after taking a hot bath, so 5 minutes of IR mask was deemed safe, in this 2 week (*too weak?*) study, even if "when we use near infrared radiation for ocular surface treatment with closed eyelids, thermal cataract formation could be a concern", *but still they have not proven that IR devices (which penetrate deeper than warm compress into the vitreous gel) didn't cause thermal cataracts/floaters in the long term*; ☺☺☺ IR from an electric mask can penetrate deeper easier than the warm compress, doing more damage that is not possible to assess, as we can't measure the temp in the center of the eyeball and effects on optic nerve; the nice thing about this paper is that it has a picture of eyelids squeezed against each other, which is another method some doctors use to express the glands after warming and get those really thick bacteria filled oils out, if any (this is not always needed, unless oils are toothpaste like, liquid oils people need gentle expression only, massaging eyelid upwards or downwards to get meibum out after warm compress, these glands are fragile, we don't want to destroy them; once a month a heavier pressing may be fine (like after IPL treatment, they do it in office), it gives time to the glands to recover, but daily, no way).

"Physical expression of MGs for therapeutic purposes is an in-office procedure with at least an 80-year history. It can be supplemented by the patient's performing self-expression and massage at home" ► IOVS 2011;52(4):2050-64. Electric fields can do *damage to frontal cortex or eyes, or deeper brain areas.* To avoid these "electric IR mask" risks, you *can* use *the method explained below to get around the "CVS/Bruder compress cools very fast" issue, with* a rubber goggle *between compress and eyes, so no pressing, no* electric fields that may alter eye biochemistry in negative ways discovered only in year 2300. If your oils are liquid like mine, you need lower eyelid or eye mask surface (not eye mask element) temp than 42-44°C the worst cases (thick toothpaste like "oils") may need for exterior eyelid; healthy people oils melt at 32°C. The Blephasteam manufacturer chart shows 45°C as the cornea heating safety limit (when thermal injury occurs) on Amazon, they claim cornea can only be heated for 15 minutes at or just below 45°C, which sounds like a lot and high too, I would only use anything > 40°C if doctor showed you have very thick oils. MP 2015;42(10):5604-15 says only 38.5°C is safe for the eye (cornea and lens don't have blood so heat dissipates slower), so I would always set my mask on the low 40°C/104°F or below settings (eye temp is 37°C, we reach 104-107°F (40-42°C) in high fever once or twice in our life, so that's some common sense, we don't want to heat eyes too high like in fever, since far IR penetrates and can heat even the cornea for 5 minutes at 40°C) for

maximum safety, test any mask first on your skin with reliable IR thermometer to make sure it won't get above whatever you think is safest after doing pubmed searches.

The Amazon mask is far gentler on eyes than the Bruder type mask from microwave oven that is very hot first 30 seconds then becomes very cold fast, this one is constant same temp high tech heat, way nicer. We don't need reach 42°C as LipiFlow does on inner eyelid, since many meibum oils melt at 35-40°C in MGD patients, and even 32°C in healthy people. LipiFlow, made by Johnson & Johnson, and iLux made by Alcon, avoid heating cornea even at 38°C, they're very cautious, heating only the eyelid. The microwave warmed Bruder type masks never reach even 38.5°C for the eyelid, so it is no wonder many times warm compresses are useless for relieving dry eye for patients who have oils that melt at 39-42°C, but they do help perhaps with general circulation. If we take a shower and water is 110-112°F, as it often is actually, that's already 43-44°C, enough to melt all oils. 112-114°F, sort of warm-hot shower, is already way hotter than the 104-106 ultrasound gel of the 108°F (metal, not the gel) MiBoFlo, so it will melt all oils on the inner eyelid, the glands are not in the exact center of eyelid, more towards the inner eyelid. So just taking a warm shower and doing massage in the shower can be more effective than a Bruder compress at times, for some people at least. Perhaps we can warm it to higher setting, while it sits on the bed (not on the eyes), and then turn it off and place it off and warm on the eyes, so we replace microwave heating with food bacteria with a more sanitary method of warm compress, using a much lighter compress turned off if high setting, on if low safe setting and you trust the brand to deliver that temp and not higher. See what works best for less bacteria and safe heat. If you got some oil heater, you can place a cloth, warm it and them put it on eyes.☺☺

People also use warm compresses that are placed 20-30 seconds in the microwave and then on the eyes. "*At 5 and 30 min, 71% and 88% of all subjects experienced increased subjective blur and decreased visual acuity*" (*due to compress pressing on cornea*, distorting it) ► OVS 2007; 84(7):580-7. This distortion is not the main issue, but the long-term causing of glaucoma (which can lead to blindness) is. ☺☺☺ The cure can't be worse than the problem. The main drawback of standard CVS, Bruder, etc compresses (how can FDA approve it?) is real weight on eyeball which can increase eye pressure and cause glaucoma, so I found a way safer (after doing it the traditional way about 5 times), warmer *and* way longer lasting heat compress method: generate tears via yawning for more moisture (optional), cap eyes with medium (not tiny) Amazon rubber mask (I use this Amazon rubber one, since it's easier to wash, sterilize) or home made mask ($0.5), where the edge of goggles (swim goggles are too big)/mask rests on the outside of the eye socket ideally to avoid pressing on the soft tissue around the eye (due to compress weight, tiny goggles can apply a tiny pressure on the eye edge if elastic too tight and goggles are too small (Pulsaderm) and/or misaligned), then place the compress (30 sec, not 20, microwave, since goggles suck more heat and need it warmer), cover compress top (leave the sides uncovered so

compress can absorb moisture from air as it cools and bring it to the eyes via the gaps under rubber goggles) with a cloth eye mask (or anything, not tight, something very light that prevents heat escaping) to trap heat. Thus, we never touch the eyeball and we provide moist heat that lasts 4 times longer than normal Bruder, warms up our eyelids much more gently and safely, is thus gentler on eyes, healthier long-term, as it doesn't cause a rapid rise and fall of temp as normal Bruder does. This type of "improved compress" thus achieves the Blephasteam goggles effect (i.e. warmer inner eyelid 102°F vs 100°F, more moist, and for longer than Bruder, see paper above), without the EMF or paying 250$ for that. Healthy oils melt at 90°F/32°C, sicker oils at 95°F/35°C, sickest at 108°F/42°C, so 102°F/39°C is plenty for most people. ☺☺☺

Compress is much warmer than 102 of course, but we talk about the meibomian inner eyelid temperature, that's what matters. You see now why moisture retaining masks and goggles raise the eyelid temp and prevent dry eyes, they keep lipids flowing and tears from evaporating, so you never need eyedrops. *People who're genetically predisposed to cooler eyes will be more likely to develop* MGD *as oils will solidify faster*, so a quick compress or two mid day, 5 min warm shower morning and evening, night time moisture retaining masks, daytime goggles when possible can all help alleviate dryness until IPL or etc fix the issue over a few months. *Perhaps, try to not* sleep in ultra cold places if you have dry eyes without a moisture and heat retaining mask as glands will reclog fast right after IPL, LipiFlow, etc, if your oils are not liquid like mine. Bedroom can't be too cold, nor too warm (and thus dry due to heater), so 50 cent moisture retaining mask may be the only option for life for many, if they don't want to spend 40K a year on weekly LipiFlow and doing 3 warm compresses a day for life. Mice with a lower body temp live longer, as metabolism slows and cellular division slows, so it takes longer for DNA errors to get out of control; thus, avoiding super warm heat during day and sleep may actually help us live 5-10 extra years, who knows? Likewise, avoiding cold is essential, since then cell replication increases and we need spend calories to keep warm. Buddha's middle way applies for both eye health and longevity. There is an optimal range for any person/genome. ☺☺☺ As we age, our circulation around eyelids is perhaps less effective, so temp drops, thus all above 60 almost have some MGD. These Bruder type masks are clumsy and not very effective at doing massage, because when you lift it to allow finger to massage eyelid, it cools dramatically, so gently let your hand be very warm too and barely lift the mask when doing massage and the goggles you placed before the compress, so that you can get the benefits of no EMF pollution and very warm temp for 8 minutes; the cheapest Amazon ones can barely compare with the "goggles plus $10 microwave heated compress" sometimes, since the USB rated temp translates in a temp of mask 20 degrees lower or 89°F (USB ones also touch the eye exerting a tiny pressure, while the goggle method above doesn't touch the eye, being safer); the rubber goggles reaches 109°F easily with the compress, so eyelid maybe 107°F, enough for most people. Some don't have enough heat to

transfer. For maximum safety, stick to "goggles plus warm compress", *since electric ones may generate too much far IR and EMF that may damage the eye.* The electric ones remain warm throughout allowing you to express glands while it's warm to avoid spending $$$ on MiBoFlo, LipiFlow which really don't do anything else than what you can do at home with a really good daily massage and safe (in year 2020 or 2100?) reliable electric mask or "compress plus goggles system for prolonged heat", at home silicone q-tip-finger meibomian expression.

The electric ones have 5 disadvantages (besides EMF pollution) versus the "goggles plus compress" method above: 1. electric ones can dry eyes. they're more of a dry heat, while the microwave oven ones absorb water from air while cooling, and provide more moisture to the eyelid even with the goggles on (well, goggles are very loose, they allow moist warm air to go under, plus you can add a tiny piece of moist cloth under or on top of the rubber to make it super-moist if you like), 2. they press on eyes a little 3. take long to reach optimal temp 4. they can break easily 5. they can fluctuate if defective and warm the eye near the cord more. So, definitely don't sleep/relax with USB ones more than 10 minutes. The only thing you can't do at home is IPL. Goggles prevent traditional stone age (they got little stones inside) compresses from touching the eyes; goggles are far easier to disinfect than the traditional compress which needs be washed and even then granules inside have irremovable bacteria. Can use an IR thermometer to see how hot compresses or goggles are inside, meibomian oils melt at 42°C or 108°F, so LipiFlow *heats back of eyelid at* 108°F. For warm compress you can also use a $0.5 smaller home made *mask than the one you use for sleeping, so it heats up faster the eyelid*. We make useless fancy cars, we went to the moon, but we can't even make a warm compress that doesn't touch the eyeball causing glaucoma if overused and place it in main RiteAid, CVS stores, so people go to Amazon to find USB ones. It would be so simple, just microwave it and place it on eyes, and it warms eyes to 108, the eyelid, but doesn't press on eyes and can't malfunction like IR/electric ones on Amazon where it can overheat. *Once I got to do the warm compress the right way with the goggle,* I learned new ways of positioning it to generate maximum moisture. You can place a white (so you can see dirt easily and when you need wash it or discard it, needs be washed each time you do a warm compress) cloth above eye like eyeeco tranquil eyes XL does; but don't use their black foam as over time it could grow grey mod and black foam hides that. I started liking warm compresses (well, they make eyes red, so after expressing meibum glands, later in the day, you can do cold compress to get eyes back to normal), as my eyelids would be so wet, as the rubber and extra eye mask on top create a weird condensation effect where temp stays warm longer, without up and down and is far more pleasant than rock bags on eyes like plain Bruder type. If you do it this way, you will never go back to the traditional way of rock bags on eyes or "CVS mask". The eyelids are cold, the moisture rich compress comes in and causes the humid air to condense on eyelid, this creates moisture droplets kept there by the rubber mask

(they would escape thru electric fast or normal mask fast without goggle in between, this then creates far higher moisture and the eye mask on top of compress further insulates things, allowing for super moist comfortable heat to happen, without touching eyes).

The traditional (not the one above with rubber or home made $0.5 mask in between) warm compresses have 4 other drawbacks as the only MGD treatment, (without the other 20+ methods in section 1) because of: 1. lack of compliance: too much work since makeup has to be removed before warming, expressing to avoid contaminating the glands, since we tear at times during gland expression; 2. people sometimes do it at night/evenings and don't blink a lot to move lipids to nasal duct, don't produce tears after warm compress or don't place eyedrops to flush gland junk out via nasal duct or they don't wipe the eye lids with a sterile scrub if no tears used/produced, so all the gunk/bacteria sit in the eye overnight causing inflammation,☺☺☺

3. dry compresses could catch microwave oven bacteria and infect the eye, unless you use a $20 UV Amazon lamp to disinfect it often or you use electric warm compress from MiBo, or rubber goggles or home made mask in between eyes and compress, Amazon USB or use a the sodium acetate type (quantumheat.net) that is far safer bacteria wise as it is sterilized and washed daily, as opposed to the standard compresses that are washed only on the exterior weekly or monthly (some doctors use usually the CVS/Bruder type, which take 20 seconds to warm up in microwave; others prefer electric heat as it's more sanitary); $CH_3COONa{\cdot}3H_2O$ lasts 500 uses, can be sterilized daily, but requires boiling water, letting it cool, etc, while Bruder can't be fully sterilized so you would need 500 Bruder masks. Quantum heat packs turn solid, and generate heat after activation button is pressed, giving it a huge edge over Bruder/CVS types as it can avoid touching the eyeball completely without goggles first, yet warm it; but they require way more extra work, plus they can in theory leak sodium acetate, use plastic wrap in between face and packs for max safety. ☺☺☺ Quantum was used by some optometrists. Washing Bruder types is ineffective in getting the bacteria trapped inside the bag, adhering to the little spheres); the unsealed CVS type compresses, that allow tons of air to seep thru and bacteria to get fixed on the cloth (inner spheres too) during use and after washing, unlike quantum heat, expose those materials and little spheres to dry heat, which could form AGE like compounds and electronic phenomena absent in wet heat, which may further inflame the eyelids without goggles (some forget to use to prevent eyeball pressure), since first 10 minutes of heat dissipation some toxic free radical forming compounds may adhere to the eyelid inflaming it, possibly even the cornea and vitreous gel too (where are the safety studies on CVS type compresses for the issues mentioned here? are those materials safe? Is it safe to use a UV disinfecting lamp on these masks to kill bacteria adhering to the inner granules that can't be really disinfected via wash?). The other issue is these granules help the air moisture and bacteria to condense on the mask material and on the eyelid, causing air bacteria to touch the eyelid and

reach MGs. With a better design or using a home made mask (smaller) or Pulsaderm like goggle in between eye and compress, this issue would be eliminated, as the compress doesn't come into contact with the eyelid. Electric ones can be washed easily. ☺☺☺

4. can't heat back of eyelid like LipiFlow can with 0 eye heat (a little eye heat is fine, we're used to it for millions of years, like solar heat and red light and IR can stimulate cytochrome oxidase in mitochondria and heal the eye, improve vision), but this is not as important, since even at 37-40°C, a safe cornea temp, we can melt oils of 90-95% of people easily. However, too much heat, when not careful, *can be bad like the* permanent eye damage done by doctors (usually cosmetic offices doing IPL for acne or wrinkles not dry eyes, as they don't know about eyes, not eye doctors) using intense pulsed light or IPL (IR or heat and VIS) treatments done without proper eye protection; the glands are on the inner eyelid, which means the compress has to be very warm (blood and skin take away the heat) and can increase eye oxidative stress, potentially causing floaters if used too much too hot daily for months. That's why USB or "rubber goggle plus warm compress" are better: they provide constant heat, taken away by the colder blood coming with each heart beat, while a standard CVS compress cools down fast (eyelids remain warm/very moist way longer with the rubber goggles and eye mask resting on top of warm compress method) and we need 35-40°C or even 42 for 5 minutes to melt oils. Biochemistry is ultra complex, so discontinue warm compress if floaters become more visible (as they do during eye stressing activities). Some eyes may respond badly to that heat, especially USB dry heat or Far IR heating the vitreous gel. Listen to your body, eyes. ☺☺☺

In spite of these drawbacks, which only apply to the traditional warm compresses sold in drug stores, the granule glaucoma causing types, many doctors suggest home daily warm compress and hand massage after LipiFlow, MiBoFlo, TearCare, iLux, IPL, etc i.e. MGs eyelid massage with the hand, a gentle *eyelid massage using the small finger of the* left *hand (if right handed), since that finger is the cleanest* of all 10, away from the eye, never press on eyes, more towards "above eye" up, down or temple, or with a sterile q tip, moistened with sterile saline to prevent lint fron q-tip getting stuck around the eye and then going inside the eye. This ensures you get the best out of LipiFlow, MiBoFlo, IPL, TearCare or iLux treatment (if doctor did it correctly and instrument heat/light sensor/bulb works correctly), so you can see less blockage at the 1-3 month follow ups. You will feel pulses pressing on eyelids during LipiFlow, after the numbness drops, and make sure that the eye thing is tightly sitting on the eye and that the doctor is doing an amazing job and instrument works (maybe ask for no numbing) to see if the pulses are felt on the 6 regions of each eye: upper nasal, central and temporal and lower. You will see in all videos on MG expression the immediate final cleaning the eyelids – after LipiFlow or at home warm compress and then gentle massage, to maximize results; some doctors won't do this, so do the eyelid scrub yourself at home, after a warm compress immediately after LipiFlow. The whole

point is to melt the oils, get them out and not have them redry on the eyelid orifices after warm compress or LipiFlow treatment since otherwise, it would be less effective, could even, in theory, worsen the condition, plug them even more;☺☺☺ at least immediately generate tears via yawning to flush gunk so it goes into tear duct drain or put eyedrops right after or blink copiously to wet the eye. *Note on showers*: see eyelid swell prevention section on shower eyelid massage and water temperature; *long warm compresses promote severe angiogenesis* and redness; in Qi Gong, we gather energy in the hands and focus it on the eyes, but "capping" the eyes (no touching), radiating Qi (IR) to the eyes; Qi contains far IR, like all warm compresses provide a little of too (especially some USB types); if your water is free from chlorine (shower filters don't remove all of it, especially after a few weeks or months, depending on lot # etc) 100%, perhaps you can try warm showers (108-110°F) with slow jet bathing the eyelids 20 seconds (never expose eyes to pressure from water or hands; only very low pressure jet to avoid pressing on the eye, otherwise, a trickle of warm water falling on the area above eye to get the eye warmer) also provide far IR energy, circulation, melting solidified oils that clogged the MGs. Most people expose eyes to the jet each shower, but to melt the eyelid oils, trickling (not jet) warm water H_2O may be needed for 3 minutes (only if you have good whole house filter for chlorine (Cl_2), THMs, otherwise, it may cause eyelid wrinkles due to Cl_2 if overused), as jet may be too much pressure unless very little H_2O comes out. ☺☺☺

How to use warm compresses to treat a stye + a modified eyeeco wet warm compress method (way safer, more hygienic than the dry compress that has *millions* of microwave food *bacteria*)

Eyeeco has a lot of videos about their moist warm compresses and moist heat techs (very different than others) (on Amazon too). Eyeeco *(and the Amazon warm/cold mask that can be placed in hot, that just boiled, water 2 min to use as moist compress, provided you wash it with soap daily; recall to always cut the elastic band to avoid pressing on eyes, let its natural weight act only, not extra elastic pressure or hold it yourself on your eyes while facing Earth to avoid pressure)* is better than Bruder, but worse than mine due to glaucoma causing eyeball pressing if used as they say; however, you can use their mask for sleeping and the small blue packets in a different way than described that prevents pressing on eyes. I bought tranquil eyes XL to use as sleep mask, to get new ideas for optimizing my 50 cents mask, etc and it was designed to be used as warm compress too; eyeeco, as company says, doesn't work as warm compress or cold one though well at all, when in freezer the inserts simply become too tough and would not fit into the cup without damaging the foam adhesive bond, plus it's too dangerous to cool it so much and then leave in one the eye in one location, it would cause a too quick temperature drop, any cold-warm compress is safer even and gentle, like a warm and cold shower. ☺☺☺

You can place the blue packets for 3 min in hot (that just *boiled* in a kettle) water and let them

warm up, then use the warm packets by alternating gently, barely touching eyes, on each half, using liquid state of packets of course for warm compress; *for cold compress, only solid is an option as they solidify, but Amazon one above is way better for cold, as when you let it warm, it* becomes soft and liquid, while the eyeeco one never becomes liquid while still cold: you need to rotate it on eyelid a lot, which may be OK with some, as long as you're gentle while massaging the MGs. Eyeeco XL mask comes with 2 sets of 2 eye packs, so one set is used for warm water and one for freezer, the warm is always liquid, don't press on the silver button, as it's too much heat that way, no need to boil anything (boiling doesn't always melt them back, or takes eons, so don't ever waste time with that, this adapted way is 10 times faster and easier and make you love warm compresses); these packets provide gentle heat for much longer and are way *safer*, bacteria contamination wise (prevent *styes*, eye *infections*): easy to sterilize with 1. alcohol 70% prep pads, 2 cents each, 2. CaviCide,☺☺☺ (20$ on Amazon/gallon, will last 2 years, just wipe them with it using a clean swab etc) 3. UV 260 nm lamp, & 4. boiling in a glass of water (tiny one they got at $ stores for candles) in the kettle etc, which you can't do with normal Bruder (*they get ultra dirty and bring insane levels of bacteria on eyes with each use*) or with the Amazon eye mask placed in hot water and washed daily with soap; the dry CVS compresses cool faster and provide an unhealthy high heat first that drops fast, compared to the even stable heat of these warm softer, blue packets, plus, sometimes, *30000 times more deadly bacteria to your eyelids*.

Even if you dedicate a brand new tiny microwave to only warm compress and no deadly food bacteria, the bacteria from one use will contaminate the deep inside areas of microwave that you can't disinfect and recontaminate the mask with each use with prior microbes. The *FDA* gift to Your eyes?☺☺☺ They're understaffed, since all budgets globally go to war too much, so, some keep playing aggressive music to feed the wars while complaining that we're in the 1st century in basic medical tech. Without peaceful music as the main type, progress will be 20 times slower. Recall warm compress is the most primitive tech, compared to LipiFlow, since it heads up the whole cornea, which is a not good, while LipiFlow only heats up the eyelids that need the heat; with current stone age era, LipiFlow is too expensive, they could make a portable system that allows disinfection of the LipiFlow eye shields and reusing those thousands of times. Bruder/CVS masks can't be washed easily, the beads inside will catch many bacteria, etc, even if washed, the soap and water minerals will stick to beads and trap bacteria and many of those masks are not even allowed to be washed, soaked in water. If you want them hotter, you can use some kettle (in a glass to avoid touching elements as they would melt the plastic, can keep it in your bedroom even) to get distilled or reverse osmosis water to a boil and leave packets there 5 min, then use them to get a 10 min warm compress; they get wrapped in the white cotton bags, so it will be very moist if you choose use those, but even without the white covers you will get some water on your eyelids vs total dryness of Bruder; make sure it doesn't press on your

eyes though; can reuse that warm water many times and do even 5 mini-compresses daily when you got a stye to help pores open; or go thru the whole 5 minute boil charge thing and do a very warm 25 min compress, but that didn't work for me, inserts don't activate, probably because I didn't boil them 10 minutes; since they're wrapped in the white moist cloth, they're very comfortable versus the dry warm compresses. ☺☺☺ don't *overdo warm compresses, since they will give you red eyes* and cause permanent vasodilation; you can just do it to warm up oil, get it out of the glands or stye, etc and then bring it to normal temp with a cold compress later if too red. Tranquil eyes XL holds the warm packet better than Bruder/CVS masks so it doesn't press on the eye; but even with this, it's better to face the earth so there is only a barely touching sensation for our eyelids, to avoid eyeball pressing and hold the insert in your hand for better control, not in the XL night mask. We can do a gentle *eyelid massage any time, without warm compress first,* by wetting eyelids with saline solution to allow easier sliding of *the* small *finger (of the* left *hand (if* right *handed), since that finger is the* cleanest *of all 10)* over the eyelid (to prevent collagen tearing and cornea tiny scars due to strong friction), then using washed fingers, see video, to gently express glands, then clean eye with Cliradex, HOCl or Zocular).☺☺☺

Cliradex etc washing is important, to prevent styes and chalazions, see a video on how to use warm compress to resolve styes; styes and chalazions are usually due to infections of the hair follicle or the MGs orifice, which becomes larger when using a warm compress; to prevent microbes getting into the gland and causing a stye, it's helpful to cleanse eyelids before and especially after a warm compress, as large pores will allow more crap in. You can use cold water to shrink the pores to normal size once you got a good "meibum flush to open any clogged pores". You can even make a reflex to always wash fingers before touching eyelids, and drying them with an eyes only towel, having a special soap for only washing the fingers you use for meibum expression, to avoid bacterial contamination from dirty hands, etc. No eyelid irritant is allowed like eye creams, makeup, etc when doing compresses, and that you washed hands before touching compress, goggles, disinfect goggles often and wash compress too frequently. ☺

11.17.8. How to protect your eyes from oxidative damage done by UV, blue light, *wind*, *smog*

Even the gentlest wind dries the eyes; *dust, viruses, smog etc increase oxidative stress, making eyes dryer and redder*, so, until you fix your meibomian and/or lacrimal glands and all returns to *normal (no more tired eyes, no floaters, no dry/red eyes)*, buy some cheap $10 blue light blocking glasses (*wrap around sunglasses or blue light protect the eyes 2-3 times better* from *bacteria, dust, smog, wind*) to wear outside at night (*especially if slight winds exist, like near beaches or running, jogging*), and ALWAYS wear sunglasses daytime or yellow tint UV/blue light blocking if overcast or sunset/sunrise. I *was shocked to find out* Bollé $12 HD clear glasses, wrap around, offer *much higher contrast than blue light glasses*, by making letters darker, while blue

light computer reading glasses make the background darker too. This really helps reduce eye strain, since computer blue light level is easy to adjust with software and lightbulb by placing away and using 500K or warm white 2700K bulb. ***Floaters are type 2 collagen bundles in the gel inside the eye, more likely to form when*** deficient in antioxidants that reduce free radicals in the eye (which cause collagen bridges to form, atypical polymers), ***when*** eyes are dry (no simulated yawns or eyedrops), ***when*** exposed to UV light from windows (spend $10 on a clear UV film for your room, to avoid $900 surgery to remove ***floaters*** or ***cataracts, our lens becomes yellow as we age***) or outside, ***when*** exposed to high energy (very close to UV wavelength) blue light from the sun. ***Thus, it's best to wear sunglasses to maintain best vision into your old age***. Since face washing, sunglasses and antioxidants prevent UV light, dust, viruses, bacteria getting inside the eye and causing oxidative stress and infections, they decrease the risk of glaucoma and more serious eye problems than floaters or cataracts. If you use makeup or acne topical powders or ointments, always wash face with soap before going to bed, otherwise, the chemicals will get stuck to your pillow or eye mask and irritate your eyes or make them dry or red too. ☺☺☺

Some makeups are ultra cheap and contain toxic chemicals, use makeup less and only highest quality, just like with eyedrops. If you drive a lot, getting UV film on all car windows helps a LOT, since free radicals from UV light (sunglasses, especially those not bent around the eye corners, can't prevent all UV from reaching the eyes, window film is the real protection) can cause floaters, cataracts, and worsen any infections. Not all floater/cataract removal surgeries are without complications, 1% lead to some real issues (that cost way over 900$) as the videos above explain, so you want to keep your eyes healthy with ☺***cheap*** preventive measures. Likewise, darker tint sunglasses with more yellow-orange-red-amber tints block more high energy blue light (some of it is 400-430 nm, very close in energy to 370-400 nm UV rays), so choose the more orange tints and the wrap around sunglasses to cover well eye corners. To get better sleep and less eye irritation, for computer work you can try better blue blockers. If you dislike wearing glasses, see the sleep section for more blue light blocking ideas. ☺☺☺

Try search Amazon or google for "99% blue light blocking sunglasses", you may find the $16 100% blue blocker (Infield on Amazon, UV400 plus 400-490 100%, or infield-safety.com) or $25 99.9% blue light glasses called NoBlue that also block all UV and meets ANSI Z87.1-2003 and CSA Z94.3 standards (hackyoursleep.com sells them too, the one I use now most of the time when outside as sunglasses since they're more HD than any $20 from Walgreens or Walmart, has "PS Z87.1+ Taiwan, NoBlue" written on it, and inside when I want to block blue light inside (inside we get 450-500 nm blue light from windows and computer screens, which blocks melatonin production and can cause chronic insomnia, dry and red eyes in some people). You may strongly dislike the $7 (if you buy 2-3 pairs) to $10 Uvex glasses, that block 98% only, made with ($1 store like safety glasses?) cheap lenses that give you headaches after 2-5 minutes (as reported by

many on Amazon), especially when changing focus. You often get what you pay for, and these Uvex glasses proved it to me. The $16 Infield, a medium price, have far better lens than Uvex, but seemingly lower quality (may get a lens headache after 30 minutes in some users, earpiece headache after 10 minutes) than the $25 NoBlue. The ergonomics of NoBlue is totally superior to Infield, most sunglasses/blue glasses on Amazon, since the NoBlue space between the temple tips is 120 mm (plus it's soft rubber very flexible, unlike the harder infield rubber), not 81 mm as with Infield. This is 41 mm difference is evident from Amazon pictures too if you pay attention.

Bollé Contrast Cobra (which allows you to prevent dry eyes via the foam kit) is really good for driving at night, if you want to block 30% of blue light and still have clear lenses. NoBlue also has the temples about 25 mm longer, making it fit better for far more head types. I looked at hundreds of sunglases at Walmart, Walgreens, etc and none comes close to the superior ergonomics of NoBlue. One solution is buying separate temples that are long and wide, unscrew the temples that came with your cheap sunglasses and put new ones that fit you perfectly. NoBlue is darker making it better use as sunglasses. Infield focus change as in driving gives headaches, so I returned them after trying them. Smaller heads who don't get headaches from temple pressure on their temple area may be OK with Infield type if the lenses are not giving headaches. If a pair has poor or medium quality lens, like many blue blocking or regular sunglasses, it's not good to wear them as they may distort your vision. Each person is different, so while some pairs may cause headaches in some, they may be OK with others after 1 hour use; lens headache is not always due to low quality lens, but to eye focus change specifics. Your eyes are worth $10 extra for a decent pair, since it may cost 9,000 to fix damage the cheap ones do. Cheap lenses can stress the eye, and then you spend $10-80 a year on eyedrops. Companies make yellow tint almost transparent sunglasses for sunset, sunrise, cloudy days to protect eyes, since UV and blue light damage the eyes even when the sun is not visible. ☺☺☺

They make *glasses* (100s of them on Amazon) that block 40-50% of blue light, like these amazing 14$/2 pairs, 13$ 1 pair, Kenzhou glasses (many Amazon brands with flexible hinges like this one (4 times cheaper than Target ones, plus flexible hinges, Walmart vision center ones are 40 times more expensive) so it fits well without pressure behind the ears, transparent lenses, for marketing purposes some glasses say 90% of "harmful" blue light, without saying they block the same 40-50% of total blue light as the other brands as you can see form the identical spectra pics (where 90% of harmful blue light is blocked, the lower wavelength (λ) nm, closer to UV, E=h*c/λ=h*ν, ☺formula explained here, higher energy (E) = higher capacity to cause floaters (collagen 2 polymers) by polymerization like blue light in dentistry lasers, free radical formation causes polymers of collagen type 2 and the faster aging of many eye parts). That's why some dentists use blue blocking glasses and why wearing 99% blue blockers while in the dentist office is a smart idea. The transparent 45% blue blockers are amazing for computer work when seeing

blue on computer is important (some software, not reading articles), and you want to remain alert (blue light keeps us alert and regulates circadian rhythm, so we need it when we wake up) or for driving at night, sunrise or sunset to prevent retina damage and glare that temporarily blind you, while still allowing to see pretty much all blue color objects, even if not as luminous/bright blue as before (more grey or green). The 100s of Amazon 7 to 9 layer lens $15 *yellow* tint HD polarized blue blocking *sunglasses (*that also block UV400, i.e. UV up to 400 nm*)* block only 40-60% of blue light, make ***traffic road yellow markings***, in some cases, when faded and at some angles of eyes and sun position, 10-20 times more visible even in daytime, images much clearer ☺HD(high definition)☺ than standard sunglasses, in the daytime, you will be ***blown away*** such glasses even exist, way better than 99% of glasses with gray, amber or brown lens you find at most stores; ☺☺☺ normal yellow/white markings will appear 50% better, more yellow and everything far sharper and in contrast (flowers, etc), but ***some yellow markings that have faded, and are there to prevent collisions***, will be seen 5-20 times better, saving lives.

Rocknight type of sunglasses with adjustable frames, temples, spring hinges (screwdriver included to adjust springs to your size and tighten back), nose pads due to aluminum construction will fit more head sizes (this brand is 135 mm width, 60 mm lens, so for small heads) and provide max comfort, while plastic ones can't be custom adjusted. Duco 9 layer lens brand is another metallic adjustable HD polarized yellow lens example, with wider 75 mm lens and bigger overall for bigger heads than Rocknight. At night, dusk, sunset, photons come mostly from street lights and since sky photons are blocked and sky becomes greenish (no longer blue), the yellow-red-green photons of the road from your headlights and streetlights become emphasized, so the eyes become more focused on the road and the road seems brighter due to this effect, even though less light passes than without glasses, so technically it's not brighter, it only seems so. You will notice it's easier to focus ahead even with the clear blue blocking glasses that only have a tiny yellow tint, barely visible. It's the neurons of the eyes that get focused on where the light and photons are, in this case the road, so they can increase safety as we're less distracted by the streetlight photons and sky or billboards photons. If it's very dark though, wearing "clear" (they all got a yellow-green tint, but nobody will notice it) blue blocking glasses (not the obviously yellow) is better as you see detail better. During cloudy days, when tons of blue photons come from the sky and get less processing by the eye, a similar illusion happens, the road ahead seems easier to focus on. If very sunny, yellow is not good, only darker yellow. So if you drive 10 hours daily, you may need 3 pairs (clear for night, yellow for bright night and dusk/dawn or cloudy day, and dark yellow or orange for day) for maximum eye protection from glare-UV-blue, road safety and minimizing eye stress. Yellow lenses are excellent for the few hours around sunset and sunrise, rainy days, etc. I wouldn't use the 99+% blue blockers in day traffic (unless driving slowly in areas you know well), since green traffic lights (especially the

arrow type, not the round ones) can't be seen very well from 0.2-0.5 miles away, especially in certain solar positions that create glare; however, you can see red and yellow better, and way better on cloudy days since orange lenses make those colors brighter, increasing contrast. 99+ are too dark for driving at night anywhere. The 99-99.9% blue light blocking sunglasses can be used at home at the PC, the darker the orange, the more blocking. ☺

Dr. Allen made a video about mainly much more expensive blue light glasses, for those who have more money to spend. Blue light *damages* more than the retina everyone talks about. 399 nm UV or 401 nm blue light is the same thing almost, it causes pretty much the same destruction. That's why it is best to buy lightbulbs that are 2700 K not the hot ones with 5000K, since 2700K has the lowest blue light. Warm white LEDs (2700K) can generate 15 times less blue light than daylight LEDs as shown in the spectra at LED.pdf. Our sunglasses standards need to be upgraded to keep up with longer lifespans and new knowledge, especially for people who work more outdoors or driving more, requiring more filtering of the most harmful blue light, to reduce its intensity. Standards for many vitamins and even protein intake have been upgraded by 50 or 100%. Perhaps make special (for occupations that spend time in cars or outside) sunglasses UV+B,425 (to block all blue 400-425) and 60-80% of the 425-450 intensity taken out, since 400-450 nm is highly damaging to retina (especially for people deficient in lutein and zeaxanthin) and other eye parts, and some 425-450 and plenty of 450-500 is enough to see blue very well. Skeptics maintain that HEV (high energy visible) light, 400-450 nm, is not that bad, but recall the high school chemistry, where molecules change due to visible light, or the acne section explaining how a 445 (low energy than 400) nm blue light $15 laser from CVS destroys acne bacteria cells by causing porphyrin molecular changes and how red 670 and 800 nm (much lower energy) enhance cytochrome x oxidase in mitochondria and can save parts of organs, eyes from aging or death, red light being used to increase visual acuity and treat various eye problems.☺☺

The government could require all buildings to have built in UV filters in windows and also to block some blue light that damages retina, since it's very cheap; require LCD monitors, tablet and phone makers to improve tech to mimic the stress free reading of a book, so we don't need glasses or monitor filters to reduce glare; educate kids that solar UV (and blue light) intensity at 1 pm is 5-8 times higher than 5 hours later or earlier, 15-23 times higher than 6 hours earlier or later, following a bell shaped curve. We can't live to 200 ☺☺☺ and have dysfunctional eyes. Meanwhile, until standards are upgraded for LCD monitors, tablets, windshields, windows and glasses, we're on our own. Windshields don't block high energy 400-440 nm blue light, and at night our pupils are very open, (especially if we drove on a very dark street and made a turn on a very bright street or a car came with headlights), so when headlights (store or street lights) shine suddenly close to us, we get retinal cells destroyed. For night driving, some anti reflective (AR) coating to existing glasses can solve the glare of headlights (and even some digital screens) issue

for those who wear prescription glasses. Yawns are easy to produce for free on demand and they may help us live longer as they lower metabolism (less wear and tear of cells, as less copies of DNA are made) and relax us, making us more like the anxiety free Immortals, and while we do them we can practice fake smiling too, to lower cortisol (an aging hormone), and get 2 benefits of longevity from our 3-10 minutes of simulated yawns/smiles daily, needed until *we figure out what causes dry eyes* and fix the issue so we no longer need to fake yawn so much. You can also simulate laughter, but yawns work way faster, since you need strong simulated laughter☺☺ for a long time, besides disturbing everyone around at work or waking your family or roommates up from sleep. But while you're at yawning, laugh at it too, if nobody minds the noise.

11.17.9. How to create INA Immortality *Nurturing* Agency that requires ingredient concentrations listed (like food labels) and PDFs on dry eyes, all diseases prevention to be emailed to buyers of medicines (via credit card identity) + basic info on the aisle in each drug store + all reviews move to reviews.gov with all products sold tested by INA with 5 million employees (they are also the courts and police) to weed out lifespan shortening products

Imagine if every Eternia citizen would get an email reminder (with amazing videos and a 500 page PDF with 5,000 references for more info) from Immortality *Nurturing* Agency INA of what they need to do in day 1-300 of pregnancy for their baby, and also an email on what the baby needs to take from age 0 to 18, vitamins and etc, as they change, and the kid getting emails with the qualities to develop and things to do to maximize longevity, prevent all violent crime, prevent 100s of diseases at age 50, etc, help eliminate all prisons, wars. Here we go, USA claims to be the greatest nation on Earth, and they don't have (they didn't for decades) in all physical pharmacies the most useful, safest eye drop there is, like all these France made ones: unpreserved 0.9% saline, single dose, with salt and water only, no chemicals, needing to order online from UK, since US sold ones (inhalation Addipak or Japan made LacriPure) have huge limitations. Talk about becoming like the USSR, dysfunctional and without choice of products, due to for profit capitalism. Where is the compassion? They could make those unpreserved special 0.1 or even better 0.01 micron filter bottles that expire in 3 or 5 months after opening, as for Hylo, Refresh multidose, with saline only to save plastic. Our FDA is too corrupt to do real science, it peddles to the aristocrats who con the 99%, letting poisons slip into the food. ☺☺☺

If you got dry eyes or live in areas with indoor humidity below 40%, you're shortening your lifespan with dry environments (hoarse voice, damaged lungs, dry eyes, eye infections, eye diseases made worse due to dry eyes, sinusitis, coughing, sore throat, bad sleep, poor body repair during sleep due to bad sleep hence shorter life, etc) and you need to bring humidity back up, yet it's impossible to find today in USA a really easy to maintain portable humidifier (not central house), that is not creating endless issues described in detail in the humidifier section, or

endless issues with heaters (except oil sealed heaters that cause less humidity loss), ultrasound, microbes, mold, bacteria films, etc. We have such low standards for product approval and testing, re: lifespan, that we live such short lives too. We have too many HR, accounting, lawyer, etc admin jobs and 10 times less R&D jobs than needed; by future standards most humidifiers today would fail approval, so would be sent back to redesign, companies need send prototype first; since we can't ban all at once or hire 5 million at once, this process will take 25 years at least, as the most vital appliances and good products would be tested first with the first 50,000 hired. Every garage or "profit makes all types of junk, jack of all trades master of none" company makes a humidifier with minimal research into making a really vastly superior product after 4 months of use in terms of bacteria buildup, scale cleanup (impossible, so many parts there, rubber, etc, unreachable by brush etc, corners, etc) etc, even if you were to use distilled water only, what about DI H_2O generators at home to stop buying DI water for ultrasonic humidifiers? That is another bad area. OK, so we have already 900 useless humidifiers that fail all decent criteria, then another company comes and floods the market with a trashy one, worse than 200 already on the market. This happens all the time and it is anti-life, anti-Immortality *for* All, regressive. Any new product ought to be better than the best so far: this is laissez-faire capitalism, liberal looting called 'economics', one company profits while 30 million live shorter; no, we want profits only when 30 million live slightly longer at least. ☺☺☺

For example, many humidifiers have fans that get dusty, moldy and manufacturer cleaning videos don't tell to clean fan, so they destroy the lung, due to a lenient system of product approval in USA and globally, we need Immortality Nurturing Agency, INA, centralize and improve efficiency, so 5 million are fired over maybe 30 years and join the new Agency to test these rotten products for 10 months and see how deadly those fans get and approve only 1% of humidifiers instead of all this junk today on Amazon at the prototype stage; this will force all the other garage companies to hire more PhD, engineers, etc and consolidate, to reduce admin jobs, boost R&D jobs to make it pass the criteria for microbe spewing after 10 months of use etc... so another 3 months to redesign and overcome issues... until it passes, so we get fewer, but much more lifespan enhancing products. A billion people will be happier instead of giving so many 1 and 2 star reviews for billions of products; returning them, getting angry and then doing criminal acts due to anger building up, leading to wars; of what use is having 10000 humidifier types, instead of only 100 that work far better than any today that copy competitors and make one easy shortcut to cut costs and sicken more people? We got 1 million restaurants today, not even one produces some really advanced product or food based on science papers with all info we got, too little applied, all marketing and profiteering, no R&D. So, you need to add 20 bottles of supplements to get good well round nutrition. Instead of like phone release 24, we get the same crap for 20 years; no science, just Neolithic food, see restaurants made high tech section for

details. The amount of 1 star reviews is astounding, all this info could have been summarized (stuff affecting lifespan length first) by INA to all before they even got it, by getting an extra screen in the checkout process, for each product, so people know the most common issues when maintenance is not done properly, about issues with the product that most complain about and then only approving the product for shipping to minimize returns and wasted energy and time and emailing this screen if not read carefully only scrolled thru after checkout, so they can cancel shipping if reading it later or return without opening if reading it 3 days later; show the mold pics after 6 months, as above and other scary things from the 1 star reviews on Amazon (too bad there is no central website to review every product, so if you buy from home depot you don't see the invaluable Amazon 1 star reviews, have the INA review of all products show up, so when people make a review it's posted there, since on Walmart we get 200 times fewer reviews for many products and it's not fair, the gov needs FAIRNESS, to Love All Equally, not on company website only and all companies who sell a product show the INA reviews, so ALL GET ACCESS to same info, as in a true democracy of equal opportunity and education for all), etc and have them decide if they want something with a fan or not, a filter or not, etc, the microbe data out of DI water at 6 months vs 2 days, etc, standardize, have all submit to same gov test and etc - don't just make claims like companies do, comparing themselves with the worst product out there; let every reviewed product get INA stamp for quality, like USDA Organic stamp label and the whole planet can then benefit from this approval and spread immortalism to all.☺☺☺

Likewise, imagine if we could find in any eye section of pharmacies, CVS, etc a device that would allow us to collect tears we generate by yawning to be able to use them within the next 10 hours or so when the eye is dry and we're too sleepy or tired to generate tears: some air tight collector; this way we wouldn't have to use as many tears; the technological challenges to doing that can be overcome, even if cleaning the collector daily would be a challenge; but this would be easier than landing on the moon. They call these reflex tears, and these have even more water than the 98.2% water in normal blinking tears, but the composition is very similar when yawning, since they're not emotional tears or "foreign object" tears which are markedly different. Another urgently needed invention is a really good daytime pair of moisture retaining glasses that uses nanomaterials to prevent fogging, allowing drops to form on the lens, which are collected into a reservoir which can be transferred every hour or 3 if needed, to a biomarker monitoring and tear sterilization device, so they can be reused maybe or at least used for chemical analysis. Eyeeco Quartz Shield doesn't fog much, but forms droplets providing a very moist air for the eyes, so something very tightly fitting on the eye, easy to see thru (silicone can't do that), like some dual pane safety goggles with anti-fog tech today, but much more advanced, creating a perfect seal around eyes for ultra moist air. The tears would also allow us to monitor certain health parameters easier that tears and monitor and to live longer (no more blood

samples for many tests), maybe to even develop vaccines to bypass injection. In a Civilization of Immortals, in any store that sells eterni eyedrops (like a rocket is vs chariot, compared to today's drops) it could ideally say on a big cardboard above the eyedrops aisle "Please study all ingredients in any facial cream or makeup you use, to make sure they're not going to cause eye issues when eyedrops mix with them and reenter the eye sometimes canceling all good effects of using the best eyedrops (even the most perfect ones generated by you 30 minutes before), wash properly before sleep, especially areaqs above eyes, wash while holding hand to avoid the cream-soap emulsion from dripping over the eyes and tiny trace remaining there to later combine with eyedrops that often get out of the eye and reenter eye when we blink. Without good moist happy eyes, we can't function well and do anything with the usual ease pretty much that we do normally, but with a little dark circle we can function very well.

Our eyes are far more important than makeup. Additionally, good sleep, hyaluronic acid in 100s of eyedrops helps the skin around eyes, so there is no need of dark circle creams, makeup, chemicals. We want your eyes to be healthy, for centuries, with 20/20 vision, and there are ways to prevent dry/red eyes, produce natural tears anywhere far superior to these man made ones, by $0.5 moisture retaining masks (which address night dryness and damage it does to eyes, damage not addressed by drug store eyedrops in people who open eyes slightly due to reflex when thinking at night, night dryness which often is the ONLY reason millions use daytime drops), $5 blue light glasses with clear tape to create daytime moisture retaining "mask" or wrap around clear glasses and sunglasses during daytime when feasible to reduce drying due to wind and draft while walking, simulated yawns (if tears needed during daytime), and LipiFlow, MiBoFlo, TearCare, IPL, iLux, eyelid scrub, NuLids, warm compress, eyelid massage, ω3 technologies that don't use chemicals which often destroy the eyes, by nutrient starvation (redness relievers that constrict blood vessels) or cause other types of damage (preservatives etc). Before you buy these eyedrops, please read these common reasons (a whole booklet is emailed to you at the address on file with Immortality *Nurturing* Agency, INA, once you check out any product, with the product 3 page and 200 page guides or scan this code with your phone or text xxxx from your phone to get the website address) for dry and red eyes and ways to far more safely cure dry eyes than these last resort man made drops, many of which have harsh chemicals, microbes due to touching eye drop bottle often after weeks/months of use, stuff we don't want in our eyes due to side effects that can get the eye drier and redder time.

It is unethical to make people dependent on toxic chemicals, when alternatives much cheaper exist. Immortality Nurturing Agency wants you to live to 900 and have healthy eyes for that long, not to enrich pockets of Pharma CEOs or shareholders." ☺☺☺ People get a 3 page short summary to read right away, with only 50 references, and a big 200 pages PDF (or webpage, with embedded videos etc) with 5,000 references that can be read later when time allows –

explaining also the correct way of using whatever products they bought (so doctors don't have to spend hours to do this, or consumers trying to find quality youtubes or articles explaining it, and it's all explained well, maybe links to youtubes too when showing is needed; this saves doctors huge amounts of time, like teachers save when they use prerecordings, so as to evolve their tone, meditate and focus on innovation and the research projects with the students). What innovation can doctors do in this saved time? They would work with medical startups or Immortality *Nurturing* Agency non-profits to create better 10 cent moisture retaining masks, glasses, etc and artificial drops and medical techs, that are imitating meibum and tear composition 100 times better (500 compounds in store tears as in natural ones, not 5-10) and expire in 30 days (Amazon delivery from factory, since with so many chemicals can't be stable without toxic preservatives, Amazon Pharmacy of the future). ☺☺☺

The PDF saves lives, since sometimes people go to the CVS or a pharmacy and pick a drop to relieve redness, their pH may be 7.9 naturally, and the redness reliever is 5.7, so this would cause a lot of damage if they use it a lot and not seeing well could cause that person to make a work or driving mistake that could shorten someone's lifespan, besides having lower quality life himself; likewise, someone with pH 6.5 naturally, may choose Systane Ultra with pH not listed on box, as being 7.9, which is higher than most people, so it would do ocular damage; yet this can happen now as nobody is required to list pH and other basic info, like mOsm/L, etc. so patients and doctors can choose something that better matches individual tear readings. People *buy "eye masks" or "sleep masks" from eye section of pharmacies, without getting* FDA *or* INA pdf, or other stores, not realizing that a warm room with a sleep mask would heat up the eye more and dry it, leading to dry and red eyes; hence a curtain to prevent light during sleep is safer, unless using a night moist mask. The mask can bend eyelashes (so they could get a neck pillow to place under head/ear between the corner of pillow and mask when side sleeping to prevent pillow pushing so hard on the mask temporal edge), leading to some lower ones becoming horizontal and almost entering eye or scratching cornea making the eye red, then person using eyedrops for redness and developing drier eye due to ever increasing inflammation caused by acidic drops with rebound redness causing ingredients (redness relievers etc). When people buy safety glasses to give employees or use oneself, they would get the PDF and be told they can wear the glasses with much more wind-air conditioning-draft protection (where the silicone seal is premade to some extent, since I can feel wind even with the silicone seal being up 97% on a wrap around safety glass). ☺☺☺

The PDF/webpage could have "Immortality *for* All" *and* "May all live to a trillion" *in the Header and Footer, to remind people of the big picture of* INA *goal.* Doctors can then do more amazing science and clinical discoveries, like using tears, lipids from healthy MGs to help stem cells migrate via a novel sci-fi tech to the other gland (atrophied) and reactivate it, etc. A

working person with kids has no time to read 20,000 papers, select the best 5,000, make this 200 page report that took 5 years to make, always improve, for a professional who read 300,000 papers on dry eyes or "condition x" last 10 years full time. People will get in the INA email the website link with the 5,000 pages, colorful picture filled PDF with the 100, 000 references (updated yearly by the Immortality *Nurturing* Agency) that presents the classical methods used to cure something and also the extra 700 methods people have cured the condition "diabetes, dry eyes, etc, cancer, arterial plaque" that are known, outside of traditional chemotherapy, prescription stuff or CVS pills, based on thousands of papers that present amazing case studies of remissions, where food components were able, alone or with some very simple side-effect free supplements or pills or less known technologies, for some genomes at least, to start a synergistic downregulation of cancer or diabetes causing molecular systems and affect healing; these rare cases are often unknown to doctors, as they're updated yearly, and doctors don't have time to read so many new cases of 7,000 new papers/month; doctors are human and they have kids, etc and sometimes don't read all new papers, due to long hours; but cases can be known to a patient who has 40-60 hours a week to research if motivated enough in vacation or lighter work weeks, since his spirit guides can suggest to do a search and he finds that one case that would have taken contacting 900 doctors to hear about and 90 years too. By that time, he would be long dead (or some permanent organ damage occur) in 5 months instead of living (perfectly healthy) another 10-25 years. Millions of people die not because we don't know how to cure it, but because the information doesn't get to the patient or primary care doctor or the many specialists who were contacted and are clueless that cure method info exists deep in the 1 million papers published last 10 years. ☺☺☺

The system is about pills, *not about information*. Without changing our culture of "instant gratification" and "cure of symptom" now, we will wreck our bodies and live 80 years, or 100 if one of those 1 in 5,000 lucky to make it. We need to move from "treat symptom with a pill and wreck the body" to "treat cause and heal the body" by reading first the common causes, as known by medicine, of each disease and condition people visit a drug store. Centralization allows INA to develop a nice eye drop that mimics natural tears better, and when we have a really good INA site, everyone goes there, and we don't need update 5 million websites (where they describe some eyedrops in a paragraph or page) sites with the ingredients in every drop, only 1 site that has 200 pages on all ingredients, effects, papers, etc, concentrations of every artificial drop and nobody needs to reinvent the wheel, they just reference it. "We the People" not Big Pharma (75% of Pharma world profits, 4% of population to finance PALACES in Mexican Cartel Style Trillion $ Thefts), 900 year lifespans matter. Big Pharma must clearly warn of rebound redness if used daily on the bottle of redness relievers and potential for long-term drier eyes due to contricting the arterioles, but no worries, "Money is the God". If we're honest, we

can say money is the God of many people too, not just Pharma sometimes, we just don't realize we think about money usually 800 to 8 million times more than about living to 110 or 300 in our lifetimes. Same story happens with a lot of other medicines, that have no such warning labels. ☺

Go to diabetes pharmacy section, get the email sent to you and the big sign above the aisle suggesting basic simple things to do: increase zinc intake if low, lower AGEs, eat more AGE inhibitors, control calories and simple sugars at each meal, via a food spreadsheet. Go to heart disease or Alzheimer section, get the email sent to you and the big sign above the aisle suggests simple things to do: reduce oxidized cholesterol, cut down animal foods that are fried, stop eating dry heat foods, AGEs, see some of the ideas here. Incidentally, all these things I just wrote above, help your eyes too and every other organ and condition, since they prevent diabetic damage, atherosclerotic damage and zinc deficiency damage that prevents proper tissue repair. Natural tears have way more compounds and very specific custom chemical ratios, personalized for each genome, body, diet, etc, which would cost millions of dollars to reproduce (pathogen free daily) exactly at our current tech level." This is called Immortality Capitalism ☺☺ of the Immortals' Civilization: *longevity (not sales) first*. *Same for all aisles that sell medicines, some basic changes often can remove the need of them*. We have USDA certified organic logo, they could make INA certified for foods, medicines, and products of all types in all stores (based on which minimizes risk of lifespan loss), ☺ Immortality *Nurturing* Agency ☺ label on any product, so that people know which ones are the least toxic man made things, at the current science knowledge level. INA could also forbid any store globally from selling any drugs without having huge banners above each aisle on how to naturally prevent these conditions using 100+ methods by lifestyle changes, so people can get that booklet by texting or scanning instantly and read next few weeks and not become dependent on a potentially very toxic to their organs man made chemical mix that shortens their lifespan by years or their super healthy lifespan by decades. Only electric cars would get INA certification for example, as the other ones produce too much smog or have high risk of explosion due to hydrogen tanks if using hydrogen tanks (made from solar panels and water). This basic yawn technique could be required in all 1st grade civic education classes, so people know what to do to produce tears to wash debris when wind with dust, pollen or something gets into their eyes. Most people don't get dry eyes until they stare for hours at a screen with blinking rate 5-10 times lower. ☺☺☺

We got 100s of scientists to design useless products, and look at these masks, so little R&D, so few scientists (need 200 materials science, chemistry, biochemistry, biophysics majors, engineers, optometrists, MDs, etc) and facilities to make a really well engineered 3D printed *night moisture* mask *or with 10 sizes for all orbital area shapes, width to length ratio, etc.* We got more choices for vibrators, cigarettes, vape products and devices than for quality night dry eye masks and day wrap around glasses to protect eyes. Pressing eyeball on pillow when

stomach sleeping can increase ocular stress, ocular pressure and increase risk of vision deterioration and even glaucoma. *This is like walking barefoot is a lot of shock for our legs, but now we got shock absorbers, so we can last longer, we got engineers designing these shoes with tons of calculations to absorb mechanical shock, so what do eyes do when they're pressed all night long or getting dry at night or daytime due to AC, central heat, etc, wind?* Moms with high cholesterol give birth to babies with 12 times the fetal aorta plaque *and likewise, every dirt and crap entering kid eyes when playing in dirt, from age 1-18 will also increase oxidative stress,* damage eye vasculature and lead to atherogenic plaque that ruins the eye 50 years earlier. Look at the eyes of many 70 year olds, they're so worn out and etc – this is due to not receiving any protection, humidity, moisture, etc, creams, etc like our hands or etc receive. A wrap around plastic made UV and strongest blue protecting would prevent enormous ocular damage from dust, viruses in the wind. Everyone almost is so against glasses, even sunglasses sometimes. We protect feet and the 10 times thicker buttocks skin with clothing and shoes, but eyes? We leave them unprotected, and the orbital area too, in the most toxic eye drying eye destroying UV rich wind, AC or central heat vent wind, etc. How can one expect to have 25 year old vision at 120? The future of day glasses is talked more about in section 2.2.7.☺☺☺

11.17.10. 1. Punctal plugs (see why to avoid), 2. treat stye, chalazion, MGD with light 3. LIST of eye antibiotics for MG expression, dry eye (*bacteria* can cause it), blepharitis, plug, stye, pink eye

Punctal plugs stop tear drainage partially or fully, but increase risk of lacrimal gland, meibum gland and inner eye infections (& yellow cornea, swollen eyelid from antibiotics). Today, a new "punctal plug that melts way faster than collagen plugs" lacrifil hyaluronic gel is used in many people, as a temporary plug for a few weeks/months (max 6 months, after 6 months it has to be flushed with saline, so it may cause infection, perhaps more than a silicone plug), until they get the meibum flowing better using IPL, probing or other techniques. Lacrifil is a gel that has no risk of getting lost in the nose or causing surgery needed to remove it, it's much safer than collagen plugs that dissolve in 9 months and can cause infections, etc. The punctal plugs are contraindicated for those with inflamed eyelids, styes, infection of the lacrimal gland, etc – so if your eyelids got swollen recently due to deadly poisons inserted in products shipped to you to clog and close the MGs, etc or whatever (while the meibography will display they're well, since doctors gives you fake pics, to make you continue using the deadly product for example) it's not a good idea to put punctal plugs; doctors can have meibum glands pics hacked/replaced, even without them knowing, even if they're spies role playing "all is well with your eyes, you got no styes, no inflamed eyelid, a plug or two would be fine, etc (when he has no idea what your normal eyelid thickness is like, not looking at them 800 times a year)", so big damage occurs. It's a good idea to flush your puncta first to make sure they're clear before you ever try punctal plug; the doctor uses a *special (blunt tip, not sharp) syringe needle* called lacrimal cannula. ☺☺☺

Lacrimal cannulas (can only be sterilized in a 15 psi program, only available via Instant Pot Max pressure cooker canning program, high pressure option, run it one hour; all other cookers don't heat steam to 250°F to sterilize) come in various shapes, so the ones that don't force the 90 degree vertical 2 mm to horizontal 8 mm to become straight during syringing, are going to produce less inflammation in that corner, so ask MD what type of cannula he uses. If straight, he doesn't know about this and you can ask him if he has a curved one or change MD. The cannulas come in various gauges, 25 is very thin, 23 less thin, 19 are largest diameter; most companies sell 23, but 23 may mean different size (outside diameter) for each company. ☺☺☺

There are 5 main shapes (I am using mediusa as examples of curving, not saying this is the best company, as their site is a little odd (typos and saying boiling is enough for sterilization (not enough, need higher temp for some spores) vs this): straight (not recommended, unless inserting only 1 mm or 2 into the vertical part of the canal), least curved, anel (partially) curved, very curved, (ideal if you do 2 mm of vertical canal and then 2 mm of the horizontal, so a partial insertion for cleaning up better the area after first 4 mm) and medium curved (this mediiusa.com one is like the Bausch and Lomb E4406 one, but better shape than Bausch, since it is more 90 degree at the bend; Medi got into the habit of sending rusted cannulas as brand new; they got reusable, 4 gauges, 23, 26, 27, 30 or disposable 23, 27, this is the one with almost natural 90 degree angle, allowing least stress for the 90 degree natural bend, highest comfort if doing the full 8 mm, since after insertion when injecting, it's not forcing the 90 degree to be straight, least tissue damage, inflammation of the 90 degree bend; though any are fine if you do 1 mm or 2 mm only, but if doing full this one is safest, whatever the optometrist prefers for ease of doing). For straight and curved cannulas, they got a lot of olive shaped ends for less inflammation during insertion, so finding one that is like that may help in some cases only, though the bulk can also cause inflammation by over dilation, but it may be useful when a certain type of bump exists, if imaging can reveal that to ophthalmologist and lead to trying olive instead; another option can be to use a round top cannula variant in the ideal shape for what is being done, with side hole, as that would irritate bumpy areas less. Perhaps, for a really good flush of the first 6 mm that get only the cannula and not the water usually in the standard syringing, doctor could do one, more or all of the following: 2 mm insertion and flush 3 ml using any except the very curved one, then 4-5 mm insert with the very curved one above to avoid 180 degree angle instead of 90, and 6 mm with the anel (partially) curved, 8+ mm insertion (2 mm vertical, 6+ horizontal) with the medium curved. The cannula is attached to a sterile luer lock (more secure) one time use 3 ml syringe (like Medline good brand, slides easily so the cannula position doesn't move) which is filled with sterile saline from a vial. Disposable single use sterile cannulas are safer, lead to fewer infections from patient to patient (but if you're the only one using it and use 270°F autoclave to sterilize, it's not bad; single use sterile cannula has no need to rise, wash, sterilize

via 1 of 5 methods: autoclave, or soak in CaviCide disinfectant made by Metrex (or soak in sonication bath, then rinse with DI water), etc: these rinses of the lacrimal drainage system can be done in 20x mirror by some optometrists on themselves, youtubes explain anatomy and how they do it: deeper 8 mm insertion, and small 2 mm insertion to flush the beginning of the canal better. Knowing what these things entail is helpful, so you can make sure the doctor does the ideal job and definitely tell him if you feel anything odd, there should be no sensation of discomfort and never accept anesthetic, as that prevents you from knowing if he's clumsy or pushing too fast or there is an obstruction or pulling eyelid away from caruncle too much when rotating syringe if he rotates as in the previous 8mm insertion video.☺☺☺

Don't be naive: FBI/Mossad/etc caused issues, like swelling of eyelid that doesn't go away and can become permanent at times, to mutilate and disfigure peop*le as* John of God *(if* videos are not fake, and real) may have done and Inquisitors did torture and kill people, like they do with toe nails, etc, brain/heart damage by sleep deprivation, torture, via weapons or stuff added to ointments, drops, etc and then suggests you get some treatment that causes other problems, or even blindness via glaucoma (say you see halos around traffic lights, that can be caused by foggy glasses, ointments creating blur, choline shrinking pupil or pre-glaucoma)☺☺☺ caused by infrasound weapons vibrating the eye to detach retina and destroy optic nerve; they create an issue, you think it's natural, they come with a solution to destroy your health. It's called the problem, solution strategy, to create more damage than they already did, detailed more here. An example of what could happen, they dry eyes, they send you to a doctor who uses bare (no gloves) hands (instead of sterile q-tip) to touch eyelid or express a gland slightly (can transmit EKC virus and others), or uses tweezers to damage your MGs and eyelids (never trust any doctor who doesn't take video of what he does to share with you (like Dr. Lorin Vogel takes video of meibum expression), even for punctal plug insertion and removal, since he could try be ultra nice to gain your trust, only to damage your eyelids, meibum glands and create styes by using the meibum forceps and damaging the eyelid, allowing bacteria to get there and create styes), or pushes eyeball with finger when trying to express meibum (to damage optic nerve) in the nasal corner, or damages the puncta drain canal during irrigation with the syringe to cause inflammation and swelling later if you put plugs there a few weeks later, while he pretends to do meibum expression, irrigate puncta or put or pull punctal plugs, since no video of what he's doing is recorded; sometimes you may even know he didn't put it correctly as you felt it, told him about it, since you asked for no anesthesia on purpose to make sure needle doesn't go the wrong way (due to spies remotely controlling his motor functions or he intentionally doing it).

Another trick they use is to take a retina scan or LipiScan pic of eyelids etc and swap it or have their hackers do the swap when it's taken since customer doesn't look at the screen much, nor is he allowed on purpose, so the it looks a little off and then next few months they attack that area

to make it sound there was something to begin with there and it's not them attacking, to get the real pic to look more like the fake; but the highly felt attacks will reveal that obviously they damage the area. Gently ask your eye doctor to not use his bare hand to express glands a little to check stuff, let him use a sterile saline moistened sterile q tip you bring in or sterile silicone top you bring in, since hands are dirty if not washed right before using them on your eyes and soap doesn't remove everything – gloves, sterile q tips or other sterile devices can be used for minimal meibum expression to avoid infecting your eyelids. Gangs often evolved to keep tabs on police brutality, but now they talk of cameras on all cops, what about cameras on all doctors, medical procedures sent to customer by law after each procedure for a democratic civilization where doctors are not gang members or military/spy agency paid torturers in a fake democracy. MDs would pay more attention if they knew all is filmed and seen by the patient during (if he can watch it) and after the procedure on a screen and emailed the video too. First bring eyelids to a healthy state and then read more to see ***if it's worth trying punctal plugs***: the short-term comfort is often replaced in the long term with some major problems and discomfort. ☺☺☺

Some people try punctal plugs if they have less tear production, don't respond well to artificial tears or want natural tears with 2000+ chemicals to moisturize and nourish eyes, longer, instead of using imperfect artificial drops with < 9 chemicals, centuries away from the safety of natural tears. If you google optometrist websites, plugs are the main way they treat dry eye when drops and the meibum techs of Advanced Dry Eye centers (which also do punctal plugs) don't work well. Meibum techs that heat the whole eye, not just *eyelid only like LipiFlow, iLux do*, have their own issues, but in this century they're what we got: oxidative stress and damage to cornea can ensue from excessive heating with daily warm compresses or other techs one would use very often; but most people don't have the 10K a month to do these high heat techs often. Punctal plugs are a 5 min procedure, they come as full silicone plugs that are easy to remove (last 2 years sometimes, while permanent closure of plugs is possible too if they fall off a lot, see video) or collagen (to see what happens) that dissolve in a few days/months but are hard to remove sometimes and are not every MD's choice due to that. Youtube has 100s of videos on "insertion of punctal plugs", so search for that to find stuff like 5 silicone clips: Oasis (includes syringing using a round soft tip, not normal needle, sterile saline to flush gunk out before putting plugs to make sure all junk from past infections is out), Comfort, Vera, Snug, Ultra (Ultra insertion tool is similar to old Oasis tool, Oasis got a modern type too similar to the press/release used by many others), see also Syringe technique, 1 acrylic: Medennium expanding SmartPlug though this one leads to infection often, (all absorbable ones are more likely to cause infection, while silicone doesn't react with stuff) etc. Punctal cautery is a last resort in severe cases of water deficiency. On each nasal corner of each eye there are 2 (lower and upper eyelid) little pink dots which are called puncta, which are the orifices of the tear drainage made of ampulla, canaliculus, lacrimal

sac, etc. Our 4 puncta are easy to see with a 20x mirror, can bend upper eyelid slightly if needed. "The lower canaliculus is the main way for tears to drain from the conjunctival sac and 80–90% of the total tear fluid drains down that way." ► MSM 2014;20:628-38. That's why many MDs plug only the lower eyelid first, to see what happens, sometimes even using a collagen plug to see how the eye would respond or partial plug; a partial plug has a hole in the center to slow down the tear drainage so eyes can be moist until the next blink. ☺☺☺ Due to risk of infection of the eye or lacrimal gland (especially if one plugs all 4 puncta 100%, not a good idea to start with), eyes need to be kept clean with daily washing or Cliradex scrub or etc and a pair of wrap around HD safety glasses when outside can reduce exposure to dust, viruses, bacteria, smog by 90% if they have some silicone wrap around (even if not tight seal, silicone doesn't need touch the skin, since a tight seal would require a non-existent anti-fog coating due to extreme moisture and would not work), diminishing infection risks associated with punctal plugs.

Punctal plugs can be too big or too small for the hole, both being bad, so hopefully you go to someone who is not new to this and has read 500 paper son this at least. The yawn tears and lying horizontally 5 minutes after yawn tears production can help flush system every 3 hours thru the upper open puncta, and disinfect it, since yawn tears have high amounts of lysozymes that kill bacteria to prevent infection and keep inflammation lower. The sterile saline drops can be used sometimes to flush the system easier or with extra water. Punctal plugs may work for people who're already used to the daily efforts needed to manage dry eye and will do the work needed to maintain a clean and flushed eye, free from accumulated junk, since now they have less dry eye and less time spent with tear application and dealing with inflammation from toxins in artificial tears, needing instead to make sure the system is flushed well every day via upper puncta or tight squeeze and washing and wiping with sterile q-tip maybe the nasal corner junk, tears, etc – to prevent inflammation via stagnant water, metabolites, etc which is called dacryocystitis. *That's why before you do punctal plugs (or if you got a stye), they send you to a pharmacy (CVS, free with any insurance) to get* a prescribed antibiotic, see the huge list.

Another punctal plugs issue optometrists explain in youtube videos is the biofeedback that happens, we produce less tears due to the eye being wet, but plugs work for a year usually; can this lead over 5 years to partial atrophy of the lacrimal gland? Perhaps, if you have really dry eyes and the plug won't actually cause real wetness, it won't send ocular signal to lacrimal gland to produce less, so it won't cause less tear production; however, if there is abundance of wetness, then it may atrophy lacrimal and cause dry eye again in a few years.☺☺☺ To determine these things they need probably a lot of advanced imaging tests to see lacrimal atrophy over years of plug use, depending on the start of the plug insertion dryness level and Schirmer's test, aqueous volume, etc. But think about it, how stone age the way is today, with pH not even written on eyedrops, no info on many possible effects of each ingredient, etc… and

how quick the decision is, put this or that plug. Epiphora is the abundance of tears after a plug that occurs sometimes, and leads to replacing full silicone plugs with flow control or partial silicone plugs; partial plugs may not prevent lacrimal atrophy when the MGs are evaporating the drops quick due to lack of lipids; so it may be rebound dryness due to lower lacrimal output is more obvious in people with healthier MGs. Nothing is without issues and side effects, so one way to prevent this negative feedback may be to wear any wrap around safety glasses less tight (or without silicone for some lucky people) so the eye doesn't get too wet and starts telling lacrimal gland to underproduce which over 5 years may lead to lower production capacity.

Punctal plugs aren't perfect, and in windy areas they dry eye quick for those with poor lacrimal output, lipid layer, no wrap around safety glasses (HD) – so some give up easily on them, being disappointed. Some tears do drain via lower ones even when plugged quite often and when we blink the nasal corner releases some water too, the eyelids too, etc, so this spill over needs to be washed more now, since it contains junk we don't want under or on our eyelids and nasal corner, since 98% of tears is water but the other 2% is 2000 chemicals and they can oxidize and mix with metabolites of the cornea and conjunctiva cells cycle, etc; many factors determine the success of dry eye resolution via these plugs, even the ocular shape and how easily tears can overflow into nasal and eyelid to eliminate the 2% and drain it preventing too much accumulation (though our eyes got used to thick drops and ointments, etc to some degree, so they may adapt to an overflow of lipids, proteins, etc accumulating there sometimes for a few hours); but we know from using artificial tears that they easily overflow, being 3-5 times bigger than normal volume of a blinking tear, so if there is too much water, that's good, it will overflow and clean it well without us having to clean eyelids and eyes so much with yawns or saline, etc☺☺☺. Cleaning more often is often a small inconvenience since many people no longer need use almost any artificial tears, gels, ointments that can ruin the eyes more. It's unrealistic to imagine that there is one thing that miraculously fixes everything for all folks, without us having to clean eyes etc. All methods require some work, frequent (especially first weeks of the plugs to make sure enough cleaning etc is done) 20x mirror checks. All techs out there, like retinal scan via Optomap retinal map generator, visual field test for testing peripheral vision (to gauge risk of glaucoma, macular degeneration, diabetic retinopathy etc), etc can be used as a cover to irradiate retina with lasers of visible, UV, IR light to create damage, since medical devices can be altered without the knowledge of the company during shipment, or the company itself can be part of the military or spy agency of the country who makes it or the country who remotely controls the factory in a 3rd country and activates dual use function only rarely when needed. The scans that seem to be provided instantly via OptoSoft or other programs, can be remotely uploaded and overriding the actual scan in real time by hacker software, while doctor never sees the real picture, unless he's a military one using cover of "independent OD or MD". When we

see green or blue cross on that OptoSoft it may be actually fine, he takes a pic when blue or red and gets more images, since you were mind controlled to shift up or down slightly, so they see 97% of retina, see 2020 paper. Everything disguised as help can be the opposite, to further science experiments to develop new treatments, using useful clueless people as guinea pigs so the "other guys have less risk", once it has been perfected on disposable clueless folks.☺☺☺

There are many types of punctal plugs, made of silicone, pictured at JO 2016: 9312340, some have slanted cap (collarette as they call it) which may diminish irritation, depending on how puncta rubs against cornea; in immortality capitalism, we would get a huge PDF with all types of punctal plugs available and the pros and cons of each, instead of just getting the default plug someone uses at the office we go to; this would let people learn the issues, types and choose one out of the 30 available silicone plugs and go to someone who is open to buying and putting those even if they don't use it, but the network would automatically show who has the most experience using those plugs or doing meibum expression, or anything in the area; others have a cap that is 3-4 times thinner, so those may cause far less rubbing sensation and not cause patients to want their removal right away; as the paper shows, most plugs (Oasis, etc) have the end designed as if to catch a lot of stuff, junk and bacteria, whereas others are one piece and will collect bacteria in the bottom area 500 times less; since the main complication with plugs is possible infection, choosing plugs that are one piece (larger diameter at the end, instead of a sudden increase in diameter as in an anchor) seems safer for preventing infection in 5 years. I read this paper after I put my plugs for 5 days: On May 18th 2022, I got my 1st punctal plug (100$ each, petite, 0.6 mm wide), which I removed 6 days later, made in USA, Glendora, CA, oasismedical.com (EU sales office is in Rome, Italy, the box says; same company that never tells what phosphate concentration is in their eyedrops, so you may get eye stones.) for the left eye; first few hours I could feel it rub against cornea, but then I didn't anymore. However, the eyelid became swollen for all 6 days worse swelling ever, when waking up and during daytime, so see below why current punctal plugs are so dangerous and stone age.

Then, next day I did it on the right eye (both were removed May 24th, since one of both eyes felt the plug a lot in the evening when more tired), since I noticed left eye was less dry at night when waking up during the night; however, since upper puncta are not sealed, the drain happens and eyes are far from wet, needing saline throughout the night still; so the benefit of plugs, which would be from no night dryness, is not there and 4 plugs would be too dangerous for infections as explained below, besides irritate cornea a lot, so *area near caruncle becomes red*; initially I wanted to wait longer,☺☺☺ but seeing that it's more comfortable than anticipated, next morning I decided to put the right one too (not realizing that I didn't look right and left enough to realize what the issue would be in future days). After both plugs went in, when generating tears 3 hours after plug insertion, via the yawn method, I noticed that the water overflows on

the skin under eyes, keeping that area wet and disinfected, since it can't drain, this will add moisture and make the glass area way wetter faster. So you will need less yawns and drops daily, which is going to save way more than 200$. However, with eye drop brands that before took 2-3 drops to get one or both eyelids swollen, now it takes even half a drop since it is increasing contact time by 10 times at least, with the plugs, so it will lead to a total reevaluation by you of which drops, ointments, eyelid cleansing products you can even use or in what amounts, besides saline which never irritates the eyelids or yawn tears, which are even better than saline but take too much effort for some; these plugs show how irritating to the eyelids are all these drops and eyelid cleansing products and how 1st century like, vs the future, our techs and products are today; almost all engineers busy on inventing new killing devices, instead of safer medical devices and eyedrops. Due to lipids having nowhere to drain that fast, except the upper puncta when you sleep not during the day, when placing drops the sensation is different – it's no longer feeling as if you put it on cornea directly, but a little like on a thin film on the cornea, as there is more stuff left over now – so it's more pleasant; placing plugs is major shock to the eye, because it doesn't drain all the inflammatory compounds and cell processes junk easily, so you need flush with saline at least 8 times daily to assist the eye acclimatization to the new environment; rest and sleep more, eat less, fast a little, take a holiday, minimize stress, to boost immune function; plan to put plugs when you're less busy at work, etc and can relax more. You will notice that the chemicals in eyedrops mixed with mucus overflow outside the eye on your skin near the caruncle, since now those can't drain via the lower puncta.

Clean face well daily. One thing to recall is that you have to use antibiotic drops before and after for a few days; when some low IQ companies design these silicone plugs, the top cap is flat and then it takes a sharp angle drop if some pics are accurate ☺☺☺ (not with the spherical edge Oasis plug), maybe 75 degrees; that sharpness there, on some 3D printed or regular I saw online or in this paper (1st pic), causes a lot of irritation of the cornea; this irritation is huge even with the spherical plugs I used for 5 days, let alone the sharp edge ones; I felt huge irritation from Oasis when looking to the extreme right (left eye, since cornea comes and pushes against eyelid, with the iris, eyeball, etc; even looking left and right by tilting head that way is a pain, so driving properly is impossible without serious cornea edema and subsequent cytokine storm, and possible infection of the cracked scratched cornea; it's not practical to turn whole body while changing lanes to avoid tilting head too much) or left (for the right eye); make sure that the brand you use has that cap edge spherical, not sharp, to reduce ocular inflammation and cornea edema. We need plugs that have the edge like a mushroom; almost all optometrists I called said most people don't like the silicone plugs due to discomfort and risk of falling, but these silicone plugs are way safer than intracanalicular (ultra hard to remove too, requiring surgery sometimes), since there is no partial unflushed unwashed punctum top part that can lead to

bacteria growth as with intracanalicular plugs or partial drain (due to bacteria film on the canal, or even under the cap and on the sides of the penetrating part for both sealed and unsealed silicone plugs) plugs causing infections more often; however, even sealed plugs have a little hole in the center where bacteria can colonize, or at least some do if hole exists in the middle (all of them today unfortunately, need Immortality ethics), so they can cause a lot more infection than flow control where that area can be flushed at least.

So, if you get punctal plugs, do some research first to see if any plugs without hole exist if they're sealed, otherwise, get the ones with unsealed hole so you can wash it perhaps, though it would seem very dangerous too; welcome to the 21st century plugs that increase the chance of infection 50 times? ☺☺☺ Welcome to the Stone Age, FDA approved too? The hole inside each silicone plug is huge, I saw it on the plug they took out, at home with a 200x magnifier I got from Amazon that can be used without a phone too, just place plug on finger and stare; the optometrist was nice and gave me my plugs, with free collagen ones since these didn't work, if I'm interested in the future after cornea scratches heal. Since collagen *plugs* are cylinders without a hole, why can't they make the silicone ones without a hole too and *insert* them without the special instrument for *holed* plugs? ☺☺☺ Don't be naive, the cell walls of the puncta regenerate themselves and flush themselves, but the silicone walls of the hole for permanent and flow control plugs, or intracanalicular can't regenerate and fight bacteria with live tissue, the biofilm accumulates and will infect and ruin your eyes; welcome to 21st century tech, all money for bombs and tanks, nothing for a decent plug. So many liquor stores, and redundancy, no wonder we have no engineers to create a much better than silicone material that would be softer and need no cap and no slide inside without a cap, so it can't be felt – it's like a science fiction material that would allow cell wall regeneration (some cells die when infected, but silicone stuck biofilm can't be removed), yet work symbiotically with the cells so as to enable it to remain in position and not cause inflammatory cytokine cascade when it rubs on cornea when looking right or left, when the plug moves from the band between caruncle and cornea onto the cornea itself (talking about lower puncta). At least create a cell culture, grow similar tissue and place it there to create a permanent own tissue plug that is easily removable if need arises, use the most sci-fi biomedical engineering to make it easily removable and never felt and 1 million times less prone to infection. Or just create a new material that will interface between inert silicone plug and the tissue in such a way, that it doesn't interfere with the cellular functions of fighting bacteria and with a certain laser treatment of the area, the nanomaterial bonds to the cells break releasing the ultra ultra soft plug to be sucked by a machine upwards: this way the plug doesn't sink down or need an irritating cap.

Collagen plugs sink down, dissolve and cause infections, they're not good, but way less irritating than these capped silicone ones; some say they have very low inflammation and infection risk vs

intracannalicular (hydrogel) and silicone; however, due to proteins in bovine collagen, they can trigger an allergic response; in the future, a small biopsy from out nail skin (that many people chew daily anyway) could be used as source of cells to grow 1 million times more cells and create a perfectly compatible collagen plug – sort of like meat from cells made in a lab, without agriculture. We need to treat the *cause*, lack of lipids in the tear layer due to clogged meibum glands, not the *symptom*, dryness; plugs are only a last step resort when *everything* else failed and all glands are dead, they shouldn't be prescribed so easily to all: use saline, healthy artificial tears, unblock all glands, express them after warm compress, reactivate them and *then only, do* punctal *plugs if not* enough *water layer*. ☺☺ Plugs, give eye infections and even nose, lung, throat thru the tear drain pathway.☺☺☺

ANTIBIOTICS for STYES, MGD, Dry Eye, Pink *Eye*, *Chalazion*, *Infections*, *Punctal* Plugs

Introduction: JCM 2022;11(14):4195 explains vision impairment is often a side effect of using antibiotics for styes, so if you get a 20x mirror and catch and effortlessly remove styes when they're 100 times smaller, you will save your eyes from damage by antibiotics. Oral antibiotics are a last resort, since they damage the microbiome. Anti*b*iotics are anti *b*acteria, while antivirals are anti viruses (hence the names end with vir, like aciclo*vir* for eye herpes *vir*us), antifungals are anti fungi (molds are fungi). Dry eyes, many eye diseases and infections are caused by bacteria, viruses, fungi or even Demodex mites that attack the meibum glands and cause evaporative dry eye that worsens every other eye issue. The next pages have content ODs, MDs avoid sharing, *due to not knowing it* or an inefficient unethical dysfunctional chaotic system of health care and medicine labels.☺☺ All insurances cover the common antibiotics below, free of charge, for styes, plugs, etc; you can use teladoc.com to prescribe something via video, takes 3 minutes to see a doctor via desktop camera or phone app from your home. (2 min my total appointment time for a prescription, choose CVS to pick it up, since it shares the color of the drops on the paper, which is important, since yellow drops can yellow eyes); just say which one you want and why for your stye or plug. All antibiotic eyedrops almost got BAK toxic preservative, so, to make it 3 times less stinging, irritating and cornea damaging, you can use 5 min before some unpreserved hyaluronate eyedrop and you will enjoy your antibiotic drops a lot more; you may be prescribed to use them once a day for MGD or thrice a day for styes; hyaluronate also helps to deliver antibiotic (or any medication) a lot better to the meibum glands infected by many strains of bacteria and to your conjunctiva, cornea, etc; recall, for any medicating (except saline) eyedrops, to keep eyes closed for 5-10 min after inserting drops, otherwise, you only get 5-10% absorbed by eyelids and eyes and waste your time and money, as most drains into puncta by blinking or falls off your eyes as you sit vertical instead of horizontal (tends to fall out of your eye corners, so lie in bed and don't blink, don't squeeze tight, let it soak the MG orifices to prevent styes), having to repeat the treatment, waste pharmacy/MD time to

prescribe again a bottle wasted. ☺☺☺

We are *in the* Stone Age, so all antibiotic ointments contain 97-99.7% hydrocarbons extracted from petrol, with all irritating carcinogenic impurities that can trigger eyelid and cornea inflammation, swelling of eyelids; for billions of years we were used to the 500+ meibum natural lipids, not hydrocarbon oil, so placing this in the eye is a low IQ way to deliver antibiotics since the oil can clog MG orifices and lead to styes, but that's today's tech:☺☺☺ treat a stye *by creating 2 more later via blocking meibum glands, and then bacteria infecting the partially blocked ones once antibiotic is removed due to original stye being cured; like they start a war to "bring"* peace *and then create 5 more wars later*; these hydrocarbon oils are comedogenic, they block the skin pores, so they could *block eyelid tiny thin almost invisible hair (the thinnest eyelash roots) or skin pores and cause even pimples or styes on the eyelid*; thus, if you have swollen eyelids, you may benefit from using liquid drops more than ointment, though ointment can penetrate deeper the area of infection, so be careful since some antibiotics swell eyelids more; swelling happens often due to mineral oil and petrolatum, just as eyelid swelling occurs in people allergic to mineral oil, petrolatum with plain Bausch dry eye ointment with 20% mineral oil, 80% petrolatum. If you used one low quality mineral oil plus petrolatum ointment with impurities, that caused an immune response and then the immune system associated that inert hydrocarbon mix with the reactive impurity, so it triggers an early inflammatory response even when impurity is no longer present in new brands of ointment; so even if you're technically not allergic to saturated hydrocarbons initially, you can become so, due to an FDA standard that allows companies to have too many allergic impurities. ☺☺☺

You may want to first try the eyedrops version of an antibiotic or antibiotic mix, that has a watery consistency, not thick, few ingredients, to determine if you're allergic to that antibiotic or not, before you place the ointment version inside, since ointment will deliver 20 to 100 times more antibiotic, depending on how much you blink how much it drains in your puncta, etc, if you sleep or not, etc; perhaps, to avoid skin pore blocking and pimples, it's better to try to place ointment in a way that avoids the eyelash (though that's hard since it overflows on the eyelids) and avoid placing it on eyelids since tiny invisible hairs can exist there, visible only with a 20x mirror. Gently avoid using a cold or warm compress that touches the areas of the face that may have pimples, since this will transport P. acnes bacteria to eyelids and give you styes and inflammation requiring antibiotics; styes are filled with yellow pus and have staph bacteria usually; why do people get styes and etc, dry eyes, blepharitis (*the* eyelid *inflammation that blocks oils and makes eyes dry due to water evaporating*)? "Demodex mites can cause blepharitis, MG dysfunction, dry eyes, styes, chalazion, and ocular rosacea" (OD can use high magnification lamp to see mites on eyelid margin or take an eyelash to examine on a microscope for white flakes and mites infestation signs, you may need anti-parasitic eyedrops if antibiotics

don't work, or Cliradex, tea tree oil eyelid scrubs daily) and the "most common species isolated (in blepharitis patients, 45% of people) were coagulase-negative staphylococci (CNSA) and P. acnes" ► IOVS 1986;27(4):486-91; see acne section on ways to get rid of these enemies of eye health; "The *eyelid-skin* microbiome (of healthy young adults) was relatively simple, and was typically *dominated* by P. acnes in the young subjects, or by Corynebacterium sp. or Neisseriaceae in the elderly subjects... (CNSA and P acnes were) reportedly cultured from approximately 50% of the freshly expressed meibum of a normal subject... *43% (of eyelid skin bacteria were P. acnes)* 18% (Staph epidermidis)" ► IOVS 2020; 61(2):18. ☺☺☺

Below you will find more frightening information about P. *acnes* bacteria, co-causing arterial plaque, *blood* clots; P. acnes also *secrete* lipases, enzymes that *break tear fluid* lipids and cause evaporative dry *eye*, as protective lipids are disappearing and tears evaporate; this dryness then makes it hard to flush microbes and leads to blepharitis, MGD, meibum gland atrophy, infection, styes. Since most pimples are on forehead, make sure a compress doesn't touch the eyebrow; most antibiotics swell eyelids when eyelids are already irritated, slightly swollen. Try to start small if your eyes are more sensitive; it seems better to try blink and be awake for 1 hour at least before going to bed, after antibiotic ointment is used, since the clear ointment disperses unevenly and some blobs of it float in the cornea of the eye (*creating funny reflections that move as you blink, shiny blobs that can move too close to eyelash roots when you blink and go to bed without checking eyes on 20x mirror to remove excess ointment accumulating in the caruncle nearby area of lower or upper eyelid and cause styes*) and can cause extreme redness, swelling there; this is your vision, you can't lose it due to infections, so standards need to be way higher than taking 1952 erythromycin orally for a cold bacteria infection or some 1948 bacitracin ointment for a toe; you can lose a part of finger or toe in a little accident, but not your eyes, so take special care, research more PubMed papers (clarithromycin 1990 is methylated erythromycin with fewer side effects, etc) before putting all "1st century junk" (by year 4000 standards), or "modern" medicine into your eyes; you know how Vioxx users took it for something and they got heart attack, etc, don't be too trusting of every online website praising an antibiotic; 99% of antibiotics were not made for eyes, they're just tried for ocular use; for safety, try ointments mostly day or evening, not at night, especially first time, due to risk of meibum blockage. This stone age stage is due to us not being serious about World Peace in 3 months, so everyone makes weapons instead of better medical devices and chemicals.☺☺☺ Some use an antibiotic prescribed for stye or punctal plugs, rarely, after the stye is gone, punctal plugs removed, etc.. for any bacteria infection until expiry date. Never drink alcohol when taking antibiotic drops or pills, since with some pills death can occur. These antibiotics were discovered in 1950-2010 and were mainly invented for non-ocular use, except 1 out of 900; then, MDs tried some for eye infections and those became products, but among those 100 eyedrops and

ointments only 5 have the least irritation for eyes, eyelids, etc; those 5 vary from person to person depending on their ocular state, DNA, etc; thus, since cornea and eyelids are skin like tissues, you need to avoid anything that is known to irritate skin, especially if you have an irritated, inflamed or red cornea or swollen eyelid. ☺☺☺

Research before jumping into using some stuff some website says, if you don't want to end up with *yellow eyes, red eyes, swollen eyelids*. Always take a drop of any antibiotic and measure its pH and act accordingly, i.e. be prepared to dilute or use a more alkaline drop 20 min early, etc. Place a drop on a white tile or plastic and see if it's clear or yellow; if yellow, be aware that your eyes may turn yellow for 1 to 25 days, so be ultra careful in monitoring eye color at 20x mirror before and after; if any yellow emerges, try one of the other 100 products, because we need eyes to be white so we can see vascularization and issues better and not have yellowness mask other diseases or issues. Read papers for your eye issue and antibiotic compatibility. You may need to switch antibiotics to a new broad spectrum one after punctal plugs, styes, scleral lens infections, since the side effects become 20 times worse, due to the antibiotic failing to drain fast, so do the proper research first and have a backup plan *BEFORE you ever consider* doing punctal plugs or using something a lot, as you don't want to cause infection by not using antibiotics with punctal plugs due to heavy red or swollen eyelid, pain, stings, etc. Read papers on ocular side effects of antibiotics after plug. Plugs increase risk of infection a lot, maybe 20 times, maybe less than scleral lens infectious keratitis. *Bactericidal antibiotic means > or = 99.9% bacteria gone in 24h in vitro; bacteriostatic takes longer,* prevent bacteria growth without killing the existing, *requires higher concentration to achieve same bacteria load reduction clinically or in vivo; the most important thing is in vivo result though; generally, bactericidal is thought of as ideal for persisting infections or for getting rid of it fast when a situation demands it, since it kills all faster, without allowing dormant bacteria to multiply wildly once antibiotic is discontinued due to weak immunity via stress or poor sleep; bactericidal* wipes out infections fast so there is no time for antibiotic resistance to develop; however, bacteriostatic tetracyclines can modulate immune response. Bactericidal can lead to resistance too, since in *vivo* some bacteria remain; bacteriostatic can also kill > 99.9 in vitro, maybe in a few extra hours, but in *vivo* 6 bacteriostatic eradicated infections (CID 2018;66(9):1470-4) better than bactericidals, so it's complex, since each antibiotic has its own pros/cons.☺☺☺

"Due to merely inhibiting further growth of bacteria, bacteriostatic antimicrobials require a functioning host immune system to fully clear overgrowth... there is a lower incidence of toxic shock and more tolerable side effect profiles". Prolonged use or repeated use of any quinolone may cause new infections to appear, such as fungal ones, like the CVS paper inserts explain when you get it from the pharmacy (for this, trimethoprim and other antibiotics. Only use antibiotics when you need them, since too much use may lead to resistance and no longer being

effective next time you have an infection. For more, read a 2009 article on broad spectrum antibiotics, drugs.com eye antibiotics, globalrph.com list, a 2014 paper on which antibiotics are ointments, solutions, their use, a 2021 19 page article; 2012 62 page list; most eye infections are due to gram positive (+) bacteria; BMCO 2017;17:212 leading infections were due to: Staphylococcus aureus (+), *CNSA* (+), *strep*tococcus pneumoniae (+), pseudomonas aeruginosa (-) (causes blepharitis, conjunctivitis). *Strep* (*S*. pneumoniae, *S*. pyogenes, *S*. viridians)☺☺ and staph (*S. aureus, MSSA, MRSA, S. epidermidis, Coagulase Negative SA or CNSA), enterococci, bacilli* are positive, pseudomonas are negative. The next 8 pages explain *445+633 nm laser stye treatment*, since stye is the #1 reason for antibiotic use in most people, to avoid the devastating effects of oral, topical antibiotic eyedrops, ointments. After this 8 page break on *light* as *bactericidal*, the antibiotic presentation continues. *This is so important and so little known*, that it's worth spending 10 min to read the next 8 pages if you use antibiotics.☺☺☺

Try avoid foods that give pimples since styes can develop due to P. *acnes* bacteria that reside in our MGs and can lead to inflamed MGs (styes, called *hordeolum* medically) that develop into meibomian cysts *(harder styes, like harder pimples)* or chalazions. Avoid foods that give cold sores (that are caused by herpex simplex virus 1, HSV1). HSV1 is treated with antiviral aciclovir (also spelled acyclovir) eyedrops, pills (for less surface of eye issues); HSV1 can spread from mouth to your eyelids and then eye, since HSV1 infects 70% of humans and can cause blepharitis (MGD) or herpes of the eye, warts on eyelid or clear or milky-grey cold sores on eyelid margin, different than yellow pus tiny styes (caused by P. acnes and staph bacteria, or others, easy to burst as explained below), crusty eyelid or even crusty cornea. Check out the forceps section 2.1.6. for one example of forceps use to gently effortlessly remove a yellow transparent stye without any squeezing and damage of the fine eyelid tissue. Excessive seaweed (chlorella, spirulina, nori, etc) or iodine intake can also cause the yellow tiny eyelid pimples (styes, visible with 20x mirror only) or facial acne: algal ω3 oil only has 0.4% of RDA of iodine per capsule, as that algae is micro and doesn't store iodine. P. acnes can also cause styes and infections of the eyelid, small cold sores or pimple like styes, etc on your eyelid rarely, see more on acne prevention here. Basically, since in many MGs P. acnes is the main bacterium for many people, MGD can be caused by hidden pimples within MGs that inflame the glands, block them, harden the oils, just as the oils (MGs are sebaceous holocrine glands, like the hair follicle glands causing pimples) harden within a pimple. So, whatever causes acne often causes MGD, hard oils that block the orifice of MGs and dry the eye, for example, you flip your toe by knocking a vacuum cleaner (not careful, due to being tired and mind controlled); this causes all neutrophils, immune system cells to rush to the site of injury and quit our eyes, MGs, leading to 10 times more pimples and MGs inflammation than before, i.e. to daily acne breakouts and dry eyes, as pimples inside MGs are not popped, so they accumulate and destroy most lower eyelid MGs.

We'll discuss below how to pop styes and how to treat MGD, styes with light, for those not taking tetracycline antibiotics orally or topically, since topical retinoids and some acne and MGD (doxycycline to kill P. acnes that causes MGD) antibiotics make skin sensitive to light (page 11 list), so they need to be discontinued before using acne masks, lasers or IPL. If you got a chalazion (a stye that became permanent and didn't heal on its own with antibiotic ointment), see the warm compress section on how to warm it up; then you can drag it downwards if on upper eyelid, upwards for lower eyelid ones, to help drain that pus towards the MGs orifice; chalazions are swelling of the MGs and can be, as 100s of youtube MDs and ODs explain, gotten rid of at home, though this video, like many, suggests massaging downwards after warm compress, so make sure you put some antibiotic before you massage it, so if any pus comes or drains, microbes left over will be killed. ☺☺☺

Other MDs suggest doing it in the shower, running warm water 5 minutes, then massaging, etc in the shower, this is not ideal (not to mention MD says to use egg on a stye, but eggs contain spores sometimes that don't die at boiling temp, only at 300°F, so wrapping an egg in a dishcloth is what ODs suggest on youtube as allegedly safer, but a dishcloth is not that sterile) since you can't put antibiotic in the shower before you massage downwards for upper styes. Hot showers make the whole eye red, you don't need heat the whole eye, only the area where the stye is. Antibiotic daily once or thrice even is needed if you do any warm compress or massage of a stye to drain it, but because antibiotic drops or even ointments vanish quick, you need to simply put it before the massage when drainage will be maximum (following the extensive preparation protocol below as if you were to burst a small 1 mm wide superficial stye visible at 20x before it becomes a huge stye, since you're eons ahead of others and check eyes at 20x daily, even if you won't burst it, since styes come in many forms few videos even cover: yellow pus thin layer superficial ones, big with white head, big and red close to eyelid margin, big and red and solid in the middle of the MG, etc). So, gently avoid placing antibiotics 5 hours before or after, hence think well before following advice in these 100s of youtubes about styes, IPL, heat masks (many dangers of ocular damage via IR, EMF) that heat a huge area instead of where the stye is only, damaging both corneas, red light as they don't cover all the important safety measures needed in case something drains quick, etc. While doctors have the best intentions many times, they often miss one thing, as their focus is ophthalmology, excision being the most basic procedure for them, and not minimally invasive nonsurgical treatment of styes: they tell people 'do warm compress and massage downwards if upper, upwards if lower stye', but that's not enough, the MGs need to be unblocked via MGs expression (70 micron probe if expression fails) so the stuff can drain, etc, before they do an invasive excision procedure that damages the eyelid: notice how patient is given only 2 choices: warm compresses or excision, but there are many other options, like trying to unblock the gland by MGs expression or probing, IPL, other forms of light,

partial treatment of that area with special laser to take out bacteria while cornea shields are used, as explained below, using FDA OKed facial skin light tools (with cornea shields).

If Immortality *Nurturing* Agency made a 10 (short version), 50 and 500 (detailed) page PDF with all the options, methods of doing it, nobody would have to reinvent the wheel and make 1000 similar basic videos about styes that have only 0.1% info of the INA PDF and 8 hour video; so imagine we have 5 million Windows operating systems or languages, not many programmers for each version; the society and operating system is backwards; likewise, with no centralized PDFs, the quality of info is poor, since no human can know all 500 pages, stye removal procedures that require no ophthalmology, updated to latest info for all 200 eye conditions. So, read a lot more books, articles, videos before you do something, as many MDs and ODs (as youtube shows) don't even know how to do a safe MG expression, as explained here, they don't wipe the eyelid and forceps after each squeeze, don't use antibiotic drops before and after, don't hold the eyelid away before full cleaning of pus, letting it touch eyeball and cause lacrimal, puncta infections, etc. It's a jungle, chaotic world, where information is decentralized and what insurance you have is irrelevant, if you get the wrong info from the MD/OD; you may be covered for a $30,000 useless procedure, but others cure it without any intervention (change diet, remove all fat, all plaque reverses for example), just IQ and knowledge, that could be free, easy to access on ina.gov and centralized for all. Many have no idea about the many ways to remove styes in other ways than warm compress or excision or injection of steroids. ☺☺☺

So, back to the massage styes in shower suggestion, it seems safer and ☺☺*lovingly gently* kinder ☺☺ to do it after shower and slowly, warm up only area of interest, then place antibiotic, then massage; always do these things in the morning, so if any drainage occurs after expression, warm compress, etc, you will have time to blink 12 hours with lysozymes to kill bacteria, to apply antibiotic, remove pus, etc. *Styes are a main reason people use eye antibiotics,* and there are *1.* tiny (transparent skin, yellow liquid filled), 2. medium (red or with white head like a pimple) *or 3. big styes (red or white head like a pimple, near eyelid margin or away)*: a stye can go from none to a tiny 0.2 mm diameter yellow half sphere on eyelid inner margin in 24 hours and if you see one, bursting it at daytime is safer than letting it burst on its own at night and infecting 40 meibum glands with its pus; you can also get it done at optometrist if an appointment is available within 1 day, and they can take a culture to determine the best antibiotic; these ones got an expanding size, so with expansion comes thinner skin that burst ultra fast with heavy blinking; never burst a yellow pus stye at night, prepare well for a well reasted time of the day before 4 pm, as you want 6+ hours of blinking and many antibiotic drops, ointment etc to flush all stuff out; styes start very small, visible at 20x only by those using daily mirror for eye monitoring, cleaning eyelids, on the eyelid margin quite often, so those need be eliminated before they grow into big dangerous ones; before bursting, apply full spectrum

bactericidal antibiotic drops that covers staph well; 3 minute later, line up 8 q-tips moistened with antibiotic *(since most adults have MGD, get a prescription via teladoc or etc for basic broad spectrum antibiotic drops, those are only 20$ for a 10 mL bottle to use when doing MGs* expressions for preventive eye care) or sterile saline as you won't have time once you burst it to line them up, you can't ever leave eyelid to touch eyeball before removing all pus after bursting it, you can't blink in this essential 3 minute process☺☺ (can even prepare tubes to place culture of bacteria and send it to MD) so you must prepare well the 2nd expressor or q-tip used to place ointment, after you remove pus with 8 moist q-tips used only once, lift eyelid where the stye is, usually on the eyelid margin easy to see at 20x if you check daily, before it becomes 100x bigger a year later. The lower eyelid needs be pulled gently away from eyeball, upper needs a little gentle lift to expose meibum orifice, you need a better light from below for upper eyelid styes, while for lower eyelid you need a good light from above your 20x mirror.

While eyelid/stye is away from eyeball, you use a MGs expressor to burst it (9$ expressor needs to be washed well with soap, alcohol 70% pad disinfected, CaviCide sterilized, autoclave etc before and after use for styes; use a separate one for eyelash picking to avoid reinfection) and then, without blinking, while STILL holding that eyelid area away from the eyeball, wipe it out 5 times with sterile q-tips to remove all pus, then apply antibiotic drops again (as you did before starting this 3 min process), then use expressor again to get all pus out by wiping over it, when expressing, don't squeeze anything except the yellow sphere, then wipe again with q-tips and then use polymyxin ointment or some *bactericidal* ointment and then use a strong antibiotic, full spectrum that kills all staphs etc; wipe with q-tips also the opposite eyelid in that same area to prevent infection when closing eyelids during sleep; this saves you 400$ visit (some people can get multiple styes in a year) and you can do it much slower, safer at home and with 20x mirror, you see styes *(they appear on the meibum orifice at first, then become big and expand to the whole gland, so you can burst it when it's small if you check eyes, both upper and lower meibum orifices, daily)* 1-2 year before they become gigantic and visible and can wipe them out safely, etc. Styes can also be caused by too much P. acnes; when using eyedrops we have drops hit and miss and they can carry acne bacteria onto the eyelid part that touches the eye and could lead to tiny 20x mirror only visible pimples or invisible pimples that form into styes. ☺☺☺

Another reason people use antibiotics is chalazions or blocked glands (styes are blocked glands usually, while chalazions are blocked glands that have been there for a while) and to use less anttibiotics, sleep at regular and healthy hours 10 to 7 or something, to boost immune function, get good sleep, do warm compress when well fed and rested so you do it right. Styes, blocked glands, chalazions need to be treated with warm compress, massage and MG expression right away, to prevent creating more styes, *chalazions (a blocked gland swells, becomes infected)* and infecting your blood and body leading to systemic infections or even life threatening

emergencies, so stop all useless activities and dedicate all energy to getting rid of your blocked glands, chalazions, styes: avoid waiting for weeks or months doing little, hoping it goes away without you doing anything beyond rather useless antibiotic drops that almost never treat styes (ointment on the stye alone has a small chance, or a big chance with warm compress, massage, expression after a warm shower; antibiotic drops are essential after stye drain or burst, but just placing drops for weeks without warm compress and expression will achieve nothing except induce antibiotic resistance eventually). If you got a stye, chalazion or blocked MG (swollen eyelid as a result, chalazions are swollen MGs), warm compress it daily (where the stye is) for 1-2 (or 5 if needed) weeks, try gently express the MGs near it daily, so you drain it yourself, instead of it draining slowly at night, causing recurrent styes on the lower eyelid in drains on if chalazion is on the upper, or worse, infections of nasolacrimal duct or lacrimal glands.☺☺☺

Act quick and save your eyes from 5 more styes, infecting more glands. Warm *that* stye (see video) *or chalazion eyelid portion (no need to do whole eye, as that makes it less comfy and can impair the healing, due to extreme cytokine storm facilitated by dilated vessels thru the eye) for 10 min/day and massage it downwards or even use* expressor tools, like *roller types 3.0 or cylinder 2.4 to drain it downwards, with q-tips ready for action if need be, as the paragraph above explains,* in case they may break and drain unexpectedly without you trying to break it that day, so that you prevent infections by wiping anything off eyelid before blinking or allowing eyelid to touch eyeball if you use any expressor,☺☺ if on upper eyelid and push it upward towards MG orifice if lower eyelid. Be aware that invisible small leaks may happen daily and it's safe to use antibiotic once a day until you get rid of styes, chalazions, draining that happens without you doing any massage or draining downwards for upper styes. Before you do anything to upper styes and chalazions (usually upper), it may help to close 20% the orifice of the other glands of the eye by doing a gentle cold compress on the other areas, and heating only the affected area to prevent too much cross-infection of the open glands.

Blocked MGs can become chalazions that then can take weeks to cure naturally without excision (excision damages MGs and will also cause cornea erosion and scratch from the little hole they make as this video shows, so you want the do it the natural way without injection of steroids into eyelid (see how bad that is) or excision which can both lead to so many problems. A few pages above, we saw many healthy and blocked MGs have P. acnes bacteria as the dominant bacteria, so when we have a pimple, it remains red for even 2 years if left untreated, and then we use sulfur powder in alcohol taped to the area with bandage to make it beige in 24 hours after being red for 2 weeks or 2 years or use Neutrogena 445+633nm (see details) laser which you can buy for 30$ on ebay. Search ebay "Neutrogena® Light Therapy Acne Spot Treatment", expiration date may be in the past, but they still work fine since they were never used, these last 5 years usually at least, with little use, even 10. Neutrogena put exp date to sell more devices

too; intensity dims slightly every 3 years. If you use these, you can cover the top of the laser with aluminum tape, so that only a tiny or small section, maybe 30% allows light out, so that you can prevent using light on a wider area, if you're testing it; you will see the LEDs are only 20% of the total surface of the rectangle that touches the skin; the acne section explains intense 445 nm causes a 100,000 fold reduction in P. acnes, see IJMS 2021;18(1):109-19.

While red light can reach retina and penetrate skin 6 mm, blue one can only penetrate 1 mm of the eyelid (as long as eye is totally shut you're quite safe from blue light, but it is always much safer to wear cornea shields, in case you don't shut completely or red 633 nm light is not good for your eye, as 445 can't go past the eyelid. Point laser *(while holding it 1 inch away from eye if no cornea shield is used to reduce intensity 10 fold, max 2 seconds/month, to avoid damaging your eyelid skin or retina)* away from most of the eye when doing a tiny part of an eyelid, by moving eyelid up if upper to shine towards the above eye area, down if lower eyelid to shine towards the under eye area, so that the light is never shining towards the bulk of the eyeball, but only getting 10% of stray red light reach the eyeball, most going above or under eye; if not using cornea shield it's risky; *you can cover most of the laser, including the white edge for 1 cm to prevent diffuse light with a 3cmx3cm aluminum tape you disinfect, to* let only a 1 by 1 mm area *to shine (this will* dim the light about 20 fold*; use* a *tiny* sterilized eyelash scissor *or a*ny sterile round tip thing ($ store sells those dental picks that can be sterilized and used for this purpose alone) to make the hole where blue light LED is, since not all 3 LEDs are blue and that goes against 3 mm thick eyelid which blocks blue from reaching eye; with aluminum tape and turn laser on for 10 seconds only after it sits against eyelid area of interest (where stye is) that has wide 7 mm by 9 mm Mastrota paddle behind the eyelid, tightly holding eyelid against the laser, to prevent red *(or even blue light, since eyelid skin is thinnest in the body)* light from going into the eye, though if you make hole well, it will allow only blue light, seen (when you do a test on your hand with light shining onto your hand, not eyes) *in dim light as blue (*blue *if hole* is 4-5 mm from top in the center*),* to prevent any light going to the eye, since blue can't usually (to be safe, have Mastrota or cornea shield anyway, even with blue light only coming thru your 1x1 mm hole) *pass past the eyelid you press the aluminum tape covered thing on*; you will see that if you move 1x1 mm hole 3 mm down, the light coming out (red *if hole* is 5 mm from the bottom in the center) is red 633 as you're near the red LED; this allows you to use blue for disinfection and red for regeneration selectively; you can use the other eye to watch the Mastrota eye, and keep the laser eye as closed as possible; however, a 660 nm red LED described in acne section allows you from 2-3 ft to treat your whole face and eyelids at once with low level red light; though such low intensity may not do much for styes.☺☺☺

Once you learn how to make it 98% blue (position of the hole AND tape the red LEDs, there are 3 total), and how to dim it 20 times with aluminum foil as shown above, you can shut eyes tightly

and treat the entire eyelid from 1 cm away with 445 blue exclusively to kill all P. acnes that have destroyed all your lower eyelids (cover all the other stuff with opaque stuff, to only treat lower eyelids) glands giving your dry eyes, without getting red light into the eyes (except about 400 times less, what you get from being at the computer with a desk lamp nearby or at the beach); MGs are on the inside, so outer treatment may not kill microbes in MGs, so you may need to use it on the inside, for a few seconds, at this ultra diminished intensity, facing away from the eye. With cornea shields you don't want to do it this way, but point directly towards eyeball where the shield is to avoid getting light to eye periphery; with cornea shield, there are no risks as long as you use it away from where cornea shield ends and for a few seconds, etc; acne masks with eyes tightly shut have only a fraction of the pen intensity, hence they're quite useless at real P. acnes disinfection of MGs, but for those with minor infection that may work fine, though doing all at once is not idea, so cover with aluminum 90% of the eye and do only 10% with a 445+633 nm mask, lower eyelids are usually far more P. acnes infected; this reduces the skin damage and oxidative stress; acne masks are not that good, since they damage the healthy skin that doesn't get pimples, so the pen allows you to treat only pimple affected skin; a 660 nm LED from 1-3 ft (0.3-1 m) away won't damage the skin, but will help it, so that's safe to do all face after you treated pimple area with the 445-633 nm pen); so keep the eye you work on shut tightly.

When you use this laser on a finger you can see in dim light how how red light penetrates 6 or more mm of the finger; blue one doesn't, so color is reddish; however, other devices like Q emit lots of yellow and green light that can damage eye structure (IJMS 2021;22(21):11605) at high intensity and even red light, if too much, too fast, can cause damage, not only boost mitochondria; for highest safety (the only way I would suggest anyone use more than 5 sec/wk), and not damaging internal eye structure with 633 nm light (acne section has more on the benefits), you can also buy cornea shields (see many examples here) and then use acne laser on eyelid exterior (don't touch eyelid, just hover 0.3 to 3 mm above it or use aluminum tape before getting closer, it will still work, if your device is not 100% sterile, do 1 eye at a time perhaps) for 20 seconds/day in each area until you treat the whole eyelid for MGD or *just 1 min/day* (4 hours apart, about three 20 seconds doses) *in the stye area for styes when you're ready to express stye within 24 hours (the* maximum softness *of pus,* don't wait 5 days to express after 20-60 sec light treatment, as pus solidifies with more time, just as with pimples not popped out within 1-2 days after laser use for 4-10 min in the last 24-48 hours*).*☺☺☺

Plan ahead, be very organized; due to this not having the FDA stamp, and being an off-label use of something and eyelid skin being so thin, you need to be ultra careful and do it at your own risk, since I'm not sure if it is the best laser intensity; however, since eyelid skin is same as other skin, it may be fine for a few seconds max *if cornea shields are on*; for MGD (no styes, just to cure dry eye due to dead or ultra infected MGs that cause chronic MGs block via chronic oil

solidification requiring endless MGs expression: we need to kill all P. acnes, staph bacteria, so reinfection, resolidification stops due to immune system being able to handle the 100 times lower level of bacteria, not just express pus solid oils every 3 months at your favorite OD), until we use light until MGD is gone and all pus etc was expressed max once every 20 days, instead of the 2 min 3 times daily (6 min max) Neutrogena says to use for pimples, since in MGD, we don't have as many P. acnes as a pimple; then express MGs within 1-2 days and see how things improve before you do it again in 3 weeks, as overusing cornea shields will damage eyelids, only need do this rarely when you got a real stye, eyelid swell or LipiScan confirmed MGD, have a day off next day to do some serious expression for half the eyelid you treat with light; likewise, if we flip the upper eyelid where the chalazion or stye is as they do when they take pics of MGs with LipiScan using a sterile q-tip (just like MD flips it with that tool, instead of q-tip in the video a few lines above), we allow the chalazion to sit on the tip of the Neutrogena light and can shine light away from the eye (this is not ideal, since we damage the eyelid if we flip it more than once or twice a year, so do spend $55 on a pair of polished shields, your eyes and eyelid is more valuable than 50$), kill all chalazion P. acnes (often 50% of bacteria) and turn, within 12-24 hours, a chalazion that was red for months into a pus beige thing that you can then drain with a similar to stye procedure within 24 hours. ☺☺☺

Have all MG expressors and tools, after reading MG expression tool section well, before you do this, as you can't turn it beige when you're not ready to drain it quick as it will infect a lot of stuff by slow draining. Prepare well, use the tools on other areas first a little to get practice and be confident so you immediately, within 24 hours, drain it after light application, and maybe again next 3 days if anything may be left there, double checking if anything comes out. Chalazions, styes are pimples of the eyelid, caused by P. acnes (can be dominant), staph and strep. Because it is the eyelid, you need to be 800 times more prepared, informed, trained, etc to burst it than a pimple. For decades they used IPL for rosacea and acne, so today, they use it for styes, to treat them with cornea shields on within 12 hours, or chalazions (use cornea shields, even if this MD does not), it's the same idea as this mini laser, except IPL is broad spectrum light and used very differently, using cornea shields, the little ball you see off her eyelash in the clip.

Amazon has acne LED masks with the same 445 nm, 630-670 nm, see a video about it. Read and understand how these things work. Many MDs have no clue many inflamed glands are mostly P. acnes due to cold compress blocking glands, so they cut the eyelid needlessly, without having to, not knowing the stuff in this paragraph and acne section on how pimples work, since they never had a pimple and medical school is all about surgery, pills, not biophysics. But if you had pimples and used Neutrogena Laser you will understand; if afraid of using the Neutrogena or flipping it slightly with q-tip is hard, just use sterile bandage from $ store and some sulfur with alcohol on the outside of the eyelid, and tape it well with the sterile bandage, so only eyelid gets it, not the

eye, for 12 hours during the day, then remove it at night, and this will do the same thing, turn a 5 month red chalazion into a beige pus, in about 24 hours, but be ultra careful, since you don't want sulfur into your eyes, can use antibiotic drop to prevent infection. Like with pimples, the turning into beige pus may not always take 12 hours, sometimes it takes 36, so 3 days of 12 hours a day application. MGs are on the inner side of the eyelid, so we apply sulfur on the outer, so it may take longer than sulfur on pimples (12-24 hours) to make it a beige pus.☺☺

Neutrogena will kill in 4 to 6 min most P. acnes once flipped, P acnes from both inner and outer eyelid sides; it has a non-flat top, top is like a 45 angle angled tip, so it will fit really easily on top of lower and under the upper eyelid pulled slightly on top of lower; if you had a *sterile Neutrogena* 12$ on ebay, *(buy 3 one for face, one for left eye, one for right eye, to keep them ultra clean, disinfect with alcohol 70% pads or antibiotic drops too before using inside eyelid, or 4 if you want to use one on your toes for toenail fungus or etc)* you could lean it behind the upper eyelid (while resting the other side of the laser on the lower eyelid with eye 99% closed) by pulling upper eyelid downwards (lower one upwards, to cover the eye with lower eyelid, so laser reflections of the upper eyelid bounce off the raised lower eyelid, not the eye, look away from the chalazion so your intake of light is 0) slightly to avoid reflections of light from upper eyelid going into your eye, and treat the inner side directly, after sterilizing via many methods (antibiotic wash, soap wash, alcohol pad, etc) the Neutrogena laser and eyes, to avoid having to flip and treat the exterior which is less effective, since the thicker tissue barrier slows the 445 nm laser from reaching the MG located at the very surface of the inner eyelid, not outer. You can try first on the outside using cornea shields with the 445+633 nm laser or Q device and if that doesn't fix your issue, go for inside using the Neutrogena (not the Q, only Neutrogena has the shape for doing inside easily). Thus, you don't need to flip it if you got the tools to properly sterilize a brand new eye use only Neutrogena and use it to treat the eyelid inner side directly by lifting it slowly, pulling it down slightly, without touching eyeball. This only works well if the chalazion is more central and you can actually lift eyelid enough or flip eyelid enough. Since excision has so many dangers, it's worth trying everything else first, sometimes, just warm compress and massage without sulfur or Neutrogena laser will work. I never tried this, but you would have to make sure no light shines unto the eye, whatever you do. If no flip, then you can keep eye almost 100% closed, except the little eyelid area. Talk to your OD and see if he wants to help you try it, before doing any excision, injection, etc, explain to him the papers on P. acnes as dominant bacteria in healthy MGs in many folks, etc. Always be safe, never shine any laser light towards the eye or let any reflect back on the eye, so flip it so all goes out or keep eye mostly closed if you don't flip it and insert the tip there under the chalazion, while looking very away from the area where the chalazion is. Too bad this is not a thing they do in office with a specialized little 30$ Neutrogena like laser, better suited for this via shape and frequencies that

kill more than P. acnes well, without a need to flip anything and while providing a universal (or several sizes, easy to attach, not fixed to the laser tip necessarily) cornea shield attached to the laser tip to prevent any reflections from tissue from entering the eye. Then, patient would come next day for the drain of pus. Due to reflections when people don't drag the upper eyelid down enough and closing eye 100% by having the plastic rest on the opposite lower eyelid (if doing upper chalazion), it is safest to always flip if you ever do Neutrogena at home, flip the eyelid top where big chalazion is, close eyes and also do it when the gland is already open and you know it's draining slowly, since it created maybe another tiny stye on the lower eyelid etc, so then pus is easy to drain without effort. Otherwise, if the gland is blocks fully and keratinized well, it will require a lot of expression to finally burst or even a wire or MG probe some ODs use to get pus out and unblock glands in the procedure 5 of the MG expression section (called MGP, MG probing), so you won't be able to do it alone, unless you got experience with MGP; it requires more courage from MD to try something different; that's why this sulfur or 440 nm is good to do only when you're 100% sure it's open and draining slowly. ☺☺☺

A chalazion already may be beige and ready to burst (as most videos show during excision), since all antibiotic ointments on eyelid exterior or inside the eye, acne masks, desk lamps etc have leaked light and made it ready to drain, so you may not need sulfur at all, so don't get too excited about that sulfur laser part, as warm compress, massage, eyelid exterior antibiotic ointment, and slow drain will do the trick in most cases. What I noticed with pimples is that they heal and leave no mark with sulfur or other creams, but if left alone they don't heal well - leaving a scar for months, or years, so you need to nourish the eyelid where the stye and chalazion was, once done, to help that healing once fully drained and not have it affect that gland, also to fully kill all left over bacteria next 7 days with antibiotic ointment etc, so it doesn't reoccur. Rest your eyes more after draining, to help them heal. However, the laser part, with special laser that kills more than 440 nm can, is useful, since if any discharge occurs for a patient, if will be dead bacteria and neutrophils, instead of live bacteria, laser can penetrate all the way, while antibiotic ointment may not; don't forget that antibiotic drops are 500 times less effective in penetrating the stye vs eyelid exterior or interior ointment, so if you got 30$ or talk to teladoc.com, always ask for antibiotic ointment first. ☺☺☺

So, while most styes and chalazions may be already beige pus filled by the time you try laser, it can still help in some cases where discharge won't happen instantly at the office or at home, as at least you get a less dangerous discharge. Gently prepare well and read a lot before doing anything. Understand well MG expression. Like pimples often disappear without you needing to burst them, so can most styes and chalazions disappear without any burst, if you apply antibiotic ointment, drops or laser light, sulfur correctly. I noticed many pimples heal only if I apply 440 nm in the first 12 hours, because the immune system is efficient and forms no beige pus, with

redness gone in 7 days on its own thru good sleep, nutrition, etc.☺☺☺ If I wait longer, then it creates one big pus and needs bursting to get it all out. Likewise, if you wait 5 days, you may not get this miracle 20$ laser cure of chalazion or stye via 440 nm within hours of noticing it, due to an inefficient system of healthcare, the lack of immortality capitalism that enables seeing OD in 12h (or education, use the laser yourself if away from eye, if no reflections, now that you know a chalazion is 100% a pimple partially). If a stye is the easy one that has a white head, and you got tons of experience with MG expression tools, antibiotics, wiping stuff out without leaving eyelid touch eyeball, etc, it is up to you if you want to pop it or not, since if it pops during sleep, it will be a catastrophe, a very thin sterilized, well cleaned, washed, etc needle or, MG probe (70 micron from the doctor, ask him to do it if you trust him) can be used to make the tiny 0.01 mm hole at the top of the white head (don't squeeze the whole thing, as it moves stuff deeper into the gland) and drain the white pus before it will flood your entire eye and infect 50 glands at night; only do this when you got antibiotic ointment to put there 3 times daily after popping it, for 3 days, until it heals and then use nourishing eyedrops with vitamin A, E, etc hyaluronate to help it heal; it all depends how big it is, how long it's been there, how likely it is to pop any time (more likely, so safer to pop it if you used tones of antibiotics before, etc and are ready to wipe all out and have the proper tools to hold the eyelid (Mastrota, etc) and push everything down (for upper eyelid) or up (for lower eyelid) with q-tip, etc.☺☺☺

After a stye, never use mascara and eyeliner, unless you want to give yourself endless styes and chalazions again. Because half the bacteria that cause MGD can be P. acnes, this device, if used safely as explained in this paragraph in a way in which 0 light reaches the eye, could actually disinfect all MGs that are atrophied, clogged, damaged in the LipiScan view and help them to regenerate, without the risk of IPL, which can create blood clots. Headaches, blood clots etc can result even those cheap China made 40-50$ Walmart sold IPL used for hair removal, see list of products), there are thousands of IPLs, though most don't have filter for rosacea like the 3 filter UK one with this Faustina IPL for acne, rosacea. Always read every manual in detail to understand the risks of light usage for any skin issue like styes, etc... and follow it, the Faustina lady is not careful when doing it on the face, she would need to wear better eye protection, like aluminum taped full block glasses (can be any small 50$ mask glasses worn under the other ones) that don't let any light towards the eye, so good foam like silicone seal, just taped in aluminum 100% to block 100% of light to eye area if doing acne on face, 100% seal if you do any facial acne). That's why they have full metallic, on top of eyelid, shields in OD offices that do IPL for dry eyes. They got 3 filters: 1. acne 2. hair removal, 3. rosacea – the one that would eliminate dry eyes with cornea shields, a do it at home thing. Acne filter blocks xxx nm, rosacea yyy nm, etc, so use IPL that tells in the manual the nm, use the blood clot forming nm.

Stuff around 418, 524, 577, 1064 nm are where hemoglobin absorbs and causes blood clots, as

IPL section explains, so those need to be avoided, but do research it more. By doing avoiding those 4, you kill the bacteria, but get no blood clots; you may not get the best appearance that removes all arterioles from eyelids and face, but you save yourself from the risk of death by blood clot or stroke, etc. *LipiFlow makers need to include blue, red light shining on eyelids without shining it on eyes, so that they disinfect eyelids too to achieve more than mere infrared heat.* Just like for MG expression we can do 5% of all 140 eyelid glands in one session, with IPL or Neutrogena, people can do 5% of the eyelids and 5% of the number of flashes they normally do on top of cornea shields or around the eye to give time to the body to heal more effectively, to not overload immune system and also, to ensure that one gets good sleep to heal the body. These IPL for acne, rosacea or hair removal are very dangerous in people with blood clotting abnormalities if they use any nm in the blood clotting ones, as a blood clot can cause silent undetected strokes, or even blockage of main artery and a need to visit 911, so be careful, and read 100s of pages and manuals and papers before ever using any IPL device, as there are 1000s for home use, and only do minimum needed and very little, one flash first, etc. ☺☺☺

That's why Neutrogena laser, with such low level light and only non-blood clotting frequencies of 445 and 633 nm is 10,000 times safer than IPL, since we put so little light at one time. Like IPL, Neutrogena could also prevent dry eye in people with beginning atrophy or clogging or infection of MGs, which MGD really is, without the use of antibiotics, for people without styes, infections, etc without the deadly IPL risks that are present even when using cornea shields. Once the immune system gets a boost due to killing microbes, it may kill the staph/strep on its own on really messed up glands, that most people have on lower eyelid after age 20 or 30, or you could just use an antibiotic that works among those below. 670 nm boosts cytochrome oxidase in mitochondria, and helps MGs regenerate. Try one spot first, take LipiScan pic later, before and after and see, besides daily 20x mirror monitoring of how much oils comes out of that tiny section of your lower eyelid, *to see if oils come out more after 1 month wait and if glands look better when you pull eyelid slightly to see them.* The use can be 1 minute a day, for 10 days, max, since that would be enough to kill and then wait doing nothing for 1 month, maybe find a red light one (if it is small and can be used the same way, with no light into the eye or get cornea shield from somewhere) only for 1 min daily if you find one with 670 nm or so, once all P. acnes were wiped out by 10 min of Neutrogena. The light may work better in some cases, to regenerate, without the use of big IPL blasts, etc. Avoid flipping the eyelid too much, 10 min to kill everything and wait 1 month, because it's damaging the elastin and collagen fibers to stretch and pull too much, as they say with eyedrops and ointments too, you create too much damage if you overdo it; this is likely to have more effect on people with pimples, as their MGs are full of P. acnes, which would die at 440 nm. May need to do 3 min a day for 3 days, and then express 24 hours later when pus forms from the massive killing, that's why a small 3 min may work better,

less pus than 4 or more; before this, buy tools and practice MGs expression on yourself, to gain more knowledge on pus expression; use also some antibiotic when doing this to wipe out as many non acne bacteria too and allow immunity to finally bring the bacteria under control. With cornea shields, you can also get blue and red light to the eyelids using the FDA approved acne mask by Pulsaderm. ☺☺☺ Gently practice good ocular hygiene when using drops, since these HSV1 virus of clear non-yellow cold sores, when placed in eyedrops by CIA, can cause even blindness due to retrograde axon transport causing virus to infect trigeminal (Fig 1 of infection) ganglion on the optic nerve parthway (MO 2019;7(10): 429) and is, like endless bioweapons and etc, used likely, like any natural disease they can repliate or cause artificial infection of, by spy agencies to cause partial or even full blindness for torture via eyedrops they infect in factories (can cause encephalitis too, which can cause death), revenge or mind control attempts, since this virus HSV1 is infecting 50-70% of humanity and it's easy to blame on natural causes (spies always choose plausible deniability methods of disability/killing). ☺☺

Menthol (40% of bactericidal peppermint oil) and camphor (12% of rosemary oil), present in many OTC eyedrops, such as Rohto, preserved (stronger antibiotic, since chlorobutanol preservative and camphor also disinfect) or unpreserved (details), have antibacterial properties. So do drops with preservatives, boric, citric acid, vitamin E, though those kill fewer microbes.

CID 2008;47(6):735-43 *Table 2 lists ORAL (not eyedrops, which mean 500 times less antibiotic absorbed systemically, but can still affect eyes negatively, as with organs) antibiotics* sending people to the *emergency* room ER *most often during overuse or allergic* response: ceftriaxone, approved 1982, only sent 2 out of 10,000 to ER, vs fluoroquinolones 9 (ofloxacin 9, moxifloxacin 21), penicillins (β-lactams) 13, sulfonamides 19, trimethoprim 19 (1962 the older it is, the more bacteria become resistant), clindamycin (a macrolide) 19 & vancomycin 22 (a 1958 mostly *bactericidal* glycopeptide) which kill MRSA Methicillin-Resistant Staphylococcus Aureus, cephalosporins 6 (1964, β-lactams, lowest effects of any *bactericidal* antibiotics, ***3rd (ceftriaxone) and 4th*** (cefepime 1994, covers more microbes, but may cause neuron damage) ***generation are*** broad spectrum ***killing both + and - bacteria; cefuroxime is 12, so avoid it)***, macrolides 5.

The most common antibiotics given for blepharitis, swollen or itchy eyelids, MGD, evaporative dry eye, styes seem to be macrolides: erythromycin 10 (1952), azithromycin 4.5 (1988) in Z-pack that destroy our brains with every cold (USA uses azithromycin 25 times more than Sweden and other nations for trivial reasons), clarithromycin 4.0 (1990); oral *(only 5 oral macrolides are approved in US, the 3 plus* fidaxomicin *and* telithromycin*)* and the 3 ocular macrolides yellow the eyes sometimes, they can damage the *liver, causing yellow eyes and skin. Please* avoid *erythromycin* eye ointment like the plague, if it yellows your eyes (they become more orange yellow tint, instead of white) after one use (happens to many), for 1-5 weeks after just one

application of 20% recommended dose on the label, and you also see halos around traffic lights for 3-8 weeks. You definitely realize how stone age our medical system is if *erythromycin* ointment is what many recommend to patients for blepharitis, infections, etc. The only use for *erythromycin* ointment is on the outside of the eyelid if a stye is there to penetrate the eyelid skin, but in a way that never gets into the eye. No wonder it is so cheap and so many articles recommend it, since the people writing articles never used it. There are tons of other ointments or eyedrops for infections, try those. Macrolides names are easy to recall: *ery*thromycin, *azi*thromycin *(covers more atypicals, less effective against common ones),* *clari*thromycin (6-O-methyl-erythromycin, 2nd generation macrolide, 'iPhone 9 vs 1', erythromycin like except it covers extra strep/staph, fewer side effects. Azithromycin has a 15 lactone ring, erythromycin 14, being sometimes called an azalide, not macrolide; otherwise, its structure is the same as erythromycin, except C=O in 9A ring replaced with N-CH_3. The small changes lead to vastly different antimicrobial properties, as the molecule is bulkier and *no longer binds 50S ribosomal subunit of some microbes, no longer causing the cessation of* bacterial protein synthesis. Azithromycin has a different chemical structure, even if very similar, and being eyedrops, it's far less likely to yellow the eyes to the same extent. ☺☺☺

Azithromycin 1.5% eyedrops "improved eyelid inflammation, the quality and quantity of the lipid layer of the tear film, and tear film stability... seem to be a safe and effective treatment for MGD-associated posterior blepharitis." ► ECL:2021;47(1):54-9.☺☺ *"Both* azithromycin *1.5% eyedrops and* oral doxycycline significantly improved signs and symptoms in patients with moderate to severe MGD." ► GACEO 2019;257(6):1289-94. Doxycycline can cause eye *yellowing* too, like azithromycin eyedrops may, the Azasite off white thick drops, since this thickness will make them stick longer on the cornea, so be careful, lower dose 5-10x, if any eye *yellowing* in both eyes, and don't use 2 *yellowing* antibiotics (doxy and Azasite, or doxy and *erythromycin*) at once, use one at a time to discover the safe non *yellowing* dose. Similar results were found by Cornea 2013;32(1):44-53 ► "azithromycin (1%)... abrogated the signs and symptoms of dry eye in patients with MGD... Tear break up time of patients with MGD improved to normal values after 8 weeks of oral treatment with doxycycline (100mg 2x/day). Symptoms of itch and swelling also improved significantly as did all the other signs...oral doxycycline treatment was slightly less effective in improving foreign body sensation.. Unlike azithromycin, doxycycline treatment did not improve the degree of meibum lipid ordering and correlative change in phase transition temperature... doxycycline improved the PCA scores more effectively than azithromycin... the difference between... azithromycin and doxycycline... may be related to the properties of azithromycin (1 drop/day) to *inhibit tissue or bacterial* lipases (such as P. *acnes* lipases that destroy our lipid layer) that otherwise degrade the lipid... Doxycycline inhibits matrix metalloproteinases (that degrade connective tissues allowing bacteria to destroy *meibum*

glands, so it is used to treat ocular rosacea and cornea erosion: that's why it is used for strengthening the blood-brain barrier (see video explanation), to protect the brain from MMP9 that poke holes in the blood-brain barrier, MMP9 is a molecular scissors that remodels tissues and can become overactive, destroying the blood brain barrier MMP9 is rich in brains with dementia, Parkinson, microglial activation of inflammation)... Both drugs... have anti-lipase effects... (both) reduce the signs and symptoms of *dry* eye... when carotenoid levels in *meibum are low* as in MGD, the tear film is unstable... (causing) *dry* eye (see the smoothie section on how to boost blood carotenoids with 0.5-1 walnut in a morning smoothie: carrot, kale, watermelon. After high carotenoid meals, tears are better; add if needed, some choline bitartrate). When *carotenoids* are *restored* with azithromycin and doxycycline treatment (or carrot, greens, kale smoothies), tear film stability is restored and patients no longer have... *dry* eye...". ☺☺

This means that vegans who eat a lot of carrots, greens etc and have high carotene intake, who already got maybe slightly orange skin on hands face due to so many veggies, may get this macrolide or tetracycline (doxycycline, etc) instant, after one use, eye *yellowing* to a far greater extent than those with 20 times lower *carotenoid* (orange lycopene (tomato, watermelon), yellow lutein (kale), yellow β-cryptoxanthin (red pepper), β or α-carotene) intake. That's why side effects to antibiotics are different, we each have unique diets and DNA, etc, so knowing a little from papers can help us prevent some side effects, reduce carotene from vitamins, etc. This doesn't mean these *yellowing* effects are due to carotenoid concentration of cornea going higher necessarily, but it could be the case sometimes. The most common antibiotic ointment is erythromycin which works better when oral erythromycin is taken too, though both can cause yellow eyes, so stop using if so, see other side effects here, including seeing halos around traffic lights after just one use of *erythromycin* ointment, even colorful edge of the spherical halos of lights with foggy safety glasses. Yellow eyes can also be caused by tiny invisible new vessels that are red-orange and give eyes a yellow tint due to microwave-infrasound attacks by various spies, or pharmacy, factory staff putting stuff in products. It's important to no longer use *erythromycin* (use it as first aid for the body if you got it, but never in the eyes) if halo lights appear, and try something else, since halo lights can also appear due to other issues, so then *erythromycin* would mask those issues if they appear in the future.

All macrolides give halos, especially ointments, due to ointments exposing the eye to 200x more macrolide than oral pills. Likewise, when people use peripheral vision to look at auras, they may have seen, in ancient times, due to taking natural compounds with similar halo effect like *erythromycin*, that *vegan* monks or people (when wearing short sleeves in the summer etc) have more golden auras, due to the *yellowing* effect of carotenoids, and they may wrongly associate such a hue with the nice behavior of those *vegan* monks or people, when in fact anyone today, who is very bad, can take carotene pills and have a similar bright gold aura perhaps for a while.

People didn't always realize in ancient times the *100,000 confounding factors*, that correlation is not causation always. Sort of like kings noticed lights, when moving hands on a piece of cloth in darkness, so the static electricity was seen as a sign from God or angel saying to go to war, due to the myth of 'Angel X' etc. Not to mention, in low IQ people, the random migraine aura could've been taken as a real aura, unlike real aura that shows up for anyone you focus on with the peripheral vision (at will vs "random when neurons misfire"). NIH says Azasite side effects include dry eyes, temporarily perhaps, so reaction may be normal eye in those with existing dry eye, vs healthy eye with some infection using Azasite for a stye; healthy eyes perceive a slight dryness as dryness, while same level of dryness would seem wet eye to chronic dry eye sufferers who cured MGD. The CO 2010;4:681-8 charts show a *dramatic* difference between warm compress alone and *azithromycin plus warm compress* in treating eyelid inflammation, blepharitis. Please read the side effects of azithromycin before taking it orally; for eyes, the eyedrops are far safer and the only form prescribed usually. ☺☺☺

Macrolides *are* bacteriostatic, like tetracyclines; most antibiotic classes have 3-5 generations, each new generation being safer, more recent, capable for some bacteria or all☺. Mayo clinic explains (like many MDs say drops are useless for styes, ointments essential) styes need antibiotic ointment on the outer eyelid, when drops fail, and that's logical, because the ointment will deliver 1000 times more antibiotic than a drop that gets flushed into the puncta as we blink, be careful since the *erythromycin* yellowish ointment may be the most uncomfortable of any you may have tried. The Akorn 30$ *erythromycin* comes in a tube and paper box that are unsealed and thus susceptible to insertion of poisons by anyone involved in delivery to patient, thanks to FDA rules), *cause eye yellowing, and inflames eyelids;* eyelid *swelling* may be due to low IQ *formulation* of the mineral oil carriers, since I noticed when trying various ointments for dry eyes, some swell eyelid 10 times *more* than others, due to allergy maybe and/or lack of research by manufacturer; so you may need to try a CVS brand *(they carry the higher quality Bausch)* of *erythromycin* ointment for eyes, and to avoid the *Akorn* one some pharmacies give to patients. With ointments, try start very small, maybe on outside of eye mostly where a stye is, etc, make sure it doesn't cause yellow traffic lights halo or anything odd.

Polysporin (mix of 2 *bactericidals* with similar structures, 1 for -, 1 for + gram bacteria: bacitracin 1948, 6th most common allergen (1 paper says avoid it if eyelid swollen) + polymyxin B 1964 polypeptide *bactericidal*) is sold as a generic or Bausch eye ointment $36, comes with a seal (unlike Akorn erythromycin), *doesn't yellow eyes*☺☺ or *burn like erythromycin*, but, like all mineral oil/petrolatum based ointments (all of them), polysporin swells eyelids when eyes are more stressed; due to bacitracin being famous for causing dermatitis reactions, it could irritate your eyelid (get like a little rash or pimple like thing at the base of an eyelash that can become a stye later, or eyes get redder like mine did) or block skin or eyelash pores since 99% of ointment

is comedogenic, skin pore blocking. Due to bacitracin causing *dermatitis*, it can cause the eyelid skin to become temporarily (3 days or weeks until it heals) *rugged* due to '*keratinization*' (possibly induced by the transformation of vitamin A into A forms that induce *keratinization*), where the soft eyelid skin becomes irritated, just like a skin reaction. This can happen even if you use 3% of the recommended amount (meaning just a little above the eyelid, whereby a tiny amount gets inside the eye only to test its effects). You won't see the *keratinization* at 1x, only with a 20x mirror, as you monitor eyelid condition daily. It may help to use skin nourishing artificial tears (Hylo Relief, MGD, etc, that have skin component hyaluronate, skin nourishing oils, etc) after such an event and only use this ointment rarely, if at all. ☺☺ Polymyxin is also part of polymyxin-trimethoprim eyedrops (*that have bacteriostatic* trimethoprim 1962*, which* lost efficacy against staph/strep *due to resistance*); this mix is quite deadly, my eyes are always feeling bad after it, become red (especially if you use them 2-3 hours before bedtime, which shows how bad BAK is), etc, so I no longer use it, except mornings; these are so deadly, they contain *4 times more BAK than other formulations, 0.04%*, go to another pharmacy, and ask that you don't receive this deadly 0.04% BAK formulation, go for one with 0.01%, so you definitely *need to use some HMW (2000kDa) hyaluronate drops first* to diminish the damage they do): they and all drops with sulfate contain sulfuric acid to bring pH to a range of 4 to 6.2, for example for the deadly Allergan Pacific Pharma formulation of Polytrim with 0.04% BAK also, 10 mL for 30$ (*so 15 times cheaper than moxifloxacin, without yellowing your eyes for days*); so they would damage cornea (via low pH, BAK) if used directly many times a day for a week, it would be 20x safer to use first some alkaline drop with buffer and then, 5 minutes later, after the thick drop, use polymyxin; or, *like with any acidic eyedrops*, you could use them when waking up only, when your pH is the most acidic in any 24h period and then, *like with any sometimes uncomfortable eyedrops if not diluted due to stone age drops with huge volume far higher than eyes are used to*, add saline solution drops within 2 minutes to dilute and thus raise pH to your morning pH, while keeping eyes closed to absorb the medicine and soak eyelash base well by saline overflowing with dilute antibiotic.☺☺☺

Due to not changing pH so much, the ointment version of any polymyxin combo is far safer to use when your ocular pH is 7.4 (many days in the evening), since it doesn't have this low pH; some steroid-antibiotic combos, like 3 in one mix of dexamethasone (a steroid), neomycin, polymyxin b, can cause halos around traffic lights (as can erythromycin ointment, *which may get rid of* 90% acne *as side effect too*), besides the classical eyelid swelling; the $ store triple antibiotic neosporin that is polysporin plus neomycin, which is very different chemically than bacitracin, polymyxin; because neomycin is toxic and has many side effects, MDs often prescribe polysporin instead of the neosporin trio; you can use left over eye polymyxin bacitracin to replace neosporin for minor first aid events, since neomycin may damage eye muscles and ear

nerves, or buy polysporin (cheaper to make than the 1$ neosporin) or get it from teladoc.com; it's 1$ at $ stores; see neomycin wiki for the terrible side effects (kidney damage, hearing loss, seizures, psychosis, etc); generally, *if eyelids swell or halos appear around lights, WebMD, the RiteAid prescription instructions say stop using it, see doctor* (or use it 2-10x less, in 5x less amount, since mineral oils swell eyelids on their own) *if eyelids swell or a rash develops.* ☺☺ For those in outside environments or who have window open always, they may get exposure to dust mites, fungi, molds (a type of fungi) from outside, etc and all fungi are best treated with natamycin 1978 5% eyedrops (the only FDA approved drug for mycotic keratitis) that treat opportunistic fungal infections, due to weak immune system or more serious fungal infections. Before using it, like with any eye drop, please gently read 'adverse effects' section in the NIH database, so you discontinue use if anything serious happens and you know what to look for.

For MG dysfunction, dry eye, ocular rosacea that give eyelid pimples or styes, MDs use the *tetracyclines class of* antibiotics doxycycline 20-40 mg/day oral as the 2014 Review of Optometry explains. However, Cornea 2013;32(1):44-53 says dry eye only disappeared after 8 weeks of 200mg/day oral. Doxycycline has to be taken on an empty stomach, 2 hr before and after a meal ideally, 5-8 hr before bed, 1-2 hrbefore lying down horizontally for a nap to prevent it from going back to the throat area by reflux: doxycycline is not meant to ever be chewed in the mouth as swallowing the pill as a powder damage throats, causing esophagitis. We're in the 1st century after the internet, a stone age, unable to make even an eye drop with 25 natural ingredients, out of 2100 in natural tears. If you got a prescription of 100 mg pills twice a day, you can first try 20 mg a day once and see how much yellow eyes, gas, and other issues develop, since gas (smelly, not odorless vegan type) and massive killing of gut bacteria happens at 20 mg/day. ☺☺☺

Doxycycline can raise the pulse and blood pressure in some people. Doxycycline can cause fungal *superinfections in any area* (eyes included, so you may later need natamycin antifungal), so before you jump to it, think/read about the risks, if you ever had any toe nail fungus infections. Doxycycline is the isomer of tetracycline (*4=tetra* cyclic rings), with OH group from C_6 moved to C_5, d-*oxy* refers to the moving of the oxy OH group from 6 to 5 (MI5, MI6, FBI got 56 main offices), *deoxy*ribo nucleic acid, *D*NA, so many call doxycycline doxy for short as in some trade names; *do*cohexaneoic acid is DHA, the famous ω3, in the eye, doco comes from 22 for $C_{22}H_{32}O_2$; *do*xy is like that *do* beginning, $C_{22}H_{24}O_8N_2$ if that's an easy mnemonic, both have 22 carbons, 2+2=*4*; MW=*444*; *UK* area code 44; or another way to recall it easily is doxy oxy OH is like a 0 from 10 and decimal, dodecahedron has 30 edges and 20 vertices, doxy, deoxy, without an OH or O, a 0 0, without a decimal, 40, eu*ro*, 4 letters, *Ro*mania area code 40, etc. Just OH from 5 to 6 makes a huge difference in side effects and which organs are negatively affected due to no longer fitting perfectly in the enzyme conformation pocket to inhibit or start a reaction, which microbes it works effectively against, since it no longer binds 30S ribosomal subunit of some

microbes (all tetracyclines bind that, like macrolides bind the 50S subunit), no longer causing the cessation of bacterial protein synthesis.☺☺ The ribosome (from ribose, the sugar in ribo nucleic acid, RNA, and in ATP, NAD, FAD, NADP) has two subunits: small (30S in bacteria) and large (50S in bacteria). The small unit (see pic of bacteria 30S and how macrolides work) decodes the genetic information encoded in mRNAs so it's bound to mRNA, while the large subunit makes proteins from amino acids, being bound to tRNA. The ribosomes *(reported in 1955 in public papers, may have been discovered before by others than official discoverers, secretly, so as to hide who know what when)* use mRNA, which came from the cell nucleus, to carry DNA sequence for which proteins to make outside of nucleus in ribosomes, like vaccines teach body to create spike proteins for the COVID19 they planned and invented. Doxycycline (and all tetracyclines) is also used for sore throat caused by infection (detected with swab lab test) with Klebsiella aerogenes. Doxycycline is used for periodontal disease or acute gum infections: if you have canker sores or gum inflammation due to biting a hard food or something, that infection of the gum will vanish in 24 hours with doxycycline, while naturally it may take a week. It's shocking how fast doxycycline solves it, did it for me on 01-18-2026. For a painful to the touch gum area, it may take 1-5 days of 100 mg twice daily. Take 30,000 IU D3 and K2, Mg when any infection exists, as that boosts the immune system's ability to kill microbes.☺☺☺

Doxycycline can cause eye yellowing, so reduce dose until eyes no longer keep yellow for days after each intake. However, people need to avoid going outside 10 am to 3 pm when sun is bright, cover all body with sun blocking clothes or sunscreen, try this treatment in the winter months when day is shorter perhaps, avoid using any bright lights indoors, acne LED masks, acne lasers, eyelid light (Q, IPL) etc as skin is sensitive to intense artificial light. MGD (meibum gland dysfunction): 42% of kids have it, 80% of older adults. Drugs.com explains the huge list of side effects from doxycycline, it includes blindness. In many studies, doxycycline removed ocular dryness. Before you try this, recall it may yellow eyes, darken teeth, skin, etc, so be careful and discontinue use, stay away from the sun those 2 weeks. Some pharmacies have 0.025% eyedrops doxycycline, which is safer, since no intracranial pressure (high blood pressure is a common effect in 1-10% of people) can occur that can lead to blurred vision, blindness. A paper above explains azithromycin drops led to the same level of MGD improvement as oral doxycycline. "In optometry, doxycycline is the most commonly prescribed systemic antibiotic... improvements in dry eye symptoms in patients with chronic MGD who were refractory to conventional therapy, including warm compression, lid massage and topical antibiotic use, after ingestion of low-dose doxycycline hyclate (20mg BID)" BID=2x/day, 40. There are cases in NIH papers with blindness reports, like this article claims. However, there are some similarities between acne and arterial plaque lesions and clots that can kill us, both have foam cells (lipid-loaded macrophages and neutrophils that are generated from a massive uptake of oxidized

lipid). Some papers call plaque lesions pimples of the arteries, see a picture of a heart attack at 58 that went fatal. It makes sense, since arteries are similar to skin in composition, and once infected, the P. acnes bacteria travels inside arteries, speeding up plaque formation. II 2015; 83(10):3960-71 found P. acnes, etc in human arteries plaque lesions, it's in our MGs too. Acne could lead to styes, ocular infections, strokes, infarcts via plaque in arteries.☺☺☺

Other commonly prescribed eye antibiotics are aminoglycosides, like tobramycin 1974 ointment (for styes, though NIH database on tobrex & every eye drop/ointment (check adverse events for every drop/eye antibiotic you use) says under adverse effects that eyelid swelling, eyelid itch, eyelid redness (erythema) are common side effects in 4% of people) or eyedrops (styes and pink eye), gentamycin 1967, neomycin 1952 (the infamous one covered above that is in the 1st aid topical triple antibiotic, part of the infamous Neosporin eyedrops or ointment that has polymyxin, bacitracin, neomycin). All these antibiotics are from Streptomyces bacteria strains, hence the name streptomycin 1950, which worked against tuberculosis and had blindness as an unwanted side effect. Oral aminoglycosides cause problems with balance (vertigo, balance, the ear-eye reflex connection can cause blurred vision due to vertigo, hearing loss, permanent or temporary, so avoid oral. Eye muscles relate to ear and balance, when we look right, eye look left, so using aminoglycosides on eyelid may cause damage to these ear-eye reflexes. The vestibular nerve is primarily responsible for maintaining body balance and eye movements, and it is this nerve that can be damaged by aminoglycosides ointments on eyes/eyelids. A 2022 paper says tobramycin is safer than fluoroquinolones from some points of view.☺☺☺

Oral sulfonamides, fluoroquinolones led to the highest number of hospitalizations, *neurologic* effects (not for eyes but some go to nerve endings of ocular surface, etc so it can do damage), so try everything else first orally, as these can cause neuropathy, optic nerve damage and ultimately BLINDNESS. From eyedrops we only absorb via swallowing 0.1 to 0.01% of an oral pill, so eye drop fluoroquinolones are 500 times less dangerous. AP 2021;44(5):161-4 says it's safer to use other oral antibiotics first before fluoroquinolones, due to tendon rupture, aorta rupture (death by internal bleeding) and aneurysm, peripheral neuropathy (optic nerve damage, nerve endings damage, etc), ocular toxicity, retinal detachment (4.5 times greater, in those aged 61 on average, some who had cataract surgery in a 2012 study, which is a risk factor for retina detaching; though 2 other studies found no greater risk:☺☺ floaters can be caused by retina detachment or infections of cornea and eye), collagen effects, ruptures due to collagen (makes up blood vessels, tendons, etc, 30% of body protein is collagen) disruption, which may affect eye nerve endings, vessels. So, since you don't want to damage the cornea nerve endings and thus be less able to feel stuff (eyelashes, dryness, etc), only use these fluoroquinolones extremely rarely, maybe once a year, if all the other ones failed. Australia bans the liberal use of fluoroquinolones, as resistance can emerge in 3 days. ***FLUOROQUINOLONES*** (broad spectrum,

allegedly OK for eyes, but very toxic orally, oral led to dry eyes and corneal ulcer from dryness): avoid. they swell eyelids, some yellow the eyes, others seem to dry the eye (ofloxacin); quinolones kill bacteria by inhibiting topoisomerase II (DNA gyrase) and IV, essential bacterial enzymes for the duplication, transcription and repair of bacterial DNA. 5 examples: 1. generic $69 ofloxacin 1985, clear solution, 2. $145 moxifloxacin 1999 yellow solution, causing yellow eyes for 1-25 days (50-200 days if puncta partially or fully blocked), ***AVOID*** IT AT ALL COSTS, 3. $244 besifloxacin 2009, milky gel that swells eyelids big time, treats MRSA. 4. ciprofloxacin 1987 broad spectrum, 2nd generation, used for styes as ointment ($250/tube, even cheapest insurances like Medical cover it) or drops for pink eye. 5. gatifloxacin 1999, 3rd generation, covers more positive microbes than ciprofloxacin/ofloxacin. Ofloxacin is a 2nd generation quinolone *(the 3-5th* generation have fewer side effects and need a 10-50x lower dose (Table 2) to kill *or inhibit many microbes*) USP 0.3% solution in water and NaCl 0.9%, made by Akorn (Lake Forest) and sold as Ocuflox for example, 300 mOsm/kg (like most saline), pH 6.4, and 0.005% BAK preservative. You can use a high MW HA eye drop right after 5 min (paper instructions say OK to use other drops 5 min later) of keeping eyes closed (good idea since antibiotic drops have acidic pH often, more acidic than our natural, so the high MW HA pH 7.0-7.4 buffer can reduce damage from low pH), to avoid damaging cornea, as HA reduces BAK damage by 80% sometimes; 0.005% is 4x < 0.02% in many drops. BAK is antibacterial in of itself, but this ofloxacin formulation does cause floaters if used before bedtime, as BAK has time to damage the cornea, since at night we don't blink and the antibiotic stays there a longer time to destroy cornea cells and make neuroadaptation change. Read the side effects here too. NIH article explains ofloxacin is used also for conjunctivitis and corneal ulcers. Ofloxacin 0.3% expires in 1.5 years. ☺☺☺

Moxifloxacin is often sold as $145 (2022) Vigamox 0.5% moxi, only has boric buffer, salt, pH 6.8, no BAK preservative and can be stored in the fridge even 36-77°F, unlike ofloxacin which requires ultra tight 68-77°F range (Besivance 59-77); moxi is a broad spectrum antibiotic, as diagram shows levofloxacin to be too (levo is S enantiomer of ofloxacin, with fewer side effects). Since moxi is buffered at 6.8 which is often way lower than our pH in the evening, moxi is much less comfortable than ofloxacin, which is not buffered; however, 5 min before or after, you can add another drop you like with pH 7.1-7.3 to make it comfier; moxi causes a burning sensation and is very yellow, so it will make your eyes yellow for a day or 25; ofloxacin doesn't, because, as you can verify by placing 2 drops on white tile or plastic, ofloxacin is white, moxifloxacin is yellow so, don't use moxi if you can use a clear one, since it yellows the most; lots of antibiotics, like azithromycin (sold as Azasite etc) etc can also cause yellow eyes. ☺☺☺

Besifloxacin (only available as the brand name Besivance) inflames the eyelids, like many drops, and may cause cornea damage, because it has BAK, Calcium ions that can form stones and EDTA that chelates ions essential to ocular repair, like zinc, and polycarbophil and poloxamer that can

irritate eyes, mannitol that can dry eyes, with 0.01% BAK and other dubious ingredients, and contains a weak sp^2 orbital C to fluorine bond which may break and allow fluorine to damage eyes. Besivance was formulated from the beginning for ocular use only, while all other antibiotics were used for decades or years for other purposes first. Besivance is the most comfortable antibiotic eye drop or ointment I tried (9-26-2022), no stings, no burning like the rest; is it an off-white gel like drop, and after you use it, a white gel will form in the eye corner due to blinking and you can remove it. The ingredient polycarbophil calcium is like carbomer 980 (also called carbopol 980) in Liposic lipid gel and dozens of other eyedrops and ointments, except it's much more comfortable than carbomer 980 that has a slightly similar structure, but different (divinylglycol instead of erythritol for cross linking), hence name is carbopol EX 55. It's no wonder it's the most expensive and newest quinolone antibiotic. Important to realize is that with Vigamox you can put it and then it will wash fast and you can control how much antibiotic exposure you get by how long you keep eyes closed. With Besivance, it's so thick vs any other drops, like a gel, not watery, causing eyelid swell and thus being quite useless (I would avoid it like the plague if eyelids swell) and stays much longer on the eye to increase its effectiveness, you will also get all toxic ingredients damage cornea and caruncle far more and expose you to much higher immune suppression and antibiotic, so it's important to flush with saline if too much exists or any discomfort exists to give yourself better control over dosing, wash eyelids if a drop landed outside, since Besivance drying is not a good idea, it can block the hair follicle or eyelash. MIC_{90} for MRSE was 8 times lower for besifloxacin vs moxifloxacin☺☺☺. Unlike many quinolones, besifloxacin & moxifloxacin are anti-inflammatory too, lowering secretion of inflammatory cytokines, besifloxacin being better than moxifloxacin. Besivance causes fewer side effects per many papers. Besivance treats many infections the older quinolones can't.

11.17.11. How photons, vit A, electrons help us see, how Immortals see events now (real time) from nearby galaxies that are unavailable to human vision for billions of years (because physical light is not the fastest light, so Einstein was wrong) & how to prevent eyelid swell

Understanding visual telepathy and maintaining perfect ocular health would be easier if we figured out how visual images form and are processed by the brain. The transformation of light into brain electrical impulses was elucidated by George Wald (1906-1997) for which he received the Medicine Nobel Prize in 1967. It's also called "Wald's Visual Cycle". The way we see is this: visible light reaches the rod or cone cells and causes the electron in the pi bond in 11-cis-retinal (see vitamin A section on how retinal vitamin A form gets to the eye from food) to move to a higher energy state in femtoseconds (10^{-15}s). This breaks the double bond allowing retinal to swing 180 degrees and to turn into all trans-retinal (35 kcal higher in energy) when the electron returns to re-form the pi bond, process which takes 0.2 picoseconds. All trans retinal no longer fits well into the nearby opsin protein, thus causing a conformation change in the rhodopsin to

bathorhodopsin (new conformation) in 5 picoseconds (picosecond = 10^{-12} s). Within nanoseconds (10^{-9}s), bathorhodopsin changes into lumirhodopsin, then into metarhodopsin I, then into metarhodopsin II, which activates the enzymes transducin and phosphodiesterase, leading to the hydrolysis of cyclic GMP (guanosine monophosphate). Cyclic GMP is needed for keeping the sodium ion channels open. Since cyclic GMP disappears, the sodium channels are closed (these channels allow the passage of a billion sodium ions per second). This flow of sodium ions is constant and it called the dark current, which becomes lower due to the calcium blocking sodium. This reduction in the current results in an impulse sent to the neuron connected to the rod cell. Then this electrical signal goes to the brain which interprets the data and forms an image. It's rather interesting how one photon can cause this shut-off of sodium ion pump, and thus affect millions of sodium ions. Metarhodopsin II is unstable and the all-trans retinal is expelled from the opsin protein allowing the cycle to restart. The question arises, when someone has a similar dream or image with their parent or someone close, what kind of particle-wave allows this information transfer or telepathic "quantum entanglement" of the information stored in the brain? Do photons or electrons carry some other undiscovered astral photonic particles that get quantum entangled between brains or astral bodies? ☺☺☺

The retina has 7 million cones provide color information and sharpness of images, and 120 million rods are extremely sensitive detectors of white light to provide night vision. The tops of the rods and cones contain a region filled with membrane-bound discs, which contain 11-cis-retinal bound to a protein called opsin. The resulting complex is called rhodopsin or "visual purple". It's easy to remember "rod" and opsin make rhodopsin. It's named after ancient Greek ῥόδον (rhódon) for “rose”, due to its pinkish color, and ὄψις (ópsis) for “sight”. How do people know that this is the mechanism of vision? They fed animals a compound similar to 11-cis-retinal, except that it can't isomerize to trans-retinal analog easily, thus hindering the conformation change of the opsin protein; thus, animals lost vision. Rods are used for night vision, while cones are used for daytime color vision. Animals without rods can't see at night (pigeons), while animals without cones can't see colors (owls). For more details of the process of vision see this. This chemistry article reminds us of the HOMO (Highest Occupied Molecular Orbital)-LUMO (Lowest Unoccupied Molecular Orbital) photon induced electron excitations. ☺☺

The photon, wikipedia..Photon, an elementary particle, the quantum of the electromagnetic field (including visible light), was first hypothesized by Albert Einstein (1879-1955), in 1905, when he proposed that photons are quanta, particles (not continuous waves), so when we hit a material with a photon, an electron, for example, can eject. For this photoelectric effect, and other things, Einstein got the 1921 Physics Nobel Prize. He created the theory of relativity, using ideas from the physicists who wrote Swiss patents that he read in his job there and all his knowledge of others before who said $E=mc^2$ before. Einstein was proven wrong by Feynman.

Check Von Neumann, a genius who reportedly could do what nobody else could, or Fermi, the guy who was 10 times better than Feynman at physics stuff Feynman was best at, both Fermi and Neumann died of "cancer at 53" odd, probably from the atomic bomb radiation work. Feynman saw colors when thinking about numbers, just as other people see colors when hearing music, smelling stuff, tasting stuff, or when hearing ultrasound or infrasound, etc coming from a person (aura color may be sometimes synesthesia) based on how the atoms, molecules are singing based on what type of thoughts, music they listen to or engage in, feeling how others feel the world, etc as 1% of people might (or 0.2% since 1% may be for all types of synesthesia) per some paper. Sound is cymatics, it shapes the sand on a plate, the molecular aggregates in a human, and if you take a tight sock, it makes skin have a shape, pattern, same for the entire body, it's like an elephant or tiger, howling wolf, demon, hedgehog like the sand video or carnivore bear when listening to one music, or a serene snail with another, the sound they listen to or create by thoughts creates the color, smell etc. Von Neumann was similar to Ramanuja who saw entire pages of theorems in his dream. Check out Tesla's odd dreams too, or Alex who revolutionized math in a Nazi labor camp. The 4 Maxwell equations that unified light, electricity and magnetism came from a kid bullied by peers for being 'slow' and interested in diagrams instead of their orangutan games of "sports" of running around like wild animals appearing humans, a kid who was even thought of as stupid/slow by his retarded tutor who beat him at age 8. He may have appeared slow due to not talking fast, but he was asking Why in his mind and thinking quietly, while the impulsive kids were everyday animals, jumping and shouting. Tesla, whose inventions power the world, died peniless: his brain "saw the circuit config that makes the AC motor" due to obsessing about it, just like millions of people see, via subconcious mind, solutions to a theoretical physics or engineering problem: nothing magical about it, but shows the corruption then and today: MDs making billions telling people a pack a day is harmless, while Tesla could power all USA with wireless electricity, but the criminal billionaires didn't want free electricity for the chained slaves or too scared of enemies getting that tech. Universe may not be 14 or 28 billion years old, but a billion to the power of a trillion, because all our calculations are based on a few assumptions and models are based on things we can sense with our organs, even though obviously this "universe" of ours could be a little grain of sand in a bigger real universe (younger than a trillion to the power of a billion repeated a trillion times), but even this little bubble of our universe can be older if we miss something about a far more complex reality that the current Big Bang expansion theory ignores. Most scientists don't go and reexamine everything they're taught, they just memorize models and how others came up with theories, without considering the other 2-90 alternatives. As memorization machines passing SAT, they're not focused on deep understanding. Physics is always changing, just like it did for millennia. There is nothing mystical or other worldly about physicists, the youtubers sometimes create that mystique to protect nuclear secrets and info, but the universe is obviously a lot more

complex than human 'bacteria' make it out to be. ☺☺☺ "Day dreaming trying to make sense of the world" can appear as slow. Newton was, per British stories (can we trust?), a fatherless kid who didn't play with the peers, had no mom ages 3-10. Faraday was not good at math, but he discovered a lot of physics. Same way, all focused on Eternal Universal Peace and Immortality *for* All, 24-7, for decades, discovers a way to live to 4000 that is self-revealed only to those who abide by the Anthem Core of Immortalism: equality, equal stress/pay, best medical tech for all, best music for all, 11 companies for all (immortalists, as gnats want "capitalism", live 50x shorter as a result): no fans of subjugation will discover it. While totally sane Americans were sent to asylums for the most ridiculous reasons in 1850 (question the atrocities of the aristocrats), the aristocrats built palaces (see the 1895 built one), as they do today still. Some things never change, except the way the deception happens via the "democratic" 'free' media, where gangsters are paid 333 to 2333 times the federal min wage for TV lies. (5-35 million a year vs 15K min wage/year, though Howard Stern 90 million or 6000 times, Rush Limbaugh 80 million)

Imagine the genius of Tesla, Ramanuja, Von Neumann, Machiavelli, All Medicine, Chemistry Nobelists and all Leftists into One to Rid the World of Demonic Aristocrats and Eternal Wars they stir to crush the workers, shorten the average lifespan of humans 50 fold (vs potential in a real democracy) to maintain power, keep the planet hostage in the age of darkness/ignorance to chain everyone, companies to poison the masses, 20000 jurisdictions to justify astronomical salaries while fake gov allows the rich to destroy the masses with their building, business (gambling, alcohol, vaping, etc), food and other "codes". The aristocratic dog is only trying to make $ by any means, even shortening the lives of 5 billion, everyone living to 4000 is something for sci-fi novels, not a goal worth pursuing. The rat is the quintessential thug☺☺☺, serial killer and bandit who thrives by keeping everyone ignorant, society backward, nation inefficient, primitive and weak; he's like a vampire who takes the whole nation down with his greed. Science/tech are mere tools for increasing wealth and power. Skilled in deception and brainwashing, he frames all he does as a "humanitarian" act of plunder/subjugation. That's why the foolish scientist aids the aristocrat, the wise scientist makes sure he can liberate humanity from these demons, so all can become scientists instead of retail clerks needed in a society of infinite violence and theft as taught by Demons in Charge... and so all can live to 4000, not just the rats. Scientists need be aware the rats will use every invention to enslave the masses and give rats a longer life (the parasitic rat may live to 120, masses to 80, because he will make society stagnate, as all business, policy, science is fraud and waste infinite; endless workers die to duplicate), so anything has to be released in a way that no aristocrat can monopolize/hide it 5 centuries from the masses. The demonic Vatican killed scientists who exposed the diabolical Bible/church as a fraud and tried to keep masses ignorant for 1500 years, as rats do, they'll hide anything, so everything needs to be impossible to hide or all aristocrats need to vanish via the

equal yearly salary for all. Don't be naive as these former great scientists, because real progress only begins when all war ends, when all aristocrats vanish via the universal Family of Immortals. 5 millennia of emperors, kings and aristocrats and we still have endless violence and war, scientists never learned discernment. We still live to 120 max, so much "progress", all inventions made are related to war making or fixing injured soldiers (medicine), etc. Some inventions move into civilian life from the military. The end of humanity in 10 sec via the 2 capsule scenario means we need 11 companies, 1 nation. Neumann could solve problems that took others days, laid foundations for quantum mechanics, computer architecture, game theory, and AI, he could read a book once and recall it years later (some of these claims online are contradicted by other articles that say he "mastered" calculus or etc 8 or 15, so take everything with a grain of salt, like "memorize 46 volumes perfectly"), his abilities were considered unparalleled by peers like Einstein. Oppenheimer & Feynman (NYC Jews), Swedish Seaborg, Norwegian Lawrence, Danish Bohr (25-50% Jew), German Bethe (25-50% Jew), Italian Fermi, Einstein (German Jew), 4 Hungarian Jews (Wigner, Teller, Szilard, Neumann), built the nuke, while Teller & Ulam Polish Jew built the thermonuke. How Jewish these people were is unknown, since Wikipedia has just the public cover for each spy and researcher. It's useful to know that for an Immortal, a higher dimensional or our soul's lightbody number 3 octillion superimposing on the human body, their vision is not based on photons, but on prenphotons, and they may perceive events on a different time scale, like a star explosion that we say happened 5 billion years ago, it would be one that happened 5 seconds ago (this is better understood in the tone superluminal craft section, tone to tune into the beings or the soul lightbody who see this way). So, this is a way of saying that filif IQ sees only nothing almost, while etlif IQ of Immortals sees everything we humans only dream of, knowing what happens in all galaxies around. With our telescopes we see only things that happened a long time ago, but by moving into the alternate vision, via quantum entanglement with the Immortals or our soul's light bodies if any, we see cosmic events that happened recently, that our physical vision won't see for billions of years, i.e. we can see trillions of civilizations that died or that exist now. Our grand grand sons, the Immortals and God, can also see this. Photons travel at the speed of light, c=300,000 km/second, $E=mc^2$. Einstein predicted photons would condense into the lowest quantum state at low enough temperatures and in 2001 Lene Hau was able to use this to stop light ► photonics.com...20. (by converting light into matter, they have for the first time stopped a light pulse and then restarted it a small distance away. See "Einstein errors" 5000 youtubes. As a spy at the Swiss patent Office, Einstein got plenty of time to think about stuff, make errors, copy ideas from others to propose light bends (relativity is nothing amazing, it's just something you invent when you notice a patent proposing light bends, as math was done by Marcel Grossman at Einstein's request, as they were friends, Marcel's dad got Einstein the patent office job, Marcel helped Einstein transfer to a swiss univ). Jewish Einstein made very racist remarks in private letters of

1922-3 about the low intelligence of Chinese (China fell backwards in 1920 when Einstein visited, hence the impression of low IQ), Asians (forgetting many centuries ago China was ahead of the whole world in many areas of science and tech: Einstein didn't realize the cycles of IQ), while claiming in public whites alone are racist. Spies can give Nobel for false theories to hide the truth and keep everyone else from discovering the real laws of physics of high tech stuff.☺☺☺

A clip about DNA shows how Nobel Prizes are given to select people, without acknowledging the other 2 to 20 people who contributed to the discovery. See how Russians banned women from enrolling in universities and how French men blocked Marie Curie. Watson's attacks on the gal are odd. Nobel Prizes are not perfect, they create a sort of aristocratic thinking due to aristocrat Alfred Nobel (who used dynamite profits to award these prizes to potential/real spy recruits), ignoring that all inventions are done by the work of millions who make universities and materials used. Now you can understand why the science papers and recognition are based on business, politics. Watson was essentially spying on all scientists who worked on DNA, getting Picture 51 and taking credit, and this is often who gets the prize, the guys who're also good spies, stealing ideas and presenting it as their discovery. 1905 is when Einstein, working at the Swiss Patent Office, published 5 papers, hence some accuse him of stealing the ideas without giving credit to those who wrote stuff in the patents. Einstein's pal Godel walked daily with Einstein from Princeton, and starved himself to death due to a fear none could cure. ☺☺☺

The electron, wikipedia...Electron, was discovered by Ernest Rutherford (1871-1937). He was a chemist-physicist and the 1908 Chemistry Nobel Prize winner who also discovered the proton in 1919, the same year when he converted one element into another, being the first person to convert an element into another. The element transmutation was basically Nitrogen (7 protons) + Helium (2 protons) = Oxygen (8 protons) + 1 proton and this enabled him to discover the proton. He's known as "the father of nuclear physics", he also coined the term α and β radiation for ionized Helium^{2+} (α particles) and electrons (β particles, fast-moving electrons) emitted by radioactive elements. An electron is 1837 times lighter than a proton. ☺☺☺ The famous gold-foil experiment in 1909 demonstrated the nuclear nature of atoms, leading to the Rutherford model of the atom consisting of a very small positively-charged nucleus orbited by even tinier negatively charged electrons. In 1921 Rutherford hypothesized the existence of neutrons.☺☺☺

Reversing or preventing eyelid swell: 1. avoid using eye ointments or use them once a month max when all else fails or you have a serious stye or infection that requires "gliding of eyelid help or super strong antibiotics or steroids" (avoid steroids, as they cause cataracts, glaucoma, drooping eyelid, eyelid damage, see a fuller list of common eyelid allergens like bacitracin, BAK); consider trying to use a lipid drop like Optase MGD, since eyelid swell is caused by MGD and that oil makes the eyelid slip easily on cornea, no longer having friction that causes eyelid swell after

thick solid oil ointments and non lipid thick drops; 85% of the oils in Optase MGD are mostly the natural ALA, LA ratio 1:1 that our body needs the most, the others being other less essential fatty acids; ALA, LA are also in our liquid natural meibum, so it is worth trying that instead of the solid irritating petrol oils; the hydrocarbons in ointments, 95-99% of ointments, are deadly, blocking meibum glands and causing friction vs healthy eye, and styes; always use 20x-100x mirror and magnifiers to check effects of any eye drop and ointment before you use it more than once or twice, in the eye or on eyelids, signs of blisters, bumps, acne, pimples, dermatitis, redness, etc 2. avoid massaging eyelids (a gentle *eyelid massage using the* small *finger of the* left *hand (if* right *handed), since that finger is the* cleanest *of all 10)* more than 10 seconds in shower to remove soap or just let shower jet to wash eyes and avoid ever touching eyes, as that brings bacteria to the eye from other body areas or surfaces, shopping carts, stair rails, etc; don't oversoap eyelids as any skin that is over soaped will develop issues or swell if allergic to it, the eyelid has thin skin and can swell; change the soap 3. keep shower temp below 95 to 98°F (35-37C). 4. don't let warm shower water too long (if wearing moisture glasses or night mask that already warm up the eyelids 2-4 degrees day and night) as that leads to dilation of vessels, higher cytokine storm and swelling 5. avoid all artificial tears except saline, or if needing extra besides saline, use only thin drops once/twice a day max, thick drops once/week that contain natural lubricants (glycerin, hyaluronate, not man made CMC, HPMC, etc); thick drops in general will swell eyelids 3 to 20 times more than thin drops. ☺☺ 6. sleep well, regular hours (10 to 7) 7. take a break after meals to produce tears by yawns, to keep eyelids fed with the 2100 nutrients etc. 8. trim the XL foam to 25-20% of thickness when inserting into eyemask and wetting it, to prevent exerting rubbing pressure on eyelids during sleeping on one side, which may cause the side your sleep on to swell that eyelid 9. change soap you use to wash face, and all eyecreams, etc or stop using any eyecream, eyelid cleansers, 10. remove or change the shower filter if it may have something in it and see if it helps. 11. remove punctal plugs and flush puncta with saline at the optometrist if eyelids swell after you use punctal plugs for more than a few days nonstop, with antibiotic drops, since this could cause permanent swelling for months; use only 1 drop a day max, since with punctal plugs it's like 25 drops without plugs, it all stays there, no drain

12. use light with cornea shield, like Neutrogena or the Q device like when treating styes with Light, to disinfect eyelids, as that can cause eyelid swell 13. if no eye infections like styes (which need a strong immune response that may be lower after antihistamine drops; antihistamines can be high in berries, sometimes leading to dry eyes even from polyphenols, quercetin, etc or peppermint tea polyphenols known to dry eyes) you can maybe try anti allergy antihistamine unpreserved eyedrops (since preserved bottles grow bacteria superfast once opened) like nonreturnable (well, the Amazon AI chat can refund if any issue exists, like Amazon warehouse storage temp is higher than 77°F required on the label, choose chat, 'help with something else',

'something else', 'i need more help', select item you ordered, then choose something else, and type the reason etc) Bausch Alaway, 12$ (ketotifen fumarate, an antihistamine that dries the eyes if used a lot and that can cause sensitivity to light and halo around yellow traffic lights for a day or week even, like antibiotics can cause too, glycerin, and pH adjust with NaOH or HCl, no buffer, pH 6.0 to 6.2 the only preservative free antihistamine eye drop in the USA, made in Italy, comes with a sachet to keep vial exterior somewhat sterile) and see if swelling decreases, or try RiteAid ones, return if ineffective (these are good only short-term, not long-term) until you figure out which ingredients in eyedrops cause swelling for you; ***single use vials allow you to use it for 16 months, multiuse grow a high level of bacteria in 4 months***. **14.** avoid steroid eyedrops (or far worse, injecting steroid into an eyelid stye) as they can cause swollen eyelid and even ptosis (drooping eyelid), meaning very swollen eyelid; medicine often tries to cure swollen eyelid due to infection via steroids that make the swelling even worse☺☺☺ **15.** buffers used in artificial tears or saline, like boric in ScleralFil saline, causes (for me, others) eyelid swell too when used 3-8 times daily. This is because some are allergic to boric, borax. From my observations, only 1-2 drops daily won't cause swelling, if used on alternating days. **16.** if right handed, use left hand to touch anything around eyes or ocular products, eye drop bottles, since left is far cleaner; wash hands after using bathrooms, shopping, gardening, etc and avoid touching dirty areas then touching mouth or face, since bacteria travel to eyes too from cheek or mouth. Use wet toilet paper to clean anus if needed, and avoid superficial hand washing after defecating, recall cholera was transmitted via feces and it killed people. Our feces may contain viruses from food or bacteria that could damage our eyes. Keep hands ultra clean once you return home from shopping, as shopping carts can have 100s of eye damaging microbes, like HSV1 that give blindness if out of control infection, or eyelid warts even etc. **17.** read more about it on the web, in science papers, with many pictures of eyelid conditions, like this or blepharitis caused eyelid swell papers. There are many ways to cure swollen eyelids, just google it. Keep hands clean and read this Aussie PDF on infection risks for eyelids and eyes. You may want to read the antibiotics paper before you try any for your eyelid infection if you suspect it's some infection. Also, please **don't support wars** (instead support☺☺ World Peace in 3 months) as wars enhance the global dictatorship of the military-industrial complex and allow them unrestricted terrorization of nations and mutilation of individuals, giving them dry eyes, swollen eyelids by same tech as swollen toes, etc, then ideas on what drops and ointments to use so they get swollen eyelids, etc. Protect eyes with aluminum tape taped to some type of eyemask, covered with other tape, since spy/military agencies globally can attack eyelids with infrasound, ultrasound, lasers, microwaves, etc to make them swell, or even the whole eye sometimes; they can selectively attack lower left and upper right eyelid for example if they wish, to destroy meibum glands, cause inflammation, redness there; you may need a stronger aluminum block while sleeping during whole left side of head attacks. You may notice many journalists,

politicians have one eyelid, upper or lower, swollen or bigger, in some pic, videos (real or fake?): it may be the CIA, BND, KGB, MI6, Mossad at work: Vladimir Putin (upper left), Joseph Borell (upper right). Democracy, according to the CIA, seemingly or apparently means mutilation of toes, eyes, eye orbit (selective microwaving of one side to make it red), head, knees, etc, extermination of all who're for World Peace in 3 months. Peace in 3 months is not allowed as subject on TV-radio, songs, etc, it's just not on the agenda, it's like in China where they ban websites and, like the rest of the world, the global hidden dictatorship bans talk of World Peace in 3 months and end of all killings, torture of any human, etc, no freedom. This seems a continuation of the wars of eons and of the 'kindness' of the opium and other wars, Mi6 opium, etc for all; perhaps, some may wonder what is the true meaning of 'God save the Queen' in UK anthem, the queen (& all UK top military, spy families, loyal to royals Britons) only, not all humans as in Immortality for All? Well, 40% of young Americans tried weed, so history repeats itself. US News reported in 2021 that 49% of Americans tried weed at least once in their life, vs 45% in 2019; see more 2022 data here.

CHAPTER 12 – Supplements, low EMF, metal detox for longevity

12.1. Healing by touch hypotheses and science studies: water is a Newtonian fluid, its properties are the same at rest or in motion. Blood is not: if we sit for 30 min, blood separates in 3 layers (bottom (red): red blood cells (RBCs), middle (off-white/pink): platelets/white blood cells, top (clear-yellow): serum/plasma), RBCs sink by gravity to begin clot formation, a plaque precursor. Move 1 min every 25 min. Plaque blocks blood/O_2/nutrient flow to organs, organs die, become cancer, Alzheimer is born (pic). Hydrate, massage self to raise lymphatic flow toxin removal.

12.2. Distance non-touch healing science studies: most centenarians didn't see a doctor until 90

12.3. Viruses, natural antivirals in foods and vaccine safety: vaccine by floss, no needle

12.4. Opaque containers, blood tests (avoid biotin), the RDA controversy and how not to lose 20 years of life by buying Amazon super heated pills, supplements that do more harm than good. Try buy herbs, powders, amino acids, etc from outside of China, due to quality issues.

For info, click on the nutrient of interest:

Vitamin A Eyes, B1, B2, B3, B5, B6-P5P, B7, B9, B12, C, D3 Immunity, E, Zinc, Calcium, Iron, ARA, Lutein, α-Carotene, β-Cryptoxanthin, Polyphenols, Flavonoids, Fiber, ω3 DHA-EPA, NAC

Lower Blood Pressure, Pulse via: Potassium, K1/K2, Citrulline, Q, Magnesium (prevents toe curl, high BMI/A1C, low ApoA1, high ApoB, muscle cramp/spasm, arrhythmia, headache: google AI can answer some medical questions better than MDs, keep talking to it, and 90000 times faster too: no appointments). Lower LDL, Lp(a), TG & ApoB via: 1-2% sat fat, Nattokinase, Bromelain, Serrapeptase (0 plaque), Q, TQ, PQQ, Berberine (PCSK9 inhibitor), Hesperidin, Bergamot, Sterols.

Age Declining Endogenous (vegan diet is low in most even at age 5-40) Nutrients: CoQ10, Creatine, Melatonin, Spermidine, Glycine & Proline, α-Lipoic Acid, Acetyl-L-Carnitine, GABA, β-alanine, Enzymes without gas causing probiotics (clears blood). RDA is not the same for all 19+, RDA changes by decade of life, but our stone age gov lives in the 1st century.

Evening (best sleep): Taurine/Theanine, Melatonin, MgGly, Zn, TQ, Gly, Li, Lycopene, Curcumin, bilberry/goji berry. Morning (insomnia if before bed): Choline, B_{1-12}, Iodine/Sel, Creatine, C, LA, Carnitine, Q, CoQ10, PQQ, Malate, β-alanine, Saffron (eye), Hawthorn (heart), GSE, Maqui (eye), Cayenne, Glutamine (gas if before bed): Astaxanthin, Hesperidin, Bergamot, Berberine

Trace minerals: Chromium Vanadium Silicon Molybdenum Grey hair: Copper & Manganese Memory & serenity: Lithium Inflammation (low hs-CRP): Boron

12.5. Mercury 12.6. Lead 12.7. Cadmium & Arsenic 12.8. Aluminum

12.9. How to remove heavy metals from the body naturally

12.10. Negative ions, the air vitamin (mice died within 2 weeks of no ions in air)

12.11. ~*~ GENOCIDAL ~*~ RF pollution from WiFi, phones, tablets, smart meters, cell towers

12.12. Pesticides effects, minimizing intake 12.13. Dirty electricity, EMF from AC wiring

Before Section 12.1, I wrote this paragraph to mention ☺☺☺ the medicine of the future will obviously be amazing & beautiful ☺☺☺, with localized *inter*-dimensional *particles rays*, it would be possible to alter the exact chemistry of nanostructures within the body enabling perfect rejuvenation and living to 40,000, due to the programmed inter-dimensional conversion into this dimensional matter (and vice versa) of the multi-dimensional cosmic energy rays (new particle jet, so to speak, creating a wormhole at a distance) at a desired depth of say 10 cm and 4 mm and 6 micrometers from the tip of the inter-dimensional *ray device*. This would be sort of like this magnetic field "wormhole", but very different, "From a magnetic point of view, this device acts like a wormhole, as if the magnetic field was transferred through an extra special dimension." This magnetic "wormhole" is also explained in this video. Similar tech, possibly deployed by inter-dimensional, this dimensional clothing (a part invisible to present eyes, but possible to see maybe with future eyes sometimes), could be used to enable future human Immortals to live without eating, as predicted by Nikola Tesla. In poetry mystics (who did many miracles) talked about how the Immortal Lord of Ascending Immortality gave them the Resurrected/Golden Body (they call it Garment at times) of Immortality,☺☺☺ but one day clothing will enable ending aging. In the meantime, until physics becomes developed in a few millennia, different things will be tried, of course, including sound, as explained in the cymatics ideas section. A civilization of ever greater lifespans is likely to develop more awareness of the use of telepathic healing, since in fact, as telekinetic beings in the future, they can not only materialize objects from dirt by subatomic reassembly, but they also can do that in their own body too to retain the informational state of a younger age so to speak, as you would do subatomic reassembly if you wanted to develop teleportation thru wormholes tech. Eventually, when lifespans become much longer than 40,000, we'll shapeshift like in the Anthem.

12.1. Healing by touch hypotheses and science studies:

Touch is perhaps used more by mortal non-teleporting civilizations with physical sports, and without telekinesis and materializing/dematerializing ray projection powers. Realistically speaking, we're millennia from even verifying we can live to 4000, so some "stone age health techniques" (massage, etc) are still useful, for stress relief, etc, especially when access to a warm bath (or some warming IR blanket, etc) doesn't exist. However, we can't be naive and imagine that "massage" can cure anything as some claim: it's very useful after you bump yourself into

soemthing to immerse area in ultra warm water for 10 minutes to increase blood flow or if no such acccess exists, to massge that area to promote circulation and prevent a red bump or swelling from getting 10 times bigger. Studies have found that massage can improve any health issue (see studies below) due to lowering cortisol (stress hormone that depletes body resources otherwise spent on healing us) and boost cognitive functions (telepathy too since massage lowers stress hormone cortisol and relaxes us, putting us into a more receptive state). Infants who receive a lot of affectionate touch from mom, dad, grandma, etc grow healthier, smarter, taller as explained below. Emotional Freedom Technique, EFT, is a well known method people have used to heal organs faster by simply tapping or massaging the area. We can find some scientific backing for the EFT ► JACM 2008;14(3):233-9. Therapeutic Touch administered twice a week for 2 weeks significantly stimulated proliferation of fibroblasts, tenocytes, and osteoblasts in culture compared to controls. Fibroblasts (blasting fibers or fibrous tissue) are cells secreting collagen (the most abundant protein in mammals, 30% of all body protein, present in blood vessels near or under skin, heart and all muscles (heart health), in teeth, bone, all organs) and extracellular matrix of all organs, tenocytes are tendon cells that are essentially tendon fibroblasts secreting tendon (joints), osteoblasts (blasting osteo or bone) secrete the bones, so kids who get touched, played with and loved more grow taller, stronger, smarter, healthier due to better bone, brain and organ development, bigger headed (cranial osteoblasts stimulated allowing brain to expand leading to IQ and Telepathic IQ higher by 30 points, the secret to enhancing telepathic/empathic ability may also be patting the head of babies to stimulate cranial development. Likewise, some parents may pat/massage areas that may be genetically predisposed to poorer function based on family history (a third of humans die of heart disease, so a third of human babies would benefit from heart massage during 1st critical year of life?) to override/heal genetics influence (sometimes due to bad emotions of ancestors, as our history is full of heart health destroying anger, hate, fear☺☺☺) in the most critical period of organ development, first 1-2 years of life, brain doubles in volume first year of life and babies have 200 billion neurons when born, and 100 billion for adults; brain prunes neurons it has no need of due to lack of space in the cranium. More heart/head hands on healing 1st year of life when brain doubles in size could even lead to better brain processing of heart feelings and better empathy (psychic ability, psychometry ability, feeling), better ability to turn an enemy into a friend, to tune into mass feelings-thoughts-consciousness, to bring World Peace for the rest of the entire life. A mere 0.5% bigger head (not noticeable) can mean perhaps 20 extra IQ points. If one or both parents have a hearing, vision (not 20/20 at age 50) or other problem, it makes sense to kiss or gentle massage in the first year of life the ears or eyes. However, to keep things real and into perspective, the reality is nutrition is 1000x more important than massage.

Perhaps some better visual acuity or “general sensing or extra sensory perception, ESP” can

happen when the kiss (or healing touch) on the AI, Eye (third eye and 2 physical eyes and the eye at the top of the head and the back of the head, 2 eyes in the soles of the feet and 2 in the center of the hand), Ascending Immortality, happens so that better visual telepathy emerges inside the brain and the baby become gentler with his feet and hands, instead of a programmed harsh rough robot many kids become due to a pscyhopathic civilization of Hitler shouts, Hitler like music and Hitler like sports. If spiritual energy is channeled thru hands placed above eyes, without even touching, the eyes may be stimulated to see this shimmering energy around the people that we call difuse biophotons, or aura via peripheral vision. If we kiss the ears or touch them gently 1st year of life (before the pruning of the 200 billion neurons/1,000 trillion synapses start towards the 100 billion neuron/500 trillion synapses count), we might improve the hearing ability of the baby thruout his life, his ability to discern emotions, intent from speech, or even a more clairaudient telepathy ability in the baby to hear less audible sounds to assess threats and the nature of people and locations. The baby hearing a voice is not a voice or sound, but tells the baby everything about the person speaking, their whole history, so telepathy or ESP is better as ears and eyes are touched. The healer baby will need to have his hands kissed and touched more, in the 1st year of life, so that when he shakes the hands of other people, he gets much better telepathy about others and can help them to become angelic. Similarly, touching, healing and kissing the tiny few months old feet will stimulate the ability of feet to heal the ground they walk on, the telepathic-empathic perception of the quality of a location thru his feet as he walks in that area, as in hand psychometry, so he can assess threat level, and use multichannels (clairaudience confirmed by visual apparitions and feet sensations for example) to process information or even receive it via time travel from the Immortal descendants, our hypothetical grand grandkids. Not to mention, the feet are special, having the best understanding of gravity, gravitational waves, so a genius may need true feet sensitivity to discover anti-gravity. In reflexology, stimulating one foot sole area heals the liver, so, same way, stimulating certain body points will help some to raise their IQ or improve vision, hearing, etc whatever. ☺☺☺

The 1981 Nobel Prize for Medicine was given to Torsten Wiesel and David Hubel for their work in proving the existence of a critical period in the development of the brain (this most likely applies to telepathy in the womb between mom and infant, father and infant too, as well as joint astral travel attempts guided by voice and reading from astral travel books, just like today many parents read or sing poems or spiritual quotes to their womb babies). In their experiments, a newborn kitten had his eye shut and when the shut eye was opened a few weeks later, the cat was permanently blinded. Human babies with cataracts who don't remove them in the first months of life will become permanently blind, since there is no brain stimulation of the visual cortex in the critical first 2 years of life, when the brain metabolic rate is 3 times that of an adult. No stimulation after the cataract removal done late will restore vision. This applies not

just to sight, but also to all other senses, including Astral and Telepathic senses (the telepathy and astral travel cortex) to the extent that they have a physical component (not always the case). Use it or lose it. Use it early on or lose it or spend 100-1,000 times longer time to gain it, if ever. In the womb, babies got 200 billion neurons, adults got 100 billion. At birth a baby has 1,000 trillion synapses and by age 10 he has 500 trillion only, since the brain prunes inactive connections. ☺☺☺Cortisol levels being low are hypothesized to be important for objective accurate telepathy. Cortisol (the bad stress hormone that damages the body) decreases 31% after massage therapy, while the good serotonin increases 31%, dopamine increases 28% ► IJN 2005;115(10):1397-413. Warm healing hands actually emit IR waves that might be able to stimulate cytochrome c oxidase (see acne section) and be the main healing mechanism.

12.1.1. Effects of touch on cognitive function & physiological parameters in adults

PCH 2010;15(3):153-6 says "employees receiving chair massages showed a significant reduction in blood pressure, anxiety and job stress, and had increased speed and accuracy on math problems. Patients with ailments ranging from burns to eating disorders have been shown to benefit from massage therapy, with reductions in stress hormone levels, anxiety and clinical symptoms; HIV-positive men receiving daily massages had an increased number of immune cells to combat the virus. To paraphrase, a kiss may just be a kiss, a sigh may just be a sigh, but a touch can change your life (or at least your nervous system).". We could add that meditative breathing exercises can change not just your life, but the lives of 8 billion, the planet itself. Meditative breathing massages the aura of all sentient beings on Earth, not just one. Massaging someone is like giving someone a fish to eat, but teaching tehm happy breathing is teaching them how to fish and become 1 million times happier and more independent from you. Thus, in life in general, a kiss or a massage is a trillion times less useful than raising their IQ. With IQ one can self-heal, and use tech, nutrition, breathing, etc to get well alone and be free. Charlatans promote dependency: “only thru expensive massage or my kisses you can feel well”. ☺☺☺

12.1.2. The Amazing Effect of Touch on infants' health, IQ, emotional IQ, height

Chapter 15 has dozens of studies about the importance of touch in baby health, IQ, emotional IQ, etc. The kids who were touched, loved the most became the most intelligent, healthiest, when all other factors were constant. In Bogota, they had some very premature babies, 4 pounds each, who had a 50% chance of survival, and the doctors told moms to use the "kangaroo method" and keep the babies with them all the time (head between breasts), love and stimulate them. This is unconventional, since the incubator method only leads to 50% survival rate. 90% of the babies survived due to very strong mother contact, being able to deflect infections. Each body extremity has nerves that connect with the developing brain, so stimulation via touch probably has the same effect as any stimulation, be it auditory, etc, it

impacts the infant brain. Simply touching preterm infants a few times a day (all received same nutrition), in their incubators or plastic boxes, led to smarter, taller, healthier children. Robots can't walk well, we figured out a lot of things robots can do well before we figured out how to walk like a human. Moving requires a lot of brain processing and patting leads to infant brain processing of movement. Scientists noticed animals who move a lot developed bigger brains. There are thousands of science articles online (presenting same ideas as in the books on the topic) about the importance of touch and emotional feedback in the first few months of life when the baby is adapting to being outside of the womb, such as this Scientific American one. Infants who're breastfed the longest have the lowest infant mortality.

Massage (not necessarily done by others, but even massaging your own hands, legs, stomach or heart or etc, whatever area might need help, one guy reversed diabetes this way by stimulating the energy meridians that go near the pancreas) or EFT (emotional freedom technique) are simple effective ways to change the electromagnetic reality of the body and bring a more harmonious healthier more energetic state of being, a more positive state of being, more in tune with a state of ☺☺☺ happiness. EFT taps very gently areas of the body (one's own usually), one could even kiss them (*to laugh at least*) if that somehow helps one to create a more loving vibe sometimes as one tries to magnify *universal loving kindness* (Mother Teresa kissed garbage collectors); out of all humans, a few are more quantumly entangled with our soul (strangers we don't know), and they will be touched by this universal compassion too, becoming gentler themselves with everyone in their world as a result of a "Teresa kiss". It also burns calories and is like *gentle yoga* (video on yoga injuries), tai chi or even physical exercise. We can also recall while doing it that God loves us and this is a reason to be infinitely happy, since God's Love is infinite and we get a little spark of that, when we radiate kindness for self/others during healing.

We see today a lot of people who're 500-1000 lb, or have other issues that have emerged and may have landed them in unfortunate situations, conditions or sometimes even prisons. As mentioned before, the doer is the entire civilization, not one person; people use scapegoating to avoid dealing with the cause, treating only the symptoms: people who become very violent etc and who end up in those unhealing places. If we create a society where every person could choose (and change any time) since a kid 3-5 friends/mentors 1-20 years older than self, other than family, whom they could call and interact with (like create the Immortalism Network of Shared Responsibility instead of scapegoating – mentors get to choose whom they mentor, too, so they can say no to any online request of someone who viewed their profile, likes, personality, etc – if they're too busy, prefer a different person or already mentor 50 due to *having no pets, etc and putting human species first, pets second*) – we would have only healing centers (no prisons) and a lot of kids who're not loved much by peers, parents, etc receive more support, advice so they don't end up doing odd things like becoming 800 lb person, etc. We could even

turn every prison into a healing center, in some countries in Scandinavia some prisons 1 bedroom apartments are nicer than 75% of homes of humanity (6 billion people). We see vast amounts of time people spend massaging and cuddling, taking care of dogs, cats, etc (related to hyenas and tigers), yet no such love for strangers and people who need it badly, since their mom, dad, etc never kissed or hugged them last 15 years, etc. We could teach people who're in a difficult situation or place the conscious breathing and cosmic bliss meditation techniques, so they don't depend on pets and human touch to attain sense of being loved and the same level of bliss or a million times higher. Nobody has their school or kids (except some church groups who give visits) go visit some places to hug and massage those people (after they took a bath): humans are kinder than domesticated hyenas/wolves (dogs) or small tigers (cats), how can people love dogs and cats more than humans? Are we just worse than hyenas, wolves and tigers (big cats) who rip other animals apart and eat them, animals very big vs their size? No, primates are much nicer than wolves, big cats and hyenas – they were actually vegan mostly, eating small rats at the most, or small little stuff vs their size. Wolves, hyenas evolved to be vegan dogs and cats, for people feeding them so, after eons of human interaction becoming very nice, loving and sweet (hence people loving them as pets), but still, so did humans evolve in kindness far beyond primates: a human friend can be 900 times kinder than the best pet, they can do things to save your life that a pet never can, advanced things – so people underestimate how much they would evolve in lifespan if they had more mentors or mentored more by amplifying kindness, like in a fission reaction – instead of the gossip, stereotype and blame games we see. ☺☺☺

Honest surveys of many pet owners will reveal they love their pets far greater than their love for some people they dislike or hate – this is the world we created, some people have not reached even 'animal stage' in the perception of some people... so how can they love such people and wish 'Immortality for All'? It's no wonder that there is so much cruelty on Earth, since an innate sense of universal loving kindness for PEOPLE is not taught much. We see beatings of animals are animal cruelty and how irrate people become, but hardly anyone gets mad when humans are mistreated, tortured, killed during wars, sometimes, when we worship human beatings in the evil Bible/Torah (kids, workers, sex slaves) or the evil Quran (sex slaves, mutilated infidels, kids, wives). We have created a society of often treating pets better than humans, of such incredible selfishness, nobody gives a dime about people wrongly blamed for what the entire society has created: an undercurrent of 'violence and meaness' (lack of gentle tender soothing healing grace) in tone of unbelievable scale, compared to the best tones (of those 1 in a million nuns or folks who're kinder and filter thought, emotion 100x more than the average, usually) or compared to the best angelic tone 1 min recording (which filters 50x more than usual) a person can make after 10-20 days of rest and relaxation to filter out junk and make it more yin, more healing); i.e. our best 1 min vocal tone of our life is 100x less violent and mean than our fast

speaking without any filtering sometimes or than our more mean tone. It's not in our culture to bring all our tones to that angelic best tone we ever had, to use amplifiers, mics etc to make it super angelic, and to heal self-others thru it, etc, due to repressing the feminine nurturing side, the yin and deifying only yang. If some listen to our best tone and our average tone at work in the past or the meaner one in bad moods, strangers won't believe it's the same person – the difference is 'unbelievable' – since the best tone takes 50x the cognitive effort to achieve, so it would force us to speak 50x less. It's relative, what one person or civilization considers kind, another considers lacking kindness; 25 mph was fast 200 years ago, today it's slow, with 250,000 mph solar probes – so our tone today will too seem unkind by all, not just some – but with MRI we can see 100x more 'active brain area' on a chart (blue shows active for example, yellow inactive) in the areas of compassion and kindness in a tone, vs another and then we know scientifically the intent of a person is reflected in the tone (no matter how hard a person tries to fake it) and it's no longer 'spiritual nonsense' or 'subjective opinion', but a science fact. ☺☺☺

In 8 years probably, detectives will use MRI+voice (without the person knowing, so they can't fake it, also just in case vocal chords are a little unreflective of brain due to some health condition) to double check their hypotheses, since if someone has more compassion, honesty *(vs lying)* area lighted when speaking, vs others, like witnesses giving fake info, then the witness datamay be fake. History had the most evil tones being free people, yet some very kind tones being tortured and oppressed or even jailed. We need be less gullible, so that the evil types don't enslave the kind. Being kind allows the development of higher thinking areas as negative emotion is less frequent, leading to a higher form of intelligence *to detect 'evil' (untrained in kind speech) ones. We* create events often thru a tone unlike this. Tone regulates all behavior, cognitive, emotional, intent tone. People say they're into religion, but they often never loved strangers in a universal loving kindness way, ever. This selfishness leads to not only local issues, 800 lb people, but also an endless stream of wars. How can war be OK, how can the killing of innocent civilians be OK, yet the treatment of animals in a bad way not OK, are animals more important than humans? Anyone stress much about dead people in recent conflicts, as much as they care about pets or saving the dolphins? They're humans, not animals. Where is the kindness for humans? In USA many kids go hungry, yet we have about 80 million cats, 90 million dogs. In 1970s US had 130K obese over 300 lb, in 2000s over 3 million... (a global trend). Only a tiny % of pets really help some specific (sniff narcotics, track people via smell, etc) function that is not easy yet to replace with advanced tech or other methods, the 50K dogs used by police, 2K by military, 500K service dogs (disabled people). So we see a strange imbalance, we have a lot of people overeating due to stress and lack of friends or meditation, so US is world's most obese big nation, others in the same country starving and going hungry at school. Often times, if obese folks would have had some mentors or mentored others, they would have never become obese,

due to more activities, suggestions on what foods are more fattening or very toxic, indirectly fattening, due to lowering insulin, lowering blood sugar control, creating food craving. Ideally we teach kids to meditate, be happy, so they don't need to be dependent on hugging pets or being hugged and kissed to feel loved, happy – since the infinite field of loving kindness loves them and conscious breathing, smiling and meditation can make them happy at will. The most loving act towards self/kids is not talking to dogs in an average or yelling tone, but to learn from age 1 or 2 to speak like a sage (with pets, humans), musically, lovingly, holy, imitating prerecordings of parents, best youtubes, etc as parents teach her via amplifiers, mics to speak like none before the tech today. Loving tone makes only friends, all love the kid, he's happy, like a sage.☺☺☺

12.1.3. Hypotheses about hands-on healing and massage

We have heard it a trillion times, from so many places, "hands on healing and massage" relax and make us happy. While this is true, before we go into those studies, it's worth mentioning that much greater bliss and healing than any given to us by massage or even petting a teddy bear or pet is given to us by the simple act of universal loving kindness breathing. When kids learn this from age 3 months (i.e mother and father do this while baby is 3 months old in the womb) they become the happiest beings, no longer depending on toys, pets, other people's moods, outer events to derive mature constant bliss, serene peace needed for maximum awareness and kindness, rejecting the scintillation of the "be happy by doing this" for profit industries who disturb the eterni potential of humankind. What if a toy, pet, teddy bear is not around? Isn't it better to be self-sufficient and a source of healing for others lost in object worship? The living ever touching and 24-7 massage of God's Infinite Immortal Spirit thru the oxygen that enters our lungs is ever present. Hands-on healing and massage therapy have a lot on common, many people get a little certificate in hands-on healing, or reiki healing or whatever, just like in Jesus time they were curing the sick by trying to channel the healing energy via a simple touch, be it just a little pat on the back. Data seems to suggest that this hypothesis is true: telepathy becomes clearer and gentler (much gentler if more practice) softer and more optimistic when we practice hands-on healing to allow our hearts to be channels of God's Infinite Healing Grace, as we send universal love thru the hands to others and relieve negative emotions in others. Many aberrant behaviors/diseases are caused/made far worse by the 'overwhelming force, minimal grace and IQ' of our world, by forgetting the power of placebo and gentleness, proven scientifically, as babies (fed the same exact foods as controls) who were touched, kissed, loved more became smarter, healthier, taller, stronger. ☺☺

Many say they follow Jesus sometimes, but Jesus didn't tell people to push, to kick, to punch, to shove, as people do in some martial arts, many sports, boxing. It's interesting how we do these exercises, or play soccer or whatever, but no hands-on healing to develop compassion and

empathy, to connect with the universal gentleness tenderness softness. It seems we have disconnected from the motherly aspect of God to some degree (every soccer mom accompanies her boy to soccer, but does she accompany the boy to do hands-on healing on sick animals or people in hospitals or to help relatives relax and feel better?). Sometimes, it seems like we have unintentionally turned God into this cold/tough/punishing being, void of healing touch and loving tender care and grace, into some mental thing, that is void of feeling and compassion. Millions of people go to gyms, and sports arenas and places, yet many in the neighborhood would live longer if they would get a 10-minute massage (all clothes on, can avoid doing on sensitive areas or opposite gender one may be attracted to, to make it 100% healing compassion loving kindness and 0% erotica) which requires a physical, emotional, spiritual exercise that transforms our civilization from eternal warfare to peace and grace. Hands-on healing is both a physical exercise and an emotional, energetic, mental one. We would be getting all exercise benefits and much more from hands-on healing, because we feel also the joy of healing another and we learn to be better emotional carriers of God's Infinite Loving Sweetness☺☺ and Grace, we learn to be healers of everyone and turn the world into a place where everyone is a healer of everyone. We can also do this massage on ourselves when alone tenderly and softly and unable to receive it from others, as it helps us to develop universal tender softness, goodness and boost immunity, lower cortisol, balance energies, as a quick shower does too or conscious breathing the World Peace creating holy spirit energy so to speak.

The quantum entanglement of all human beings means that when we massage one person (even self) we change our brain patterns, our emotional radiation patterns, our intent vibe, our loving kindness, our tone of speech, and these then get imitated subconsciously by others who encounter us or who may be entangled to us due to energetic resonance, even though we never met or knew those people. We all imitate without realizing the tone of speech, emotional radiations, intent averages, etc of other people to one degree or another. Thus, we end up changing the whole humanity slowly when we replace kicking, pushing (or other unloving or neutral movements void of loving kindness coherence) in many sports with hands on healing. The key is to not just massage to get a physical stimulation only, but to put the whole mind and body into a coherent focusing of *gentle tender softness* that changes us and the pet or person we touch, even if self. For many people, who may not have pets, this can help them to become more compassionate, gentler, more *tender*, softer, kinder towards everyone, even if all they massage is self 5 minutes a day, it's obviously way better than shoving in basketball, rugby, football, soccer, martial arts, etc or playing a video game of physical aggression simulations. It helps transform our violence and cruelty abundant world into a paradise of universal kindness, gentleness, grace, peace, sweetness, musical healing tone of speech (sing and use a microphone when wanting to call someone far away, to maintain the most sublime emotions and eterni tone

like these voices). If people are not doing hands-on healing daily with their spouse, they're possibly missing on their greatest opportunity to become more infused with the *gentle tender softness* of *the Holy Immortality for All Spirit* of the Immortal Lord of Ascending Immortality, (a name for God). The massage time while listening to soothing peaceful music is a good time to practice eterni speech, since it's much easier then, as the body is already radiating very angelic emotions, energies thru the hands & whole body as we're meant to do during eterni speaking. ☺

At least, if people have issues with laying on hands, they could actually do some alternative forms of physical exercise, like putting sound insulation in a house with loose walls or something, to help people sleep, pray, heal rest better, etc. There are many ways to be a channel of God's Infinite Peace and Love, but this move away from emotion and touch makes the world less peaceful less kind too, as most tenderness is lost, empathy diminishes. Imagine if kids would be taught to go volunteer 30-90 minutes at a hospital or healing center (where people even from prisons can visit to receive hands-on healing) instead of playing soccer 30-90 minutes or other popular things kids play. *The immune system of a person who receives daily 0.5-3 hour hands-on healing becomes much stronger and the hospital stay becomes much shorter sometimes*, due to the power of placebo, of positive vibes, of love, of touch, of brain stimulation thru neuron links to skin. This is a scientific fact that anyone who doesn't believe in Jesus (or his call of people to cure the sick) can prove thru science. Matthew 10:8 says "Heal the sick, raise the dead, cleanse those who have leprosy, drive out demons. Freely you have received; freely give." The word demons doesn't have to refer to some confused spirit (some atheists don't believe in that), human or whatever, who might accidentally influence others, it may refer just to our own "inner psychological demons" such as anger, not feeling loved, paranoia, anxiety, lack of conscious breathing habit that induces activation of tranquility neurons in our brain, lack of vigilance to the quantum entanglement via telepathy diffusion of thoughts from anyone on planet Earth, especially from people within same country or 30 mile radius. However, since infinite possibilities can exist, even the most militant atheist can agree that it is possible that someone who has a very peaceful or very loving energy irritates the hell out of spirits of the opposite nature and when that human filled with peace and love touches someone the electrical charge of that higher frequency love so to speak zaps that spirit, almost boiling it, so to speak, causing it to disconnect its tentacle to the aura of the human and freeing that human. Not only that, even if no bad spirits exist connected to a person, but energy blockages (electromagnetic) can exist within a person that get completely zapped by the frequency of another person and their energy, being by definition different and void of the "energetic issue" or imbalance in the other human's energy system, pure biophysics. It's a little like if someone who loves rock and roll and heavy metal and violence visits to a church place of tranquility or a meditation area playing very soothing music in the background 24-7 for best

delta-theta wave brain states, he feels bored to death (his brain waves are β usually) and irritated by the silence (due to the power of brainwaves habit), but a meditator feels irritated when he goes to a heavy metal concert and visit 3 minutes, as he loves theta-delta brainwaves and some α. It's a little like that, music changes brainwave patterns and neurodynamics, telepathy dynamics and many other habits and when a person vastly different in music, diet and many other lifestyle habits "zaps" via gentle healing touch another who is opposite, a real change occurs and that person might actually start to question his "music, diet and other habits" after the touch, simply due to a funny lovely energy, not necessarily because he might have gotten freed from "telepathy of some confused or even harmless bored spirit nearby his aura". So, while it's normal people don't believe until they see proof, one can't assume they know everything about the universe and whether or not spirits exist, influencing us and can be literally driven out by someone with a strong known or unknown (to her/him or others) zapping ability. But everyone (atheists too) agrees energetic imbalance can develop and telepathy diffusion can mean anyone can get bad ideas sometimes from the human planetary consciousness field and the better people feel, as when healed, touched, the stronger they're at remaining peaceful, balanced, undisturbed by random telepathy diffusion.

To use a metaphor, we're a "dead" civilization, sort of, so when we raise our level, when we raise "the dead"☺☺☺ (ourselves or others via science), we become alive with the sweet gentleness tenderness of *the Holy Immortality for All Spirit* and hands-on healing, and the amazing science of living to 4000 and World Peace can bring, nonviolence, paradise, ascending "Immortality". There have been a few rare cases where an NDE was not 2 hours, but 1-3 days (sometimes the person wakes up while in the coffin/morgue), so raising the dead in a “literal” sense occurs these days too, those dead never died in the Bible. We could say that some of the more helpful qualities to develop in a Civilization of Immortals are gentleness tenderness soft healing tone of speech, universal compassion, truthfulness, kindness and all things that then naturally birth very deep empathy and telepathy ability, including channeling God's Infinite Mercy to do hands-on healing and help people to recover much faster or be in top shape. One can easily imagine how conceivably, people could do this daily in every family or a local church or something, to help people remain connected with perfect health, healing, love and prevent going into drug-alcohol addictions to replace the missing love, wellbeing coming from being healed with a touch. The hands-on healing has been practiced in many cultures thru time, it's not something modern science recently discovered in small babies (increasing health, IQ, etc, see above) or that happened only during Jesus healing of sick people and that of others doing healings, etc. Traditionally, healers of many types, used hands-on healing too, for millennia, possibly because there is a lot of physics going on that we don't yet understand, biophysics. Imagine if prisons would be healing centers where people watch angelic movies that they then

start to imitate (people subconsciously imitate the tone of speech, body language, actions of people in movies and real life) and they become these amazing & beautiful ☺☺☺ healers, relearning things, becoming angels. The world would become such an amazing peaceful paradise. Everyone will become a healer of everyone. ☺☺☺

12.2. Long distance non-touch healing

Many studies have proven the benefits of inner peace and brain oxygenation on our mood. Likewise, when we learn to be happy with simple things, like even breathing or listening to relaxing music on headphones, we become more content and more capable to be a source of healing for those around us and if they ever think of us, they will entabgle with our brains and become a little happier, and since we're entangled with all humans we make all beings happier silently without trying to when we're happy. It's like long distance healing, when we're happy we teach others to be happy, we don't massage them to make them dependent on massage, like with Eucharist bread dependency for control, but we're teaching people how to fish (giving fish is not very useful, teaching people how to fish and be self-reliant is ideal) for happiness themselves. Some "possibly not faked" pathetic studies on long distance healing exist (poor designs, not randomized double blind placebo controlled all the time, etc, many issues):

1. It was not "suggestion via placebo" or positive expectation, since it was done in animals too, not just humans and animals had no clue they were being prayed for. "Prayer-group animals had a reduction in wound size compared to non-prayer animals (P=.028). Prayer-group animals had a greater increase in red blood cells (P=.006), hemoglobin (P=.01), and hematocrit (P=.018); a greater reduction in both mean corpuscular hemoglobin (P=.023) and corpuscular volume (P=.008); and a reduction in wound grooming (P=.01) and total grooming behaviors (P=.04) than non-prayer-group animals." ► ATHM 2006;12(6):42-8. 2. Prayed for women had double the pregnancy rate and double the implantation rate of non-prayed for women ► JRM 2001;46(9): 781-7 (poor design, since just the fact so many people care about them to maybe pray for them decreases cortisol; real study should never tell people what the study involves, just give a sugar pill to "determine if cholesterol goes up or down") 3. Prayer for bloodstream infected patients led to lower mortality, much shorter hospital stay and fever ► BMJ 2001;323 (7327):1450-1. 4. The EEG brain patterns of 2 close friends, spouses, parent-child pairs seem to quantum entangle while the 2 are at a distance: when 1 moves into a pattern it causes the 2nd to move into a similar pattern at times. This is truer when the 2 interact a lot routinely ► Event-related electro encephalographic correlations between isolated humans ► JACM 2004;10(2):315-23. 5. Results suggest that subjects in the active condition exhibit a significant improvement in wellbeing relative to control subjects under circumstances that don't seem to be susceptible to placebo and expectancy effects. ► Expl 2015;11(1):11-23. 6. Seed germination was boosted by healing

energy ► Measuring effects of music, noise, healing energy using a seed germination bioassay ► JACM 2004;10(1):113-22: the PDF version explains on page 116 that they placed the hands over petri dishes, went thru 5 steps of healing, so the IR waves penetrated the seeds, plus EMF fields, showing how IR effect can explain it too, without even having intent. They need neutral people who know nothing, asked to place hands above a box, where petri dishes with seeds are, covered with a paper, so they can measure effect from intent vs from hand IR. So, spouses can wave hands over genitals,☺, before procreative attempts, for best DNA? don't touch, as you don't want liquids to come prematurely, just use intent + hand bioEMF 2 mm above? No touch to prevent premature female orgasm or ejaculation that hinders ideal fertilization. This "*intent*" can be applied daily, while dressed, doing chores? Eggs comes from birth, but can be *changed a lot*, and the uterus emits *changeable* liquids that enhance embryo formation. 7. Good intentions (if study is not fake) help healing: "Can we help just by good intentions? A meta-analysis of experiments on distant intention effects": JACM 2012;18 (6):529-33. This makes sense, brains sense others' intent in person and evil intent raises stress, impairs healing. At a distance, the subconscious to conscious brain communication may be weaker, so if the receiver doesn't know there is evil intent, he may not be affected much. 8. Radin. Compassionate intention as a therapeutic intervention by partners of cancer patients ► Expl 2008;4:235-43 9. Krucoff. Music, imagery, touch, prayer as adjuncts to interventional cardiac care: Monitoring and Actualisation of Noetic Trainings (MANTRA) II randomized study ► Lan 2005;366:211-7. 10. Radin. Possible effects of healing intention on cell cultures and truly random events ► JACM 2004;10(1):103-12. 11. Astin. Efficacy of "Distant Healing": A Systematic Review of Randomized Trials ► AIM 2000;132:903-10. 12. Krucoff. Integrative noetic therapies as adjuncts to percutaneous intervention during unstable coronary syndromes ► AHJ 2001;142:760-7 ☺☺☺

12.3. Viruses, natural antivirals in foods and vaccine safety

12.3.1. Intro: the need for scientific integrity and the end of banditry that runs healthcare

12.3.2. The 5 COVID19 vaccinations and other vaccines I took 2021-2024, as a pro-science guy

12.3.3. The basics of the flu vaccine and why the US Flublok vegan vaccine is the best worldwide

12.3.4. Natural antivirals (fruits, legumes, veggies, spices, zinc lozenges, nasal saline)

12.3.5. Issues with existing vaccines, endless cases of vaccine injury: we need improve vaccines

12.3.6. The autism-vaccine correlation (causation in cases of over-vaccination or mercury?)

12.3.1. Introduction: the need for scientific honesty, discernment and kindness

The vaccine "side effects" were almost as high (a good video on COVID) for placebo as with the

COVID, due to the nocebo effect, negative things happen due to the mind creating them. However, COVID19 was a highly planned and staged event, like Spanish Flu, WW1, 2. Vaccines can be used as a cover for achieving ulterior goals, such as lowering IQ of a population by 5-20 points, mass sterilization (lower fertility 4 fold), increase cancer risk 5 fold, they can be planned in advance 20 years, while the public is deceived via total media control it was all "happening in real time", spontaneous jump from bats to humans via a Wuhan lab, or 1918 Spanish flu, etc. Autism rates increased 270 fold since 1970, 68 times since Big Pharma passed a 1986 law that made them immune to vaccine lawsuits, so the kids vaccine mandate moved from 11 shot in 1983 to 58 in 2023. The history of 300 genocides shows us Vaccine Wars aren't mere imagination, but possibilities. Thus, knowing some basics helps us be safer. Check out the fake science papers section, to understand how Big Pharma floods the Internet and Journals with 10-50 times more fake studies thru academia it controls via grants, in order to use the preponderance of evidence to sell whatever drugs, vaccines or procedures it wants, just like Big Food sells lethal AGEs rich poison to us. Big Pharma is run by gangsters who need palaces, so they don't want lower profits by having to research safer vaccines. These same CEO bastards told us "mercury in vaccines is safe", when it damages the brain of infants and adults alike, as do other vaccines in other ways, but when you don't want to work hard, end aristocracy and have 50 times more research, all CEOs and "their army of trolls" do is attack the "vaccines cause autism" group as "crazy", when any 7th grader knows vaccines don't ever leave the brain intact, they can't, because it goes into the blood and blood goes to the brain and some components will affect the brain directly chemically or indirectly (via the immune response), just look at the adverse events if this 7th grade concept is too hard to understand by greedy thieves and genocidal psychopaths who get 8 million/year☺☺☺ for University President Barking Dog (metaphor relating to tone of current decentralized education) in Chief. It's a genocide because if you use $8 million/year salary wisely over 3 years, so 24 million, you can add to humanity 500,000 lifespan years in 3 years, i.e. with 24 million or $48 per person, we add 1 lifespan year to 500000 people by a simple nutritional intervention (so many lack so many vitamins polyphenols, etc, but the goal is the theft by aristocrats, not total lifespan), not using it = equivalent of killing 20000 folks at age 55, (80-55)×20000=500000 lifespan years). They say it is offensive, yet we simply are some of the more honest people in US history, who dare expose these wild dog cannibal like bastards. The so called "professors of immunology, autism,☺☺☺ neurology, etc" are often career conmen who missed chemistry in the 7th grade due to being too busy trying to plan to make $ by becoming a rich 200K college professor, as money trumps scientific honesty and integrity. The adjuvants, aluminum, etc are damaging. The baby immunity emerges at age 6-12 months: CDC gave babies so many odd vaccines by 6 months old, that we need to space them out and give more time and think about the genocide we're doing. Recently, only filif cat IQ folks came out of USA physics, chemistry, no major discovery last 70 years, could it be due to these

vaccines making everyone low IQ? Or due to CEO pay being 400x higher than average vs 20x in 1965? How come nobody thinks of quantum device to wipe out all viruses/bacteria on Earth? This chemical physics, physical chemistry way of thinking removes any need for any vaccine, we sterilize the planet, and that's it, so simple. Living to a billion is easier then. Well, today we got some youtubers saying "a new study shows flu vaccines prevent dementia", but how was the study made? Did the people who get the vaccine do so because they had more time due to less stress in life, vaccination being a marker for a better deal overall, meaning better food, sleep hours, weather, air quality even if it seems as if they're same income or class? He claims that the reason people live 5 years longer in some rich zip code is the vaccines, but already 1 million studies show aristocrats live 10-20 years extra due to not changing jobs every 4 months and having 4 jobs and changing place of residence every year…, eating organic food, etc. His video seems to say covertly that aristocrats use Dem Party to test, optimize vaccines, and then only use vacs as Republicans (the vaccine skeptic Party), after Democrat (vac loving) masses were harmed during optimization. With all these advantages, those zip codes should get 10-15 years extra, not 5-7, so the vaccines may actually shorten their life, but this is not presented in the video. His claim that Australians live 5 extra years is due to vaccines is ridiculous, they allow only the most qualified immigrants, have nicer weather, 5 weeks of vacation, a more socialist system of free healthcare, constant temp means less stress, no harsh winters, living near beach, getting sunlight, vitamin D, they live as long as Americans of the same standard of living/climate and getting fewer vaccines. Saying all vaccines are good is like saying "all seed oils are great and better than coconut or saturated fat as some MDs say", when it's not true, seed oils can be good (canola, flax, walnut, chia with high ω3:6) or bad (high 6:3 ratio) or saying "everyone should eat high ω6 like corn or seed oils because it's good for them, or bread, when we know this would be very bad if they eat little ω3 or have gluten allergy. It's the 10,000 biomarker values that determines what is OK for someone, context matters: most men have low 3:6 ratio, so only some seed oils help. The heart disease, all cause mortality outcomes are different among seed oils, things are more complex. The vaccines are safe… they say, but hey, what about this, measure 10,000 biomarkers before and after for 40 million people to see if they really improve and live longer overall in the first 50 years after a shot, they don't have that data, only managed data to justify their jobs were done well. We need oral, nasal, anal insert vaccines, anything that doesn't harm the veins and create turbulent flow clots. We need safer vaccines.☺☺ We need better nutrition, sleep, etc so all live to 4000, not getting sick for centuries, instead of decades today as with the people who get flu/colds only twice a lifetime. Would you trust these MDs who became MDs to make 10-80 times the minimum wage to tell you the truth? What kind of science is that? The science of 33 million crap companies instead of 11 real ones, and of 1 billion studies instead of 1000 real. Each person has millions of data points in a Universal Immortality Healthcare and that determines if a vaccine/vitamin needs be taken on top of the universal

powder for living to 4000.

Civilizations of "Immortals", where everyone lives past 500, can't use the unsafe occasional death causing vaccines of today (1080 deaths from flu vaccine alone in 20 years in US alone). The corruption of the understaffed CDC is explained in a 2 hours Congress video. CDC has 100 times fewer people than needed due to aristocratic redundancy where these mass murderers create 4500 banks when we need only one actually, all to loot people, justify $50 million salaries and palaces, to waste national resources, banks are one industry example, many others exist, see the 11 companies for the 250+ page discussion. The Big Pharma owners, CEOs, etc live in palaces in Rancho Santa Fe and other cities with 1 million times fewer potholes than Washington DC CDC rat cage headquarters. The DC government (like our capital city in DC where crime is 500 times higher than in aristocrat Big Pharma resort cities) is simply a dumpster for slaves to dupe slaves, while imperial aristocrats from California (199 billionaires), NY (136 billionaires), Florida (117 billionaires), Texas (83 billionaires) where most (535 out of 899, so 60%) billionaires live, run the USA thru fake bought elections and fraudulent governments they control via industry lobbies) awarding themselves and the aristocrat class insane salaries (389 times higher than average worker in 2021 COVID crisis vs 20 times more in 1965). The genocide by these Aristocratic Big Pharma CEOs and the entire industry and phony officials they mind control is clearly shown in this 2 hour senate hearing (repeats over 12h) on the COVID19 vaccine, how Pharma has immunity from lawsuits for vaccines (unlike any other industry, since 1986) the safety, the dangers, efficacy of the spike protein (causes clots, strokes, heart scars) vs nuclear protein vaccine, the length at which criminal CDC officials removed important info from Vaccine Safety Website (heart issues, etc), etc and also in the 11 companies section explaining how endless diseases can be prevented, reversed via diet, not managed via drugs that kill, without bankrupting our nation via trillions of useless procedures that make the CEOs and their management team super rich. The lethal part of the vaccine, the killer spike protein, is unassailable by body enzymes, and sticks in the blood everywhere for 6-9 months, causing clots, heart inflammation (myocarditis), plaque. The spike protein mRNA makes attaches and enters cells via the ACE2 receptor, and then damages human cells as shown in these 320 studies. The 320 studies are also at the doi address. The GENOCIDAL EFFECTS of the Pfizer 'Nazi' vaccine (for COVID created in labs with US money in Wuhan) and all mRNA vaccines are detailed in a simpler language at this site too. Covid 19 has multi-basic (polybasic furin) cleavage site, unlike natural corona viruses, was designed decades before the Pandemic probably, when they planned this pandemic as part of Bioweapons Warfare. The smokescreen story about "emergency vaccine development" was just a ruse (lie) for the masses to cover the tracks of the Nazis who planned this, using Wuhan geeks as ☺0 IQ☺ puppets to do it. Wear a mask if you like it, because every reinfection does more damage.☺☺☺ The 2025 US Health Secretary who says "Make America

Healthy Again" said in 2020 that 17 out of 22 TV ads in the evening news cycle in USA come from Big Pharma which uses a military WW2 loophole to get their endless unsafe vaccines, drugs pushed onto us, make huge profits for their gigantic California mansions of $10-90 million each, while 0.7 million Americans are homeless and a tiny home costs only 35K, but the Big Pharma aristocrats steal (for 250 years) so many trillions from the state by giving themselves salaries of 5-50000 times above the average, that the homeless and 130 million Americans living in moldy crappy housing don't count, they're mere "toilet paper" of the rich. US Big Pharma got 75% of Pharma world profits, using 4% of population to get rich on. THEY STEAL LIKE MEXICAN DRUG CARTEL GANGSTERS. Big Pharma eyedrops contain 2 to 10 out of 2100 chemicals in natural tears at the different concentrations from tears, showing how pathetic the research is, but they spend billions on palaces while people suffer due to bad eyedrops, drugs and vaccines. The toxicity of the eyedrops alone is huge, yet Pharma does nothing to address it. Check out safety data for medicines to treat Covid vs vaccines (far higher death toll) for Covid19, showing there is room for improvement: the mRNA made spike protein is alleged to do damage to vessels by forming clots and arterial plaque, and fasting autophagy (see how to lose 30 lb to decrease risk of severe COVID) clears the spike protein. Other spike protein killers are nattokinase/bromelain and possibly curcumin. Citrulline is especially life saving, since the COVID19 vaccine produced spike proteins make the blood sticky and prone to clotting, and the NO produced by arginine (plain arginine is destroyed by the digestion, so citrulline produces much more arginine constantly) relaxes blood vessels, preventing easy clotting that occurs when blood vessels are stiff.

Many MDs think more should have taken medicines (remdesivir, ritonavir, molnupiravir, many others with far fewer deaths than the vaccine which may cause miscarriage Nazi sterilization program by German Pfizer vaccine) and healthy foods, enzymes, etc to destroy the spike protein, instead of vaccines that killed 5000 people within 48 hours and disabled 22 million people worldwide via 17 billion COVID shots. In 1986, kids got 3 vaccines until the age of 1, in 2025, they get 29. In 2025, child chronic diseases rose 4 fold vs 1986, a coincidence, or related to obesity doubling, more diagnosing (more checking), vaccines up 10 fold when immune system is not even developed and many other junk diet issues, microwaves, etc?☺☺☺ The point is Big Pharma steals trillions to build Entertainment Palaces and Estates for their Families, while Americans are getting killed by medicines, diet recommendations, vitamin RDAs, food industry products, 25 years earlier than they should die at if we had a really scientific government, not one of low IQ folks with 30% of STEM graduates from college only. What have these Huge Estates have anything to do with Granting every American beautiful colorful telepathic radiant teleporting shimmering shapeshifting Immortal bodies able to live trillions of years? Nothing. It's just GREED, low IQ of CANNIBAL CHIMPS pretending to be human. We're the land of Freedom, from Parasites killing every human at 80, Freedom from 80 year lifespan, Freedom from Death,

so all may Enjoy Trillion Year Lives, Eternal Bliss, happiness, without being Killed by Vaccines or Disease. Let us be clear: if CEO pay is only 4 times min wage to root out greed, you don't get the greediest British etc bastards running USA, but the most immortalist ethical and austere saint like beings running our healthcare industry with one universal healthcare for all and 100 times more efficiency in every industry, 100 times more real research, 0 duplication. We need centralized scientific government, not greedy thieves. ☺☺☺ I never watched TV for decades, it's all ads for nonsense, pills. 38000 Americans died from Vioxx drug alone. No ads exist for healthy diets that prevent or reverse endless diseases used to manage (not cure) many diseases caused by bad diets, World Peace in 3 months, 0 violent crime thru decent human rights USA doesn't have (decent shelter for all, nontorture, jobs for all, decent food for all, decent transport for all), thru happy breathing, 0 taxes, single family housing for all, free central education and fair pay, 0 torture by spy agencies, cops and military of tens of millions of US and foreign citizens, etc. All media is controlled by the military of most nations, since the aristocrat fake clergy complex 'controls' the military, being one. Sad but true, so we need to question the lies told by the TV.

12.3.2. The 5 COVID19 (a staged pandemic) doses, other vaccines I took 2021-2024

Circular mRNA accumulates in cells, leading to aging and death of cells, and many companies propose creating circular mRNA vaccines (original Pfizer/Moderna COVID19 vaccines are linear mRNA), wait and see how all will live shorter? Even so, due to media brainwashing and fear, on 4-6-2021 I got my Pfizer dose 1 at Walgreens, since it contains no preservatives and everything in it seems safe, way safer than vaccines from former centuries using live attenuated virus. I'm not sure if it was a smart move. The fakery section explains, that COVID19 is far more complex, staged, than the fake (or often incomplete) news we hear. I didn't choose the vaccine, it just so happened Pfizer was the first vaccine I could get, but it seemed the best to me anyway. No allergic reaction, but in the first 4 hours I felt my arm area more (arm pain typical to any vaccine), a little like after lifting weights. To prevent a swollen lymph node forming or a bump (*reaction to the needle or chemicals,* usually too much toxoid during tetanus vaccines or aluminum during other vaccines, subcutaneous nodules (small lumps under the skin)) of the skin at the exact point of needle injection, it's good to rest that day, eat enough protein and walnuts (or other linoleic acid sources), vitamin C to stimulate collagen synthesis to heal the muscle/skin tissue damaged by the needle, and sleep well days before and after. Definitely stay away from $Al(OH)_3$ vaccines famous for bumps ► ADAPA 2008;17(4):182-4, because aluminum is toxic and 100 times more absorbed via vaccines than food. *Nodules form with many vaccines* ► Vac 2020; 38:3169-77*; this pdf has 39 links to other nodule articles*. You can even take a shower in the first few hours, it improves circulation and helps soothe the discomfort, this is good 800 nm IR for cytochrome oxidase to generate energy to heal tissue. Definitely don't lift weights or exert the hand where you got it. Most get vaccinated on the left arm, since most use it less. The gentle

shower jet on top of bandage at 4 pm, 3 hours after the vaccine, diminished muscle pain sensation 80%; same happened April 7th afternoon; then resting right after made it even better; so definitely, first 2 days, the most critical for avoiding skin bumps, good circulation via warm bath or shower helps; I was quite scared before vaccinating, since I got 1 tetanus vaccine only in the prior 26 years and that only one formed a huge subcutaneous bump, so I slept most of the day to make sure no bump this time. On April 7th, 2nd day, arm pain was much less during moving it, and I felt a little tired, so I slept half day too besides watching the links about vaccines below. April 8th, arm pain was far less when moving, almost normal, 20 times less than April 6th. April 9th, 3 days later, I removed the bandage the nurse placed and saw everything was normal, with a tiny red dot visible inside the rectangle (and a tiny red on the inner bandage), so I replaced bandage placing it at 90 degrees of the first (and used some Vital Care cream, $3 at $ store) to allow skin shape to return and rectangle to disappear, thus, 30h later, on day 4, the dot looked even smaller. The nerve endings destroyed by the needle need methyl-B12 to heal faster, so eat extra B_{12} first 2 weeks after any vaccine or injury. *First 48 hours I took about 7 showers to provide more circulation, with water focused a lot on left arm in every shower first 10 days.* Nobody wants 70 bumps from 70 flu/etc shots. On April 27th, 21 days later, I got 2nd dose at CVS 4 miles away (1st was at Walgreens 7.5 miles away). 2nd time the arm swelling and pain was much less, the immune reaction was lower, but I was still tired first 2 days, but I hear that's ultra common, for many to have way less sensation or side effects after 2nd shot. ☺☺☺

On November 20th 2021, 7 months after 2nd dose, like millions of people, I got my booster, or 3rd dose, *(3rd dose* boosts antibodies 20-40 fold, *since they go down 6-7 fold 6 months after 2nd dose, enabling us to reach* 4.4 fold higher antibodies after 3rd dose than 2 weeks after 2nd *dose)*, and the reaction was mild, like after the 2nd dose, maybe a little more; however, the technician was hurried and didn't let me remove my shirt (so I have only the t-shirt, since I forgot to remove it) and because he was holding the shirt, he was tensed, impatient (I was going to take my shirt off, but he didn't let me, he rushed to do the shot, doing it wrong probably, due to long line prior that later became no line after we left, staged), rude (told me to take my hand off otherwise he will vaccinate it instead, I was holding the shirt to make space for him) and his syringe was moving the way it's not supposed to and the injection site got red 7 weeks later, so it seems safer and ☺☺*lovingly gently* kinder☺☺ to remove all clothes that may cover your arm (T-shirt etc) without having to hold it yourself when your place in line gets close, and wear that loose t-shirt back home, otherwise, it will damage your arm due to the nurse trying to hold the shirt away from the site; next 7 weeks you wear very loose clothes on that arm so you don't interfere with the natural healing. Relax, don't tense your muscles, so syringe goes in smoothly; they don't tell you these things and then you got red swelling. 3rd dose was an unprofessional small pharmacy, playing loud restless music that makes people agitated when it should be relaxing so

syringe goes well and people relax arms etc, carsonpharmacy.com, not the Walgreens, CVS, big chain pharmacy, so avoid small unknown places you never been to before, had to wait 1 hour in line too, very rude and unprofessional staff (didn't tell us to bring vaccination card and then made a big show out of it, even though they could check record at myvaccinerecord.cdph.ca.gov. My 2nd booster, or 4th Pfizer COVID vaccine shot, was on 9-29-2022, the updated (for omicron) Pfizer bivalent booster, that was FDA approved on August 31 2022; 2 weeks later, around September 15th 2022, I got a wart (not a skin tag), about 2 inches from the vaccination site, possibly due to HPV cancer causing viruses in the vaccine as Dr. Mercola explains it too (vitamin E may work, skin tag oil won't work against warts, from Amazon or Target) or the immune response was big and activated dormant wart (HPV)/skin tag (HSV increases chance of skin tags) virus; the lady who touched my arm without disinfecting between patients (so maybe HPV virus in my arm???) or "cancer viruses☺☺☺ in the vaccine as with the 1950s-1990s Polio vaccine 'intentionally?' allegedly filled (up to 1990s) with SV-40 cancer causing viruses" (CDC removed page on SV40, sv40foundation.org); sort of like Nazi geeks, in conspiracy theories, place "sterilization agents in vaccines to do population control, and other brain damaging things to take over other nations"; though Pfizer used in USA is made in Michigan, USA and Pfizer used outside of USA is made in US or in Marburg, Germany which plans to produce 1 billion doses/yr.

I chose Pfizer for all 4, not Moderna, due to fewer heart damage, inflammation side effects. My 5th Pfizer (Comirnaty) vaccine (so called 5th shot for most people) was the updated 2023-2024 vaccine, *approved in 2024, which contains raxtozinameran, an mRNA with instructions for producing the spike protein of Omicron variant lineage XBB.1.5*, which dominated the world from Nov 2021 until Dec 2023. The original COVID vaccine was for the original strain of COVID, made with 1 mRNA called tozinameran. The first booster of 2021 had the mRNA for the original strain plus the BA.1 variants spike protein, so 2 mRNAs: tozinameran and *ril*tozinameran. The second COVID bivalent booster (so called 4th Pfizer shot for most people) everyone got almost in 2022 (not the first booster, or so called 3rd shot, that had only BA.1 variants mRNA), had a new mRNA for the spike protein of BA.4-5 variants, so it had tozinameran (for original strain, the very first COVID variant) and *fam*tozinameran (for BA.4, and BA.5 variants that appeared later). The first half, tozina-, is the prefix required by the WHO from now on (but chosen by Biontech Germany company, *to* Nazi, *to*zina, or NATO zi, NATO day, since zi is day in Romanian, *each company gets to choose the first part of a vaccine name*), while the second half -*mer*an is the required suffix for all future thousands of mRNA vaccines for thousands of diseases, from *me*ssenger, RNA, just as "caine" is the suffix for local anesthetics, "ast" is for anti-asthma drugs. So, tozinameran is the original mRNA, that is no longer present in newer COVID versions, while all the future COVID19 mRNA vaccines will be named 1-3 letters followed by tozinameran. *Companies are working on mRNA for all other vaccines or even cancer*, so their name will end in

meran. Tozina may also be from 19, nineteen, pronounced naintin phonetic, COVID has O, so tozina. These Comirnaty (easy to recall, Comintern was the Communist International, or recall the official reason for the name, a combination Comi*RNAty* of the terms COVID-19, *m*RNA, com*munity*, i*mmunity, comi RNA ty,* community *RNA or* commie *RNA,* communist *RNA*) Pfizer vaccine versions *will be released yearly, like the flu yearly releases,* except they're much safer than the flu vaccine, being mRNA vaccines free from mercury in thimerosal present in multidose flu vials and containing no inactivated or live-attenuated virus, which can be bad, since a virus could be fully live, active by accident or cause various biochemical issues due to this 'partial inactivation'. Always get single dose flu vaccines, as those have no mercury, like *Flu Block vegan vaccine, which is eons ahead of egg based inactivated vaccines (most flu vaccines that are free with insurance)*, since it is more like mRNA, it only creates the spike protein, not the whole dangerous virus. You get what you pay for, cheap trash flu shots are more dangerous. Honestly, only older people need yearly flu shots probably, if one sleeps well 8-9 hours daily and is very healthy. Most healthy people get flu once 15 years. Comirnaty is safer than Moderna Spikevax, having fewer heart side effects, possibly 5 times fewer than Moderna. That's why most COVID shots today are Pfizer at all US pharmacies, like Walgreens, CVS, RiteAid, etc. Nobody almost carries Moderna anymore. This may be the victory of leftists, immortalists, communists, over predatory capitalism. Comi*RNAty* was made in Germany first, *to*zinameran, *to* Nazi mRNA, comis are (pronounced as R) Naty or Nazi, communists were like Nazis, meaning antisemitic, anti-Bible. Are you a commie? Means are you a communist? A comi is a commie or a communist. East Germany was communist, West Germany Nazi, the mix of the 2 is Comirnaty.

This *bivalent* 2022 booster has mRNA for both the *omicron* (famtozinameran) and original COVID *spike protein (*tozinameran*), hence the bivalent* name, making it *more effective against omicron* (that damages throat more). See the natural antivirals section for food based ways to fight Covid19. Throat or mouth swab can yield false positive results, if saliva is acidic due to eating acidic stuff – and the viral count goes higher in nose weeks after infection (saliva tests are 12 times more likely to yield positive results for PCR early during infection), so the need of throat swabs for omicron is not always high (*unless it's first 2 days of infection, not well after we had most cold symptoms disappear*), though fasting and fasting 2 hours before sampling may be better, making sure saliva pH is neutral (*fasting and proper mouth cleansing with water, etc removes new variables, chemicals in food that give false negatives or positives*). In our culture of 'show off our manliness' people get to work heavily with vaccinated arm, forgetting this could cause an unseen internal scar that remains there 25 years and damages lifespan length; it's perhaps better to rest (the first 48 hrs after) the arm and body much more than usual, sleeping more; ideally, we should get the day off on any vaccination to sleep *3-5* hours at least right after; why? To build 100% immunity in the first 2 months after 1st COVID19 vaccine, we need a strong

adaptive immune system from enough B cells (they mature in bone marrow, produce antibodies to inactivate viruses, etc), CD4, CD8 type T cells (they mature in thymus, they destroy specific new pathogens the body has adapted to target for destruction). ☺☺☺

T cell count drops 70% next day after a very bad sleep, so it's key to sleep well those 2 months. *Immune strength depends on vitamins A, C, D, E, zinc, Se, iodine, etc.* We read stories of people dying or getting sick after vaccination, that could be due to low nutrient intake and poor sleep. Instead of 95% *protection*, they get 25-50%; why bother to get Pfizer, the "*best* vaccine" then? It's great to postpone stressful tasks for 3 weeks until dose 2, since stress suppressed immunity, T and B cell count and function. If your ω3:6 ratio is already very low (ideal to prevent aging related inflammation) and you eat a lot of ω3, taking less ω3 for 3 weeks (after dose 1) can boost B and T cell function, so the body can develop proper targeting of spike protein fragments. Johnson vaccine grants 'full' immunity at 2 months, mRNA ones 2 weeks after dose 2, so maybe 3 months in weaker immune systems for all vaccines; so we need sleep well 4 months after dose 1 to avoid asymptomatic transmission that these vaccines may only prevent in those who got the best targeting due to best sleep in the first 4 months. Pfizer vaccines mostly prevent serious disease 100% if we slept well between the doses, not asymptomatic infection (preventing infection 100% may take best sleep and diet for 5 months after dose one; decent sleep week before dose one too*)*. Israel study found variants can break thru the best vaccines, like Pfizer, which shows few take the COVID19 pubmed papers seriously (super strong nutrition, sleep well, avoid foods that lower B or T cell count, stress, etc at least first 2 months) – *those who got vaccinated* got confident, went out and got infected *before reaching the* best *immunity; because of these reports, I plan to wear my face shield even after everyone stops wearing masks;* immunity *is so complex.* mRNA vaccines got some advantages. CDC shared a video on how to knot and tuck a disposable (well, reusable if you wash it) mask for a better fit; I tried this and it's way better, since the mask doesn't fall anymore; these masks got a plastic thing where the nose goes, that is there so we adjust it so the mask doesn't flatten our nose, *the plastic can be angled to fit exactly your nose shape;* after this, *you never have to deal with the super annoying issue of mask falling 50* times daily when talking and having to raise it above nostrils; if you bought a *colorful mask that is thicker or a pm* 2.5 filter, *you can do the same, and use the white plastic* from inside a disposable to insert into the new mask if it doesn't have one (make a small hole).

Pineapple *helps recovery of wounds, due to bromelain, reducing needle injection healing time. Read below to see what an* all out T cell mobilization happens and how stressing left arm or even body, can strain the body resources and lead to out of control inflammation, rashes, lumps, etc at injection site like it happened even after COVID19 shots. CDC says it takes a few days for the arm sensations to fully go away for some. This is normal, the needle destroys lots of muscle, nerves, capillaries, so to feel stuff in the arm for days is a sign of normal healthy peripheral nerve

system. To not feel anything when moving arm is more alarming, especially if young, it means we don't have good nerves there, since full healing (seen on instruments) takes at least 2 weeks (all tissue); even a little scratch on our hand (dermis only) takes days to heal, imagine when doing muscle, nerve, etc; a needle with saline solution or with nothing alone would also cause the same, due to the injury itself; the liquid inserted further aggravates the injury as it displaces cells; there is nothing alarming about feeling injection site weird first 3 days, much less each day. Mayo 2 min clip and Vox 7 min clip explain side effects. Most people feel tenderness, arm soreness after any vaccine at the site of the needle injection. What about COVID19 vaccines tech? How do vaccines work? ☺☺☺ Thankfully, COVID19 vaccines contain no mercury, preservatives or aluminum. Pfizer vac is made in USA (raw materials Chesterfield MO new amazing factory inaugurated 5-30-2019, plasmid DNA Andover MA, formulation Kalamazoo MI). Walgreens gives you a paper that lists the Pfizer ingredients in the vaccine. Johnson and AstraZeneca use an adenovirus unable to replicate to teach the immune system, and have 67% and 70% (Astra) efficacy. Pfizer facilities and manufacturing video is here. Pfizer mRNA vac is most effective at 95%, having safest chemicals, approved for ages 16+, Moderna 18+ (meaning less safe for younger ages, so for adults too); Pfizer was founded in 1849, Moderna 2010, Janssen in 1953 (owned by Johnson, making JJ vac *with Ad26 virus*), AstraZeneca 1999 (though it was merger of Zeneca which was around for longer). Moderna has chemicals that make it more stable at much warmer temps, (-13 to -5°F vs -112 to -76°F) just like eyedrops have more preservatives extend shelf life. "A greater % of participants who received the Moderna vaccine, compared with the Pfizer-BioNTech vaccine, reported reactogenicity" ► JAMA 2021;325(21): 2201-2; both mRNA vaccines gave 80% protection from infection 2 weeks after 1st dose. JJ can be stored in the fridge 3 months, it's 1 single shot vs 2 for Sputnik (2 common cold human adenoviruses, Ad5 + Ad26), Astra, Pfizer, Moderna *(Astra can be stored at 38-46°F for 6 months and Sputnik same temps for 2 months; both are DNA coated in chimp (Astra) and human (JJ/Sputnik) unreplicable adenoviruses, DNA injected into cell's nucleus, so it produces mRNA and spike protein)*, so JJ/Astra & Sputnik help use in poor infrastructure areas, but may not be the best due to the issue explained here, and fainting adverse effects. JJ was even paused due to clotting risks, like Astra was in Europe due to clots. Pfizer uses natural phosphate buffer *(serum phosphate is 1.1-1.45 mM, 5-40 times higher concentration than serum acetate);* Moderna uses unnatural Tris-HCl buffer not present in humans, plus acetate at a concentration possibly higher than what we're used to; Sputnik uses EDTA buffer and some Tris too. mRNA is destroyed by ribonuclease (RNAse) enzymes, after mRNA was used to make the 1273 amino acid spike protein on the edge of COVID19 virus; RNAses break down mRNA (like proteases digest proteins we eat) inside cells and in between cells too; then these vaccinated cells, with the spike protein inside, take the spike protein and digest it in their proteosome and then present spike fragments on the outside of the cell using MHC1 (major histocompatibility complex 1); tissue CD8 "killer" T cells

then bind to MHC1 and analyze if fragments are normal; since they're not normal, the CD8 cells will eat (eight and ate pronounced the same) directly the infected cells, thus CD8 is called killer T-cell. (T-cells and B-cells are lymphocytes (white blood cells) that form the adaptive immune response, while neutrophils white blood cells are the innate immune response). ☺☺☺

The mRNA in the mRNA vaccines will be destroyed quickly (though some claim it can take 9 months to kill all spike proteins that damage the body like the virus damages it), it can't remain in the body or teach the body to make spike proteins forever, which would make our immune system busy killing all cells with spike proteins. The spike proteins produced that leak out of a muscle cell destroyed by CD8 killer T-cells, are digested by the neutrophils (complete destruction, without creating antibodies) and *macrophages and dendritic cells (professional immune cells)* which use MHC2 on their outside to bind to CD4 "helper" T-cells (1*8=8,2*4=8, easy to recall which MCH binds to which CD cell); CD4 are the immune inspectors which analyze *these* macrophage, dendritic cell *post-digestion spike protein fragments* and inform ☺☺☺ B-cell to produce antibodies (immunoglobulins) to bind to these spike fragments to inactivate virus spread, so the CD8 killer cells can later wipe out cells with such spike protein fragments on the outside (CD8 have the antigen (spike protein fragment) recognition protein called TCR or T cell receptor); thus, all spike proteins produced in our muscle are destroyed by CD4 (indirectly) and CD8 (directly) cells; all mRNAs are destroyed by RNAses inside and outside the cells fast. The tiny amount of spike protein that attached to A2 receptors (not causing major cellular dysfunction) of other cells (after leaking from a CD8 busted infected cell) is slowly digested by the cells (taken inside) or later those cells are killed by CD8. Thus the vaccines can't cause a spread of mRNA or spike protein contaminated cells; the real virus however, unlike the unreplicable spike protein, can send more messenger RNAs, making ever more RNAs than we got from the lipid nanoparticles (Pfizer, Moderna) or adenoviruses (the other 6 vaccines, e.g. 3 Chinese ones 65-78% effective) and infect other cells. So mRNA may be safer than adenovirus vaccines.

Many didn't get Hepatitis or pneumonia vaccines (read the benefits), etc, so nowadays there is the Heplisav-B vaccine, with 0 mg *aluminum (Al)* as section 11 at the dailymed NIH page shows chemicals in every vaccine, vs toxic Engerix 0.5 mg Al, Recombivax HB 0.5 mg Al, Prehevbrio 0.5 mg Al, for Hepatitis B (disease which *kills annually, in 2024, 0.8 million people*). If you're not active sexually (outside of procreation), the vaccine for B in small kids with undeveloped immunity makes no sense, due to adverse events that can be lethal in adults even. Gardasil is another poison vaccine that criminal MDs push on kids (adults in their 40s OK perhaps, sometimes, if issues with colon cancer family history or risk perhaps and high fiber vegan diet didn't help) who don't need it, as they shouldn't be sexually active. The brain develops until age 28, so why are they giving kids so many useless vaccines to damage the brain? *US is the only nation that vaccinates on day one of life* and the number one in first day of life infant death

among developed nations. Avoid sharing toothbrushes, razors, needles or anything sharp with anyone, as it could infect you: use best hospitals that clean well their sharp tools (of other patients' blood) to avoid infection. Since *Al* is toxic, best is to take Hepatitis B with Heplisav first *(I took it July 6th 2024, when I also got in my left arm the 2023-2024 COVID19 (Pfizer version, like my first 4 shots of 2020-2022, called Comirnaty) Omicron XBB 1.5 updated vaccine, and Boostrix TDAP)* and Hepatitis A weeks/months later, after your body removed all *Al* from other vaccines and you gave T-cells all the time to produce antibodies, etc. 2nd dose Heplisav Aug 5th 2024, when some short sadistic blue eye fake blonde lady (maybe Ashkenazi Jew) did the vaccination in a way to maximize pain (there is a way to do that by moving the needle to create a red spot) asking "Are you OK?" after she did it "You should be OK, as you were from the 1st shot". All the other vaccinations done by the main Walgreens tall guy pharmacist were fine and didn't get red, the bandage had 20 times less blood, plus had much less pain during the actual injection. *Equal pay for unequal job?* Let's have performance based pay. One day, all can go to the only review site that disables the ability of frauds to hide their reviews thru 40000 review sites, we can go to reviews.gov and make a review. The way Walgreens setup their vaccination thing is not right, between doctor and patient chair, there is a table that makes the doctor or nurse bend over a little to vaccinate, diminishing drastically their control over their arm. The MD needs to be far closer to the patient to inject in the most perfect way. Put a screen between and make a hole where the arm will be if you worry about contamination. If nurse extends arm, she won't do a good job. CVS and many places make the same exact mistake, they don't allow the injecting person to be closer, which increases swelling and error. It's a decentralized ☺abysmal IQ☺ that creates oxidative stress. We need one national policy. Doctor needs be 4" from patient, not 30". These ladies know how to create pain by technique, she may be CIA-military lady. ☺☺

Going back to immunity discussion, too many vaccines at once means limited T-cells will be available for each immunity, unless you already were vaccinated before with TDAP or COVID and the body will work far less to boost immunity. *This way you keep Al under 0.5 mg per visit*. Hep A in USA are Vaqta 0.45 mg Al (adult doses in this paragraph, kids *Al* doses are half, so 0.225 in this case), the best choice due to 0.05 mg less Al or 0.5 mg Al with Havrix. Hep A vaccine is an inactivated virus, so it is more dangerous than all the rest that have a protein spike on the virus, that the body is trained to attack. We only have a limited amount of T-cells to produce antibodies, etc, so taking too many vaccines at once is a bad idea, but 2-3 seems OK for adults if total *Al* is 0.3 mg or 0.5 mg max. Getting both Hep A and B, via Twinrix (the 2001 approved combo, the only one in US for both Hep A and B, see list of common adult vaccines from CDC) is fine if that same day no Al exists in other vaccines you take, such as COVID19 (0 *Al*), vegan *Flublok* Quadrivalent (spike protein). Studies show that the flu vaccine increases lifespan, because during flu the artery inflammation will cause arterial plaque to break and form blood

clots or new plaque areas, leading to heart attacks later. These reasons are the same reasons all other vaccines in general make you live longer. The *chance of paralysis from a flu vaccine is 9 times smaller than from flu* and the vaccine reduces the chance of flu by 50%, so overall, you protect yourself from paralysis more, especially if you take mercury-free single dose ones like the *Flublok* vegan one (recombinant flu vaccine, leads to less flu than egg vaccines, teaches body to attack spike protein like mRNA COVID vaccine), which is 100% different from the vaccines that caused paralysis (live attenuated or inactivated egg based vaccines of the actual flu). Thus, *vegans* will understand the universe helps them and *Flublok* risk of paralysis may be actually 5000 times lower than from the flu itself, and thus may be the best money you can spend to live longer. CVS, RiteAid, Walmart, Walgreens only have murder based bloodshed based (male chicks are killed by billions in egg farms, thereby destroying the human quantum field) egg vaccines known to cause more paralysis than vegan vaccines, to get the best, FluBlok, go here and call the location closest to you, to make sure they have Flublok, since they expire soon after the flu season. *It's not free, but you get better immunity and lower paralysis risk*. Search PubMed for more papers to see the latest consensus on whether the vegan flu vaccine is 500 or 50000 times less likely to cause paralysis than the flu itself or egg vaccines. *Each flu damages your body more, your brain, your arteries. Taking Flublok* will simply reduce that yearly risk in half, as well as living alone if single (no roommates, get a studio) *with separate air conditioning*, to avoid sharing house with infected folks who never take any vaccine. Other useful vaccines are Prevnar20 for pneumonia (0.125 mg Al) usually for adults over 65 or weak immunity adults and Shingrix (0 Al) for shingles for adults over 50 or younger *weak immune system folks*, like the 200 million sleep deprivation and torture victims: shingles vaccine can prevent deafness, blindness and other issues. Adacel TDAP is 0.33 mg Al, Boostrix TDAP is better with only 0.30 mg so I got Boostrix on July 6, 2024. This was my 3rd ever TD vaccine and 2nd TDAP. Each year, on Earth, *pertussis kills 160000, mostly kids under 5, infects 24 million people*. Adults die too, though rarely in USA, since they get free TDAP these days. Pregnant ladies need to get TDAP. Gently get TDAP to avoid kid or adult death due to whooping cough (pertussis), also called the 100 day cough. Babies under 3 months are the most likely to die due to this lung bacterial infection. EU doesn't require TDAP every 10 years, but US does due to waning immunity. Check out babies who die of whooping cough, and the effects of no vaccine. ☺☺☺

Many missed the meningitis vaccine, which is made of 2 parts: 1 with the B strain and 1 with the A, C, Y and W strains of the bacteria. The older vaccines most people know are Men ACYW types: 2 brands in USA: Menveo (0 mg Al, no preservative, no adjuvant), and MenQuadfi (0 mg Al, no preservative, no adjuvant, but has 55 mcg tetanus toxoid (the stuff in tetanus vaccine) as a protein carrier for antigens). On July 7th 2024, I got this MenQuadf and had a slight headache for 2 days. The other type is Men B, that covers the B strain of bacteria: Bexsero (the worst vaccine,

with 1.5 mg Al) and Trumenba, the best Men B only vaccine, with 0.25 mg Al, same 0.25 mg as all 5 strains into one Penbraya. Thus, it is best to avoid the Bexsero, as it contains toxic Aluminum and too many chemical adjuvants. If you only want to get A, C, Y, W strains, stick to either vaccine (Menveo or MenQuadfi) because it got no Al, though Menveo seems safer, to avoid tetanus overload, if you got the *TDAP tetanus diphtheria pertussis* vaccine recently. If you want the best protection, meaning vaccination for all 5 major strains, get Penbraya, 0.25 mg Al, as it has *one injection, not 2 like* with *Trumenba + Menveo* or *Trumenba + MenQuadfi.* Penbraya is a new "2 old vaccines (MenACMY and MenB) in one" (FDA approved in Feb 2025) MenABCWY pentavalent targets all 5 Neisseria meningitidis strains: Men A, B, C, W, Y. Meningitis kills 500 people in US alone, with about 2000 suffering brain damage, deafness or limb loss. It's a deadly disease, with 20% of adults over 45 dying within 2 days of infection. Outside of US, 240000 people die each year, many within 24 hours of being infected with meningitis, 2.4 million get some damage from being infected, with the chance of being infected being highest in Sub-Saharan Africa (where blacks live, not the Arabs in the north Africa). You can easily get infected if you visit Africa, or contact African visitors to USA, so be vaccinated if you travel. Aluminum is dangerous, so avoid more than 1 vaccine with aluminum per day. *Health first, laziness second*. *Canned* green *beans got 2.5 mg silicon in 100 g*, more absorbed than any other common food, so eat that to detoxify of any aluminum, eat your zinc and other metals to compete with aluminum absorption. It takes only 2 minutes to do irreversible brain or nerve damage. MenACYW is given to all who travel to areas with blacks, Africa, etc, and all military recruits, as CVS PDF says.

You will see that sometimes a pharmacist may not give you pneumonia vaccine, Prevnar20, at Walgreens, so you just go to CVS to get it (just click in the online checklist you have a condition) and I got it without him asking me anything about my risk factor or condition, on July 7 2024. There are 20 risk factors that qualify you for it that are listed in the online vaccine scheduling prompt, even heart disease, diabetes, etc and weak immune function due to COVID19 or sleep deprivation, torture of heart, etc during military torture of 100 million people. Read here how bad the sleep deprivation is for your immune system. One night of bad sleep means 70% less T-cells to build immunity next day. You can simply say "you smoke a pack a week and need it", they can't verify it, since they won't understand what torture is, it's far worse than smoking tobacco, hence real risk of WW3. Bad sleep 7 years impairs your immune system and pharmacists who don't know what military is up to simply can't know. When a clueless more narrow minded pharmacist doesn't give you the vaccine because you're younger than 65, you can say CVS online form says vaccine OK for (copy/paste from CVS) "Conditions or risk factors include: alcoholism, cigarette smoking, cerebrospinal fluid leak, chronic heart disease, including congestive heart failure and cardiomyopathies, excluding hypertension, chronic liver disease, chronic lung disease, chronic obstructive pulmonary disease, emphysema, and asthma, cochlear

implant, decreased immune function from disease (COVID, etc, many diseases) or drugs, diabetes. Immunocompromising conditions: no spleen, chronic renal failure or nephrotic syndrome, splenic dysfunction, sickle cell disease, congenital/acquired immunodeficiency, immunosuppressive drug use or radiation therapy, HIV infection". Recall, *anyone who uses an airport can get meningitis or hepatitis A or pneumonia bacteria, and today, due to high levels of illegal migrants from the worst places on Earth, any visit to a store, market, EV/gas station can infect you*. *Better be safe than dead*. That's why military recruits get sometimes even 12 shots in one day, as Walgreens pharmacist may tell you. Let's face it, every person has 2 to 90 unknown diseases to some degree, made worse by military pulse rise, sleep deprivation, RF attacks.

Always take 2-3 warm showers, with 90% of time soaking the left arm where you got the vaccines in warm water to increase circulation and diminish redness. When you have an injury or hit hand with something, warm hot water first few minutes reduces redness 20 fold, the same is true for this too, you want to get into the shower in 5 minutes once you're home. The warm water stimulates the immune response too, increasing antibody concentration. Sleep 10 h daily next 3 days to build immunity which depends on high T-cell count, meaning good rest.☺☺☺

12.3.3. Basics of flu vaccines, Flublok, the best, and the 3 most used flu antiviral medicines, all neuraminidase inhibitors: Oseltamivir (Tamiflu, bad), Zanamivir (Relenza), Peramivir (Rapivab)

From 1938-2013, all influenza vaccines have used egg embryos to grow. Today, you can go to vaccines.gov and check flu, egg-free to get the only egg-free vaccine, 99.9999% *vegan* Flublok (no preservative, single use vial), the most advanced flu vaccine (*vegan*) available within 1-20 miles: no dead or attenuated infectious influenza virus, no antibiotics (usually ≤ 0.1 µg), no egg proteins (ovalbumin ≤ 1 µg, that cause allergy), no formaldehyde (≤ 100 µg in Fluzone, 10 in Fluad, etc), thimerosal (multidose), no preservatives, no gelatin or latex. Dailymeds explains all details about Flublok contents and manufacturing: 0.5 mL dose got NaCl 4.4 mg, Na_2HPO_4 0.195 µg, NaH_2PO_4 1.3 mg, polysorbate 20 (27.5 µg), may contain *"baculovirus and Spodoptera frugiperda (a caterpillar, larva of a moth that eats fruits, hence frugi-perda, lost fruit) cell proteins (≤ 19 µg), baculovirus and cellular DNA (≤ 10 ng), and Triton X-100 (≤ 100 µg)"*; baculovirus doesn't replicate in mammalian cells and is harmless; *insect DNA is safer than chicken or dog protein or DNA in all other vaccines (they are working on 100% vegan vaccines, without any trace of insect DNA, but* Flublok is way more *vegan* than most that got tons of egg protein*)*. The stoppers used for the single-dose vials are not made with natural rubber latex, unlike other vaccines. Just say you don't eat eggs (true for vegans) and want egg-free vaccine. Flublok is only for adults. Flublok Quadrivalent (Flublok for short, all are now Quads, the sticker they append to the receipt says Quadrivalent, NDC 49281-721-88) is not available in most places unless you ask your doctor to get it for you, but passporthealthusa.com has it for $75 and I got it

on Jan 6th 2022, no lines, I was the 1st in line to get it at my appointment, small office, it was the fastest vaccine ever, very nice nurse. Flucelvax Quad inactivated vaccine grown in a dog cell culture, see section 11, (susceptible to mutation and adaptation, thus to loss of effectiveness) and also much less vegan than Flublok which uses an insect line to grow the proteins for 4 types of flu strains circulating that year, not the dog line to grow the virus or eggs to grow the live virus for most vaccines; modified viruses, even if inactivated, can cause issues, so ***Flublok is safer***. Flucelvax is popular, but the virus is inactivated with β-propiolactone, disrupted by the detergent cetyltrimethylammonium bromide (bromide screw things due to its reactivity) and purified through several process steps, leading to dubious immunity. Flublok has the exact spike proteins, no chemical reactions with inactivating chemicals, detergents in your blood, etc. Flublok is mercury free since it only comes in single dose pre-filled syringes, while Flucelvax is only mercury free for the pricier single dose where the syringe is pre-filled. Most nations *don't even offer Flublok, as it's more expensive,* newer and they just didn't hear *much about it*. Flublok has 3 times the antigen of regular flu shots and leads to 43% less flu than regular shots. Very clean and amazing office at 2041 Rosecrans Avenue, El Segundo. I never did flu shot before (since in my US stay of 15 years I got sick only once before the US military started attacking me with their flu and other bioweapons), except maybe once as a kid at 5, so I was elated to find out this one was 10-20 times less sensations than the 1st COVID19 vaccine – basically only a slight heart rate increase and some arm sensation mostly next day, maybe due to the fact I had natural flu many times, even before this shot 3 weeks prior, so body was used to the spike proteins and indeed, Flublok, as papers below explain, is notorious for causing less reaction than the 80 year old egg based dead flu virus vaccines; because of this, I'm no longer scared of the flu vaccine, knowing that Flublok never has mercury, you just need to be careful to have arm uncovered there, to relax and wear loose clothes next 7 weeks, so you don't interfere with natural healing and don't use that left hand where you had it to exert much first 5 weeks. CVS lists Flublok for $74, but when you call they say they don't have it. For those < 18 years old, 99.999% *vegan* Flucelvax only is available that is more ecofriendly, uses no eggs, has fewer mutations, just some 1958 cocker spaniel kidney immortalized cell lines that can be cultured and multiplied. Flucelvax got dog cell protein ≤ 25 *μg* MDCK, dog cell DNA ≤ 10 *μg*, *other dog/bird protein* ≤ 240 *μg*, polysorbate *80* ≤ 1500 *μg (Flublok got* 54 times less), but it seems far safer and ☺☺*lovingly gently* kinder☺☺ to get single dose Flucelvax, since multidose contains thimerosal deadly (especially for small kids) mercury compound, see table. In 2016, the FDA approved cell based Flucelvax (for 6+ months & older: dog kidney cells grow the flu virus and then β-propiolactone 'inactivates' the virus. What if still live? FDA says they're better than egg-based vaccines, since virus mutates less, but can still mutate, while Flublok has no mutations).

In 2013 FDA approved *vegan* Flublok (18 years and older) which is similar to COVID19 Pfizer-

Moderna since, unlike all other vaccines, it doesn't contain dead virus (maybe not dead if error happens), but the hemagglutinin spike protein (or mRNA with instructions to make the protein for COVID) that causes immune response. The benefits (shorter flu, no death or hospitalization, less lung, heart, diabetes issues) of Flublok (all are unpreserved) or unpreserved Flucelvax flu vaccines are explained here. Due to less protein residue and less mutations of virus during egg treatment, etc, the Flublok presents clear advantages over the rest, since it's free of egg protein and dog proteins (MDCK cells *cause cancer in rats, so in EU the similar vaccine was withdrawn due to consumer hesitancy*); but even Flucelvax is free from egg proteins, if purified well, and is way safer than egg vaccines for egg allergic people, since it has probably 90,000 times less egg protein residue. Flucelvax is grown in Madin-Darby Canine Kidney (MDCK) cells instead of eggs, but these cells are removed (well, 99.999% maybe) after growing the vaccine, so we're not getting dog cells into our blood. The virus doesn't mutate as much as with eggs. "By all criteria, Flublok vaccine *exhibited superior performance* (vs egg-based and Flucelvax) in eliciting both CD4 T cell responses and HA-specific antibody responses" ► NPJV 2020;5:77. Flublok has "improved efficacy and a slightly lower local reactogenicity compared with standard inactivated influenza vaccine, despite the presence of more antigen" (45 µg antigen (HA spike protein) vs 15 in most egg vaccines, 3 times more per FDA and dailymeds – see ingredients, last). Flublok "enables vaccine production to overcome the well recognized egg substrate *disadvantages*...: selection or adaptation of influenza virus strains for production at high levels in eggs or cells may result in suboptimal genetic *match* between the vaccine strains and the disease causing influenza virus strains (Flublok spike proteins are identical to real virus);... the MDCK (*Flucelvax*) production process uses egg-derived virus seeds in its manufacturing process as well and the *mutations associated with adaptation to growth in eggs remain an issue*; the time required to produce a high growth reassortant; the manufacture process requires high-level biocontainment facilities or workers with appropriate immune responses against the viruses they produce; the influenza virus inactivation process requires the use of undesirable chemicals; the *endotoxin* content can't be carefully controlled; and the presence of ovalbumin or residual chemicals or antibiotics required to maintain a low bioburden during processing." ► TAV 2015;3(4):97-108 also explains Flublok is the high tech flu vaccine that allows in the future to create what all others can't: "include HAs designed to *mimic 'drift' in influenza viruses* as the process of predicting antigenic drift advances and, at a minimum, could address late appearing influenza viruses" (instant production vs egg ones). MO 2020;8(11):1745 explains "A 30% reduction in RT-PCR confirmed influenza" in Flublok (2.2% got flu vs 3.2%) vs egg vaccine and Flublok "HA protein is produced in a proprietary non-transformed, non-tumorigenic continuous cell line (expresSF+ insect cells) grown in serum-free medium, derived from Sf9 cells of the fall armyworm"; the paper covers Medicago, world's 1st 100.0000000% *vegan* vaccine (no insect DNA traces, but let's be real, if you eat veggies, greens, there is so much insect DNA from insect

poop, etc, especially if you eat kale (hard to wash), bee pollen, honey, royal jelly, etc and it can be *way more than the tiny amount in* Flublok *which is* 99.9999% *vegan*). More pros of Flublok (way less denatured proteins, contaminants, etc) are explained in this 2008 study. ☺☺☺

Fluzone *Quadrivalent*, the most common vaccine at most pharmacies, is less effective and is an inactivated virus vaccine, made from flu viruses growing in embryonated chicken eggs. The virus is inactivated with carcinogenic formaldehyde, then chemically disrupted using octylphenol ethoxylate (Triton® X-100) detergent. Adaption and mutation in eggs is an issue. Always ask for the pricier single dose pre-filled syringe, as that has no mercury. All the multi-dose flu shots in USA contain 25 µg mercury that destroys every organ. Avoid it, go Flublok. *Chemical virus inactivation changes the virus a lot* and the immunity you build is not like Flublok. That's why flu vaccines reduce risk of flue only 45%, since most flu vaccines are not Flublok. With Flublok, your risk of flu is reduced 63%. Not perfect, but better. Flublok is only 0.5% of flu shots. You always see those charts saying "get the shot, risk is halved", they refer to bad vaccines. We need more science jobs via centralization, so we make even better vaccines, to reduce risk 99%.

The 2017-2018 flu season virus in the United States was mostly H_3N_2. H stands for hemagglutinin and N for neuraminidase. H and N are 2 proteins that coat the flu viruses and these proteins change over time, allowing them to evade the human immune system, hence they make a new vaccine each year. The currently approved recommended medicines for flu are all neuraminidase inhibitors that bind to this neuraminidase enzyme, preventing the reproduction of the virus inside the host cell. The 1918 Spanish flu that killed about 70 million was H_1N_1, the Hong Kong flu that killed 1 million was H_3N_2. Below is a list of the 3 antiviral drugs approved by the FDA for the flu (they are all neuraminidase inhibitors), followed by a list of foods that boost immunity and have powerful antiviral effects too. Many people think that plants are kind of powerless, but if you read the studies below you will see some plants have powerful neuraminidase inhibitors (not man-made) like chlorogenic acid in plums and blueberries, and other compounds more effective than known drugs against many viruses. Medicines are just one chemical compound, while plants have 1,000s of compounds each, sometimes 10 antiviral compounds: quercetin, one of 5-100 flavonoids in plants, prevents entry of influenza virus, as do other polyphenols. Plants have to defend themselves against viruses, as we do, so they create these flavonoids, polyphenols, etc that kill the plant and human viruses.

Many people are lazy or lacking any proactive strategy when it comes to preventive medicine (Let food be Thy Medicine) by eating healthy plant foods that are highly antiviral and antibacterial, so they end up being sick or in the ICU and going to the doctor, and in those cases, antiviral medicines can save lives, as their immune system is weak and they lack antivirals in their blood from food. In such an emergency case, antivirals are essential. The healthiest people

never catch a cold, but they're rare. Few people have the willpower to make an antiviral smoothie of garlic, ginger, onion, pineapple, honey, bee pollen, 1 drop of lavender oil (safer than peppermint/mint leaves that got pulegone) etc.. cilantro, red pepper kale all mixed into one or to eat those over a period of 1-2 days as part of smoothies, maybe not all at once. I have not had a flu shot in the last 25 years, except once in 2022, the vegan one Flublok. ☺☺☺

Here are 4 studies that indicate antivirals can save lives: 1. Patients who got neuraminidase inhibitor antiviral medicines were 8.5 times more likely to not die (they excluded patients who died within 3 days, less chance to get the medicines). Out of 55 patients who received medical treatment 45 (78%) received neuraminidase inhibitors (Tamiflu [44], zanamivir [6]), 8 received amantadine (14%), 1 rimantidine (2%). 3 died within 8 hours of arriving to ICU, 1 within 24 hours rest within 28 days. ► JAMA 2009;302(17):1880-7. 2. Those admitted to ICU or who died took longer to take medicines for flu, compared to those who didn't go to ICU. None of those who died got the antiviral medicines within 48 hours of symptoms onset, allowing the virus to multiply rapidly ► NEJM 2009;361:1935-44 3. Pregnant women who took antiviral medicine later were 4.33 times (13/3=4.33) more likely to die or visit ICU than those who took it early (1-2 days after the onset of flu symptoms). 13 out of 30 in the late group went to ICU and only 3 out of 30 went to ICU in the early treatment group. 6 who died had a false negative test result for the flu since the 15-minute test is often times inaccurate. None of the 8 moms who died (after going to ICU) had received antiviral medicine within 48 hours of symptoms onset (6.5 days after on average instead) and they died in 14-49 days, but 6 of them had some health issues to begin with (hypothyroidism 2, asthma 2 gestational diabetes 1, history of Hodgkin's lymphoma 1). 21 out of 22 women who ended up in the ICU were given Tamiflu, the pill that led to deaths before ► NEJM 2010;362(1):27-35. 4. Treatment that started within the first 12 hours after the onset of fever shortened the illness by more than three days, as compared with treatment that was started at 48 hours ► NEJM 2005;353:1363-73. ☺☺☺

fda..8.htm recommends any of the 3 most popular antiviral medicines for recently circulating influenza viruses, while amantadine and rimantadine (flumadine) are thought of less effective, as some virus strains developed resistance to them (but still used when the others fail):

1). Relenza (zanamivir) inhaled ► formula at Zanamivir ► 5-acetamido-4-guanidino-6-(1,2,3-trihydroxy propyl)-5,6-dihydro-4H-pyran-2-carboxylic acid ► a neuraminidase inhibitor ► approved in 1999 for treatment of acute uncomplicated illness due to influenza A and B in patients ages 7+. It was also approved in 2006 for preventive use (prophylaxis) for ages 5+. "zanamivir reduces the time to symptomatic improvement in adults (but not in children) with influenza-like illness by just over half a day, although this effect might be attenuated by symptom relief medication. Zanamivir also reduces the proportion of patients with laboratory

confirmed symptomatic influenza. We found no evidence that zanamivir reduces the risk of complications of influenza, particularly pneumonia, or the risk of hospital admission or death. Its harmful effects were minor (except for bronchospasm)." ► BMJ 2014;348:g2547.

2). Tamiflu (oseltamivir phosphate) oral, avoid ► for kids, but causes deaths, suicidal thoughts, explained in the vaccine section 1st paragraph. Oxford was against giving Tamiflu to kids under 12. "Oseltamivir (Tamiflu) and zanamivir have small, non-specific effects on reducing the time to alleviation of influenza symptoms in adults, but not in asthmatic children. Using either drug as prophylaxis reduces the risk of developing symptomatic influenza. Treatment trials with oseltamivir or zanamivir don't settle the question of whether the complications of influenza (such as pneumonia) are reduced, because of a lack of diagnostic definitions. The use of oseltamivir increases the risk of adverse effects, such as nausea, vomiting, psychiatric (CIA trick?) effects and renal events in adults and vomiting in children. The lower bioavailability may explain the lower toxicity of zanamivir compared to oseltamivir. The balance between benefits and harms should be considered when making decisions about use of both NIs for either the prophylaxis or treatment of influenza. The influenza virus-specific mechanism of action proposed by the producers doesn't fit the clinical evidence." ► CDSR 2014;(4):CD008965.

3). Rapivab (peramivir) intravenous ► it is a neuraminidase inhibitor, with chemical formula at Peramivir ► approved in 2014 for flu in adults (most dead in any flu season are seniors, followed by 50-64 group)☺☺ "Intravenous peramivir was effective based on the result of direct comparison with oral oseltamivir" (Tamiflu). They noticed adverse effects for Tamiflu, making this peramivir better for most of the people perhaps ► OFID 2017;4(3):ofx129.

12.3.4. NATURAL ANTIVIRALS (Zinc Acetate lozenges, 0.9% saline and list of foods included)

Plants have to defend themselves against viruses, as we do, so they create these flavonoids, polyphenols and other compounds that protect against or destroy plant viruses and, due to sometimes similar structure, human viruses too. That's why some who eat very healthy never get a cold/flu ☺☺ without ever taking a vaccine (plants have natural neuraminidase inhibitors, like berberine), because their blood is full of these plant antivirals, like quercetin, etc. There are 8,000 polyphenols alone, many of them are antiviral compounds. I have not had a flu shot for decades until 2022, and only once in my life at the most, if I recall well, as a kid. Cloth masks with 2.5 pm filters (filters, 100/15$, last 24 hours, so 24 days if used 1 hour daily for shopping, etc) can prevent virus inhalation almost as well as N95 (90% vs 95%, while cloth mask without filter only 50% or 60% for better ones), but restrict air intake 4x less. CDC, FDA, other articles suggest using the surgical blue mask (3 layers) under a cloth reusable (that you wash) mask, so you buy 50 blues from $ store for 6$, cut the elastic, place as insert in the cloth mask to avoid annoying ears to no end with 2 loops or wear it alone, 50 dark blue smiley face/13$, 100

black/10$ or 50 dark purple/9$ (dark colors filter UV better, keep skin younger). This is cheaper than 20$ for 50 2.5 pm filters that make it hard to breathe; some masks got a pocket to insert filters or trimmed surgical masks, but some don't wash cloth masks often, so disposable ones can be better (washing disposable ones diminishes the filtration ability) if worn correctly. 1 issue with surgical 3 ply ones is lint pieces that can get into eyes, unless you wear sealed glass. Triple cloth masks that are washed as often as you would dispose of another may be safer, as they have fewer industrial contaminants to breathe in or even possibly hidden nanomaterials, chemical or biological weapons (even if made in USA, military spies can intercept shipment, replace masks, etc). See this paper on inhalation resistance in Pa (Ctr+F Pa). There are 200+ common cold viruses (coronaviruses, rhinoviruses, plus the rare or engineered cold viruses marketed and spread as covid19 variants by armies or lab made? COVID19 variants), 300+ viruses for flu (A-D influenza viruses), so a strong immunity, masks (indoors, etc), diet help.☺☺

1). COVID19: some claim some berries killed 97% of COVID19 in 5 minutes in vitro, even green tea killed 80% (see science paper PDF here), can be gargled (or make a smoothie with purple kale, purple cabbage, blueberries, dilute with water or cucumbers and gargle it, or ***eat 2 blueberries at a time slowly so it takes 15 minutes so you can kill more virus, liquefy them*** with your teeth and slowly ingest to lubricate the throat with blueberry paste sort of, since same polyphenols that kill influenza kill COVID19 too, green tea and many polyphenol foods share the same antiviral chemicals) to kill the omicron covid19 variant that settles in the throat more than the lungs. Cough drops are not recommended for Covid19, since menthol numbs throat and hides shortness of breath, severity of throat issues. Menthol kills too many good bacteria, see this. Plus menthol irritates throat skin. Blueberry smoothies work too or berries one at a time slowly to soak throat. Honey blocks ACE2 (angiotensin converting enzyme 2) interaction with the Covid19 spike protein, which stops Covid19 virus entry in cells and its multiplication. Combining honey with carrots (puree, juice or chewed to release juice on the throat) is better, as carrots have coumaric acid, which most honeys lack in high amounts and this coumaric inhibits Covid19-ACE2 interaction. I noticed just chewing carrots soothes the throat a lot, no need of honey even, chamomile tea also helps carrot soothe it even more, make sure you drink water at night if throat gets dry during sleep, keep mouth shut to avoid throat dryness by inadvertently breathing in thru the mouth partially (mouth breathing is a bad idea, since no nose exists to filter the air and protect your lungs). Many foods got coumaric, even lentils got way more than many veggies/fruits. Honey worked better than antibiotics for coughing. However, this block is partial, while some bees produce 99.7% block: "At the 2.0% concentration, Wallacetrigona incisa honey (bitter taste) showed the strongest inhibition of the binding (99.7%)". Carrots also help sore throat, be it plain carrot you chew (juice comes out as you chew it slowly and soothes the throat), carrot juice (can make it with a smoothie, squeeze the pulp) or the water after steaming

carrots, see the carrot section. Smoothies every morning help too, plus they increase nutrient absorption, so make a smoothie daily too. Buckwheat honey (buy raw, unfiltered, like North Canada, no pollution, says no pesticide/antibiotics on the label unlike US honey, 6.6lb/75$) is the darkest honey, meaning it has the most antioxidants (better than the expensive Manuka honey, many honeys got "superior antibacterial efficacy compared to Manuka"), attacks the sore throat Covid variants (2022 review, 2023 study, 2021 study) the best: google confirms many studies found buckwheat is the best for sore throat in general, not just Covid sore throat. However, chamomile tea *(0 caffeine)* polyphenols apigenin/luteolin (which help prevent hair loss) also kill Covid virus and it's way cheaper than cough drops (sip slowly over 5 hours, 9000 times fewer calories and belly fat, plus better sleep if used 40 min before bed (see caffeine end of first paragraph). So, you can dissolve buckwheat honey into warm chamomile tea for a very soothing throat ointment, add magnesium glycinate to bring calm and brain support for energy production, and drink it slowly over 1 hour in the morning or afternoon to saturate the throat in those chemicals, and gargle with this sweet tea, then swallow it, can add salt or potassium salt to it when gargling. Fenugreek seeds (just like bromelain/nattokinase), also kill the spike protein, if you grind them into a powder (stool can harden if overeating). Omicron variant multiplies 10x slower in lungs, 70x faster in bronchial tissues, has cough, sore throat, runny nose as main symptoms). Gargle with honey plus propolis dissolved *in water* to kill Covid, see NIH study. "zinc can interfere with proteolytic processing of polyproteins in RNA viruses, and the RNA polymerase of SARS-CoV-1.. COVID-19 (SARS-CoV-2 virus) patients taking supplemental zinc in addition to standard therapy were reported to have lower death rates, and patients with lower zinc levels on admission had higher mortality... Covid19 patients taking high dose oral zinc appear to recover shortly after initiation of zinc" ► JMV 2021;93(5):2588-90.

2). ZINC Acetate (not citrate, tartrate or Zn-N bonds: aspartate, glycinate, picolinate):

PDTC inhibits the replication of 3 picornaviruses (positive-sense, single-stranded RNA viruses with a 30 nm icosahedral capsid: mengovirus, rhinovirus (cold), coxsackievirus B3) by binding Zn^{2+} so the resulting complex can enter the cell, increasing intracellular Zn^{2+} and blocking the RNA replication via the viral RNA-dependent RNA polymerase (RdRp). Thus viral replication stops. "(PDTC) inhibits proteolytic polyprotein processing and replication of human rhinovirus by transporting metal ions into cells... these zinc ions play an important role in the antiviral activity mediated by PDTC" ► JGV 2007;88(Pt4):1206-17. Zn is part of 1000 transcription factors and 300 enzymes in humans, so it plays a role in immune response to invading viruses. Zn^{2+} is the active lozenge agent that inhibits rhinovirus replication and prevents it from binding to the nasal/throat mucosa. Zinc acetate releases 99% of its Zn^{2+}, whereas Zn gluconate 72% at the throat normal pH of 7.4. ORMJ 2011;5:51-8 found that at >75 mg zinc/daily "zinc acetate... (led to) a 42% reduction in the duration of colds... zinc salts other than acetate... (led to) a 20%

reduction" while less than "75 mg (led to) no effect.": first line of Table 1 shows 1 study got 64% less cold duration (3.9 v 10.8 days). Essentially, Zn acetate released double the Zn^{2+} ions (99% vs 50% for the rest) on average, for the same label amount of total zinc, leading to double the days by which the cold was shortened: 42% vs 20%. Zn tartrate, citrate (where Zn is still ionic Zn^{2+}) hold onto the Zn^{2+} too tightly vs gluconate or acetate, meaning they don't release enough Zn^{2+} in the saliva we swallow to kill the covid19, influenza A, B or cold rhinovirus. The covalently bound Zn in super tight glycinate, aspartate, picolinate, amino acid chelates where nitrogen N binds to Zn, don't do anything topical to the throat viruses, as they release zero Zn^{2+}. Not all lozenges thus are the same, since the addition of citric/citrate, tartaric/tartrate, bicarbonate (baking soda), as inactive ingredients prevents the release of Zn^{2+} by binding to Zn^{2+} released from gluconate, acetate before they can attack the viruses. "Due to inadequate lozenge iZn (Zn^{2+}) very few of more than 40 different brands of zinc lozenges on the US market are expected to have any effect" ► MH 2009;74(3):482-92. Thus, you're often better off buying Zn acetate/gluconate and keeping the powder under tongue 3 hrs daily, or buy a dropper, make a fresh solution when sick, and take 5-10 drops every 5 minutes, no more than 150-200 mg Zn daily. If you buy lozenges, instead of 100% pure Bulk Supplem. Zn acetate (ZnAc) to keep under the tongue for 1 hr, make sure no ingredients (citrate, citric, etc) in there bind to Zn^{2+} released by acetate or, if you can't find acetate at the store or online, gluconate. 285 mg gluconate is 40 mg Zn, so you need to place under tongue tiny amounts each hour and not swallow it, but let it dissolve slowly, so with each reflex to swallow saliva you deliver 3-4 mg to attack the virus, maybe 1 g gluconate daily, about 130 mg Zn for 3-5 days of cold, to saturate the throat with Zn^{2+} so the cough or soreness, mucus, etc go away and it won't linger 1-3 weeks. We need to take it immediately when we feel a sore throat, congested sinuses or running nose or any sign of cold, so buy ahead of a cold pure Zn gluconate to use for cold and even whole family Zn supplementation or a lozenge (with minimum ingredients, to prevent Zn^{2+} binding, no vegetable or Mg stearate) to have ready, because if you wait 5-40 hours to buy it, the viral load spikes 10 fold and you miss the chance to reduce cold duration by 2-10 days ► JFP 2011;60(11):669-71. With "zinc doses of 80-92 mg/day, common cold duration was reduced by 33%... (with) 192-207 mg/day (..by) 35%... Interest in zinc lozenges for the treatment of the common cold arose when the common cold symptoms of a 3-year-old girl with leukemia disappeared within a few hours after she had slowly dissolved a therapeutic zinc tablet in her mouth instead of immediately swallowing it as instructed. The benefit seemed to be obtained from the slow dissolution of the tablet in her mouth, which implied that zinc has local (topical) effects in the pharyngeal region (*her dad George Eby published many Zn papers (1984-2011) after this 1980 discovery, he invented the Zn lozenge*, see all *his 20 papers* and the *girl's reason for swallowing Zn* (swollen tonsils)" ► JRSMO 2017;8(5):2...1. Virus enters the body when we breathe, via nose and throat, so if Zn^{2+} kills the nose/throat virus it will prevent viral spread thru the entire body, including muscles (up to 89%):

"Zinc acetate lozenges shortened the duration of nasal discharge by 34% (95% CI: 17% to 51%), nasal congestion by 37% (15% to 58%), sneezing by 22% (−1% to 45%), scratchy throat by 33% (8% to 59%), sore throat by 18% (−10% to 46%), hoarseness by 43% (3% to 83%)... cough by 46% (28% to 64%)... muscle ache by 54% (18% to 89%), ... headache and fever (by 0%)" ► BMCFP 2015;16:24. Fever is a whole body response to kill any virus by higher temp, headache is due to heat shock proteins from fever, so they're not affected much. Essentially, you can take 500 mg Zn daily or 50 and still get same effects, if you keep in mouth the 50 mg of lozenges 10 times more than you keep the sweet 500 mg ones that you swallow fast or chew to enjoy a glucose spike. It's not so much the amount taken, but the hours daily you soak the throat in Zn, the 2017 study (which claims gluconate and acetate have similar effects, unlike Eby claiming acetate is better in his papers) measures Zn mg, but we need measure the time it was in the mouth, we can eat 4 bags of cough drops in a day, like many do, or 1 bag in 2 days: fast chew/movement or 10 times slower dissolution. Cough drops are to soothe throat pain/cough, not to kill the virus. Swallowing a Zn pill won't help as much, we need the 100% Zn gluconate or acetate lozenge (minimum ingredients, watch this video to get this point better) or 100% Zn acetate or gluconate powder to keep under the tongue sublingually for hours daily when sick, to halve the flu/cold/covid duration. The Zn for cold is topical for the throat, not a Zn pill we take as vitamin daily that many triple during a cold too to aid the topical (on the throat, for 3 hours daily, not 3 minutes) effect *(though not needed, since 150 mg topical will get enough in the system for the extra needs of viral fight)*. In Zn deficient kids, swallowing zinc pills can work a little too: 8-13 year old kids given 15 mg Zn glycinate/day (4.6 mg Zn) for 3 months had the same number of colds, but *the coughing* lasted 1 *day instead of* 6 days *for placebo,* running *nose* 2 days *instead of* 5.5 ► PICH 2013;33(3):145-50. So, good Zn status boosts immunity, reduces cold duration by 30%, but to shorten cold 90% from 4 weeks *(Zinc/D3, etc deficiency,* poor sleep (3 times lower T cell count)*)* to 2-3 days, take sublingual zinc acetate & nasal saline + 50K D3, 1 g C, 2 mg K2 + stuff below. The nose, throat are doors of a fortress (body) and if we don't seal that, 'invaders come and kill locals'. Gargle with salt, clove water, ZnAc solution until cough ends.

3). Add 0.9% saline to the nose, as nasal saline kills nasal/throat viruses. ☺☺☺

4). BERBERINE powder, 90$/lb ► inhibits neuraminidase, like all main flu drugs sold

5). GINGER ► Antiviral effects ► JFP 2016;79(6):1001-12 and "Fresh (not DRIED) ginger (Zingiber officinale) has antiviral activity" ► JET 2013;145(1):146-51

6). GARLIC ► 24 occurrences of the common cold in the garlic intervention group compared with 65 in the placebo group, resulting in fewer days of illness in the garlic group vs placebo (111 versus 366) ► AT 2001;18(4):189-93. See the antiviral activity of garlic extract against human cytomegalovirus in vitro ► CMJ 1993;106(2):93-6. Allyl compounds selectively killed H (type 1)

infected cells ► BBRC 1993;194(2):610-21. More garlic benefits is in the detoxification section; its capacity to remove toxins frees the body from having to fight toxins, so we can fight viruses. Up to "27 tablets/ capsules (can be needed) to obtain the same equivalence as consuming 2 g of crushed raw garlic", due to the loss of allicin, so for best outcomes stick to raw garlic. Check out the effect of garlic on the skin, before you use it on skin.

7). ONION ► influenza A virus replication inhibited in vivo by Welsh onion fructan ► FC 2012;134(4):2164-8. Garlic has 15 times more fructans (inulin) than onion, so it works better. Fructans are polysaccharides, polyfructose to be exact, glucans (β-glucan) are polyglucose, you always hear about β-glucan in oats, yeast, etc. Breastmilk has oligosaccharides that boost babies' immunity vs formula fed sicker babies. Poly and oligosaccharides help immune cells make more antibodies. Red onion got 2x the flavonols (antivirals) of yellow ► JAFC 2007;55(25):10067-80.

8). YEAST ► Colds incidence/duration halved in kids via β-glucan ► JNFS 2016;6(4):518-22. Immunogenic yeast-based fermentate for cold/flu ► JACM 2010;16(2):213-8. ☺☺☺

9). CARROTS ► Carrot rhamnogalacturonan-I (cRG1 in pill form, a polysaccharide made of galactose, rhamnose, etc, like β-glucan is polyglucose), fights the rhinovirus of common cold, reducing cold severity/duration ► Ntr 2021;13(12):4395 & Ntr 2022;14(20):4258. ☺☺☺

10). VITAMIN C ► COVID19. Flu/cold symptoms fell 85% ► JMPT 1999;22(8):530-3

11). PINEAPPLE or Bromelain. Fewer colds, flu, infections in kids ► JNM 2014:861659. Likewise, many proteases, nattokinase, serrapeptase destroy 100+ viral proteins, Covid19 spike.

12). PURPLE-BLUE-RED fruits/veggies high in Flavonoids & Polyphenols. Flavonoids☺☺☺ got antiviral effect against human viruses ► JMV 1985;15(1):71-9, Chikungunya virus ► AR 2016;133:50-61, influenza A, respiratory syncytial (RSV), parainfluenza type 3 (PIV 3) ► JNP 2004;67(4):650-3, human enterovirus A71 replication ► AR 2017;150:60-8.

13). QUERCETIN

14). CAFFEINE FREE TEA ► avoid tea with caffeine if trying to conceive as it leads to low IQ sick babies. Five tea polyphenols (which are also found in healthier foods free of brain shrinking caffeine) inhibited influenza A virus in order: theaflavin > procyanidin B2 > procyanidin B2 digallate > epigallocatechin > epigallocatechingallate ► Fitot 2014;93:47-53. Green tea flavonoids kill influenza, Herpes simplex, tobacco mosaic, enterovirus, rotavirus, Epstein Barr, HIV virus ► RPADD 2012;7(1):60-5, free pdf at eurekaselect.com. ☺☺☺

15). PURPLE KALE ► the healthiest veggie with many flavonoids (and other polyphenols in plants) that are powerful antivirals. Kale smoothies kill influenza via sulforaphane: sulforaphane

antiviral is only produced when we eat the kale, broccoli raw. Kale has way more sulforaphane than broccoli or any other veggie and smoothies way more than chewed kale, as the crushing action generates more sulforaphane from the enzyme (that heat destroys) and sulforaphane precursors. The antiviral activity disappears after cooking, as the enzyme is destroyed. Using inoculation with live attenuated influenza virus as an infection model, they showed broccoli sprouts reduce markers of nasal viral load ► PO 2016;11(1):e0147742. Broccoli sprouts reduce flu virus quantity and virus-induced inflammation markers ► PO 2014;9(6):e98671. Sulforaphane Inhibits HIV Infection of Macrophages through Nrf2 ► PP 2016;12(4):e1005581, Suppresses Hepatitis C Virus Replication ► PO 2016;11(3):e0152236. ☺☺☺

16). TURMERIC/CURCUMIN

17). KIWI ► CJPP 2013;91(6):442-7. Gold kiwi reduces severity/duration of upper respiratory tract infection symptoms ► BJN 2012;108(7):1235-45.

18). LICORICE ► Glycyrrhizin inhibits influenza A virus uptake ► AR 2009;83(2):171-8.

19). COCONUTS ► Husk extract inhibits HSV1 virus RM 2002;153(10):647-52. Coconuts are also antibacterial (carrots are too, like hot peppers capsaicin) ► JMF 16(12):1079-85

20). CLOVES ► lowers male/female fertility. Eugenol antiviral ► JFP 2016;79(6):1001-12

21). HONEY (see also Covid19 section 1). above): The best one is raw unfiltered, with maximum polyphenols. Honey is used for treating acute irritative cough ► RPP 2016; 34(4):412-7. Manuka honey has antiviral effects ► NPB 2013;3:121-8, it's even used in eyedrops. Honey is best bought unfiltered, raw, full of polyphenols from a local supplier, not the one that sits on the shelf in stores, with light destroying 50-90% of the special nutrients, vitamins, etc. Mix raw honey with a propolis capsule in a spoon or 25-80 caps/lb honey, it works to soothe your throat, use a tiny spoon to eat often to keep throat soaked in honey and propolis (can add 1 tiny piece of menthol/tiny jar of honey to get something healthier than Halls cough drops with carcinogenic colors, etc), this is much better than buying candy with 'honey and propolis', since those have added ingredients and sometimes are full of lead, 2,000 times above FDA limits. Even if lead won't be so high in cough drop candy, raw honey has all good stuff, commercial is empty, due to high heat, irradiation, heavy filtering, light. For cough, honey is great, you can add topical chest throat rub, 1$ at $store, this one is more natural. Among cough drops the Best brand (since 1976, @ $ stores) has 0 toxic colors, β-*carotene*,☺☺☺ MCT (fats that kill bacteria), soybean (LA + ALA, essential for throat cell regeneration), menthol, honey, useful when eating honey every 3 min is not feasible, or want to soak throat in oils, menthol, provitamin A at once, β-*carotene* reduces free radical damage during colds. Kroger (since 1883) sells online (1$) 30 drops/bag, same ingredients as Best. With 1-2 bags (30-60 drops)/day your sore throat will feel

good in 1-4 days. Keep throat soaked in menthol, etc. For throat, we can also gargle a tea of peppermint, chamomile, lemon juice, honey, propolis. Honey has traces of pollen:

22). BEE POLLEN, PROPOLIS (best quality, stops running nose), ROYAL JELLY ► bee products are antivirals ► OMCL 2017:1259510, propolis is antifungal ► APS 2013:308249. Propolis flavonoids (see structures) kill 100s of fungi, molds, Candida fungi (50+ listed in this table) and molds (even black mold from buildings), and Trichophyton (mold that causes 90% of toenail fungus, so buy quality US alcohol tincture to apply on toenail, as in this paper, maybe add tea tree oil too, kills it faster, synergy, cover it with bandage after a few minutes of drying, otherwise your socks will get brown spots; also take oral propolis to attack the fungi from within and without at once). Caffeic acid phenethyl ester (CAPE) is a propolis antiviral polyphenol ► JIE 2015;4(4):344-7. See more on propolis here. Propolis acts as a mold killer and mold, bacteria can downregulate vitamin D receptor (VDR) 50 fold, leading to the need for 100K D_3 intake during a flu or cold, due to co-mold infection: CCCR 2012;8(1):57-65 ► tick bite bacteria "can reduce VDR expression by 50 times in monocytes". By releasing the VDR from the cage of old microbes or mold, the immune system works 50x better, able to use D_3 to kill the flu/cold/Covid. ☺☺☺

23). Vitamin D ► Low D = Colds/Flu ► nih.gov..flu. "Add vit D.. to prevent colds and flu": NIH.

24). PLUMS: Chlorogenic acid (CHA, plum is the richest source) inhibits neuraminidase & influenza A (H_1N_1/H_3N_2) virus ► SR 2017;7:45723, Enterovirus 71 replication/viability ► PO 8(9): e76007, hepatitis B virus AR;2009;83(2):186-90. ☺☺☺

25). STRAWBERRY, BLUEBERRY & Other Berries ► Berries are rich in Chlorogenic acid (CHA).

26). APPLES & Fresh Apple Juice: Fresh apple juice was 16 times more effective against polio and coxsackie (sore throat, fever, etc) virus than fresh juice bought from the store. Antiviral activity of freshly made apple juice dropped 256 times after 4°C fridge storage for 4 weeks (64 times after fridge for 2 weeks) and 16 times after heating to 149°F/65°C for 1 minute. In heat we trust? Other studies found many of the veggie, fruit benefits disappear with steaming and cooking. Fresh is best. BJ 1953;53(3):337-40 found apples contain on average 10 mg/100g CHA. See CHA levels of fresh apple juices at MNFR 2005;49(8):797-806. Cider apples can have 49 mg CHA/100g, desert apples 13 mg CHA/100g. Cider apple juice got 59mg of hydroxycinnamic acids, mostly CHA. Plums have 76mg CHA/100g. Cherries got 45 mg/100g. Apple Pomace, a byproduct from the apple cider industry, inhibits herpes simplex virus types 1 and 2 ► JMF 2012;15(6):581-7: the end of this paper explains some of the ways phenolic compounds inactivate viruses.☺☺☺

27). ESSENTIAL OILS & SPICES (peppermint, etc contain neurotoxins like pulegone): OREGANO essential oil ► JAM 2014;116:1149-63, tea tree, lavender, thyme (thyme may cause abortion; so may mints and myrrh), peppermint (14$/lb may lower testosterone in males, thus cause dry

eyes and infertility, low conception rate, low sperm count, etc at certain levels; all mints may do that, spearmint too), eugenol oils are powerful antivirals ► EJD 2013;7(Suppl1): S71-7. Lavender oil can cause allergies and is toxic to skin cells in vitro; it contains 51% linalyl acetate and 35% linalool. Peppermint oil (it's 40% menthol, 30% menthone) can wipe out 99% of certain viruses ► PM 2003;10(6-7):504-10, yet a 2019 study found peppermint tea (not sure if causal chemical in tea is also in oil) may cause dry eyes. Other essential oils can do the same. Spices (oregano, rosemary, peppermint) have antiviral effects due to several polyphenols, including caffeic acid derivatives. Antiviral effect of water extracts of rosemary, peppermint, sage, thyme are here ► PM 2006;72(15):1378-82. Antiviral action of extracts of rosemary ► FCT 1996;34(5):449-56. Antiviral activity of carnosic acid (rosemary) against respiratory syncytial virus ► VJ 2013;10:303.

28). SEAWEED (wakame, popular in Japan, Chile (14 millennia), but ocean contaminants an issue): 60+ year olds who ate seaweed extract (vs placebo pills) had antiviral antibodies 2.5 times higher before flu vaccination ► JN 2013;143(11):1794-8. Seaweed prevents infections by HSV viruses (that cause warts, chicken pox, shingles, mono) ► BMCCAM 2002;2: 11.

12.3.5. Millions of vaccine injury cases and other issues with existing vaccines

A 6 year old Allen, TX girl started hallucinating and trying to commit suicide in 2018, after taking Tamiflu. Dr. Mercola explains that 5 kids under 16 died from Tamiflu. There have also been nine deaths among older teens and adults, attributed to neuropsychiatric problems or brain infections. A 2015 article explains that 0.25 million neuropsychiatric disorders from Tamiflu have been reported. HET 2008;27(12):911-7 shows brain effects of Tamiflu. IJP 2015;47(1):11-6 is an article about the Tamiflu fiasco. ANS 2017;135(2):148-60 explains that "In Japan, Tamiflu is contraindicated for children and adolescents of ages 10–19 years in principle since March 2007, due to concerns that it may cause abnormal behaviors. Sudden death is another concern". This Japanese ban of Tamiflu is also explained in the New Scientist. The problems with Big Pharma (75% of Pharma world profits, 4% of population to finance PALACES in Mexican Cartel Style Trillion $ Thefts) are explained in the book "Bad Pharma: How Drug Companies Mislead Doctors and Harm Patients", or in the brief Tamiflu article about withholding bad data and releasing only good data by Roche, same methods of GSK with Seroxat anti-depression drug (which led to teen suicides) presented below, and other behaviors which led to $3 billion fine for GSK. The author says "We like to imagine that medicine is based on evidence and the results of fair testing and clinical trials. In reality, those tests and trials are often profoundly flawed. We like to imagine that doctors who write prescriptions for everything from antidepressants to cancer drugs to heart medication are familiar with the research literature about a drug, when in reality much of the research is hidden from them by drug companies. We like to imagine that doctors are impartially educated, when in reality much of their education is funded by the pharmaceutical

industry. We like to imagine that regulators have some code of ethics and let only effective drugs onto the market, when in reality they approve useless drugs, with data on side effects casually withheld from doctors and patients..."☺☺☺ vaccines.news has more info on vaccines Big Pharma and their Nazi puppets don't reveal. The "acting director of the FDA's Center for Drug Evaluation and Research, highlighted that while U.S. children receive 72 core vaccine doses, children in Denmark receive just 11. U.S. ...exposed to ... more aluminum adjuvants—5.9 mg by age two compared to Denmark's 1.4". Denmark life expectancy is higher than USA. Vote for Big Pharma greed now. They want to exterminate/dumb down the workers, while stealing trillions from US Treasury for Palaces and to fund 61 extra vaccines vs Denmark. After 34 years of coercion, FDA no longer requires Hepatitis B vaccines for 1 day olds, since kids don't have sex or use drug syringes, the routes for infection. In 1991, FDA criminals decided to vaccinate all 1 day old babies against a disease no baby could get until 18 if a normal person. This genocide caused brain damage and immune collapse, as babies' immunity barely begins at age 6 months. No wonder the babies born after 1991 seem to be living in a parallel universe. 10% of adults got serious side effects from COVID19: heart issues, miscarriage, cancer, blood clots. The point of this is to eliminate all people with IQ 200, so US remains decades behind other nations, because only 200 IQ can discover really amazing tech, the 150 are little kids.

The reason so many kids and infants die or suffer horrific lifelong disability is that there is no Federal Requirement for MDs to conduct a Nutritional Immune Check for Mn (MnSOD), Cu (CuSOD), Se (Gpx), Zn, Fe, Mg, Ca, A, B1-12, C, D3, E, CoQ10, K2 MK7, to ensure that these are in optimal (not "normal") levels needed to win if one would be attacked by a live attenuated virus able to do big damages without a healthy diet of omega 3, polyphenols, etc. Doctors need to be mandated to make sure that patient brings nutrients to optimal levels for high stress, higher than the normal today, optimal sleep depth and regularity, so that the adverse events go to 4 instead of 90,000. For example D_3 of 30 ng/ml is too low for a strong immunity, so bring it to 70 first with K_2, Mg, D_3. Without proper vitamins and regular intakes, the body is too weak to deal with issues, so doctors need to give patients a custom Multivitamin called "Rise" for 1 month to bring levels to optimal and then a "Maintain" multivitamin to keep All optimal for 6 months, so no side effects. With the deep deficiencies today, noted by many papers as each vitamin section shows, it's like asking patients to retrieve a red hot steel plate from an 800°C oven without gloves, pure insanity. This is 1000 times worse if the patient is a helpless baby, whose brain doubles in the first year of life and whose parents are so clueless, he's also without a real immune system until month 9 and with 10 deficiencies, setting him up for 30 points lower IQ and other issues from day one. It's nothing but a calculated genocidal hybrid war of turning US into low IQ land as news show. The multivitamins need a few natural antivirals too, like quercetin, etc, in case people don't eat those foods, so when flu season hits, they have 20 times the chance

to prevent infection. The flu shot only reduces infection risk by 63% for Flublok vegan one and 45% regular, so we need to develop a special multivitamin formula to reduce risk by 99.9% when combined with the vaccine. Without a goal, you don't get there, nutrition is 1000 times more important than vaccines, for many people with strong nutrition and sleep habits don't get flu for 30 years, and we know with dietary changes, we can extend that to 3000 years like honey bees live 40 times longer. If we extend human lifespan to 5000, by age 3000 most will have no issues. Today, Big Pharma wants more $, so they make 90,000 vaccines for 90,000 diseases, instead of keeping us young to postpone 90000 diseases. If we take a strong multivitamin with 200 extra nutrients, 10 times the size of pills today, we have a strong immune system that fights 90,000 diseases, and we can achieve the same 50% reduction in infection rate from 90,000 diseases as 90,000 Big Pharma vaccines: regular flu shot 45% reduction. Which one destroys us 90,000 times more, the multivitamin or the 90,000 vaccines or 3 vaccines daily since birth? We need 11 companies for good sleep for all: bad sleep one night means T-cells down 3 fold next day. Most MDs are simple lapdogs of Big Pharma (MDs promoted smoking in 1950s, 60% MDs were smokers, used lead fillings in 1850s, mercury today) with greed usually for the 10-80 times the federal min wage, 0.12-1.2 million/year depending on practice, specialty. With advanced eterni foods, you can develop 1 eterni powder to cure each known disease. We can't do that in capitalism, which is based on fraud, deception, marketing, bullshitting. ☺☺☺

Millions of people weaken their immune system, damage neurons by taking mercury containing flu shots (forgetting for 2 millennia centenarians did not take flu shots and that 1,080 people died as a result of flu shots), when we can take 5000 IU vitamin D, and natural antivirals. The mercury-ethyl bond in thimerosal ($NaOOC\text{-}C_6H_4\text{-}S\text{-}Hg\text{-}CH_2\text{-}CH_3$) is weak, so Hg^{2+} forms fast and starts destroying good cells and depleting the blood of antioxidants for days. In 2025, USA recommended, not required, that all MDs stop giving mercury multi dose flu shots, about 33 years after Denmark banned it in 1992 in kids: this is because USA is run by bandits building Palace to their Infernal Selves. We need obviously 11 companies for efficiency, to have 10 times more health and longevity staff and 900 times bigger food industry scientists/engineers (eterni foods) to replace agriculture (pig trough feeding at "restaurant pubs for mentally retarded chimps") with elegant powders dissolved in water, with personalized levels of 50000 chemicals that change every week based on complex calculations of 1000 biomarkers, shipped to your home. The crocodile filif IQ of cannibal chimp like CEOs of Big Alcohol and Junk Food is like that "sky high IQ" of the MDs in smoking ads in the 1950s, when most MDs smoked, just as half MDs used lead fillings for cavities in 1850s due to their "special connection to the God of greed and 'truth'", which caused a big debate over mercury amalgam too, so by 1840, the sole US dental association, the American Society of Dental Surgeons ASDS, required dentists to avoid silver fillings. This noble ASDS vanished in 1856, as *most* dental *doctors were too greedy, low IQ, evil*

(gold was more work than Hg), so they formed the demonic ADA, who rules to this day and promotes the devilish use of mercury fillings: American Dental (Demon) Association (ADA). Nobody brought these criminals to court for all damage their fillings caused yet. Scientists are working on oral and nasal vaccines (beyond the approved FluMist Quadrivalent which anyone can administer from the comfort of their home after online ordering) to avoid arm injuries that can cause scars leading to clots, turbulent flow, plaque, infarct, recurring inflammation.

Doctors are busy with patients, forms, family, and etc, and don't have the time to screen patients often, read new stuff etc, given the doctor to patients ratios now, we need way more ETs, NMs, NDs, MDs, RNs (maybe 5 times more than now) to be able to properly screen, educate, prevent disease and give all 500 year lifespan. This is impossible today, because most jobs in USA are bullshitting, duplicating others' work, products, research, marketing, retailing, junk that nobody needs with 11 companies, self-checkout and 10 trillion cameras and online ordering, 9000 times fine the amount stolen, death for any 2 week no healing violent crime (there won't be any prisons for theft or anything nonviolent, only fines/education, lifetime labor for soft push or minor scratch healing in 2 weeks, and the rest all DEAD: no aristocrats☺☺☺, no prisons, max pay 3-5 times minimum. Many centenarians have not seen a doctor ever. Vegan centenarians from Bama, China don't even have a hospital nearby, they don't need "vitamins, vaccines, hospitals, wine, coffee, pills, beer, meat, dairy" to live to 110, nobody almost gets sick. For 100s of reports of vaccine injuries organized by vaccine type, that appeared in the media over the last 50 years, check out whale.to/vaccines.html with 5000 science papers. Sleep & eat well, before and after, make sure vitamin D is 60-100 ng/ml first, K_2, Mg OK, since you can't boost D without taking Mg and MK7 K2, as D depletes Mg and can calcify heart and blood vessels without K_2, causing bent fingers via joint calcification and kidney stones too. Vitamin D is the General of Immunity Army. Take 5000 IU if sick or planning to vaccinate if D < 50 ng/ml.

Below is some good info on the 1100 people *who* became permanently disabled *or* died *as a result of* FLU SHOT, etc vaccines (the Vaccine court awarded $3 billion already to those disabled):

nvic.org..Influenza.aspx explains that "As of November 2013 (since 1990, so 23 years), there have been more than 93,000 *reports of reactions, hospitalizations, injuries and deaths following influenza vaccinations* made *to the* federal *Vaccine* Adverse *Events Reporting System (VAERS), including* 1,080 *related* deaths, 8,888 hospitalizations, 1,801 related disabilities and over 1,700 cases of GBS. In 2013 the Federal Advisory Commission on Childhood Vaccines (ACCV) voted to add GBS to the Vaccine Injury Table within the federal Vaccine Injury Compensation Program (VICP)." ☺☺☺ The CDC data shows in 2014, 4605 people died because of flu vs 3975 in 2023 ► cdc..flu.htm. 86 deaths were reported (probably more unreported) from the flu vaccine. 9 year old Breanna Browning girl went blind and paralyzed 2 days after the flu shot ► y..4.html. For

200+ links to MDs who think vaccines are not always safe, see wh..vaccines.html. OK, not everyone is on board with the flu vaccines. Dr. Mark Geier, a pro-vaccine MD and PhD involved in the design of vaccines explains how to improve flu vaccines via proper long-term safety testing (no safety/efficacy testing done on many flu vaccines) in this video ► youtu.be..4, just because people point vaccines are not perfect, can be improved or can cause autism or other problems doesn't mean they're anti-vaccine. Italian Court ruled vaccines cause autism. Actually, the circumcision section, 2nd paragraph, explains why vaccines are not always good if overcrowded, during brain doubling in size first year of life, due to: pain and overwhelming a nonexistent immune system, which only gets to be somewhat good at age 7 months; the entire circumcision section explains the pain to autism link and the damage too many needle wounds will do to IQ: *want an* ☺abysmal IQ☺ BABY*? Pack all vaccines in 10 months. Asymmetric warfare, take over nations.* See how all vaccines need be oral eventually, how MDs and parents can team up to create a new medical system that induces 0 cries and far less pain after vaccines.

Slate.com article claims FDA covered up medical fraud. It's a complex issue and one can't make generalizations, but due to the huge corruption within government agencies who collide with Big Pharma (75% of Pharma world profits, 4% of population to finance PALACES in Mexican Cartel Style Trillion $ Thefts) by going in and out of Big Pharma jobs and government regulatory jobs, it's hard to make a good decision regarding which vaccines or vaccine frequency are safe for kids. Naturalnews.com says Merck virologists exposed a vaccine fraud. Because most people lie every week, we can't always trust all companies say, as the lawsuit papers indicate ► co..51.htm.☺☺SV40 discovery revealed that between 1955 and 1963 around 90% of children and 60% of adults in USA were inoculated with SV40-contaminated polio vaccines. 90 million Americans were inoculated with cancer causing virus via the polio vaccine, this info was removed from the CDC website. Yet many experts believe this accident didn't cause cancer.☺☺☺ See wikipedia..SV40, news.40.html, screenshot of the CDC page removed in 2013 confirming SV40 stuff, sv40...org. Youtube..g explains studies that showed Seroxat doesn't work (for depression) were not published, leading to it being approved in the UK, causing kids to commit suicide. How often does this happen with medicines and/or vaccines? One of the most debilitating nervous system disorders that are caused by vaccines is encephalopathy. This was the diagnosis given to Angelica, the child of Theresa and Lucas Black. Angelica developed life-threatening seizures and brain damage within three days after receiving several vaccinations in 2001. Five years later, the federal Vaccine Court heard their story and awarded the family $2 million plus $250,000/year for life for medical expenses. Even at 14 Angelica was severely disabled. She can't speak. She eats through a feeding tube. Angelica requires around-the-clock care. 60 UK brain damaged victims of vaccines got 1 million pounds each. The CDC website explains vaccines contain aluminum, formaldehyde (known carcinogen), mercury (known to

damage nervous system if people can't eliminate it fast, some people can't), MSG and other toxins. "For example, adjuvants, such as aluminum hydroxide used in vaccines and medical silicones used in breast implants, can cause an autoimmune disorder known as Shoenfeld's syndrome. A recent study published in the journal Apoptosis demonstrates that hepatitis B vaccine causes liver cell destruction in Hepa1-6 cells. *This cell death is attributed to the use of the adjuvant aluminum hydroxide*, increasingly identified as a contributing cause of autoimmune disease in immunized patients" ► AD 2014:152428. The liver cell destruction study they talk about is ► Apo 2012;17(5):516-27. It's mind blowing that some people *still file patents for aluminum hydroxide vaccines for TSS and other things. The* graphs at c.graphs show how most of the diseases people get vaccinated for were reportedly falling anyway as a result of stronger immune system thru better nutrition, sanitation, plumbing. The graph designers hypothesize that if nobody was vaccinated, the chance of them dying from some of the diseases may be 30 times smaller than being struck by lightning. Others hypothesize that vaccines don't have the same huge effect on mortality as before. 53,000 India cases of polio like paralysis where before a lot of vaccination, they got 700 cases, prompted many to doubt the safety of certain vaccines. "It is imperative that health professionals and the public realize that congenital rubella can cause autism and that measles and mumps can cause significant disability, including encephalitis" ► Ped 2001;107(5):1221-6. *MMR vaccine with live viruses* may cause encephalitis *then?* ☺☺☺

According to many vaccine safety specialists and researchers, MMR vaccines would have fewer negative reactions if they were split in 3 separate shots for measles, rubella and mumps, every time kids get many vaccines at once the risk of negative reaction and serious damage increases dramatically. How can a child of 12 months withstand so many vaccines as recommended these days with no side effects, if it's a sudden thing not done in millions of years? Many can't. It's 12 times more vaccines than in 1940. The immune system and developing brain can be affected. Are they? More research needed. Avoiding vaccines with thimerosal and aluminum is a smart choice according to many MDs, especially since doctors can provide mercury free versions if you ask. It seems that if you don't overdo it, avoid mercury-aluminum ones, and you wait until the child is older (stronger immune system) and if you do 1 vaccine per 2-3 months, instead of giving multiple vaccines in the same day or month, bad side effects drop by a factor of 5-20 sometimes, according to some MDs. But still, science always changes, and Discovery Channel showed how 150 years ago doctors gave poisons to people calling them medicines back then, so who knows, in 200 years some vaccines today may be considered poisons as a combo when given in a short time frame. It's up to individual parents to choose what is best, but all data shows it is critical to stay away from silver dental fillings (amalgam is 50% mercury), tuna and other high mercury fish, thimerosal vaccines always. Google and PubMed can help all find out the truth. ☺☺☺

There is very little discussion about the health of vaccinated versus unvaccinated children, and

very few huge studies, but the truth may be surprising and hinting that vaccines could become a lot safer. With 3 trillion spent each year on alcohol, gambling, smoking and illegal drugs by our planet, no wonder is hardly any money for this kind of science. And then sometimes half the people in a group get enraged that "vaccines are not as safe as they could be" but they smoke and drink a lot too. The irony of life. The problem is often the same as always, we all (with a few exceptions) lie now and then and this habit goes up to the highest levels and things get faked for so many human reasons. WHO Bulletin 1972, Part 1 and Part 2 explain some of the risks with live or attenuated virus induced immunity and possible unwanted side-effects. Presumably, as we know from the history of science, when a more advanced method of achieving the same end is found via scientific progress, the old method is given up. People found ways to make dental fillings without lead, etc. 1 in 50 kids may have some mitochondrial disorder that in the presence of fever caused by vaccines can set off autism like symptoms as CDC official explains on CNN. This lady, after 1 year break from CDC, went to Merck Pharmaceuticals Vaccine Division, industry, regulators being one team. JACS 1971;1(1):33-47 says that *rubella* causes autism, does using live attenuated rubella virus (as in the vaccine) also cause autism? *Measles-rubella vaccine caused the death of a 31 year old, rubella virus was* found in the brain tissue ► JCV 2013;58(4):737-40. "In the 1970s, Stella Chess found a high prevalence of autism in children with congenital rubella syndrome (CRS), 200 times that *of the general population at the time*" ► FHN 2016;10:25. This paper though presents other studies of 1.2 million kids that found no link between MMR and autism. It's complex, as study design, funding of authors, beliefs influence outcome. In 900 years, we'll have different vaccines, so why not make them safer earlier? ☺☺☺

12.3.6. The autism-vaccine correlation (causation in cases of over-vaccination or mercury?)

For a more nuanced discussion on autism, see the parenting autism section. Below is a list of 20 studies showing vaccine dead or attenuated viruses and the metals found in some of them (mercury, aluminum, etc) may cause *autism*. The aluminum section contains some studies showing vaccines with aluminum cause neuron death and possibly autism.

1. JTEHA 2010;73(24):1665-77 ► "U.S. male neonates (ages 3 to 17) vaccinated with the hepatitis B vaccine prior to 1999 had a *threefold higher risk for parental report of autism* diagnosis compared to boys not vaccinated as neonates during that same time period."

2. JIB 2011;105(11):1489-99 ► "(i) children from countries with the highest ASD (*autism*) prevalence appear to have the highest exposure to *Al* (*aluminum*) from vaccines; (ii) the increase in exposure to *Al* adjuvants significantly correlates with the increase in ASD prevalence in the United States observed over the last two decades (Pearson r=0.92, p<0.0001); and (iii) a significant correlation exists between the amounts of *Al* administered to preschool children and the current prevalence of ASD in seven Western countries, particularly at 3-4 months of age

(Pearson r=0.89-0.94, p=0.0018-0.0248)." The 5th section of the free article states "these (intense vaccination) periods (i.e., first 4 postnatal months) coincide with several critical stages of human brain development and biobehavioural transitions that are known to be impaired in autism (i.e., onset of synaptogenesis, maximal growth velocity of the hippocampus [3], onset of amygdala maturation [81] and development of brain-wave and sleeping patterns [82,83])."☺☺☺

3. JTEHA 2011;74(14):903-16 ► "The higher the proportion of children receiving recommended vaccinations, the higher was the prevalence of AUT (autism) or SLI (language impairment). A 1% increase in vaccination was associated with an additional 680 children having AUT or SLI… results suggest that although mercury has been removed from many (still part of multi-dose flu shots, etc) vaccines, other culprits *may* link vaccines to autism"

4. JTO 2013:801517 ► B-Lymphocytes cell proliferation and mitochondrial function are impaired in autistic kids at a much lower thimerosal level.

5. JBS 2002;9(4):359-64 ► "Using serum samples of 125 autistic children and 92 control children, antibodies were assayed by ELISA or immunoblotting methods. ELISA analysis showed a significant increase in the level of MMR antibodies in autistic children... over 90% of MMR antibody-positive autistic sera were also positive for MBP autoantibodies, suggesting a strong association between MMR and CNS (Central Nervous System) autoimmunity in autism. Stemming from this evidence, we suggest that an inappropriate antibody response to MMR, specifically the measles component thereof, might be related to pathogenesis of autism."

6. PN 2003;28(4):292-4 ► "The level of measles antibody, but not mumps or rubella antibodies, was significantly higher in autistic children." ☺☺☺

7. AJCN 2004;80(6):1611-7 ► unlike controls, "the children with autism had significantly lower baseline plasma concentrations of methionine, SAM, homocysteine, cystathionine, cysteine, and total glutathione and significantly higher concentrations of SAH, adenosine, and oxidized glutathione. This metabolic profile is consistent with impaired capacity for methylation (significantly lower ratio of SAM to SAH) and increased oxidative stress (significantly lower redox ratio of reduced glutathione to oxidized glutathione) in children with autism"

8. MP 2004;9(4):358-70 ► "The ethylmercury containing preservative thimerosal inhibited both IGF-1 and dopamine-stimulated methylation... The potent inhibition of this (methylation) pathway by ethanol, lead, mercury (Hg), aluminum and thimerosal suggests that it may be an important target of neurodevelopmental toxins." Methylation is impaired in autism. ☺☺☺

9. JCN 2007;22(11):1308-11 ► "a significant relation does exist between the blood levels of Hg and diagnosis of an autism spectrum disorder. Moreover, the hair sample analysis results offer

some support for the idea that persons with autism may be less efficient and more variable at eliminating Hg from the blood."

10. JCN 2006;21(2):170-2 ► "Autistic spectrum disorders can be associated with mitochondrial dysfunction. We present a singleton case of developmental regression and oxidative phosphorylation disorder in a 19-month-old girl." Vaccines give autism to dysfunctional kids.

11. NS 2005;11(5):417-40 ► "Oxidative stress, brain inflammation and microgliosis have been much documented in association with toxic exposures including various heavy metals. The awareness that the brain as well as medical conditions of children with autism may be conditioned by chronic biomedical abnormalities such as inflammation opens the possibility that meaningful biomedical interventions may be possible well past the window of maximal neuroplasticity in early childhood because the basis for assuming that all deficits can be attributed to fixed early developmental alterations in net." ☺☺☺

12. NT 2005;26(1):1-8 says that thimerosal neurotoxicity is linked to glutathione depletion. Glutathione (GSH) has SH group that binds easily to Hg. Most urine Hg is bound to glutathione. Depletion of GSH is associated with autism. People/MDs can still order vaccines with thimerosal in USA. MD Geier made a thimerosal video. Some can't metabolize thimerosal to harmless products that are eliminated safely. That's where the bad reactions to vaccines come in.☺☺☺

13. CID 1999;29(4):855-61 ► "The *presence of* measles virus *in the brain tissue* was confirmed by reverse transcription polymerase chain reaction"

14. HP 2006;12(2):203-9 ► "for each 1,000 lb of environmentally released *mercury*, there was a 43% increase in the rate of special education (for mentally challenged) services and a 61% increase in the rate of *autism*. The association between environmentally released Hg and special education rates were fully mediated by increased autism rates."

15. IJT 2003;22(4):277-85 ► "*Hair* Hg levels *in the autistic group were* 0.47 *ppm versus* 3.63 *ppm in controls*, a significant difference. The mothers in the autistic group had significantly *higher levels of* Hg *exposure* through Rho D immunoglobulin injections and amalgam fillings than control mothers. Within the autistic group, hair Hg levels varied significantly across mildly, moderately, and severely autistic children... 0.79, 0.46, and 0.21 ppm, respectively. Hair Hg levels among controls were significantly correlated with the number of the mothers' *amalgam* fillings *and their* fish *consumption* as well as exposure to Hg through childhood vaccines, *correlations that were absent in the* autistic *group*. Hair excretion patterns among autistic infants were significantly reduced relative to control. These data cast doubt on the efficacy of traditional hair analysis as a measure of total Hg exposure in a subset of the population. In light of the biological plausibility of Hg's role in neurodevelopmental disorders, the present study

provides further insight into one possible mechanism by which early Hg exposures could increase the risk of autism." The more autistic the kids are, the less Hg *is eliminated thru the feces,* hair, nails, urine*:* Hg *sticks in the brain destroying neurons.*☺☺☺

16. JTEHA 2007;70(10):837-51 ► "8 of 9 patients (a) had regressive ASDs; (b) had elevated levels of androgens; (c) excreted significant amounts of Hg post chelation challenge; (d) had biochemical evidence of decreased function in their glutathione pathways; (e) had no known significant Hg exposure except from Thimerosal-containing vaccines/Rho(D)-immune globulin preparations... (f) had alternate causes for their regressive ASDs (autism) ruled out. There was a significant dose-response relationship between the severity of the regressive ASDs observed and the total Hg dose children received from Thimerosal-containing vaccines/Rho (D)-immune globulin preparations. Based upon differential diagnoses, 8 of 9 patients examined were exposed to significant Hg from Thimerosal-containing biologic/vaccine preparations during their fetal/infant developmental periods, and subsequently, between 12 and 24 mo of age, these previously normally developing children suffered Hg toxic encephalopathies *that manifested with clinical symptoms consistent* with regressive ASDs (autism)."

17. ANE 2010;70(2):147-64 ► monkey model mimics certain neurological abnormalities of autism, "maturational changes in amygdala volume and the binding capacity of [11C]DPN in the amygdala was significantly altered in infant macaques receiving the vaccine schedule" ☺☺☺

18. JNS 2008;271(1-2):110-8 ► "Consistent significantly increased rate ratios were observed for autism, autism spectrum disorders, tics, ADD, and emotional disturbances with Hg exposure" from thimerosal. "efforts should be undertaken to remove Hg from vaccines." ☺

19. CBT 2010;26(2):143-52 ► "Thimerosal may penetrate the brain, but is undetectable when a clinical dose of thimerosal is injected. the possible biological plausibility for how low-dose exposure to Hg from thimerosal-containing vaccines may be associated with autism"

20. Thimerosal (has Hg) leads to lower blood glutathione level► NEL 2005;26(5):439-46 ► "autistic children had a higher Hg exposure during pregnancy due to maternal dental amalgam and thimerosal-containing immunoglobulin shots. It was hypothesized that children with autism have a decreased detoxification capacity due to genetic polymorphism. In vitro, Hg and thimerosal in levels found several days after vaccination inhibit methionine synthetase (MS) by 50%." Autistics have low glutathione levels (PLEFA 2002;67(5):341-3), excessive oxidative stress (FASEB 2009;23(8) :2374-83). organic...h article got keywords, phrases that can be used to google research vaccine safety. Study shows that the vaccines might be able to attack the immune system and the nervous system, which explaining why many got paralyzed, disabled for life after vaccination ► neu...7. The baby immune system is weak. For the first time in millions of years

we infuse 58 shots into the system (vs 7 in 1980) in a very short period of time. People die from anaphylactic shock from eating nuts, fish, etc or asparagus due to allergies, imagine what can happen to the immune system with a 58 shot that coincides with 62 fold higher autism rates. Vaccines don't do safety studies when mixed, the FDA approves vaccines on individual case by case basis. Science papers show that combining foods sometimes dramatically changes their effect versus alone. Toxins, allergens, they can be far more lethal at lower doses when mixed. ☺

12.4. ESSENTIAL VITAMINS & NUTRIENTS for Health & Longevity

12.4.1. Intro: Mg Stearate etc block the absorption of vitamins/nutrients: see 22 bad ingredients

12.4.2. When 10$ vitamins save lives or even $400,000 in surgeries

12.4.3. Avoid B7 for 3-14 days before blood tests and some optional tips to minimize issues

12.4.4. Avoid inhaling any solid powder (silica especially) vitamin, dissolve in water first

12.4.5. Buy vitamins with opaque containers (not clear), as light can degrade many vitamins

12.4.6. Amazon edibles killed the equivalent of 20 million: storage/ship is 90-155°F, far hotter than Walmart's frequent 2 day air vs 21 day trucks to restock warehouse, unless it was < 65°F outside for the last 3 months (China ship is 3 months) & now is < 65°F (mid-end of winter). Many items (clothing, etc) are 3x cheaper at Walmart, whose ship time is often half of Amazon prime. Heated pills lose 9-99% enzymes, probiotics, $B_{1,9,12}$, C, polyphenols, carotenoids (0 astaxanthin).

12.4.7. Toxic artificial food/vitamin colors & toxic cosmetic ingredients

12.4.8. Huge reductions in all cause mortality at intakes 2-10x the RDA: RDAs need rise with age

12.4.9-60. Vitamin A (Eye), B1, B2, B3, B5, B6-P5P,... full list is found here. ☺☺☺

12.4.1. Intro: Magnesium Stearate, 22 bad inactive ingredients in 97% of vitamins

Avoid magnesium or vegetable (a name to hide it's magnesium) stearate, stearic acid, vegetable stearine (which is glycerol stearate) as inactive ingredients, see below: stearate can block vitamin absorption by coating vitamins in stearate in a much tighter way than stearic acid. Now you understand why some vitamin studies find some vitamin "does not work": it's not absorbed. It's ideal to buy any vitamin from brands with 0 *inactive* ingredients, since stearic can block absorption too.☺☺☺ Magnesium Mg stearate *is cheaper, less natural, frequent in the human diet than stearic acid* and often derived from cottonseed oil, etc high in pesticides. Try Micro Ingredients multivitamin and B complex (1 capsule each to prevent B_9 above UL intake, 0 inactive ingredients, healthiest B forms). Thus, *soaked* rice flour (flour made from soaked rice, free of 6

classes of anti-nutrients) or plain cellulose are the only acceptable extra ingredients if any, as they don't block absorption, but rice flour is an allergen due to lectins and cellulose is treated with acids and bases and causes the creation of toxic trace impurity chemicals. In a smoothie, as it reacts with the food, etc the stearate may soon dissipate. The video shows that baking soda reacts with vinegar fast, causing the carbon dioxide effervescence, etc, but MgStearate coats the baking soda and it doesn't produce the CO_2, showing how bioavailability of vitamins can decrease with MgStearate 20 fold if taken as a capsule, not stirred in a smoothie first (capsule removed). The stomach doesn't have a 3000 RPM food processor to stir up a capsule's contents in a minute, so you may be getting 10% of absorption vs the smoothie method of discarding synthetic AGE-like or oxidized cellulose fibers in the capsule (which can rot in the colon). MgStearate (which coats vitamins much more than stearic, hence it is used 90x more, creating a uniform waxy like coat around supplement particles, as this PDF image clearly shows MgStearate literally coats every particle, preventing/diminishing the particle absorption by the body, on page 2, diminishing bioavailability more as the shocking video shows MgStearate blocks the natural base-acid reaction between baking soda and vinegar. The Cu section explains how Mg can interfere with uptake of several minerals via another mechanism, low level (0.1 to 2 mg trace mineral pills) minerals. If Mg Stearate, etc has high affinity for some nutrient, it will wrap around it and block its uptake by 50% or more, we need real tests not "hear say google claim Mg Stearate doesn't affect anything". Companies are not required to do safety tests, to prevent wrecking microbiome (leading to constipation, IBS, colitis, dementia, mood swings, plaque, infarct, stroke) with unabsorbed copper, etc… Medicine is for babies, 1 chemical (statin, etc) effect on body, nutrition is for Nobel Laureates: 80,000 chemicals effect on the body. Hence NDs are above MDs, nutrition is 80,000 times more complex than medicine and 80,000 times more powerful, giving us 80 billion year lifespan via eterni foods. Stearic is less uniform and more petal shaped, so stearic acid is used only by the more natural/health minded companies or those with a lower profit greed. Industry profits go up when using an agent that flows better, but bioavailability slows and you may develop deficiency too, though we need more data to see if stearate blocks 50 or 90% for most. To avoid deadly excipients, you can buy 100% pure powder by searching "nutrient name powder" on Amazon, measure with a precise balance what the daily dose is and recall that amount to get the 0.3g. 0 extra ingredients is the best supplement, though you need to create tiny (so very little oxygen, water can get in) opaque bottles (tape aluminum to make them so), to place a small amount and keep the rest of it in an air tight bag in the fridge to prevent oxidation due to oxygen, light, moisture. Capsules insulate from moisture better, but will also often cost 50-200% more/g, besides having contaminated excipients, like rice flour with arsenic that is unsoaked, has anti-nutrients, mold, mycotoxins, etc and with 10 supplement bottles, that soon ends up being 1kg/year of toxic rice flour full of gut barrier destroying compounds, MgStearate to block absorption (waste 70% of pill $). Choose vitamin

pills in a way that minimizes total excipient intake, to avoid junk. Place vitamins (if eaten without capsule) that contain SiO_2 (or any pill, since inhaling by accident is bad for the lungs) in a smoothie and mix, don't take the powder and inhale some by accident, as SiO_2 can damage lungs if inhaled daily, causing lung cancer or even 15 years early death. Ingest whole capsule or dissolve in a smoothie. The astaxanthin section explains most Amazon "companies" are scams.

Thus, the Immortality Anthem standard is 0 *inactive* ingredients by law in all vitamins, the age of adding *them* to cut costs is over: no more tablets, all are capsules (or softgels with one oil OK as carrier) with the healthiest least treated cellulose capsule, so no excipients are added to make tablets stick, no lethal colors. Discard caps, softgels after getting vitamin out, dissolve in smoothie, water or mush you make out of a fruit or veggie, since today's capsules are not that good, some for gelatin softgels full of heavy metals, hormones, viruses from cow bones, joints, etc. The costs are high due to 33 million companies, because with 3 million times fewer companies or 11, we cuts many costs 300 fold and we deliver 3000 times better vitamins than the best today. That's the Change Americans earns for. We need no CEO palaces and 400 times higher pay than average worker, but Immortality *for* All. Amen, one nation under Immortality Party and the Kind Soft God of Eternal Immortality *for* All. Avoid most NOW Foods pills, they add too many inactive ingredients, to increase profits, like stearic and stearate, since the 2 cut costs of pill making, but can reduce bioavailability 50-99%, making pills a waste of money. They need be fined 1 trillion, like most vitamin companies, and acquired by Universal Immortality Inc.☺☺☺ Taking vitamins with stearic, stearate can mean blood level can be OK, but organ level may be low, so you can live 5 years shorter or even 10, due to corporate greed, since nobody can take biopsy of 40 organs and body areas every year.

Please read the first 2 paragraphs of the B2 section as they explain the huge importance of B vitamins and why it is best to split the daily B complex or multivitamin you have in as many portions as possible (if capsules, take a small part), to achieve the best brain protection, since our body can only absorb a given amount of B and other nutrients at one time (always go with brands that have $B_{1,2,3,5,7,12}$ way above RDA, B_9 <1700 DFE, B_6 <21mg). Bs are for the Brain and energy production, without Bs your neurons die fast. Without Bs you get migraines and headaches, lower IQ, shorter life. Small companies don't even test mice via biopsy to compare a vitamin formulation with/without inactive ingredients, to prove that their so called "needed" inactive ingredients are harmless and don't block absorption at the tissue level when blood seems OK in rats or rabbits. It's OK to take animal biopsy, when we live to 9000 we make pet hamsters live to 20, instead of 2 today. We can do studies using terminally ill patients and take biopsies later, once dead, if they OK it, to see human studies to see what happened with the so called "amazing inactive ingredients" nobody needs, except greed itself. Small companies = death and infinite ignorance for all, you got 1 million times fewer PhDs per vitamin company. So

you get the equivalent of a Windows or Android OS with 1 million times fewer programmers, pure garbage from the 1st century. All vitamins/fats are best taken when waking up with breakfast, the biggest meal of the day. To prevent strokes (which peak between midnight and 6 am), don't eat any vitamins, snacks or meals 5-9 hours before bed, drink water when waking up. Try to especially never take A, D, E, K, B at bed time: endless people got strokes by taking high doses before sleep: D, B_6 (it strips myelin from neurons, making you unable to walk), E (never take more than 200 IU daily), A (always < 3000 IU), B_3 (<50 mg) before sleep, since most strokes happen during sleep. As we age, levels of 100+ essential endogenous nutrients drops (CoQ10, melatonin, spermidine, creatine, etc) and this causes faster aging, physical, mental weakness. To remedy this, we'll catalog these nutrients, adding them for the 13 multivitamins: MultiVitamin 8 is for ages 70-80, ... MultiVitamin 13 ages 120-130. To make all citizens live to 120, we need to boost the size of each bottle as age advances, per Universal Immortality Inc recipes, so MultiVitamin 9 will be probably 10 times heavier than MultiVitamin 1, as the frailty needs a lot more support. No human is 130 now, the oldest is 115, with only one lady having lived past 120, and verified (not fraudulent claim), Jeanne Calment age 122.45 years, in a weird coincidence.

The Immortalist Party mandates all OTC (over the counter) vitamins are no longer tablets *(except 0.1% of current tablets with slow release properties that capsules can't imitate),* because tablets end up whole in stool, contain bad inactive ingredients that hold tablets together, tablets are cheaper to manufacture for aristocrats stealing trillions, bad for workers. All vitamins will be cellulose capsules with 0 inactive ingredients. In the transition, we ban the inactives/actives:

1). magnesium stearate added to save costs since capsule machines get stuck easier due to 33 million companies, no innovation to create capsule machines that 'don't get stuck, lower speed'
2). stearic acid added to allow gigantic palaces for aristocrats by cutting costs/R&D budgets
3). vegetable stearine or stearin, vegetable stearate added for the same reason: greed.

4). croscarmellose sodium known to cause hives, pulmonary edema, heart failure, allergies, sending many to the ICU. On Sep 8-9 2023, I got 3-4 hives/day on the left foot after eating 4 g of flaxseed/day for the first time in 5 months (I ate 9g flax/day for 4 years without any hives, except once a year or twice, hives may have been due to other things) pulverized with a coffee maker. I got 2 hives on Sep 11 2023, 2 days after I ate the last 4 g of flaxseeds. The culprit most likely was the Deva ingredient croscarmellose. 3 other times (August 2023) when I used Deva without flax, 1-2 hives appeared, 2 hives when I took 2 pills/day (Sep 8, etc) as each pill is half RDA. ☺☺☺*Kindly*☺☺ place some cream over hives appearing after ingesting a vitamin brand, and it will stop itching, *don't scratch hives* to relieve itching, as that can form a scar or bleed. Take a hot shower, let warm-hot water flow 2-4 minutes over the hives to improve circulation.

5). food colors causing cancer, dementia via pigments/aluminum salts 6). titanium oxide to

lighten pill color (in 1000s of brands) 7). carcinogenic teratogenic BHT (common in Walmart Equate, etc) 8). saccharin, aspartame, sucralose, stevia: artificial sweeteners alter microbiome

9). > 5 mg niacin form of B_3, required % of niacin listed on label if a mix, since niacin has issues

10). pyridoxine form of B_6, known to cause peripheral neuropathy at 24 mg/day in a few (they can become paralyzed, unable to walk), since this is not the natural form we got used to for eons. Set upper limit to 15 mg of P5P form, 1.5x the Australia 10 mg limit. The EU limit is 12.5.

11). *cyano*cobalamin form of B_{12}, because cyanide release is toxic; use the 3 food forms: methyl, adenosyl, hydroxy. Cyano is used due to it being cheap, ban B_{12} addition to bottles that are not opaque as stability is poor in drinks, and altered B_{12} is toxic, prevents real B_{12} absorption

12). vitamins without % of vitamin A is preformed (retinyl ester) and % that is carotenoid (carotene), since all need to get enough esters and can't calculate with such vague labels

13). pharmaceutical glaze: shellac causing dermatitis, produced by killing many lac insects raised for this; thou shall not kill; shellac is 35% aleuritic (lung damage) & 40% shellolic effects are bad (shellac). The glaze contains 20-50% shellac and tablets are not needed for vitamins.

14). talc (heavy metals, asbestos) a powder to prevent clumping and sticking to the pill making machine, talc that can contain lead at 20 ppm and asbestos, leading to lung cancer if powder is getting into lungs during chewing. USP vitamins can't contain asbestos. 15). bentonite (heavy metals, microbes) 16). PEG (allergy) 17). PVP (allergy)

18). vitamin brands that don't offer a biotin free version of B-complex or multivitamin, because this is needed to be taken daily to measure the deficiency or overdose of certain nutrients.

19). crospovidone (povidone and crospovidone can bind to polyphenols [are used *to remove polyphenols from some foods*] and polar (hydrophilic) nutrients that for some people are life saving if intake is low. We need *stool analysis of crospovidone adducts with nutrients to see if 10 mg* traps iodine or mcg level vitamins, essential trace minerals. At intestine junctions or any digestive tract location, some things can occur, where an intermediate is trapped temporarily reversibly by crospovidone, interfering with the uptake of some nutrient. Crospovidone is < 10 mg/tablet (means that it's 2.1-3%) per company, in Kirkland B_{12} 300 tablets of 5 mg, as are the other five inactive ingredients that say <2%. You can read the iodide crospovidone controversy. The USP criteria for contaminants are not promising, i.e. cellulose, etc could have more contaminants (heavy metals ≤ 0.001%) than rice flour rich in arsenic (5 times more than lentils).

20). Microcrystalline cellulose, MCC, so common in billions of tablets, capsules as a binder/filler, is processed with acids like many legumes are before protein powders are made, and dried with

air which can cause the creation of many toxic compounds ☺low IQ☺ buyers ingest gladly, fully trusting the PhDs who made that poisonous filler, while RPN 2008;164(3):331-7 found MCC "yielded an acute and self-limited inflammation *that impaired* lung mechanics." Cellulose is safer than MCC (as long as bottle doesn't let too much light in, as with white bottles without aluminized label exterior), since cellulose is not treated with acids, oxidized by drying like MCC. Cellulose has impurities which form lethal compounds during drying, acid/base treatments.

21). unsoaked rice grains flour has 6 classes of anti-nutrients and is toxic, since it contains also 5 times more arsenic than lentils. Rice flour can grow bacillus cereus possibly lethal bacterium, which can cause lethal pneumonia in those with weaker immunity.

22). maltodextrin, man made refined carb, glycemic index 95-135 (vs 65 for sugar, spikes glucose and insulin instantly) depending on the source and processing (has gluten if wheat extracted), causes gas, damages gut, added in 20-50% to many plant powder extracts (Bulk Supplements examples: dried goji, grape seed extract has no maltodextrin, bilberry, hawthorn, goji powder, maqui have it, so find brands that have no maltodextrin like: bilberry, hawthorn, maqui). Read the ingredients list and order only from companies that have no other ingredients, saying 'None'. This is added to increase shelf life, due to a decentralized system of "rat IQ". With 11 companies, i.e. centralized food distribution, we know exactly how many units are needed and items sit on shelf 50 times shorter, so we don't need chemical stabilizers that wreck our health. Aristocrats hate centralization, as it's their end. The frequent use of H_2SO_3, HCl, NaOH in wet milling (corn, rice) is explicitly designed to denature, break apart, alter proteins. The leftover proteins are heavily degraded (toxic) and usually discarded or relegated to animal feed, but traces remain in the maltodextrin or protein powders extracted by acid/base. Spray dryers blast maltodextrin (extracted from many sources) with above 300°F (150°C), so in this dry heat traces of healthy and toxic degraded proteins (all plants have proteins that remained in maltodextrin after warm water or acid, base extraction) mix with glucose to form oxidized lipids, lethal AGEs (even if a healthy protein reacts with glucose), other free radical forming chemicals born of sugars reacting among themselves. Maltodextrin actively degrades the intestinal mucosal layer. It suppresses beneficial, anti-inflammatory gut microbes while feeding inflammatory, gas-producing bacteria. Because it enters the bloodstream faster than sugar, it forces the pancreas to release a massive wave of insulin, which activates liver transcription factors ChREBP, SREBP-1c that systemically turn on the liver's fat-making machinery, converting the excess glucose flood into triglycerides TGs. Just like with fructose, the liver packages TGs into large VLDL particles. As VLDL circulate, they swap fats with normal LDL, leaving behind the small, dense, easily oxidized sdLDL particles that advance arterial plaque, so we die of infarct/stroke. Maltodextrin raises TGs and the lethal small LDL. Maltodextrin preserves foods via reducing water activity and preventing moisture clumping. Because it has no water content and doesn't

spoil, adding it to a product dramatically lengthens shelf life. Today's food production is semi centralized, but distribution is infinitely fragmented. A major brand manufactures a powdered mix in a central factory, ships it to regional hubs of 9000 companies, lets it sit in warehouses, transports it to 40,000 grocery store backrooms, restaurants, expects it to survive 6-36 months on a supermarket shelf, 9 months in a consumer's pantry. To survive this 3 year timeline without turning into a rock or harboring mold, the food requires high-stability additives, anti-caking agents, moisture absorbers like maltodextrin. Immortalists would ban maltodextrin, as it causes needless deaths. Companies need to merge to be able to lower prices, sell inventory fast, store foods at right temps, avoid Amazon if Amazon temps are high (they are for pills). If we move to a unified, closed-loop logistical network with a single centralized data center tracking exactly what is bought/sold in real-time, of the 11 companies, the supply chain transforms: factories mix/ship foods based on predictive, real-time demand, eliminating the need for long warehousing. Food/supplements will be formulated to last 2 weeks instead of 2 years. Additives will Become Obsolete. Without the need to survive infinite shelf-time, extreme shipping temps, and humidity swings, industrial fillers, anti-caking powders, structural stabilizers, and moisture barriers would be stripped entirely from the food supply. That is the victory of ☺☺☺ We the People ☺☺☺ against the aristocratic mafia state: health & Immortality for All. ☺☺☺

The safe B complex or multivitamin brands are less than 1%, Micro Ingredients is safe:

What do immortalists think about the many B-complex, B_{12}, multivitamin brands? This paragraph will clarify with a few examples. The best brands are those with 0 INACTIVE INGREDIENTS, and, if possible, no vitamin C known to degrade B vitamins in solution very fast (less in solid form), so Micro Ingredients B complex is OK. Avoid junk brands that have low levels of B vitamins and read the NOW foods list of scam products to see many brands that have 0-4% of listed label. Generally Bulk Supplements and Micro Ingredients are the safest among the top 3 cheapest brands, as they do contain what is listed and have fewest fillers, though Bulk Supplements shouldn't be used to buy magnesium (except MgO) or highly perishable items like glycine, Mg glycinate (they mix it with Mg oxide and say MgO on the back label, and claim Mg glycinate on top label), etc due to ammonia formation. Sometimes Nutricost 1 filler (rice flour OK) products can be cheaper than Bulk or Micro. These 3 offer essentially 3-10 times lower price than others who don't sell it as bulk powders, etc. Avoid NaturePlus B50, Country Life multivitamin, Walmart Equate, Deva multi, Nutricost 2 mg B12, Bronson 5mg B12, aSquare 5mg B12, cheap because of using the cheap deadly MgStearate. Avoid Nutricost B-complex or NOW Foods 5 mg B12, since they got the B_{1-12} absorption blocking stearic acid. Stearic is pricier than stearate and less deadly. Avoid anything with stearic or magnesium stearate or vegetable stearate (such an Angel vitamins triple B12 or Kal methyl-adenosyl) as inactives, avoid anything with niacin form of B_3, with pyridoxine form of B_6, with *cyano*cobalamin form of B_{12}. Nutricost

got rice flour (this is dangerous due to bacillus cereus which can cause death even; the spores multiply in dry rice flour and can produce toxins when ingested causing anaphylaxis, so discontinue if any issues arise with digestion) and calcium silicate as the only 2 inactive ingredients (if you trash capsule). Check out the vitamin company of the future. *Always read 1 star Amazon reviews for anything you buy.* Avoid any see thru bottle vitamin brand (even if the tint is green, red or blue, brown), if you can distinguish the caps, it's allowing TOO MUCH LIGHT inside, since B vitamins degrade in the warehouse light. You can always buy any brand that has higher level, above UL, as long as you use only 20-50% of the capsule, so you don't go above UL. Move any vitamin (in a white or ultra dark, bbut not 100% opaque) to a 100% opaque (aluminum tape plus clear tape on top of aluminum) bottle of your own if you buy any bottle that is not pitch black (100% opaque), since white opaque is not enough. You want 100% light block. ☺☺☺ Some studies found that those taking 0.8 mg folic acid B_9 (which means actually 1.335 mg DFE, or above the USA NIH 1 mg DFE UL for B_9) 20 mg B_6, 0.5 mg B_{12} got half the brain shrinking of placebo, so in that case you can take a brand with 0.8 mg B9 every 2 days to supplement your B complex, but you may still need take extra B_{12}. Take extra B_{12} to reach 0.5 mg daily minimum. You can use whatever combo of vitamin B_{12}, B complex and multivitamins, so that nothing is above the UL for B_6 (EU, Australia, UK about 10 mg), B_9 and niacin form of B_3. EU B_3 limit is 900 if niacinamide form, 10 for niacin. Australia advices against pyridoxine form of B_6 and against > 10 mg B_6, so then all the Amazon B50, B100 make no sense, at the most brands that have 20 mg B_6, since B_6 above 20 mg may cause peripheral neuropathy. I would avoid NutraBio or any B-complex or multivitamin with pyridoxine form of B_6. The NutraBio B100 (and B100 Now foods from Chicago Jewish 3rd capital of USA) 100 mg pyridoxine can destroy all your peripheral nerves over time, in praise of Allah, the Merciful Rapist of all nonMuslims and Yahweh, the Merciful Rapist of all nonJews. NutraBio has Halal and Kosher certifications, an affront to US democracy, as Halal and Kosher are terrorist methods of animal slaughter. Halal/Kosher NutraBio 0 empathy company, adds 50 mg PABA that may cause kidney issues in some, research before taking. 100 is too much PABA for long-term use showing how many B_{100} formulas are dangerous. Forget about Kosher (see page bottom) or Halal certified B_{100}. Find some combo, free of cyano B_{12}, that gives you all B_3 as niacinamide B_3 and B_9 below 1.7 mg DFE, and, if PABA is present, PABA 25 or less. *Avoid B complex with* only 2 *mg* B_6, go for brands that got 10 mg at least as in the studies to prevent brain aging. You can always use 2 B complex brands. B complex is used by those avoiding multivitamins (B-complex and separate pills for iodine, $K_{1/2}$, selenium, zinc, D_3, E) due to odd colors, cyano B_{12}, *too much B_3, Mn, zinc oxide*, 0-low D_3 or $K_{1,2}$ or etc. The advantage of taking separate pills is that you can alter amounts and see outcomes. NOW Foods Daily vits has no toxic cyano B_{12}, no ZnO, but it has stearic acid which prevents absorption, though not as bad of an adsorption block as magnesium stearate. A good combo is *half serving (1 capsule)* of Micro Ingredients multivitamin and Micro Ingredients B complex (1

capsule to avoid going above UL for folate, *if you take a multivitamin*).

12.4.2. When 10$ vitamins prevent a $400,000 surgery sequence (5000/month glaucoma medication and then more laser surgeries, etc) ☺☺☺

This chart shows how blood level of melatonin and 100s of nutrients is not the cellular level of melatonin (melatonin in blood is regulated by the pineal gland, but blood melatonin is only 5% of the body melatonin, as with other nutrients where body level is 5-100 times higher than blood level; that's why blood tests don't indicate deficiency very well for many nutrients). Only 0.3% of body magnesium is in the serum. AJO 2022;26:101471 found dry eye patient "received a loading dose of 200,000 IU (vitamin A, 70X the RDA) per day for two days, followed by a maintenance dosage of 8,000 IU (3x RDA) per day. The treatment plan also included stopping all glaucoma medications and use of artificial tears… symptoms significantly improved within 11 days… The patient's symptoms significantly improved within 11 days... By 5½ months, her visual fields had returned to normal, her visual acuity was 20/20 in both eyes, and her IOP was 15 mm Hg in her right eye and 16 mm Hg in her left. Color vision also was preserved. ..surprised at how rapidly her dry eye symptoms and visual fields improved... a nurse, had spent 80% of her income on glaucoma medications, when the remedy was a supplement that costs under $10 for a 100-day supply. (vitamin A)", showing how the dry eye optometrists and others only suggest stuff that makes them filthy rich (they already get 20-80x federal minimum wage) for more palaces. You know, MDs often propose endless procedures and surgeries for preventing blindness, so she may have ended up paying 500000$ in treatments over 40 years. Medical education is 2 hour nutrition, because Big Pharma won't make money selling vitamins. Any eye place you go they push IPL or stuff that makes them Big $$ in 10 minutes, not ever a blood test for vitamin A, that makes them 0 $, ODs suggest 600$ LipiFlow, 2000$ IPL by Israeli's Lumenis. Greed. Deut 23:20 conmen. Thieves. Like frauds making multivitamins in clear bottles, under "Rabbi tone"☺☺☺ supervision (see label), which degrade due to light, as shown in the vitamin light and the food sections. OD could give a simple at home test for the vitamin D or others, as we know low D causes weak immunity and weak ability of fighting the bacteria that infect/atrophy the meibomian glands and dry eye by lipid deficiency present in 86% of dry eye patients. Plus, they never do any testing for thyroid panel and other deficiencies that could drive this dry eye development since age 5. We need a total reform of the ultra corrupt medical system, as outlined in the 4.5.6.5, with any health issue mandating a visit to the NDs who change 2-40 nutrient intakes to try fix any disease. The system simply manages disease, it's pathetic. Anyone with a health issue needs to 400 nail, hair, blood, urine, feces biomarker tests for a full nutrition pic, what they do today is 1st century crap, 1% of what they should test to get a really precise understanding of the ultra complex stuff going on, as trillions are stolen, see dental corruption. Food companies focus on food colors, texture, flavor, not if the food will double lifespan.

12.4.3. Avoiding biotin (B7) in vitamins before blood tests & other blood test ideas

All need avoid B_7 for a 3 days if B_7 ≤ 30 mcg, a week if B_7 > 30 mcg in vitamins, 2 weeks if B_7 > 5 mg, as B_7 leads to false negative/positives for many tests (thyroid, A, D, lipid panel, ferritin, HDL, LDL, homocysteine, hs-CRP, Lyme Disease and many other things). Egg yolks (anything made from eggs) and all foods on the right most column of USDA list have biotin and can interfere with some blood tests that use biotin-avidin/streptavidin (BAS) technology. Thus, many old tests you did are probably high, low or false negative/positive, if you ate B_7 from multivitamin during the 3-15 days before. This is why companies like walkinlab.com and other blood test companies need to be shut down and taken over by Universal Immortality Inc, because they don't let patients know that no B_7 is allowed 10 days before a test if high dose 5+ mg and 3 days no biotin from regular 30 mcg multivitamins. The "cow filif IQ" at the Immigration Services also do wrong tests, cholesterol etc for green card people, without telling them to stop B_7 3-7 days before the blood test. Sadly, millions of MDs worldwide, forget to check if their patients took B-complex or multivitamins with B_7 and thus MDs give them false results that later cause dry eyes or other health issues from false thyroid data, false A, D and other data skewed by B_7, by 100s of unknown to medicine today chemicals. This leads to billions wasted in invalid tests, billions of misdiagnoses. To do this, use for that 1 week period before a methylated B complex ($21 B1,2,6,9,12+choline+TMG (methylation agent to lower homocysteine) or $21 B6,9,12 or others on Amazon, methylated ones often have no biotin) that has no B_7, very dark tint or opaque white, black bottle, and no stearate/stearic that reduce absorption of vitamins, so that the blood test somewhat accurately reflects our regular intake of a B-complex (impossible, since every brand is different, but at least the main key B vitamins, hence immortalists mandate any vitamin brand be made in biotin free form too), and also to prevent brain damage from low B intake during high stress week that may occur before a blood test. Ideally, do a test in normal stress level, so you do get a representative number that removes the sleep quality and stress level confounding factors. Take E, Zn, A, iodine, Se, CoQ10 separately, since no decent multivitamin without stearate exists, but E, A, I, Se need match a typical multivitamin (500-1500 mcg RAE A and 150 mcg I) that has biotin (not 2-10 times higher), in order to get comparable blood levels to measure. Do blood draws only if you're not going to fast in the next 4 weeks after the blood draw, since puncturing a vein requires protein to heal and fasting makes less protein available. Lose weight first, as high belly fat kills you more than a vitamin deficiency: did you get 10-15% body fat yet? ☺☺☺ Carefully wash your left (if right handed, so use the hand that you use less and don't exert with that hand for 2 weeks) elbow area where you want them to take the sample and have the nurse disinfect the area with an alcohol pad and then when reaching home, as with vaccines, let the gentle shower jet warm that area to prevent redness, just as you do when you bump one area of your body and observe how warm-hot water for 4 minutes in the

first 10 minutes reduces redness and swelling 100 fold. This routine needs to be explained to every patient, as it reduces the amount of neutrophils (very valuable) going to the site 10-30 fold and reduces body damage that happens after each vaccination or blood draw 5-30 fold. We need to unify all healthcare facilities, procedures into 1 universal software, with screens nurses have to check (did you tell patient to warm the area with shower water when going home within the first half hour for 5 minutes or 10-15?) as the Universal Immortality Inc section explains.

Ideally, the immortalists develop a robotic surgery type of device, the size of a wallet, that is attached to the elbow (like the blood pressure devices) and uses ultrasound to take a pic of the vein and draws blood with a much lower diameter syringe than used today (lasts longer of course to draw blood but damages the body less), for a much smaller damage to the vein, and takes the blood sample in a way that reduces errors and swelling 9,000 fold. After the extraction of the blood, the machine remains there for 10 minutes to warm the area and act as the "warm shower" of infrared machine that facilitates the 100 times less swelling, less purple in the area. Today's nurses are human, tired, have bad days and they damage veins too much to make it practical to monitor biomarkers more often to enable all to live to 150. We need to understand rockets travel 9000 times faster than human walked, and future machines can extract blood while doing 9,000 times less damage than humans doing it, less intense neutrophils reaction to the veins. Microsoft AI was 4 times more accurate than human doctors in diagnosing disease. Go figure, perhaps we need smarter MDs and ODs. Sounds like the greediest becomes MDs, etc not the smartest? Isn't it time to bring reform? Ask the blood draw nurse to kindly use the elastic tourniquet to hold tight the white cotton pad sitting on the injection site (you remove it in 20 min) as many nurses do 1-2 seconds after the blood draw, otherwise, the injection site can get 50 times more swollen with severe redness there for 1-2 months, a red hematoma develops without the tourniquet. When nurses don't know what they're doing, the scar of their blood draw is 5 times bigger 7 months later than someone who did a blood draw a month ago, visible if you gently pull the skin away to see the deeper tissue with the 3 dots for example, 2 for the botched 8 ml draw (twice due to poor technique) and one for the 24 ml draw by another much younger nurse. Avoid lifting objects or wild exercise, pushing objects with the punctured hand, eat pineapple, protein, vitamin C, zinc to boost collage repair of the damaged skin/vein. ☺☺☺

Nurses say let's test for "basic blood panel or disease X (that uses biotin, B7, or streptavidin, which reacts with blood biotin in the assay step)", without knowing that avidin & biotin from egg yolks (or any recipe make with yolks) or biotin B_7 pills can interfere, causing false negative, positive result and death later. In 2025, 85% of CLIA (chemiluminescent immunoassay) tests, use the BAS (*Biotin-avidin/streptavidin* (strept-avidin is bacterial equivalent of avidin, from streptococus bacteria), see details by Ctrl+F "biotin" in this 2023 paper) technology, so those who take B_7 (vitamins) may get false results with some CLIA tests. However, Google says

Labcorp's Lyme Total Antibody CIA test utilizes the DiaSorin LIAISON Lyme Total Antibody Plus assay (which is free from BAS), not the Zeus, which is free from biotin-avidin per technical support, BAS in their MTTT: Tier 1: VlsE1/pepC10, 2 antigens binding to Lyme bacteria proteins, IgG/IgM ELISA CLIA, Tier 2: ELISA for whole cell antigens. Zeus is old. So MTTT Zeus test may not interfere with biotin pills if a company uses MTTT Zeus at a location, if there are no other substances that react with biotin from vitamins and thus give a false negative or positive result; the company says biotin in vitamins won't interfere. The Zeus MTTT not using BAS is a positive sign though, since 85% CLIA tests do use BAS. However, Labcorp may use DiaSorin MTTT test always, which doesn't use BAS per technical support. Most hypothesize B_7 pills don't interfere if BAS is indeed not used. Quest Diagnostics has a list of tests made useless by biotin B_7 pills. Not to mention, the enslaved 90% have to work hard to do useless tests, wasting 900 billion over decades, losing sleep due to overwork, living 3 years shorter, tests that are not needed or need to be repeated, after the patient and doctor figure out after 3 months of various activities that the initial test was invalid and needs to be repeated, all due to the Republican Party (right wing parties equivalent overseas) opposition to a universal system that requires doctor to input the amount of biotin patient took last week in the system or other things for other procedures. An advanced software takes all guesswork and removes the need for doctor to ask questions or recall to check for biotin intake or etc before a procedure is done. More importantly, we all need to keep our egos in check and realize that biotin is only one of many chemicals interfering with certain blood tests, and currently, we don't know that, so every MD/patient needs to triple check one's diagnose, hypothesis formulation, since we're in an age of ignorance. The blood level of a nutrient is not even the tissue level, so we get more uncertainty about a diagnose. One day, a picture of our wrist will measure 5000 molecules in the blood, and any tissue level of the main 5000 nutrients and biomarkers, but that may not happen for decades at least. Until then, one can't be too sure of one's so called "diagnose", since we know far too little, with one symptom being often caused by thousands of possible deficiencies, single or combos. To use a more "metaphoric" word, today's medicine is sort of "bullshit" vs the future, just like 1st century theory of chemistry, medicine was versus today. Keep that in mind, don't become fanatical.

12.4.4. Avoid inhaling any solid powder (silica especially) vitamin, dissolve in water first

12.4.4.1. Silica SiO_2 (silicon dioxide), calcium silicate $CaSiO_3$, inhalation can kill you due to this fine powder, even if SiO_2/$CaSiO_3$ are present in foods in much bigger grain sizes, we eat sand daily with our greens, veggies, etc silicates that help collagen to form. Kindly try avoid any vitamin with silica (or calcium silicate) as inactive ingredient if you plan to chew or eat it without the capsule without first mixing it into water or a pureed smoothie and rotating blade 30 seconds to wet every particle so none goes into the lungs. Silica powder, present in some capsules, or chewable tablets, can also ruin the lungs, so, if you chew silicon dioxide containing

vitamins or pour vitamins into a smoothie, *mix well with watermelon juice or whatever to wet the entire powder,* never *eat the* dry *powder*. *Simpler yet is to avoid anything with* silica (inactive ingredient) *added:* why does FDA allow companies to add it if it *can ruin the lungs* of those vitamin users who don't know? The inorganic silicon, as silica, is very poorly bioavailable, versus the veggies, legumes silicon, so the 1-2% in capsules etc is not worth the lung scars and silicosis it can produce, including death. If you use them, mix well with the smoothie first, stir it very well with the spoon at least. Many people discard capsule and pour it in mouth of smoothie without stirring well, but even with capsule taken via acid reflux silica can get into lungs and damage them. For safety anything solid ought to be dissolved into a smoothie if capsule is not swallowed. Even if you eat the powder from a tablet or capsule dissolved in mouth saliva or watery food, in the process of swallowing, some wet one could get into the lung area, at the junction of lung and throat where it dries during breathing, and cause damage, so it's safest to avoid anything with it, since 100s of brands exist without it. Single ingredient vitamins (iodine, zinc, etc), often have silica added, simply use a brand without it.

12.4.4.2. Minimize vitamins with oils if you chew them, because chewing them can cause lipoid pneumonia, please don't chew oily vitamin, fish oil, etc softgels in your mouth empty and then swallow them, as oil can leak into lungs, be inhaled and reach the lungs causing damage, shortness of breath, being confused with COVID19: people get lipoid pneumonia by using 1. oil to cleanse teeth or 2. oily nasal products. Simply swallow the entire softgel with water or, if not eating the softgel or capsule for solids to avoid toxic ingredients in the softgel or capsule, poke the vitamin with a $ store dental tool, pour the vitamin softgel contents into a smoothie, mix it 20 seconds, then eat it, since this 500x dilution makes it far safer to swallow as if it's in the food itself. This way you avoid esophagitis from harsh ingredients and lung damage from oily softgels. If you squeeze softgels in the mouth, add to mouth a full spoon of smoothie before you add the softgel, then *mix it before you swallow*, never swallow empty oil on the throat as it increases risk of oil getting into the lungs.☺☺☺ Avoid oil on salads as this can cause similar issues, since oil is not blending with a smoothie and it's highly concentrated on a piece of veggie you swallow.

12.4.4.3. Tablet vs Capsule vs Softgel:☺☺☺ Tablets oxidize less than capsules with powder (since air is in contact with the powder and light can get thru easier inside via clear/white caps) and far less than softgels. Tablets have a longer shelf-life, but in the future, all capsules will be made weeks before shipping, and eventually never, by eterni foods revolution that eliminates all supplements, since each diet is custom to DNA and weekly nutrient biomarkers. S*ome vitamin ingredients (alpha lipoic etc) can irritate the throat, so then, use capsules or smoothies to dilute powder instead of chewing a tablet.* Tablets can end up whole in the stool. Capsules absorb much faster than tablets, irritate no throat and have no animal gelatin prions, viruses, bacteria, heavy metals like gelatin softgels do, though recently, some softgels are made from tapioca

starch or carrageenan, but these can cause allergies too. It's safer to not swallow any gelatin or vegan capsule or softgel as its bacteria are not vegan and can cause choline, etc to become TMAO, the deadly one. I never swallow any capsule, unless it is lipoic, a known throat irritant. Vegan capsules are fine, 1 a day, but more than one could cause gas due to lack of digestibility of the cellulose used that rots in the colon. Some claim capsules are better since C doesn't touch B_{12} as much as in a tablet and won't decompose some B vitamins. Liquid vitamins oxidize instantly in days and need to be avoided at all costs, many beverages with vitamins added have almost nothing left for some vitamins after 10 months on the shelf. Each time you open the bottle, air ruins the vitamins. FDA needs to make oils in bottles sales illegal, due to insane levels of oxidation. Too much plaque can emerge. More on oxidation is in the Eterni Food Inc section.

12.4.5. Vitamins in jugs, bottles, etc can degrade up to 100% in mere hours

Vitamins A, D, E, K, B_1, B_2, B_6, B_9, B_{12}, are sensitive to visible light, B_7/CoQ10, others to UV light, so store multi*vitamins* and individual vitamins☺☺☺ (especially A, E, D, K oil capsules where oil and capsule is transparent) in 100% opaque bottles (tape them with aluminum foil or tape, but tape aluminum afterwards to prevent exposure and light holes or any opaque tape if not 100% opaque, test with flashlight for opacity in dark room), away from heat and moisture. Remove pill from the bag/bottle they came in right away, since 99.8% allow light in, the ones that are pitch black when looking inside in bright light, while blocking the bottle entrance, to see if the "seemingly opaque amber, black (appears so, but it's 10% transparent) or indigo is really opaque or not", otherwise, as the bottle sits in light around the house stuff degrades. Keep everything in the dark cold fridge to prevent light and heat degradation even if you do change bottle to opaque. Cover the inside of the bottom drawers of the fridge with cardboard to make it opaque if you don't change all bottles or bags, to keep fridge light away. Otherwise, you eat oxidized toxic ingredients that sicken you. The vitamin companies will never switch to the pricier black (the cheapest color that blocks light 100%), as it reduces profits by 0.1% or 0.5%, so you need to act. Unless immortalists win elections, the scam will go on for centuries: for example all oils, such as castor oil are sold in plastic bottles that leach carcinogenic plasticizers, plastics, BPA, etc and the oils are not extracted via hexane neurotoxin free processing (cold-pressed), stored in dark glass bottle. Here is a list of Amazon amber bottle cold pressed glass brands: only 2 out of 15000 brands of them have dark amber glass, cold pressed (hexane free), dark paper label to block more light. What we see is capitalism is all about profits, with 99.99% of companies selling poison rich products. What's the solution? 11 companies replacing 33 million of course, you get efficiency, 100x more quality via 100x more R&D. They need to kill billions to build palaces, they don't care 24 mg astaxanthin contains 0 mg due to light or 1% of label value (list here). The industry is run by genocidal aristocrats worthy of lifetime labor, but nothing can be done when election faking puppy spoiled aristocratic dogs are in power. They don't even tell on label, as

immortalists would require to “immediately move into the fridge, this is certified to have been handled in a light free facility (Amazon is moving towards that) for 0 light exposure while outside the cardboard box. Kindly transfer into the 50 free opaque glass (or new safer than glass material free of microplastics) bottles available for free at food.gov, where ideas on 4000 year lifespans for all exist. don't leave outside of fridge or in this nonopaque container, as we're too greedy to make one company instead of 1 million *(we need* fabricate a reason to make 500x the average wage of the slaves we work and sicken to death with fake oxidized pills*, the reason is 1 million companies are needed),* make a cheaper than white plastic material to pack it all, greed is the source of all disease we create for profit to sell you more pills to cure the disease science erases by knowledge. We're the greediest bastards. Buy from us, Sincerely, the ever richer, small aristocratic terrorist bourgeoisie who keeps USA in the stone age of 70% non-STEM majors, endless duplication and 90x less research than 11 companies would allow for. Truly yours, the aristocratic devils. In Theft we Trust.☺☺☺” The light can degrade even sulfur amino acids (methionine etc) in mineral-amino acid chelates like selenomethionine. When you buy any antioxidant online, be it saffron (active ingredients crocin, etc) extract, etc, you have more than the 3 main carotenoids, polyphenols or whatever other ingredients in that plant or etc and all these 100-900 extra chemicals can oxidize during the manufacturing process due to oxygen, light and heat. The current vitamin industry is a 1st century sewage mixing type of stuff, that has no science to it. Every ‘nutcase’ starts a vitamin company, gets some raw material from some place and that could have 0.1 to 100% of the label amount and then sell it with 700 other toxic oxidized compounds and almost none of the active ingredient, or even if 80% is there or 100%, it has other oxidized and bad stuff that nobody is told, since we don’t have the barcode to indicate % of pure form (not oxidized forms) for all 900 healthy variants in that extract. The problem is that when every “idiot” makes a pill, they don’t know what is supposed to be those 500 other compounds via that extraction method and in that form and their toxicity, so here is the issue with 10000 governments or 10000 companies making “saffron or whatever extract or amino acid”, they don’t have the correct quality criteria to assess its purity and safety. With 200 Amazon saffron brands, only 1 really passes the highest quality criteria for maximum effect without damaging the body via oxidized extra or main ingredients. The advantage of 11 companies immortality capitalism is that the quality is 1 million times higher, because you don’t have to check 1 million variations of a pill that is done by stone age peasants. Can’t compare a garage company with 1 with 1 million PhDs, mass spectrometers 1000 times faster than today’s.

This explains why many studies with vitamins or ω3 oils which are light/heat sensitive get vastly different results. Studies would need to ensure participants store light/heat sensitive vitamins or oils *identically*, to remove that *confounding* factor; otherwise, they have to estimate degradation. All oils, many organic compounds are unstable in the presence of visible, UVA

(passes thru glass, plastic), or UVB/C (blocked by most plastic and glass). Vitamins in solution are far less light stable than those in pill form (where the deep inside of the pill is protected against light), so "vitamin", "energy" drinks, all milks with B (and A, D, K, etc) vitamins may have little/0 left, see Table 1 of BB 2019;116(6):1537-55, so avoid those. The only exception is *vegan* milks, since vegan companies know more nutrition and the container is opaque with a silvery layer on the inside, not transparent glass, plastic or semi-opaque paper (skim milk in plastic lost 57% vitamin A in 4 hours of store light, see vitamin A stability section). Maybe now you avoid store shelf carrot, orange, etc juice in transparent or non-silvery inside paper containers, and kale chips, etc with "vitamin A, etc" in not *so opaque* plastic/paper bags. I would be skeptical of companies that sell oil capsule, liquid vitamins, liquid fortified cosmetic or fortified food products, in non-opaque (100%) containers or solid vitamins, solid food products in transparent/semi-transparent containers (butter, cheese (with holes especially), etc allow a lot of light in, for much of the product on the exterior), it shows they don't know the most basic things about proper storage in warehouse, Amazon, etc; how can you trust the rest? If milk loses 57% of A in 4 hours, what will happen in 4-12 months on a shelf in the store with other products in "not 100% opaque" containers, be them cosmetic, food, etc liquid products? ☺☺☺ The vitamin E section has a huge discussion in the first 3 paragraphs about the vitamin E tablets losing half vitamin E in 5 hours. So, did the science geeks account for storage of bottles in bright lit areas in their studies? No. Then you wonder why a study says vitamin E worked, another said it did not due to all E being gone. Oxidation products can be toxic and do more damage than the 70% E left, same for other "supplements" in clear bottles. Flax oil, in 100% opaque black bottle, expires 6 weeks after opening, now think about clear bottles of A, E, etc☺☺☺, *by the time you get it it is EXPIRED in the warehouse light technically due to toxins formed*. How many garage companies test the toxicity of these oxidation products? So, how much vitamin is left in clear bottles with liquid beverages? Nothing? That's why all live to "120 in 2024". We got a row of alcoholic products and nothing dedicated to vitamins in supermarkets. 0 IQ nation.

Relying on fortified (liquid especially) food shelf products to calculate intake for any vitamin, is not scientific by any standard, since even if the container is 25-100% opaque, you don't know what happened in the factory, as far as light protection, was the fortified milk used to make the "cheese" all without any vitamin left in 9 hours? Mechanical cheese machines have light and they stir, pour the cheese, yogurt, etc, *for a while. You know how FDA tests for vitamins: look at the milk aisle. Then we wonder why nutrition studies are so contradictory? Which one had no vitamin? That's why nutrition science is difficult: many things, light, heat affect contents. We already know,* from the previous chapter, that produce, when exposed to store light, loses some vitamins in *3-20 days*, and many phytonutrients, by 10-70%. These are solid foods (like many solid foods sitting for *3-20 months* on shelves in non-opaque packaging), so it's not wise to eat

only the minimal RDA light sensitive vitamins from produce (if no vitamins taken due to being "*for* natural stuff *only*"), because it degrades in the store too before you put produce away from light in your fridge at home. I take vitamins daily. So, always eat produce fresh, store in the fridge immediately (dark) and minimize foods not sold in opaque containers or packages, as light/heat destroy thousands of polyphenols, unsaturated lipids, etc not just 10 vitamins. This paragraph, when practiced, could save many from losing 30 years of *achievable* lifespan. The more foods are processed, the more thousands of compounds are destroyed 3-100%. That's why when I became vegetarian, then *vegan*, I tried to eat minimally processed foods. That's why only eterni foods produced days before being eaten, are feasible for huge lifespans. People go to the meat or fish aisle where unsaturated lipids oxidized due to light sit for 4-12 days, then eat this, create oxidative stress and arterial plaque inside the body and live shorter. Vegans buy walnuts, nuts in transparent packages and guess what happens: peroxide formation speeds up, fats degrade, people die 20 years earlier. *FDA protects public health, but you can do better.* Buy seeds/nuts from bins, they only sit hours (or 2 days max if less bought item) in a bin, exposed to light, not months on a shelf with transparent plastic lid, semi transparent yellow plastic lid (no silvery foil on all) or glass/plastic transparent container. We need *food industry reform. Companies make* 50% profit, but won't spend 1% on an opaque package. ☺☺☺ They could use a thicker plastic wrap that is very dark or aluminized on the inner side to cover the entire bottle/cap (unlike labels today that cover only about 70% of it), to save on the amount of dye used to make color plastic (pricier than white). Clear bottles should be illegal. Thugs use them because they increase profits, but many nutrients degrade 90% of contents before use. Recycled black plastic is cheap vs any other dark color, but they don't use it much due to FDA lack of a rating system for the light score of each nutrient and how much visible light is OK.☺☺☺

12.4.6. 10 reasons for not using Amazon to buy vitamins, edibles, main reason being heated vitamins, edibles (warm 95°F warehouses, 155°F trucks) can help you die 25 years early:

Amazon says during preloading, truck transport, 155°F can be reached ► "stored at a maximum temperature of 155°F for extended periods of time", so Apr 15- Oct 5, meltables are rejected. It's known upper racks of a warehouse are often close to the hot metal roof, so when outside is 105°F, those pills can reach 100°F for hours daily (only lowest racks are at 85°F), degrading themselves (true for both Walmart and Amazon if no swamp coolers, so you need order in Jan-Feb only). The Immortalists will require all powders, foods to indicate the day it arrived at the Amazon/Walmart/etc warehouse (so people know the outside temperature during the 1-21 day trip from manufacturer to amazon, since 100 outside means 155 during amazon warehouse to amazon final warehouse, which inactivates or degrades heavily endless products now sold on amazon), and maximum temperatures of 1. chemical processing, 2. of transport, since many enzymes die above very low temps and we need to know that, as dry heat also creates AGEs.

Amazon and many companies are genocidal, they ship via amazon Fresh and Whole Foods in paper bags with aluminum interior that cannot be recycled and cause enormous waste in landfills. The amazon religion is pollute and poison. Walmart emails discount codes (enter them on the last screen, lower right, "Have a promo code" on Place Order page) for some reviews you make, 5$, so you may save more on Walmart, because 5$ is more than 1-5$ from an amazon subscribe. Walmart relies on cross-docking, meaning products rarely sit still, with fast inventory turnover, and moving from manufacturer to distribution center to store shelves to you very quickly. Amazon inventory can sit in fulfillment centers or seller warehouses for weeks or months if a specific batch isn't selling fast. Walmart transit is more predictable, faster and more climate-controlled, trucking routes to physical stores are streamlined, while staging on open, uncooled outdoor pallets is heavily penalized by corporate logistics rules. Amazon trailers waiting to be unloaded at fulfillment centers can sit in the sun for days. Semi-truck interiors routinely cross 55°C to 65°C (130°F to 150°F) in summer. If you expose for weeks (ocean containers, pallets, hot trucks, as from LA to NYC) at 150°F rice flour and any (in)active ingredients that contain sugars and protein, you form glycoproteins or AGEs that destroy your body. 4-12 weeks at 150°F 4 hrs/day during transport via truck or ocean can produce a similar accumulation of Maillard/AGEs as 2 hrs at boiling 212°F or 2 minutes at a dry 220-300°F oven heat. It's like cooking your body in an oven, that's what amazon does to us and the "cabbage IQ" gov allowing these ocean containers to poison us. It is Baal worship, boiling babies in the Bible.

When we buy a bottle today, aristocrats block us, the workers from seeing:

1). The exact date and time the pallet arrived at the Walmart, Amazon, etc fulfillment center.

2). The total duration it sat waiting in an inbound yard or unloading dock, truck, etc.

3). The real-time temperature logs of the specific warehouse zone or transit container it lived in.

We can't see if items sat @ 85°F or 155°F. Imposing standard supply chain tracing mandates, similar to how the USDA tracks raw meat or how the FDA handles prescription drugs, help us double human lifespan, if temps are required at all stages to be < 70°F thru innovation of cooling, distribution via 11 companies. Under Immortalist Party, Immortality Credit Score reform, every single order confirmation page will show a "Logistics Report" detailing:

1). Date/time it left the manufacturer. 2). Date/time it reached retailer. 3). Maximum heat thresholds recorded during transit steps vs the ideal for that product category (55, 65, 70). ☺☺☺

This allows us to see if a July bottle was ruined and to cancel the order within minutes. We need a National Unified Eterni Food Inc that ships/stores edible items, eyedrops (eye nutrients), medicines (body nutrition of a unique type) in 3 categories using special vans: max 55°F, max

65°F, max 70°F to ensure minimal powder/pill/fats/polyphenol degradation. This can only be achieved economically if all give up egos and 4 million wasteful companies (4 million HR, accountants, sales, marketing, no need of sales and marketing if 11 companies exist, eliminate 20 million useless jobs) merge into the 1st of The 11 National Unified companies. Until immortalists win, we can only buy heat sensitive items in Jan-Feb for an entire year.

Would you prefer to live to 150 or 4000 and have all foods stored at 55°F (ideal for ω3, oil containing softgels, etc) in proper warehouses by the efficiency of mass scale, or live to 80 and have amazon edibles sit at 100-155°F, killing you, because the small aristocrats need 0.1 million terrible warehouses in every little store where they keep them at 75-105°F, and sit at 140-155°F for 1-2 month during ocean/truck shipping for hrs daily ruining everything? It's a matter of choice, resources are limited, we can only produce that much electricity to 1. cool spaces, useless stores, to sell $1.4 trillion worth of junk or 2. really healthy eterni foods stored shipped at 55°F. Diet can help us live to 4000, if we stop being so selfish. Do we choose life, longevity or just buying junk every day to feel trendy? Is the point of life to buy junk and die at 80 or buy less, higher quality and die at 80 trillion? ☺☺☺☺☺☺☺ Do we need 4 million chariot companies (today's food companies) or one rocket company (1000 times the speed and service), Eterni Food Inc, that produces eterni food helping us live to 4000? Do we want this rotten canned expired toxic food today full of sodium that raises blood pressure, with 2000 preservatives, etc or fresh food made 2 days before arrival, born of a company with 1 million, not 2 PhDs? The aristocrats today sell us death for fast burial, as the only way to justify insane incomes is thru duplicating and wasting national resources: 4 million companies instead of 1 company. They live off as parasites, and hold hostage the entire planet essentially, as none of their companies has a ready made powder made 2 days ago stored, shipped at 55°F, to dissolve in water and get 1000 times better nutrition than the richest man alive today could get from 900 pills, extracts and foods. They sell us stuff 2 years old, that's 365 times older than 2 days, you get what you vote for: Dem and Reps are just more of the same scam. We have go to their Stone Age store or restaurant, drive there, waste time, cook it, etc, when it all could arrive daily, freshly made, personalized to your atomic composition, future DNA, etc. Even if you go there, they can't cook it properly (nitrogen under water), soak it properly, to avoid AGE, ALE formation, everything is trash, poison to kill us 4000 years before our time. The same dynamics is in every industry, see the Eterni Food Inc on how they poison us, like the small contractors also poison everyone in the absence of Immortality Building Inc. No food company stores all oils and fat containing products at 55°F today to prevent oxidation, so the gov can fine them 5 trillion each, because a human life free of injuries from food is worth at least 5 trillion billion each, so funds to create the Eterni Food Inc emerge. Some people want to remain in the stone age, so they want no change, just more of the same barbarism: torture animals, drink blood (0.4% of meat), be merry, die at 80,

like a rat. We can grow up past IQ 80 of sports infantile imbecilism (sports can't give you 4000 year lifespan) and make our supplements inside USA instead of moving balls like cretins, instead of importing them from overseas. We can control quality much better anyway, cut emissions, help the planet, bring trade deficit to zero. The repeated night chill/day heat cycle brings moisture in bottles, helping mold growth, spores grow and when temps drop for days to 100°F, or less, the growth speeds up. Heat means air expands and exits the bottle, chill means air contracts and enters the bottle. Amazon poisons us, theanine from the same company is roasted peanut flavor on amazon, and mild umami taste from Walmart, meaning the roasted one has the pyrazine heat decomposition products. In early July 2026, genocidal Amazon, led by soon to be trillionaire Jeff Bezos the Conman, who has more than a dozen estates (worth 0.7 billion at least), after poisoning 400+ million folks with super heated supplements and deceiving them with pills containing 0-1% of the claimed ingredients, decided to remove the public access to all reviews for products, especially the 1 star reviews, that are a gold mine of info, from people who know the geniune type of that product, how bad it smelled☺☺☺ (if edible, the now invisible 1-2 star reviews, show, for billions of edible products and supplements, the criminality of Amazon, poisoning billions, they sit, go rancid and smell like hell, so this evidence is hidden from the planet, so Amazon can continue its genocide against all nations, but mostly USA, the primary user of Amazon edible products, pills, powders, supplements. Sadly, most online sellers never store their pills, supplements, edibles in the corrrect temps, but Amazon tends to store them in the worst temps together with other few million small criminal aristocrat run companies worldwide, among the vast range of "temps" of the 100 million related businesses worldwide. So it's not like Amazon is alone, you walk into many places, it's so hot, yet those aristocrats store things that go rancid very fast in that heat. This is a global issue of utter corruption☺☺☺.

Nothing to worry folks, fried chicken, from KFC, Popeyes, McDonalds etc are poisoning billions too with AGEs, all as a gift from MAGA, the great Republican Mafia of "Rat IQ" Aristocrats, whose main goal in life is making billions via GENOCIDE. No regulations, so the genocides can keep going on and all die at 80 instead of 125. Same for all other 100 million restaurants, not American, but run by local "cow IQ" folks, selling fried foods and oxidized foods with 2-200 times more AGEs☺☺☺ than properly cooked under water, pressure cooked foods with zero oxygen contact almost. Not picking up on US companies, as the others do the same crap, it's just hypocritical to claim you're the best country, and you export the most lethal junk food available in many towns and call it "kindness in action". Inform people how to be free, prepare food by pressure cooking, don't kill them and make them slaves of the US Corporate mafioso. If you want the globe to adopt our 11 companies and language, we got to become honest and ethical and stop being run by Hooligan Aristocrats, we need to get the Science based We the People Government we (and no nation) never ever had☺☺☺. The vipers from outside, Dutch Giant

Foods, German Aldi, Lidl, etc also sell a lot of junk foods full of AGEs, so how are we going to Declare Independence from Foreign Mafias and Have Safe Foods when these guys, Amazon, EU, etc poison us all and nobody in America knows it? It's pathetic, we need a peaceful, nonviolent, elections based, 1776 2.0. The Walnut section explains the French Mafia activities in USA: take US land, poison the walnuts by dry heat, create lethal compounds and sell bad walnut oil to Americans to poison them, deprive Americans of the good non-oil walnut compounds.☺ Time to fine "La Tourangelle Nut Oil Company" 1 trillion? Aldi 5 trillion Giant Foods 9 trillion? Not just Amazon 900 trillion? Someone needs to bring discipline in this NATO Concentration Camp run by Genocidal Royal/Rich Families. Let We the People run NATO, not the aristocrats, 11 companies for all NATO, 1 language, 1 gov, 3 agencies, one universal pay☺ and zero violent crime forever, by 1776 2.0 immortalist revolution, the start of ethics. ☺☺☺☺☺☺☺

Jeff Bezos is allegedly, per Wikipedia, born of 'Danish' father (alcoholic Jorgensen, a name many Jews had too) and English or Jewish Gise (Ashkenazi last name) mother, Bezos is the Cuban adoptive father last name, his whole game (see his childhood pics) may be to poison Americans for the UK/Israel, the dumber we are, the easier the takeover by MI6/Mossad aristocrats. Jeff Bezos deserves lifetime labor, together with all involved in this criminal high temp storage, transport of edible perishable products and the July 2026 theft of knowledge from the American slaves (Amazon removed ability to see reviews in the past for users who made negative honest reviews, it's like USSR, applaud the dumbest decisions or be dead, he's a KGB Cuban spy probably) who buy edible products from Amazon and live 1-4 years shorter because of it, imagine 2 years times 300 million people, 600 million lifespan years, like killing 20 million people of age 50, 30 years lost, 30 times 20 is 600 million. A Holocaust of 20 million, a return to Feudalism, where almost everyone is serf in reality, and free on paper. If you click reviews, you now can only see mostly 5 star reviews. Pathetic, USSR 2.0, no real feedback, Pure Fraud. You can't see all 1 star reviews that hold all you really need to know about a product before ordering, not even if you scroll, it gives a message "We're showing a limited selection of reviews. To see more reviews, you can send a request." If you send a request, it will take up to 5 business days to unlock your Amazon account and see 1 star reviews again (possibly because Russia, China want to use Amazon reviews data for their military AIs to make the AI stronger, and even to spy, kill, torture dissidents by reading their Amazon reviews and figuring out what they order, so they can ship lethal poisons from China, AI can identify a person by writing style if the person doesn't change it to cloak themselves). It may also be that whoever reads a lot of reviews or makes 1 star reviews is seen as a web crawler and they want to review account to make sure the account is not a Chinese spy. Jeff Bezos is a bandit extorting the American people and poisoning them with super heated worthless toxic supplements, and even arguably stealing all our toil in writing reviews, keeping the info away from us, using American taxpayer infrastructure to get

filthy rich with his Jewish gang, keeping our reviews away from us, so the rich can access them while the poor can't, unethical Jews can just get ratings anyone can fake with paid reviews. Many people will give up and not contact Amazon to see more reviews, remaining clueless forever, you can always bypass their block by creacting a new account. Jeff behaves like the quintessential merchant Jew (a Jew always looks for his God, Money, so did Jeff, creating a new online bookstore, no goal to grant Trillion Year Lifespans to All, just MAKING MONEY) and may be Jewish himself: he treats us as if we're worth 20$, see Talmud, "kill gentiles if they may make you lose a small amount of money". America needs a state owned or nonprofit universal online market, market.gov or eterni.i to replace this criminal Amazon run by Jewish gangs. Jeff also destroys the US youth by promoting alcohol, buying 4000$ bottle of wine, selling alcohol on AmaHellZone, like the Jewish Mafia that made alcohol prohibition fail in the USA. Essentially, everyone worldwide needs to boycott Amazon until they show all reviews again which are the property of the USA not Jeff Bezos, USA, We the People, that provide all infrastructure, Borders and Customs, for Amazon Gang Leaders to make their billions, all Amazon dried foods, etc are rotten, supplements rotten, nuts poisonous, rancid. This reviews policy change makes it impossible to see if the 1 star reviews are superficial "didn't like color or shipping time", if there is a common complaint "it's yellow, supposed to be white, horrible smell, etc" and if you need to avoid a product before you even buy it.☺☺☺ Jeff Bezos and Amazon leadership need to be fined 900 trillion, we need to launch a Class Action Lawsuit to Force Amazon to Either: Store/Ship Pills and Foods at correct temp by creating a USPS like Federal company called Eterni, below 78°F and provide some $ back to those who bought supplements based on amount spent, or pay 900 trillion and allow all reviews to be seen by all, meaning the state takes over Amazon renaming it Eterni.com, to create true ethics. This is the most criminal action by a genocidal Amazon Leadership Gang, stealing trillions from US taxpayers (Jeff Bezos paid 2% in taxes one year, many pay 15%), giving themselves astronomical wealth, at the expense of the people they kill by lethal supplements reaching 120-155°F in US trucks and over the ocean.☺☺☺ Without the 1, 2 star reviews, you can't know what is going on, since any bandit can pay people to make fradulent 5 star reviews. Essentially, Amazon tries to hide the billions of reviews that would enable 350 million Americans to sue Amazon and all aristocratic gangsters who have been poisoning us. See why we need centralized reviews.gov and no company should control the reviews for any product allowed in USA by US customs or FDA. With the Republican Gangsters at the helm, the aristocrats can sell all poison they want, and nobody will know, nothing is tested, no regulations, selling billions of bottles that have 0-20% of listed ingredients, plus heat toxins, etc. All Amazon managers deserve lifetime labor in California picking up produce, not just a fine. They never check any claim, billions of products don't match the description, etc either. Total fraud.☺☺☺

For most supplements, ordering all for 1 year in late January (or coldest month in your climate)

is the best strategy to avoid 50-100% degradation. Any reputable brand of good manufacturing has its supplements available on Walmart too. Buying from small unknown companies is very risky as they may be full of toxins and zero active ingredients. Buy vitamins/medicines/ω3 @ 74°F iHerb warehouse (95°F Amazon, up to 155°F in trucks) if you live near their warehouse and free ship is 1 day or subscribe to 49$/yr Walmart+ free 1 day ship, not Amazon prime $180/yr. Walmart offers at home pickup returns, just use original box and print a return label, no need to travel anywhere, 30 day for supplements/foods, 90 day for objects (3 times longer than Amazon). Walmart store (not warehouse) pill storage is 74°F, Walmart+ ships 2x faster than Amazon for many items. Walmart allows returns of supplements, powders (that stink of chemicals, mold or don't work for you), while Amazon doesn't. Walmart rules. Maqui powder ships in 1 day at Walmart, 5 day Amazon prime to mainland. iHerb free shipping takes 18 days to Hawaii vs 4 with Walmart. iHerb = longest free shipping, so Walmart storage/ship temps are the best. The Amazon subscribe discount isn't worth the $90 million in damage to the body from oxidized nutrients + rancid ω3 oils that raise hs-CRP 10x, killing 20 years early by infarct. For mainland-Hawaii, Walmart uses FedEx Air for vitamins (75°F max), Amazon uses ships (144°F max). Amazon = death. Amazon uses dry vans (125°F max) to ship from manufacturer to warehouse, Walmart uses Air for big distance (75°F max). Amazon restock time (sit on pellets, transport) for LA-Miami is is 21 days max, vs 7 days for Walmart. Walmart trucks 95°F max, Amazon 120°F due to pellet waiting, for 300-1200 miles. Keep all snacks, vitamins, foods in the fridge. Buy pure (0 extra ingredients), to avoid toxic unlisted ingredients that could send you to the emergency room (berberin derivatives that prevent liver detox enzymes from working, causing toxic buildup, liver damage, etc). Amazon trucks delivery from manufacturer to all cities, can sit waiting to be processed and travel in hot weather, so temps rise to 155°F sometimes for 30 min and stay at 140°F for hours, point at which all vitamin B_1 and B_9, key for survival and for helping B_{12} lower Hcy, go to 10-20% of original value (B_{12} to 50%) the longer the transport takes (3 weeks at times). Even a 50-70% drop in B content, polyphenols in July temps for long distances (3 weeks is standard for Amazon), like Nevada Bulk Supplements to their Nashville, TN warehouse, then days to NYC, or California manufacturer to Boston or Florida, can cause infarct due to the arterial oxidative stress from oxidized polyphenols. We see this in many Amazon pics, the same vitamin in some pics or when you get it is beige, and red in other pics (yours at home too, becomes red over months of air exposure in a bottle, proving Amazon ships lethal junk) in other customer 1 star reviews, as polyphenols, etc polymerize, they get dark in color. A 80% loss is common with ALA white powder which becomes a yellow solid polymer as Amazon 1 star reviews pictures clearly show: since at 144°F ALA becomes yellow chunks. 80% loss can happen with vitamin C, many powder polyphenols in tea/grape seed extract, any plant extract out there bought in the billions/yr. Likewise, all walnuts from Amazon are rotten, lethal, criminal, but genocidal Amazon managers steal billions for palaces while killing 150 millions of Americans 4-6

years early by toxic supplements stored at high temps, moved by trucks that sometimes reach up to 145°F for hours daily. This becomes 600-900 million lifespan years lost so far, or equivalent of killing 15-22.5 million people aged 40, to remove 40 years out of each, bigger than the 1940s Holocaust, done by those sometimes Jewish managers. Melatonin, PQQ, CoQ10, TQ, NAC, spermidine, creatine (becomes useless creatinine, hence many report zero effect from 'a brand'), etc can lose 15-30% if 20 days of 4 hours/day 140°F exposure, plus 1 hr at 155 daily, which is possible for summer ocean transport or So Cal to NYC or Florida☺☺☺. Taurine, glycine, proline, choline, citrulline, theanine, β-alanine, acetylcarnitine, berberine, choline, iodine (kelp), selenium, many amino acid mineral chelates (glycinate) are not affected, though glutamine becomes pyroglutamic acid. However, these amino acid powders all have impurities of 0.5-2% with some chemicals that aren't heat stable, becoming deadlier with prolonged heat exposure. Nattokinase becomes inert after 1 hr at 150°F and some even claim at 140°F it will degrade fast in hours, bromelain takes a little longer, same for other enzymes, so millions who take inert nattokinase will damage their bodies with clots or some will even die from a preventable cause: huge salaries for Amazon aristocracy. The luckier ones will have heart attacks and strokes that shorten lifespan by 5-10 years, imagine so many useless 911 calls, harassing cops etc because the US cops at FBI can't bring correct temps for pills. Pathetic. What is FBI for then? That's national security. Serrapeptase vanishes after 15 min at 131°F and FedEx, UPS, etc trucks can reach 152°F even on 100°F days. Wait till weather is 85F or lower to order heat sensitive items, as FedEx, UPS, Amazon, USPS trucks can reach 152°F in 100°F outside weather, vs only 105° in 85° weather. Many plant extracts turn from dark purple to white or light pink, like Christmas garlands turn silver from any color in UV light, since cheap plastic bags allow UV and air to oxidize it and you see that in 100s of products, like maqui powder, the number one plant extract for dry eyes that is available at Walmart too as stinky powder smelling like asphalt, benzene, hexane – so definitely avoid Bulk Supplements for maqui, try freeze dried Food to Live brand, cheapest safe brand/lb. Bulk keeps their supplements in Nashville facility and ships them slowly.

Since Bulk Supplements Nevada etc ship in ziploc plastic bags, like 100s of other softgel, capsule or powder Amazon/Walmart sellers, oxygen diffuses thru the plastic and oxidizes, all digestive enzymes and probiotics are 100% dead at 110°F (super common in summer), so never buy that from Amazon, ask manufacturer how it is shipped to warehouses and what is storage temp there. Sadly, 50,000 active ingredients lose 20-99% of potency, creating in the pills highly toxic compounds that compete with real forms for absorption at times, destroying the body and transport/absorption molecules/proteins, and increase Hcy, hs-CRP and oxidative stress, leading to dementia, cancer, stroke, infarct. Holocausts by aristocrats or Jews are never discussed in USA. Nobody dares to take Amazon top leadership to court, as they co-run USA. Likewise, criminal small aristocrats keep their stocks in highly warm warehouses at times, shipping items

from China or overseas on ocean liners where the metallic container will reach 120-155°F, creating millions of tons of lethal compounds making sick millions of Americans. These "new vampire class naturalized citizen businesses" import products that kill Americans, we call this TRADE… to commit national suicide: see the astaxanthin bottles from China with 0% product (80% loss of carotenoids is common in the 3 week journey, on these ziploc bag brands from China, their journey is 3 weeks on US mainland, to West US it's another 1-3 months). The "made in USA from globally sourced ingredients" SCAM means these thieves never check any overseas storage temps or potency of every lot once the crates enter US warehouse after 3 months of journeys from China factory to US, by that time nothing is left 0-9% of healthy polyphenols, carotenoids, etc, plus 90% of oxidized lethal forms…, that DAMAGE OUR ARTERIES. Hybrid War against USA. We acquire debt while killing ourselves. On Amazon 1 star reviews pages, we see about 50,000 reviews with pictures of softgels that are fused together and/or spilled into the bottle, even from "reputable" NOW Foods, and this is normal and happening at even trucks reaching 110°F, which is super easy as you ship NOW Foods from Chicago to the US 9 months of a warmer year. This requires 40 trillion fines for NOW Foods, Amazon, Walmart and all related companies who're guilty of complicity to genocide. This money will be used to create world's first ethical supplement company, called Eterni Food Inc, that will list on its website, the source of each "globally sourced ingredient", the location of the manufacturing plant, so everyone knows how long it's been on the road by the estimated ship time, since Eterni Food Inc uses its own refrigerated cooled trucks to ship everything, independent of USPS, UPS, FedEx, DHL. This ensures maximum biosecurity and food quality. No more carfentanyl in imports.☺☺☺ No company will have the right to produce any vitamin eventually, unless they can ship it the right way and since only Eterni Food Inc has the mass scale advantage and can meet the INA, Immortality *Nurturing* Agency, requirements economically and still make a profit after fines, all cannibal companies of today will shut down their "profits by genocide" advanced Ivy league terrorist schemes. Then, we will all sing, terror by businessmen is no longer all pervading in USA.

For the defense of the motherland, Eterni Food Inc becomes the only global company certified by the Immortality *Nurturing* Agency to ship supplements within and towards USA, as it tests each lot upon import or exit from US manufacturer, with 1000 tests, and ships it from any foreign factory to each US house with 30-80° cooler EVs than all these genocidal Walmart, iHerb, Amazon and other Nobility Kills Humanity "companies of death and genocide". As reforms deepen, all food that degrades 1% via transport will be moved to Eterni Food Inc☺☺☺ Testing, labeling, shipping, since small manufacturers of vitamins and food lack the logistics for proper manufacturing, storage, transport, meaning over time all food/vitamin companies will merge into Eterni Food Inc to grant all 4000 year lives via the universal immortality 11 companies system of trillion year lifespan civilization building. USA will no longer be the dumping ground of

poisons by foreign exporters who amass trillions in trade surplus via genocide. Eterni Food Inc is the basis of powder foods of the future that will enable us to reach 4000 year lifespans first, before we develop 50,000 or 1 billion year lifespan tech. Right now, every bandit becomes a CEO killing people with oxidized products, we got a million of these parasitic leeches, many of them MDs who can't even write a mathematically correct label. Every supplement will have the INA label, meaning shipped, stored and tested, approved or rejected for sale in USA by INA, the Immortality *Nurturing* Agency. Right now, MDs and any fool with a pill making machine, garage, unhappy with making 20-90 times the min fed wage by screwing people, open these lines of pills to double or quintuple their astronomical salary by poorly shipped, stored products that fail to meet immortalist standards which, since we lower violent crime 1 trillion fold, will mean 1 trillion times higher ingredient purity and less oxidation, to protect brains from violent states given by MDs who subcontract products to fraudulent companies creating contaminants from heat/light oxidation. Today, the definition of banditry is 1 trillion times more lenient, as violent crime is 1 trillion times higher. But today's average MD is a bandit of the future, as future ethics is 1 trillion times higher. Every bandit becomes MD to make tons of money. If we implement the universal pay, we eliminate greedy thieves from the medical field. A dime a dozen. Aldehydes from rancid flax, chia, ω3 carrier oil wreck every cell: malondialdehyde (MDA), 4-hydroxy hexenal (4-HHE), other cytotoxic α,β-unsaturated aldehydes causing oxidative stress. The urine test measuring MDA sees how sick a person is: this test gives insanely high (toxic) results for users of highly lethal Chinese flax oil as carrier pills. Once ingested the electrophilic aldehydes rapidly bind to the gut lining proteins/DNA and carbs we eat, generating free radicals, AGEs, toxins, leaky gut, damaged blood brain barrier, dementia, cancer, organ damage. Then, we end up living 20 years shorter. Now we know why everyone fails to reach 100 today, except 1 in 3000. Corruption. All probiotics kept in a truck at 120°F for 20 hours, common for Amazon 9 months of the year, go to 0%. Same for many digestive enzymes at 130°F for 10-100 minutes, which is easy in a 3-21 typical journey by Amazon truck from one state to another. Go figure why Amazon probiotics don't work and why your endothelial markers are so high: virtually all Amazon food is poison and Amazon needs be forbidden from selling any food or supplements. All Jeff Bezos & top shareholders, managers etc mansions need be sold to the Immortality *Nurturing* Agency to pay the 80 trillion Amazon fine for genocide of 10 million, so we test every product before we accept the box, every pallet tested at US ports and we build research labs in all the mansions to create the best powders to make US reach 150 average lifespan first. Jeff = bandit. Amazon removed the 1 star reviews reading ability for many people as google search shows, so people don't know the issues with a product. FBI needs to save the 1 star reviews and charge Amazon managers 900 trillion for trying to hide fraud. Amazon is trying to protect the aristocrats poisoning the masses. For me this inability happened right after I added this to the book, showing Amazon mafia controls USA, it's the Aristocrats' Gang. The Florida, etc Mansions Mafia

doesn't want people to know the product quality, easier to kill the poor. The lawyers would make 1 trillion suing Amazon based on their 1 star reviews, plus all the frauds selling poison on Amazon. All APIs and drugs will be made in US, 2000 times better quality than imports. We the People, thank God Almighty, Free at Last, no more Trade to Enslave/Genocide us all so fast. The big grocery/restaurant poison selling chains are next to be dissolved…, in the transition time, we can use pressure cookers to oxidize much less, after soaking legumes. ☺☺☺

12.4.7. Avoid artificial food/pill colors & toxic cosmetic ingredients

12.4.7.1. Intro: toxic synthetic food colors
12.4.7.2. Life extending food colors
12.4.7.3. Healthy cosmetics made at home
12.4.7.4. Toxins in cosmetics

12.4.7.1. Introduction: Artificial toxic food colors that ought to be banned:

Many cosmetics, foods, vitamins have toxic TiO_2 (most used pigment) and artificial colors called "lakes" which are aluminum (Al), sometimes barium or calcium, salts of the dyes. This includes Centrum, Walmart Equate, RiteAid, and many other brands; others have kidney damaging ZnO or kidney destroying cyano B12, I only found one multivitamin with preformed A (that vegans don't get from diet, palmitate form, the best), 120 µg chromium, 1 mg Cu (good for those taking more zinc for eyes like AREDs vitamins), 150 µg iodine as KI (not kelp with arsenic and half of kelp bioavailability, not 50-120 µg) since *vegan* diet is iodine deficient usually, little calcium [20 mg vs 200 mg others, since Ca in supplement form can give heart attacks, *via heart calcification, plaque is made of hydroxyapatite* $Ca_5(PO_4)_3(OH)$], little magnesium (15 mg vs 100 mg others, 40 mg Deva, we *vegans* get tons of natural healthier Mg from foods, double the omnivore myself), that is free of colors, toxic forms of nutrient delivery, stearic acid or Mg stearate that block absorption, like Micro Ingredients multivitamin and B complex (1 capsule each to prevent B_9 above UL intake, 0 inactive ingredients, healthiest B forms). In the EU some colors are banned, even in their dye form, not the Al lake salt form. Al Lake food coloring, used to heavily coat liquid medicines for children, contains high levels of Al and harmful synthetic petrochemicals in trace amounts that were used in the synthesis process but are "impurities left over". Given that kids up to 12 may ingest 1-4 pounds of such dyes or their Al lakes, the amount of Al ingested can be truly SHOCKING and enough to cause autism, and all kinds of diseases. Al poisoning can lead to memory impairments, autism, epilepsy, mental retardation, and dementia. USA approves in general only 7 artificial colors. ☺☺☺ For the FDA website on dyes see fda.gov...26.htm. Cosmetics, cough drops, often use CI ##### for some of these:

• Blue # 1: Research shows it causes kidney tumors in mice. The FDA website says "The Food and Drug Administration (FDA) would like you to be aware of several reports of toxicity, including ►►...► death◄...◄◄, temporally associated with the use of FD&C Blue No. 1"

• Blue # 2: Has higher than blue 1 incidence of tumors, specifically gliomas in male rats (a type of tumor that starts in the brain or spine).

• Red # 2: Toxic to mice, even at low levels; causes tumors of the bladder. Legal in EU, not US.

• Red #3: FDA recognized it in 1990 as a cause of thyroid cancer in animals based on TAP 1990;103(3):549-56 and other studies and this led to a partial ban. It was banned in cosmetics, but still allowed in food and medicine as the link above explains. Legal in US (there is a partial ban, so Red 40 is mostly used now), but illegal in EU. See the Red 3 video. FDA banned Red 3 totally in 2025, as it is obtained from petroleum (traces of contaminants), and toxic.

• Red #40: Most popular *dye* of all, helping you *die* sooner perhaps. Debilitates the immune-system in mice. Allergic reactions common.

• Green #3: Causes bladder and testes tumors.☺☺☺

• Yellow #5: Affects behavior and induces severe hypersensitivity reactions.☺☺☺

• Yellow #6: Causes adrenal tumors in animals.☺☺☺

Many people want the toxic artificial colors banned ► cbsnews...dyes. In 2018, the FDA banned 6 carcinogenic flavors that it approved in 1964, see pg 20 of PDF, while the FDA chief approved aspartame even after studies showed it could cause cancer and FDA staff wanted it banned, as the FDA chief left FDA to make 1000$/day as a consultant for a company making aspartame, showing how fast FDA can approve lethal compounds (benzophenone, ethyl acrylate, methyl eugenol, myrcene, pulegone, pyridine) without any serious studies. Ignoring the science his subordinates said justifies a ban, the political Republican appointed chief Hayes (Republican chiefs of FDA, EPA always favor Big Business over the science and the public interest of clean water, air, etc) has set himself up in 1982 with a salary equivalent to $1.2 million in 2026 as a consultant for Big Aspartame. He died of blood cancer, the very cancer he gave millions with his many fraudulent decisions Wikipedia mentions. God didn't save the Catholic fraud, killing him at 78. He was one of many doing the same. God also killed Kennedy at age 46, another Catholic who proposed to destroy US manufacturing and middle class in 1963, by lowering tax rate for billionaires from 94% to 65%, starting a process of 60 years in which US industry was sent to China, etc, workers pay rose 10%, while CEO pay 2000% and Catholic pedophile priests came in. His plan was simple: bring in 50 million Latino Catholics to "make US Catholic again". JFK proposal led to the destruction of the US family, as nobody afforded kids and violent crime rose 7 fold. As a result, lacking workers for the ultra redundant genocidal aristocrat run system of 33 million companies, they imported 50 million Catholic spies working hard to ban English and split USA into two. JFK thus totally destroyed USA, with lots of help from Reagan, another one God

tried to kill, who took the 65% tax rate and made it much lower 35% for the final destruction of the US. Much of FDA and most Republican FDA chiefs are industry ass kissers who favor profits over life, as the Constitution was done by men of 1776. Worm IQ folks forget we don't study physics from 1776 books, so likewise, we can't use 1776 Constitution to run US 250 years later: we need a New Constitution, a New Anthem & Scripture of 2030, not 700 BC. Who cares about perfect (flavor, vitamin, cosmetic) color if we die? We can use natural food colors as explained in the future food colors and components section. Pharma companies don't do $50 billion studies for evaluating the safety of various excipients, texture givers, pills disintegrants, taste and color givers, since it would bankrupt them to evaluate how these compounds would behave regarding 100s of conditions and 100s of essential nutrients in certain conditions of low absorption.

Chemistry is complex inside the body, since one inactive ingredient from a company can bind (when one eats 40 mg of polyphenol # 5047 (8000 of them in plants) or inactive ingredient #8 in pill # 3 or even without it) and render useless active ingredients of a pill from another Pharma company or life saving polyphenols and nutrients from foods, leading to a shorter lifespan. Thus, when in doubt, it may be safer to minimize pills with many "frivolous" ingredients, put there by Pharma to help people who find it *too difficult to* "pull the ends of a plant fiber capsule, discard cellulose capsule and put powder in water/juice or a smoothie" and people, who (victims of an anti-longevity culture of "taste and texture, food appearance and color is everything, living to 150 less important") have to have something *very sweet, with a specific color, ultra flavorful and amazing*, as if life is all about taste buds not living to 250 to experience the bliss of meditation, a million times happier than tasty food eating, for centuries not 80 years. *Pharma does that because doctors tell them patients are not compliant with pill taking if not tasting like candy, so what can they do?* Hey, we can live to 500 in bliss if we take eterni foods and medicines,☺☺☺ there is no need to have such tasty pills. Eterni Foods can have in these powders we use to make stuff at home with water most vitamins we need, prepackages in every "ready made meal, since AI calculated our vitamin needs based on our weight, age, conditions"; a little pill chewing with some food or water helps create neurons per some hypotheses (IJMS 2015;12(6):502-9), no need to swallow it and have all these excipients that help it disintegrate in a certain way, etc; people can place all pills (semi-broken if very hard) in the coffee grinder with a little sugar and the daily flaxseeds or chia seeds and other herb spices can improve bioavailability a lot, if this powder is added to a smoothie or soft fruit or vegan milk drunk right away. For example vitamin B_{12} section has a long discussion about USP and 2 vitamin brands: Costco with 9 inactive ingredients and Nutricost with rice flour only. The question (that science can't answer now) is whether the stuff in rice flour is more or less life shortening than the 9 ingredients in Costco pill (especially crospovidone). However, we have been eating rice for eons and our genomes have adapted over eons, but some compounds are new to our genomes, only a few decades, and adaptation often

takes centuries, not days. Some people take 5-30 pills, so then the interaction of these pills, their inactive/active ingredients, has never been evaluated in a safety study (same for vaccines at times, *58 shots in a short period, can lead for some genomes to* wrecked immune system). One may take a pill that inactivates the good food or pill, so net effect is one may live shorter with 20 pills than without any. The dry eyes section explains just how mindlessly we go to an aisle, with 100% trust in these Pharma companies, and buy stuff thinking ingredients are harmless for our eyes or bodies. If companies would be required to do proper safety studies for all their ingredients, they would go bankrupt immediately, and release only 1% or less of the new☺☺☺ "frivolous inactive" ingredients, fillers, binders, disintegrants, colors, taste-texture chemicals. Recall natural poisons in natural foods, and how much longer we would live with eterni foods that eliminate the junk in natural foods and our "Wild West" man made foods/ medicines.

Povidone in vitamin or other pills caused anaphylactic shock in people, like PEG and other ingredients did. Rice flour did not. While in 1 billion years, when we live on cosmic energy and new matter, we adapt finally to taking "cyanide", some less lethal compounds may take our genomes millennia (not 1 billion) before we adapt to them without them shortening lifespan by 1 year or 2 months. Incidentally, for the last million years or so, bee larvae did not adapt to lower food intake (can't build big body of queen) and p-coumaric acid and phenolic acids in bee pollen that shorten their lifespan 40 times. New compounds are not just new and possibly detrimental (although some may increase lifespan unbeknown to us), they take a lot of body resources to become "adapted to it", which may shorten lifespan that way, as body repair is delayed, due to nutrient shortage and chemical stress in dealing with the changes this new chemical introduces, changes that are not necessarily bad, but having a postponing effect as with changing residence all the time. Think about it this way, to understand me better, if you keep changing your residence every 3 weeks, you introduce new changes in your schedule that cause you to postpone projects, you delay a lot of "body repair equivalent" tasks, to adapt to a new environment, so how much work can you get done in life? That's how much body repair gets done when the body is overflowed for first time in millions of years with 70 vaccines and 900 ingredients that simply end up killing many people 5 to 80 years early. That's why the transition to eterni foods will be gradual *(it already started, protein powder companies, powder meal and many food companies are the first steps towards that)*, i.e. first we take compounds totally identical to what we eat now (made in new ways, not plants), minus the known food toxins and make very similar formulas, optimized to get all known best nutrients from a variety of fruits-veggies-etc that we can't get now, as it's too much time to mix 500 foods for most people (even if some do it). Protein powders are a far cry from eterni foods, as they take the plant, remove good fiber, treat it chemically in ways that increase AGEs and protein oxidation and then sell it as "health food". Eterni means doing better than nature, making identical

proteins, fibers to what is in plants initially, not changing the plant protein making more toxic via glycation and cross linkage. If many new compounds shorten lifespan synergistically, or cumulatively, each 1 month, we end up with a slower lifespan increase, fact seen worldwide last 50 years where *lifespan increase is becoming more negligible with each year*. ☺☺☺

The safety studies cost $50-400 billion only because of our anti-science culture, where we have millions of restaurants and liquor stores (many foods have 100 times the antioxidants in wine), and 0 science of 500 year lifespans foods research centers. Why is it so expensive to do these safety studies? Perhaps because the citizen science, the infrastructure of an eterni food culture is not there, the 1 million eterni food labs in the country are not there. Imagine if people would value education and science, work with all for "safer ingredients"; instead of going to the gym to exercise 20 minutes, they would exercise at home (meal making and a few pushups, altruistic activity, stretching, chores, gardening), making a food table (see a pic, or use the free web version of Microsoft Excel, 50$ for 2021 Office, free Google Sheets or the much better (than Google) free LibreOffice to view my food table; save as Excel, .ods (like NIH ODS or DOS), Google Sheets, create yours from mine, after changing food columns, etc) entered smoothie that is much healthier, walk to the store to buy ingredients, cut down on gasoline emissions, and help create 100 million participants nutritional studies (or all enter their intake in an Excel format the university or ☺☺☺ Immortality Nurturing Agency☺☺☺ makes, format used for 1 billion nutrition studies) and free millions of fellow citizens from ultra boring McDonald's like jobs, since people spend a few minutes at home to cook way healthier water cooked (no deadly dry heat) foods using pressure cookers (press a button, 1 seconds versus 10 minutes waiting in drive thru and not exercising, allowing belly fat to shorten lifespan) for low AGEs. Then we get nutrient intake that is far more precise and provides better data, for gigantic nutrition studies that cost 1 million times less once the websites and infrastructure of entering is setup. Many people have no clue what they're eating, very random and unscientific. It took a degree in STEM to learn about entropy and they eat in the most "random and maximize entropy" way; is this how they lead the world towards Knowledge? Some pro-innovation people who want 500 new therapies, ingredients yearly, forget that their choices lead to a huge waste of resources and the most anti-innovation environment possible: endless gyms, gigantic dining/living rooms (that huge living room could be made smaller so each kids has his own room or an eterni sciences lab exists in every house) and kitchens sitting empty and unused, restaurants sitting idle much of the time, or making Paleolithic foods, useless liquor stores and no materials left to build the 1 million eterni food and medicines labs throughout the country; if the eterni foods win, we can get 500 ingredients a year released, but with 900 times more safety studies done and perhaps 300 times less lifespan shortening/ingredient, and in 99% of cases lifespan lengthening ingredient. Eterni Foods means every medicine and vitamin pill is 900,000 times more exact too,

as atom tracing and attograms are the norm. USP, the strongest vitamin certification, only guarantees that heavy metals are < 10 ppm, other toxins under certain levels, but if something is right at the border, it could cause more oxidative stress in a person that the oxidative stress the vitamins prevent, especially if the contaminant is already at the limit of "getting very toxic is more is ingested". This makes vitamin studies very hard, since inactive ingredients and/or their impurities can cause so much chemical stress in some people's systems, that they cancel out the benefits of taking that pill formulation or create new diseases. That's why Eterni Foods are ideal, since The Food Company includes vitamins in foods; if we do get a vitamin powder, we mix it with the eterni powder that we make our thick shake from, so we no longer need "inactive ingredients"; plus all is ng/g weight accessible via barcode, all toxins, heavy metals. ☺☺☺

12.4.7.2. Natural healthy life extending food colors, fibers, proteins, carbs, etc

In 2014 FDA approved Linablue or phycocyanin for a huge variety of food products; it's a natural spirulina extract blue color, that is non-toxic and noncarcinogenic, having health benefits, such as neuroprotection against oxidative stress (SR 2015;5:14418) and others (EBCAM 2016: 7803846 ► antiinflammation, antioxidation, anticancer, immunity boost, hepatorenal protection). In many studies it was shown that more polyphenols extend life. Most restaurant foods sold (except purple kale/blueberry smoothies) are deficient in polyphenols. ☺☺☺ Eterni Food Inc can be tasked with non-agriculture methods of food production based on future techs which will make agriculture (and Big Ag companies) a total waste of time, land, water and energy, just as solar did to coal. If we focused to get to the moon, and we did it. Likewise, if we create Immortalist Centralized Education of 1 million research labs and bring world best computational, organic synthesis (they got new devices that can try 1000 reactions), biochemical synthesis chemists we will figure out ways to mass produce with 9000 times less land, water, energy the same amount of beautiful colorful polyphenols (using these as food colors lengthen lifespan, not shorten it) we get from having 100 g of purple cabbage eaten with every vegan burger. Red or purple cabbage which has 2,831 times more anthocyanin polyphenols than green, but cabbage has goitrogenic chemicals, so eating cabbage daily is not easy for all, as most cabbage grown is green now. We can bring the best physicists, nuclear chemists and engineers to develop in the next 50 years far better analytical methods and later discover room temperature element transmutation for molecular assembler living room printing of molecules of food as directed by the supercomputer for every person based on daily photo of their 7 quadrillion trillion atoms and molecules, based on what we need in mg to eat next day for living to 5,000 years old. We outrun nature at 17,000 mph with ISS, 1,000 times faster than we can run as humans, we can outdo nature 1,000 fold at producing these beautiful colorful polyphenols and include the 500 mg polyphenols in 100 g of purple cabbage, or blueberries in a *vegan* eterni powder that you dissolve in water. It takes *4 months to grow a ton of purple cabbage* to produce 3,000 g of these

polyphenols, when with 1,000 times less land, water, energy, but advanced tech, *we can do it in 1 hour*. We can also later (when physics, nuclear chemistry advance) discover using molecular human simulations new colors, fibers, carbs, fats, proteins that give us all 4000 year lifespan and are even better than the natural polyphenols on this little planet in the infancy of our species. In the short term we can produce in chemical ways the best natural fibers, proteins we know for maximum lifespan, without heavy metals, antibiotics, pesticides, PCBs in it, and include these in the eterni foods, etc to give all another 80 years of healthy life in the short term (next 50 years).

12.4.7.3. How to make cosmetics at home for a lower toxin load:

It's best to buy *vegan* label products (even RiteAid has a lot of Vegan label cosmetic products), as those are quite often the healthiest with the least or 0 toxic chemicals and have the least Al containing brands (they often have "Al free" label) and they often cost about the same, even cheaper if you buy the bigger size containers. Vegan products are more into the health food category, easily found at the health food stores (sometimes at RiteAid too) like Sprouts in Los Angeles. This supports a nonviolent compassionate world, where *vegan* label is on most products, and you often pay same exact price for *vegan* products healthier than stuff at Walmart, Ralph, Target. It's good to remember that Al containing compounds or ingredients may not have the world Al in them. Red 5 Lake could be an Al salt of the red 5. Most personal care products, hand/face creams, shampoo, soaps have many toxic chemicals that are absent only in 0.1% of products or none, so in such a case, to avoid dry eyes from preservatives and amino alkyl salts, etc and endless cancer, Alzheimer, diabetes, oxidative stress risks, you can simply use edible oils to moisturize your skin, such as canola or something free of those lethal compounds that are absorbed by the skin and damage your blood and every organ via the blood.

Home made Shampoo, Sunscreen, Deodorant, Soap, Body/face/shave cream, makeup, Hair Dye:

1. **DEODORANT ►** 2 min video explains recipes, some use corn starch/coconut oil (solid). For Walmart price, you can buy something healthier, *vegan* labeled from the health food store. You can buy essential oil for fragrance, and add the 15 ingredients at # 3, face cream. You can make a deodorant that functions as both cream for face, body, eyes (no sulfur/salicylic), scalp.

2. **SHAMPOO/HAND dispenser Soap/Body Soap 3 in 1 ►** Buy the $ store Shugar vegan soap (5 oz 1$ or 1.25$, the cheapest least toxic *vegan* soap in USA, no toxic colors added, no extra toxic ingredients, except sodium etidronate which is added to prevent foam formation during soap making at the expense of public health, may irritate eyes slightly in some people, though keep in mind our eyes use phosphate as buffer in the eyes and this is simply $Na_4(PO_3)_2C(OH)CH_3$, *so any irritation may be from the alcohol group, which like* alcohol pads *around closed eyelids, would sting if you open eyes too soon; however the concentration of this is so small in a soap that you*

would not feel, but it still may disturb ocular tear homeostasis) at $ tree stores. However, Shugar has only 1 bad chemical, etidronate, and this is with the lowest irritation and other concerns at the EWG website on toxicity, compared to 2 to 10 chemicals of much more deadly nature for most soaps. A bad soap could make eyes dry or red, irritated, etc. Same for shampoo, etc. You can buy the twice as expensive per gram castille vegan soap, kirkssoap.com, 3 bars of 4oz for 4.7$ at Publix, so 340g/4.74$ Kirk has no fragrance, has *vegan* glycerin per company email (derived from coconut, meaning it is free animal viruses and animal protein residue allergens). Kirk got the least ingredients of any soap I ever bought, so for those with allergies to fragrance, it may be better. The US labeling laws are lax, so they don't require them to state what fragrance they use to see its allergic potential or toxicity. Likewise, on many soaps, it says "color", which is fraud. Once again, this is "profits first, health last" mentality. The *vegan* Shugar Works is the ONLY 1$ brand in all states (Kirk is only in a few Eastern states or online) with least toxic stuff, *all non-vegan soaps indirectly support the cruel animal factory farms and are contaninated with various microbes, allergens that are resistant to soap)*. If you want liquid soap, you can dissolve Shugar in water and add 5 tbs vegan glycerin; mix in food processor (or a container, if you grate the solid soap) until a liquid that will solidify slightly once cool if you added too little water or glycerin. You can buy from $ store a shampoo with no carcinogenic colors or toxic stuff, and add or use (no store stuff) the 15 ingredients in the face cream below (except sulfur/salycilic/too much oil). Add peppermint, rosemary or pumpkin oil to shampoo to promote hair regrowth:

3. FACE Serum & BODY CREAM ► 3 min video about *vegan* Homemade Face and Body Cream ► 2 tbsp cosmetic aloe vera gel, 1 tsp sesame oil, 1 tsp almond oil, 3 drops lavender essential oil, 3 drops cedarwood essential oil. Be careful with lavender, as it may cause allergies and is toxic to skin cells in vitro. See Amazon links to buy powders of these 15: vitamin $B_{2,3,5,7}$, A, D_3, C, E, K, CoQ10, *salicylic (if* acne*)*, some oil that is high in linoleic acid LA (canola, etc) and α-linolenic acid ALA, zinc picolinate, *sulfur (if* acne), hyaluronic acid, since acne and facial creams brands contain 1-8 of these 15. You can add essential oils, glycerin oil, purified water, vegetable oil, etc to give it the right consistence. With these 15, you'll create something more nutritious than anything out there. You can buy organic *vegan* cream $8/0.95L. Vitamin A 0.1% retinol or retinyl (far less active) ester, E 0.1% are popular safe concentrations for creams.☺☺☺

4. SHAVING CREAM ► Some like aloe vera gel for shaving cream, soap, shampoo, face/body cream. Any face cream, like the 15 ingredients one above, can be used as shaving cream, providing much needed vitamin mix for the skin, removing need of wasting more time to wash stuff off face due to toxic shave cream ingredients. Any shampoo and cosmetic product could be edible, imagine if this would be the global policy. If it's not edible, it's TOXIC. Anything on the skin goes into blood stream eventually to some degree, therefore it is ideal that it is EDIBLE.

Most cosmetic products contain ingredients we would never want in our bloodstream or mouth. Avoid ones with parabens, propylene glycol, etc if possible due to birth defects, etc.

5. MAKEUP ► *vegan*; sleeping well and using 15 ingredient (minus sulfur/salicylic) face cream above often for decades, removes need for makeup, as skin is radiant. Wear smiles and tones, colorful clothes that inspire immortality, eye health, are way more important than makeup. Moisture retaining masks (night) hydrate the eye with 700 chemicals in tears, and there is no need of any eye cream. Makeup is vanity, see Eternal Beauty section. Proper nutrition keeps you young for 4000 years, without need of makeup.☺☺☺ Invest in your Beautiful IQ.☺☺☺ You, the genius citizen scientist, can help bring eterni cosmetics born of 4000 year lifespan nutrition, which, like eterni foods that help us live to 9000 later, without even needing any cream. ☺☺☺

6. HAIR DYE ► many spend $1 ($ store, 5 min, minimal absorption) or 8$ each time. Yet $.5 buys 1 lb/450g of purple cabbage; make a smoothie or juice (or squeeze the "smoothie" to get the juice), poor the juice in a mix of vegan yogurt and apply thick paste to hair (don't spill into eyes), or add it to a spoon of shampoo before you shampoo, to nourish hair follicles; this way the light won't decompose the antioxidants if it sits in the shampoo bottle. $ store got $1 blackberries, make a puree with something thick, apply thick paste to hair 1-2 hrs: brown hair remains brown, only silver-blonde hair turns darker. Carrot/turmeric for orange/blonde hair. The polyphenols in it, via retrograde axon transport prevent brain aging; diffusing into hair follicles they prevent hair follicle loss (occurs to due oxidative stress). Adding some water can help puree cabbage better. See youtube. Henna, indigo are other natural methods, takes 2-3 hr. Hair chemists know which chemicals make the polyphenols easier to uptake by axons; they can work with Pharma to invent "do at home" formula of mixing 1-4 food ingredients + purple cabbage juice, for a <$1 polyphenol "scalp cover" that postpones, cures Alzheimer, many brain diseases inherent in living past 100 (all due to oxidative stress), besides preventing hair loss. It has to be mixed with a nonpolar thing that creates an emulsion, since axon ends are less polar.

7. SUNSCREEN ► mix coconut oil with 100% pure zinc oxide powder from Amazon. Way safer. Or wear big 3 inch rim hat and UPF 50+ long sleeve clothing, gloves, UPF 50+ umbrella, etc. Avoid octisalate, homosalate, octinoxate, octocrylene, oxybenzone (benzophenone-3), +400 others… They cause dry eyes, infertility, thyroid diseases via lowering testosterone and thyroid mess up.

12.4.7.4. Terratogenic (birth defect causing) food, vitamin and cosmetic ingredients:

Infamous Parabens, PEG, TEA, Mineral Oil, TRICLOSAN, Petrolatum

Cosmetics fans know the deadly effects of the artificial colors added to cosmetics, vitamins, foods. PEG causes allergies in some, check the end of Systane section for studies, though not all PEG polymers are equally damaging (small, medium high MW) or equally pure *(impurities and*

degradation products can cause long-term skin or other issues), just like with HA (low MW inflammatory, high MW helpful, etc). In 2016, FDA banned triclosan and 18 other chemicals in hand and body washes ONLY (not other products). These are used as antiseptics which were found by several studies to disrupt hormones, cause miscarriage, low birth weight, 25% reduction in heart muscle strength, heart failure (the chemical disables the functioning of heart and skeletal muscles). If you're Vegan, non-Vegan or just health conscious, it helps to read ingredients of whatever you use. 75% of Americans use triclosan containing products. These products include the following non-banned products: toothpaste, deodorants, undergarments, toys, plastic kitchen tools, boards among other things ► ESPRI 2012;19(4)1044-65. Triclosan suppressed thyroid hormone and affected estrogen mediated responses ► TS 2010;117(1):45-53. Triclosan impairs heart muscles, by excitation–contraction coupling and Ca^{2+} dynamics of both cardiac and skeletal muscle in vitro/vivo ► PNAS 2012; 109(35). Triclosan impairs *swimming behavior in fish, mammal muscle functioning* ► EST 2013;47(4):2008-17. Triclosan causes miscarriage, cancer (doubles risk, 2025), low birth weight (poor health) ► PO 2016;11(5):e0154758. Triclosan causes miscarriage ► SR 2015;5:18252. ☺☺☺

Most *vegan* label cosmetic products say aluminum free, paraben free. Parabens are destroying offspring health (low birth weight, shorter lifespan), are *teratogenic,* endocrine disrupting (thyroid/testosterone hormones are acne/dry eye preventing hormones), skin irritating, cancer causing (link explains EU, ASEAN, Japan restrict them, EU banned butyl and propyl parabens in cosmetics in 2015*) esters* of para-hydroxy- benzoic acid; EWG toxicity: isobutyl 10 > butyl 9 > propyl >> ethyl 3 > methyl 3; methylparaben (MP) is the methyl ester, $HO\text{-}C_6H_4\text{-}COOCH_3$. ☺☺☺ EER 2020;196:108057 found that BAK (and probably many other related $R_4N^+Anion^-$ compounds they use in cosmetics), parabens and phenoxyethanol ubiquitous preservative in cosmetics/vaccines can damage in 30 minutes, kill in 24 hours, in vitro, the cells of the ocular MGs at concentrations *below those approved for human use*; this can then lead to evaporative dry eye, red eyes. Women, who use way more parabens than men, die faster in proportion to paraben use. Asthmatic boys with 10x the blood paraben levels had 2.6x more asthma emergency room visits, CeraVe Bumpy contains MP and TEA. Parabens cause breast cancer in mice and ladies, skin cancer in all, infertility: MP "primarily affects fertility in women, whereas phthalates and benzophenone-2 primarily affect fertility in men". MP lowers sperm count & quality, lowers testosterone and thus causes dry eyes. Chlorphenesin is a sedative, anxiety reducing compound, that is used as a muscle relaxant, etc and, in alcohol form ($O\text{-}CO\text{-}NH_2$ replaced with OH), as an antimicrobial in creams; it also kills meibum cells and has many side effects most people would never suspect for a compound with EWG score of 3. *These compounds are so present in eye creams, makeup products* etc that it's no wonder many women have dry eyes. *This means, most creams, shampoos, etc out there are not safe to use around the*

eyes at all. The list of 900 bad compounds include the common 20 here, 100+ here with 100s of references and the infamous 12 of EWG here. In the future, they may use the same plastic they now use to make a hard thick container to make 200 thin plastic sealed bags with cream that are one time use (i.e. within 48 hours maybe), and eliminate the need of so many preservatives and chemicals today. It does require retooling many factories and people realizing that life can be shorter when we put toxins inside to make our skin look soft, wrinkle free, or even to heal it after some scratch during gardening, chores. Likewise, shampoos, personal care products can move to 100-400 2-day-use bags. Eyedrops already come in 1 plastic container or 30-90 1 time use preservative free containers. A scary video on sodium lauryl sulfate in cosmetics, etc is here.

Cosmetics got triethanolamine (TEA), wiki...Triethanolamine. SDS says mutagenic, avoid eye contact. TS 2004;79(2):242-7 found it causes "increased incidence of liver tumors in female B6C3F1 mice thru blocking choline uptake by the cells"; NIH got a 168 page pdf on carcinogenic TEA. Most skin creams got < 5% TEA (see 114 pg report with studies/regulations). Sunscreen with TEA caused an allergic contact dermatitis ► CD 2001;44(1):59. Contact allergy was linked to TEA use ► AJCD 1996;7(3):164-5; allergy in kids using products with TEA ► PD 2015;32(3):e112-3. Workers with TEA get itchy dry eyes, you can too. Petrolatum impurity polycyclic aromatic hydrocarbons (PAHs) are world famous carcinogens ► ER 2016;145:93-100 and CCC 2015;26(12):1791-802. Petrolatum has monoaromatic aliphatic hybrid hydrocarbons, up to 0.65%, which can cause issues; mineral oil up to 0.05%, as shown here. Many detergents, soaps, etc contain 1,4dioxane carcinogen, so choose brands that contain less. Minimize perfume and dyes, or make your own using safe at home recipes.☺☺☺

12.4.8. Amazing reductions in all cause mortality as a result of intakes 2-10x the RDA

Below are some of the studies showing "UNBELIEVABLE" *reductions in ALL CAUSE MORTALITY* and disease incidence as a result of intakes 2-10 times the RDA, while also showing the mortality increases due to barely reaching or not meeting RDA for zinc, iodine, etc. Chapter 12 first page has a list of nutrients (5 out of 500) that decline with each decade, some from the age of 15. It's evident that the US/worldwide policy of defining the RDA for 14+ or 19+ as a constant number is a public health disaster, because the requirements for many vitamins (especially those with no upper limits (ULs), like B_1, B_2, B_3, B_5, B_7, B_{12} or those with huge UL like C, A, etc) increase as we age, due to the human body's decreasing ability to absorb it and due to the need to compensate for 100s of endogenous antioxidant and cellular repair molecules whose concentration halves every 10-30 years. For example, we see 1000s of youtubers making comments on B_5 pills of 500 mg/day (100 times the RDA for B5 for 14+ per NIH) having the miraculous effect of removing their pimples after they wasted 15 years trying 500 treatments, diets, facials, IPL, laser, creams, lotions, powders and fancy supplements and $9,000, when the solution was right in front of

their face, a much cheaper ignored vitamin, at 100x the RDA, 500, not 5. For some, the acne only vanished at 3g/day, which is 600x the RDA. This shows the government lives in a fantasy world completely disconnected from reality. I myself suffered a toe injury in 2016 and all white blood cells went to the toe to help the fracture heal, etc. Then, within weeks, for the first time ever in my life, acne erupted on my forehead and face, mostly forehead with an intensity 500 times higher than any time between ages 1 and 20. This shows the immunity was weak and unable to cope with the demands of fighting on two fronts, the P. acnes bacteria on the face and the toe injury. It took me 10 years of endless dietary changes, switching vitamins and adding this or what supplement, red light, etc to figure out how to fix it in Jan 2026 and it was B_5 plus glycine, the amino acid that makes 33% of collagen, because as we age, our ability to produce stomach acid and digest proteins weakens, especially for A+ blood types and vegans, so then the skin finally was able to repair first time ever the scars fast, to get rid once and for all of this horrific ordeal that was wasting minutes daily to squeeze the pus and treat it with various anti acne solutions, powders. This is only one example, of a minor health issue, though acne can happen on the arterial walls too when it happens on the face, as they found P. acnes bacteria in arterial plaque. 1000S of similar examples of much more serious health conditions exist, all solved by a mere increase of 2 to 1500 times the RDA intake, sometimes 50x above the UL even. Some of these shocking results are in each of the vitamin sections linked on the first page. MDs treated "incurable diseases" with way above UL or RDA intakes of D_3, A, E, Mg, B_1, B_2, B_3, B_5, B_7, B_{12}, etc, so *we need to* reestablish the RDAs *and come up with higher numbers* for each passing *decade,* one can't assume a 50 year old needs the same B_5 as a 20 year old, it can't be. ☺☺☺

JN 2011;141(10):1847-54 (Table 1) found 60% of Americans (most are omnivores) *eat <* RDA (*not enough, not* ~~even~~ *the bare* minimum RDA) for vitamin E (*93% when excluding fortified foods and vitamins,* 91% when *excluding* vitamins), 70% *eat <* RDA for vitamin D (*100% when excluding fortified foods and vitamins,* 93% when *excluding* vitamins), 34% *eat <* RDA for vitamin A (*74% when excluding fortified foods and vitamins,* 45% when *excluding* vitamins), 45% *eat <* RDA for magnesium, 25% *eat <* RDA for vitamin C, *88% eat <* RDA for folate *when excluding fortified foods and vitamins*. (B_9 is not a problem for vegans, only omnivores). RDA is the bare minimum, since absorption is often poor, *especially if fat soluble vitamins are eaten with low fat meals*. Vitamins A, K, D, E, CoQ10 are often taken with a solid multivitamin with a low or 0 fat meal, meaning their absorption, if swallowed, can be 5-15 times lower than with a pill that comes as oil, whose oil is squeezed into a puree rich in natural vitamin A and fat, as explained in the smoothie section on proper mixing of vitamins in smoothies for vegans and the rest. Many don't chew vitamins or mix them with food, which is a bad idea, since eating them with food makes them more like food and makes them count less towards the UL (for nutrients where UL is pills only) than a pure pill swallowed whole and being digested more slowly *(didn't have time to melt*

into food matrix, bind to it partially so as to behave in some ways or entirely like a food vitamin at the sites of absorption, sort of like molecular mimicry *events, it imitates food vitamin better).* **NIH explains for pill nutrients, any adverse effects are reduced when mixed with food vs empty stomach. Chewing allows vitamins to react with food matrix early on (pureed smoothies) and often be "perceived" as "food" like vitamin. The 60% (E), 70% (D) numbers are even higher if we remove the amounts not absorbed from vitamins (chewing, not swallowing, the vitamins is key, to maximize absorption and avoid them going intact in the stool, getting serious malnutrition).** ***Low serum carotenoids are linked to shorter leukocyte*** telomeres ► LHD 2018;17:164. ***Those taking multivitamins have longer telomeres; among nonusers of vitamins,*** **those taking more vitamins from food (Table 4) have longer telomeres** ► AJCN 2009;89(6):1857-63. "Those with **shorter** telomeres in blood DNA had poorer survival, attributable in part to a **3.18-fold higher mortality rate from heart disease,** and an **8.54-*fold higher mortality rate from infectious disease***" ► Lancet 2003;361(9355):393-5. "Age-related diseases and premature ageing syndromes are characterized by short telomeres" ► NRG 2005;6(8):611-22.

To get the huge benefits **of healthy** low AGE **veganism, without the downsides of low intake of 8 key nutrients (*I take these 8 extra besides half multivitamin, for reasons explained at the links*), vegans can take a multivitamin and/or vitamins that provide extra: *1*. iodine (low in *vegan* foods except sea weeds, algae, strawberries), *2*. selenium (low, except for chia seeds, flaxseeds, mushrooms, sunflower seeds), *3*. B12 (0 except for algae or sea weeds), *4*. D_3 (very low, unless fortified), *5*. K_2 (*MK7* and MK4, 0 except fermented soy natto), *6*. E (low) and *7*. zinc (not high in some vegan diets); 8. *vegan* algal oil (contains DHA-EPA from algae (fish get it from algae), without the heavy metals, pesticides, PCBs in fish or fish oil). I also take daily choline and CoQ10, sometimes some taurine, but these are not needed, except for some vegans and age 25+, when CoQ10 production starts slowing. Most healthy vegans, all omnivores get enough iron, except for pregnant women who need more iron. *When learning* RDAs *we're aware most studies are done on omnivores, so since vegans eat many chemicals at 10 times the level of omnivores, the study conclusions may differ slightly or vastly, due to different diets that confound: for a vegan to reach 120 or 900, he may need to eat more/less % extra of a nutrient (vs average vegan) than omnivores.* As we age though, the absorption of everything decreases, so things change. *Before buying vitamins, check ingredients to avoid the bad* brands as explained here. *Omnivores* need optimization too, since their diet has oxidized cholesterol and trans fats which damage arteries (see pictures) so they need minimize that and the saturated fat, they eat 3 times less fiber, 5 times less antioxidants, low magnesium, low folate, high protein, high AGE, sodium, Fe, Se. We can admit half soils can be depleted (see zinc first paragraph) of zinc, selenium or various minerals, that USDA food estimates are averages based on many papers and cultivars, so someone may be eating from a cultivar or soil with 50-90% lower content of B_3 or zinc, and be**

deficient, since they're "against vitamin pills" or "going above estimated RDA intake". Selenium section 1st paragraph explains some lentils have 25+ times less selenium than others. Even vitamin A, C, B, lycopene, can vary from crop to crop, cultivar to cultivar, by a factor of 4 or even 10, see vitamin A 1st paragraph. So is 10% RDA OK? We didn't test foods for nutrients; that's why we benefit if we move from stone age to eterni foods, data not estimates. *We can wedge our risks: could one or more nutrients come from a low cultivar or soil, if we get it from 2-3 foods only? Could animals eat these plants and be themselves low in that nutrient if an animal food?* At least if we get 50-100% the RDA from vitamins, we're sure that really is there, if a good company made it, but with food we can't be so sure at ALL. So then depending on nutrient, and *its* UL, the computation of what to eat becomes a whole lot more complex. Iodine in multivitamins keeps our brains alert, awake, so try take vitamins before noon, to sleep better.

150 years ago, people were using lead for dental fillings and now it's poison. B_9 fortification became mandatory only recently. Not to mention each individual has a different degree of absorption, well illustrated by this B_{12} example: 1% of people lack the intrinsic factor glycoprotein necessary for proper absorption of dietary B_{12}, so in these cases, their intake is increased about 1,000 times to 2,000 µg per day (then it drops to lower µg, but still way above the dose for healthy people) as explained at ► CDSR 2005;(3):CD004655; high oral doses became as effective as the old traditional intramuscular injection method. Absorption levels from different foods make RDA insignificant at times, if individuals choose, by chance, foods with low bioavailability, even if they don't have peculiar genes, like the B_{12} one. Spinach Ca is 4% available, kale Ca 41%, pill K_1 95%, spinach K_1 4%, greens K_1 5-17%, banana Si 2.5%, green bean Si 50%. A mom may eat 80% RDA of a nutrient (Ca, Si, K, etc), yet get 2 times more absorbed *nutrient than a mom eating 320% RDA from foods where that same nutrient absorbs 8 times less. Then,* RDAs become confusing, leading to malnutrition, miscarriage or pregnancy issues (low K for example) or big birth defects for moms who, unknowingly, eat lowest bioavailability foods. That's why many eat 0.33-1 multivitamin/day (third or half) daily (0.33/0.5 for brands that got more Bs) and they get B_{12}, I, (MK7-MK4) K_2, Zn from other pills. Thus, it's much safer to eat 10-50+% extra above RDA (especially during pregnancy) for all nutrients, since we can't possibly know all chemicals (50,000 on any day) we eat that inhibit absorption via a synergy never published by science. Mn^{2+}, Ca^{2+}, Fe^{2+}, Cu^{2+}, Zn^{2+} all compete for absorption, too much of any shrinks the others. How much above RDA is optimal for living to 900 depends on bioavailability, nutrient: vegans eat a ton of K, but little B_{12}, omnivores eat little K, but enough B_{12}. Phytates inhibit minerals, etc. Thus, dads can search "food x nih bioavailability" for absorption of all mom eaten foods, enter every food in USDA databases (some are listed) to make sure they're not ultra low/high versus average of NIH foods used for RDA establishment.

Each section below starts with the NIH website RDA (or AI, Adequate Intake, when RDA doesn't

exist due to insufficient data); *when a separate* RDA *exists for* pregnant *or* lactating *moms for an age bracket, it is thus indicated.* Afterwards, the ULs (upper safe limits) are presented, which are formulated for pills only, pill+fortified food, or pill+food, depending on the vitamin, as indicated. The optimal level of a nutrient varies by *genome*, diet, atomic composition, absorption. iherb.com is a huge online shop that offers vitamins only with the required storage temp (Amazon warehouse can get very *hot* for many vitamins, probiotics), with high turnover and cold temp, unlike most places online selling vitamins, Walmart. In the last 25 years studies came out showing that for many nutrients, the daily RDA (recommended daily amount), is insufficient for maximum healthy lifespan and total lifespan (vitamin D, B_{12}, K, etc). After all, how can RDA be the same for a *100 lb 5'2"* thin *adult* and *a 250 lb 6'5"* muscular *adult or 400 lb obese one*, as currently stated for many nutrients? In 1950s, the RDA was twice today's RDA for protein.

►► 12.4.9. VITAMIN D_3 ◄◄

The Institute of Medicine is not to discover the truth, but to protect the Big Pharma Mafia, the eternal slavery system and set RDA at 600 IU instead of 8895 IU ► Ntr 2014;6:4472-5. *70%* Americans are deficient even at 600 IU RDA, causing bent fingers and bone deformities, due to rickets, so you may need a finger splint to straighten them, they sell them on Amazon too. A 70 year old produces 25% of the D_3 a 25 year old makes. The deficiency is also due to nutritional illiteracy, since a fat soluble vitamin D, A, K, E needs some dietary fat to be absorbed, simply taking a pill with water and no fat next 12 hours is bad. D deficiency can even cause tetany (involuntary muscle contractions). NR 2025:1-12 found D_2 pills may reduce body levels of D_3, the form we need, so take D_3 pills, not multivitamins (some vegan ones) with D_2. The NIH RDAs in IU are: 0-12 mo 400 IU or 10 µg, 1-70 yrs 600 IU or 15 µg, 71+ yrs 800 IU or 20 µg. The ULs are: 0-6 mo 1000 IU, 7-12 mo 1500 IU, 1-3 yrs 2500 IU, 4-8 3000 IU, 9+ 4000 IU. The D we take from pills is converted into usable form by magnesium Mg dependent hydroxylase enzymes as this NIH paper diagram shows (kidney 24- hydroxylase adds OH in position 24, liver 25-hydroxylase adds OH in position 25, kidney 1-α-hydroxylase adds OH in position 1-α). These 3 hydroxylase enzymes turn pill D_3 into 24,25$(OH)_2$D (a form far less used by cells), 1,25$(OH)_2$D (the main form used by the cells for creating bones and *collagen the most important body protein, 35% of all protein, essential to skin, cornea, eyes*, etc, form which acts mostly via the VDR vitamin D receptor, which viruses try to block to evade the immune system) or 1,24,25$(OH)_3$D (a form least used by cells). A blood test only measures 25(OH)D made in the liver by 25-hydroxylase, the precursor to the 1,25$(OH)_2$D made in the kidneys and then used by tissues, so a vitamin D test is not that useful if low in magnesium. In reality, blood tests are not reflective of tissue levels of most minerals and vitamins, you need more hair and nail analysis. Thus, you absolutely need to take 400 mg Mg from food and/or pills (glycinate form, very bioavailable) daily. Since high D causes more calcium absorption, you need to take MK7 form of vitamin K2 too, the one K_2 form

whose blood half life is 4-6 days not 3 hours like MK4 form of K_2 or 12 hours like K_1, to prevent calcification of heart valves or blood vessels via atherosclerosis, causing heart attacks and have calcium go to bones and teeth instead. Since Mg can block zinc (Zn) absorption, you need to take extra Zn too, so all 3 need be taken, ideally Mg glycinate, as that is easy to absorb and helps your sleep, D_3-K_2-Zn can be taken in the morning and Mg 3 hours before bed to soothe your sleep.

Taking MK7 K_2, Mg, Zn is essential when taking D, otherwise, you get vitamin D_3 toxicity, where it accumulates as 25OHD and ruins your body leading to severe calcification (watch fingers bent by 10000 IU D) and bent fingers like during D deficiency (video explains high D lowers potassium, Mg and vitamin A, and causes Th2 immune dominance). Stop taking D_3 if any calcification shows as bumps around the fingers or on MRI, etc, since the liver stores enough D_3 for 2-6 months for those who briefly (a fe weeks or months) took high vitamin D_3 to cure a tick or whatever infection. Always remove all calcium from any pills and lower calcium intake when taking higher D_3, to avoid this calcification scenario, even if only 4000 IU/day. High or low levels of basic nutrients can cause fatigue and endless health issues. When sick with flu, cold or infected with Lyme (tick bite), some molds, etc you need way more vitamin D.☺☺☺ Some MDs say the UL depends on the person, so some can tolerate even 8000 IU daily. Most doctors and people have no idea that some mycobacteria, molds, viruses have evolved ways to destroy our immune system, to evade it, by downregulating the VDR (Vitamin D Receptor, a transcription factor regulating the expression of genes which mediate D's biologic activity) significantly in order to slow the innate immune system defenses, causing the absorption of vitamin D to decrease (the most important vitamin for the immune system, together with vitamin C), which also destroys your heart due to calcification of heart valves and arteries. CCCR 2012;8(1):57-65 says "Borrelia burgdorferi (tick bite bacteria often infecting humans) can reduce VDR expression by 50 times in monocytes" so you may need 50 times the normal D intake, after a tick bite, to deal with normal threats to immunity. Dr. Berg explains that while serum vitamin D may be healthy, the tissue level may be 50 times lower (which causes obesity) than needed, so he suggests taking 50x more vitamin D, once a week 50000 IU or 10,000 IU a day (drink 2.5 L water to dilute calcium to avoid kidney stones if you're prone to that). This may work only short-term, as some people will develop *mucous cysts in their finger joints due to abnormal synovial fluid production in response to higher blood calcium in their arthritic joints*, so just because some youtube doctors or naturopaths take 8000-20000 IU doesn't mean it will work for anyone, since everyone has a different metabolism and health issues set. Lyme test can be positive and serum vitamin D can be normal, but 50x lower in the tick bite area. Dr. Berg takes 20000 IU daily, while MD Zyrowski takes 5,000 IU to maintain a 100 ng/mL level, 10,000 if he needs to raise it (after a drop) and that only 100 is ideal. Some doctors cured cancer, diabetes, autism, ADHD, etc with 100-220 ng/ml, while new research *shows D3 analogs cure cancer* too. Some MDs used even 200,000-600,000 IU

for some sick people for a few days or months (this level is where kidney stones develop), that's up to 1000 times the RDA. Levels of 5000-60000 IU daily for years didn't change blood calcium in 3 studies: 3 people got 20-60000 IU and calcium/PTH (parathyroid hormone that manages calcium levels in the body) didn't change ► JSBMB 2017;173:308-12, asthma/psoriasis were managed with high D_3 and 50000 IU had no bad effects ► JSBMB 2019;189:228-39. Ntr 2014;6:4472-5 noticed that the Institute of Medicine, IOM RDA of 600 IU is most likely insufficient to reach 50 nmol/L (50 nmol/L × 400 ng/nmol = 20 ng/mL) in 97.5% of population and 8895 IU may be needed: the paper argues IOM erred and millions of people got bent fingers, low immunity, other health issues because of this error. So, for most to reach 100 ng/mL, fat people will need 20000-30000 IU at least, since D_3 goes first to fat cells not to blood: "blood level of 25(OH)D in those taking even 20,000 IU/d was less than 100 ng/mL… Obese adults require doses 2-3 times higher." (kidney stones can occur at 1-2K IU in people with sarcoidosis, William syndrome, some lymphomas…, genetic… absence of the 25-OH vitamin D-24-hydroxylase) ► MCP 2015;90(5):561-5, so it's best to watch for blood calcium to see if it rises when D rises. A cardiologist gives his patients 8000 IU to raise D from 12 to 70 ng/mL, to lower the Coronary Artery Calcium Score (CAC Score) from 700 to 400. In most people, the CAC rises yearly by 25%, the CAC is a marker for total arterial plaque. D_3 raises HDL, reduces blood glucose and insulin resistance, arterial stiffness. An eye MD found out D_3 cures glaucoma, but only at levels 100-150 ng/mL, which he views as optimal, due to the fact glaucoma is an autoimmune disease. Many MDs claim "30 ng/mL is normal, 100+ is high", others say high is 150 ng/ml. Some studies argue 125 ng/mL is optimal, which is 6x higher than 20ng/mL. Glaucoma (the leading cause of blindness) is hypothesized to be an autoimmune disease, so D_3, the Master of Immunity, is key: CTI 2020;9(10):e1180, AR 2020;19(6):102535, MIT shows how T-cells enter retina during high ocular pressure to destroy it, Harvard explains it too. "glaucoma patients have lower levels of vitamin D compared to controls" ► JFO 2020;43(10): 1009-19. Many doctors aim for 100-150 ng/mL to reverse glaucoma, other autoimmune diseases. "high levels of vit D prevent the risk of headache (lowers brain inflammation, speeds brain Mg uptake for making ATP)" ► FN 2024;15:1423569.

"Current recommended vitamin D inputs are inadequate" ► AJCN 2003;77(1):204-10. I needed 12,500 IU/day (2.5 caps) for 4.7 months to raise it from 30 to 100 (104ng/mL on 12-23-2025) and then a cap of 5,000 IU (*500 caps 5000 IU/10$* Vitamatic) to maintain it or one *10000 IU/cap, 500 caps 17$* every 2 days, cheapest brand with opaque, not clear, bottle, to protect from light. Other people need only 2500 IU to maintain the high D of 80-100: but it's safer to take a 2500 IU cap daily than a 5000 IU every 2 days, to avoid shocks to the system. *RxHomeTest has a vitamin D home test* to see yours. *10000 IU ships from the cold warehouse iHerb (as Amazon says)*, while 5000 IU ships from warm warehouses of Amazon and D reacts with light/heat to produce toxic compounds, so go with iHerb or Walmart. For example, B_{12} like compounds in seaweed can

compete with real B_{12}, preventing real B_{12} absorption. Likewise, vitamin X like compounds from degradation of X can compete with real X for absorption. During high stress, we deplete D_3 fast. D_3 is the Master of Immunity and most deaths are due to atherosclerosis which flourishes when immunity is low. D_3 is longevity. It's "recommended that people at risk of influenza and/or COVID-19 consider taking 10,000 IU/d of vitamin D_3 for a few weeks to rapidly raise 25(OH)D concentrations, followed by 5000 IU/d. The goal should be to raise 25(OH)D concentrations above 40–60 ng/mL" ► Ntr 2020;12(4):988. 90+% of USA *have D* < 60 ng/mL, *so they get* sick with flu/cold all the *time*, as they don't know *the* science. Only 0.7% of USA has D_3 at 100 ng/mL shown to prevent many cancers, flu, respiratory viruses, COVID19, common infections. Only 0.03% make it to age 100. Without immunity, we can't prevent atherosclerosis, die 30 years faster. In the winter, serum D_3 become falls 50%, so we get the cold. The sun isn't there to protect against the flu, 10 minutes of noon sun can produce 2500 IU if arms and lower legs are exposed to UV index 9 sun as we wear shorts and T-shirts (if light skin, less if dark), but winter summer UV index is max 5 (10 min at noon would be just 700 IU). D_3 reduces the risk of flu. ☺☺

100s of youtubers noticed improved energy, sleep with D_3, K_2, Magnesium (Mg is lowered by D_3). Too much D_3 can slow down stool movement, cause constipation via hypercalcemia, so taking Mg softens the stool and allows normal stool softness and speed to return. Other MDs suggest 80-100 ng/ml at least and some MDs used 150-250 ng/mL to cure chronic diseases. Sulforaphane in broccoli, cauliflower also boosts VDR. According to IR 2014;63(10):803-19, HIV completely shuts down VDR activity, Epstein-Barr virus lowers VDR activity, Mycobacterium tuberculosis downregulates VDR, Mycobacterium leprae inhibits VDR activity through down-regulation of CYP27B1 in monocytes. "VDR is nearly *ubiquitously* expressed, and almost all cells respond to 1,25-$(OH)_2D$ exposure … 3% of the mouse or human genome is regulated, directly and/or indirectly, by the vitamin D" ► ER 2008;29(6):726-76. Aspergillus fumigatus secretes a toxin capable of down-regulating the VDR in macrophages, meaning it will *make infection by anything else easier*, and lower vitamin D, hurting teeth, bones, heart. Aspergillus fumigatus is a deadly ubiquitous garden backyard leaves mold (also found in some houses that have odd smells of mold) that grows in different colors, including black, but is not the stachybotrys black mold. "Aspergillus fumigatus is the most important airborne mold pathogen and allergen worldwide. Estimates suggest that > 3 million people have invasive or chronic infections that lead to > 600,000 deaths every year." This means your immune system can be 95% incapacitated after heavy mold or infected tick bite exposure if you take low D_3, typical of *90% of people.* We need bromelain, D_3, ω3 to boost the VDR when sick. D_3 works better with preformed (supplement form vegans especially need) vitamin A, which is absent in vegan diets without multivitamin retinol esters vitamin, since the conversion of carotenoids to vitamin A is not always good.

That's why, to avoid lifelong unknown D deficiency, it is critical to destroy the Lyme disease

bacteria within days of a bite by eating plenty of garlic, because, as Antib 2018;7(4):89 explains, garlic oils kill the dormant *(that reactivate 10 year later to destroy joints, brain, heart) Lyme bacteria 100%*, better than expensive antibiotics people take for 3 weeks after a bite, dormant bacteria that *don't show up in tests*. Use peppermint or other essential oils to keep ticks away (or DEET, permethrin), as they hate that mint smell. The US map of Lyme disease is here. That's why "garlic was believed to keep vampires and bloodsuckers away", because ticks are bloodsucking insects and peasants thought that vampires in the night sucked their blood via that tick bite hole (all vampire stories in certain nations originate from the areas that have highest or 20 times more ticks density than 85% of the nation). So, instead of science, they just did believe in garlic and rituals of "vampire banishing" via fake miracles Jesus or other conmen 'vampires' disguised as 'sons of God'. It seems best to take max 8000 IU D, unless you're sick for 8 days with flu/tick bite, because high D can cause calcium buildup, joint pain, joint bumps (mucuous cysts shift bone upward making it seem like bone growth), kidney stones. Take more K_2 when taking more D_3, as K_2 prevents Ca from calcifying heart or vessels. ☺☺☺

Perhaps, when you realize how many thousands of microbes affects us and cause 20 billion lifespan years lost (equivalent of killing 1 billion 60 year olds today, who lose 80-60=20 years each), you understand why we use the term GENOCIDAL ARISTOCRATS, who pamper themselves with 11 times (US Congress passing useless laws, failing to ensure all have a job, decent housing and food) the federal minimum wage salary or 15-5000 times higher wage for real aristocrats, while the people have no decent housing maintained and kept germ free, mold free, lead-toxin free. Food intake is hard to estimate, since USDA tables lack D level for many foods. D is 0 usually in unfortified *vegan* foods. The AAP recommends that 1-100% breastfed infants receive 400 IU/day of D_3 shortly after birth and continue until they're getting enough D_3 from food (this means continue until age 190 if vegan... as vegan = zero...). Walkinlab.com and other sites allow those without insurance or doctor's signature/knowledge to check their vitamin D. NIH explains that D < 30 nmol/L risk being deficient, while D > 125 nmol/L can cause adverse effects. It's much safer to get D_3 from pills or fortified foods (common for fortified orange juice, soymilk, almond milk, *vegan* milks) than from the sun, as explained in the UV shortening lifespan section. The body makes 0.5+ g cholesterol daily; part of it is used to make D_3, cholecalciferol, hence the similar structures. Due to rickets (bone softening) in kids, in the 1930s, the US mandated D_3 fortification in milk (400 IU/quart), which still holds true today ► FS 2017; 82(4):856-64; after milk fortification with D became popular, vitamin A was also added to milk in the 1940s (today all low fat and skim milks get 2,000 IU vitamin A) and today FDA requires companies to test A, D levels using HPLC or the better UHPLC. That's why all *vegan* milks have A & D added too; the paper explains in 1 study D degraded in the presence of light far less than A and B_2, rate constant/hour being 0.0009 vs 0.0616 for B_2 or 0.0298 for A. However, the lower rate doesn't

mean D is safe in a bright environment: "*After 2 months, the vitamin A and D_3 losses reached 60-68% and 61-68%, respectively, for oils (*oil is similar to oil capsules of A, D, E, K vitamins*) exposed to natural light,* and 32-39% and 24-44% *in semi-dark conditions*" ► FC 2015; 184:90-8. Don't rely on transparent vitamin D bottles or fortified foods with degraded D_3, because you may become deficient, leading to Alzheimer, diabetes, flu, cold, COVID, etc. ☺☺☺

JN 2011;141(10):1847-54 found 70% of Americans *didn't get even the* minimum RDA for *vitamin D*. In 2025, the % may be lower. Many vitamins state 400-800 IU is 100% of RDA, each vitamin brand having their own RDA definition. This is the ☺abysmal IQ☺ of decentralization. After taking 1,000 IU D_3 in Nature Made multivitamin for a year, which is "250%" of the 400 IU RDA, serum D was only 76 nmol/L in August 2017, the first time I ever measured it. Before 2016, I always took the 400 IU, so vitamin D was probably < 75 (deficiency) for most of my life. So, our USA gov of phonies has an RDA that makes 95% reach suboptimal level (<100), 65% deficiency (<75) level ► FN 2022;9:965376. This is normal, given the corruption blocking a unified universal healthcare, a unified RDA standard, instead of so many aristocrat invented RDAs. In America, the rich gangsters start companies, decide what the RDA on their label is, hilarious, are we a nation or a collection of colonies of slaves of various aristocratic families? NIH website, several studies show one needs 1500-2,000 IU/day (2.5-3.3 times the RDA or 4-5 times the 400 IU RDA that some companies use) to reach the optimal 80-100 nmol/L level found in healthiest people who live the longest. Many MDs suggest taking 2,000 IU, others say 4000 IU. So, why can't the RDA become 1500 IU, 2.5 times than the current 600 IU for ages 1-70? This is what happens when most papers are fake science and we fail to centralize education and healthcare, every mom and dad starts a company, we got 100000 of them, who makes vitamins and supplements. If that wasn't enough, they add magnesium stearate which can block D absorption in low fat meals by 90%. Pathetic, they have no clue what they're doing, look at the pathetic studies that ignore 100000 confounding factors. For vegans eating no D_2 fortified foods, most multivitamins won't help much, having only 400-800 IU. Those who're obese and not in the sun, may need 3,500 IU as explained at youtu.be...4. *Unfortified* vegan *foods have* almost 0 *D.*

A review of 32 studies found that mortality was 90% higher (almost double) *in* the lowest vitamin D (0–22.5 nmol/L) group compared with the highest vitamin D (> 75 nmol/L) ► AJPH 2014;104(8):e43-50. In a study of 26,916 people, when blood vitamin D got below 30 nmol/L, the mortality increased by 67% versus those with vitamin D at 75 to 100 nmol/L. When vitamin D was 30-40 nmol/L mortality increased only 33%, at 40-50 nmol/L mortality was higher by 16% only compared to the reference of 75-100 nmol/L group. 400 IU of D_3 (for *vegans* especially) in many multivitamins will often times not even reach 30 nmol, and many vitamins use D_2 which brings it below 20 ► PO 12(2):e0170791. ☺☺☺ A study of 26,018 people (ages 50-79) found that those with lowest blood D_3 were 57% more likely to die versus those with the highest D_3 ► BMJ

2014;348:g3656. $D_{2,3}$ pills over 3 years reduced mortality ► PO 2013;8(12):e82109. Mild D deficiency (< 50 nmol/L) is a reality for 41.6% of adults in US (higher % of D deficiency exist in many countries, even 80%) ► NR 2011;31(1):48-54. In a study, 84% of pregnant women were D deficient, with levels <35 nmol/L (14 ng/mL) ► AJCN 2005;81(5):1060-4. Among sick people, those with D > 75 nmol/L had 41% mortality, while those with D < 75 nmol/L (30 ng/mL) had a mortality of 74%, blood sugar 31% higher ► IJEM 2014;18(4):511-5. 75 nmol/L is much higher than the "alarm" level on the NIH website of 30 nmol/L. In a group of sick people, those with D < 30 nmol/L were 2.2 times more likely to die within 28 days than those with D > 30 nmol/L ► Clinics 2015; 70(5):326-32. D supplementation lowers autism symptoms ► JCPP 2018;59(1):20-9. 2000 IU synthetic D_3 may be same as 5000 IU of "*vegan*" D_2. D_3 (cholecalciferol, the form our body produces from cholesterol and utilizes) was found to be 3.4 times more potent than D_2 (ergocalciferol, natural form in plants), cumulative 25(OH)D levels at day 28 being 205 ng.d/ml for D_3 versus 60 for D_2. Using the curve, at infinity, the D_3 versus D_2 difference becomes 9.5 times. ► JCEM 2004;89(11):5387-91. 25(OH)D stands for 25-hydroxy vitamin D, due to the fact the liver enzyme cholecalciferol 25-hydroxylase is adding an OH to D_3 ► wiki..Calcifediol. *25(OH)D* is what doctors use to measure blood D_3, it's the bioavailable vitamin D. D_3 was found to be 87% more effective at raising blood 25(OH)D concentrations, increasing vitamin D storage levels 2-3 times more than the same amount of D_2 ► JCEM 2011;96(3):E447-52.

►► 12.4.10. VITAMIN K_1 & K_2 (half life: K_1 8 hr, MK4 3 hr, MK7 60 hr is the best) ◄◄

MK7 form of K_2 keeps arteries flexible, lowering blood pressure BP. Without MK7 to prevent artery calcification 24-7, Ca deposits in artery walls instead of teeth/bones, arteries become stiff and unable to bend, leading to high BP. The NIH AIs in µg are: 0-6 mo 2, 6-12 mo 2.5, 1-3 yrs 30, 4-8 55, 9-13 60, 14-18 75, 19+ men 120, women 90. The ULs are nonexistent, since no adverse effects were seen at high doses (50x the RDA taken by osteoporosis patients), except for people (they can ask doctor if taking K is OK) who take blood thinning medications. I get 900-2000 µg K_1 from food alone; multivitamin brands have 0 to 80 µg, 0 and 80 two I used for years. Since my multivitamin has no K, I take a K pill (1 pill every 2 weeks or so, a little bit of the capsule powder every 3 days), since some people fail to *fully* convert plant K_1 to K_2 and body prefers K_2. MK7 lasts 4-6 days in the blood compared to 2-4 hours for MK4 or 4-12 hours for K_1, so my pill contains 5,000 µg K_1, 25,000 µg MK4, 500 µg MK7. Some people take 1 such pill daily, i.e. 10-20 times more than I do and have no side effects. Weston Price found some groups ate 10 times the K_2 of USA and their teeth were perfect, unlike the US where so many need braces. K_2 takes calcium out of the blood and sends it to the teeth: kids need MK7 to have healthy teeth. MK7 is critical to ensure no calcification of arteries occurs when MK4 and K1 disappear from serum after a meal. 99+% K in vitamins/foods is K_1 and K_2 forms MK_4 and MK_7. Many studies show those taking 300-900 µg from food live longer (those taking 300 µg from pills even longer as it is

equivalent to 2,000 µg from food), healthier lives than those taking 100 µg from food, having 2.7 times less heart disease, 2 times less diabetes and cancer. K.pdf has 11 pictures (to facilitate understanding the studies below) about brittle bones/teeth, low ucMGP, calcification of arteries, CAC (coronary artery calcium) score, mortality & K deficiency. OI 2001;12(12):996-1000 observed no bad effects even at 45 mg (RDA*500). Many other studies with 45 mg (and *even some with 135 mg*) vitamin K were done and found no side effects. Moreover, multivitamins can list 80 µg as 100%, some have just 20 µg, or a 6th of the minimum a male needs, or possibly a 12th if a muscular tall male weighing 270 lb instead of a tall thin male weighing just 135 lb or short one of 100 lb. The richest sources of K_1 are in µg/100 g: Kale 817, spinach 483, turnip greens 251, broccoli 102, romaine lettuce 103. The bioavailability of K_1 from foods can be 20 times lower than from pills. Pills have about 80+% bioavailability, while kale has 4.7% bioavailability ► BJN 2010;104(6):858-62. Thus, the average person gets about 40 µg pill K equivalent thru food, assuming meat-cheese K_2 is as well absorbed as pill K_2, which may not be the case. Most multivitamins have K_1, which the body converts into the MK4 version of vitamin K_2 by enzymatic dehydrogenation of 3 carbon bonds. K_2 has 6 fewer hydrogens than K_1. As with ω3, B_{12}, etc there might be people where this K_1 → K_2 enzymatic step is impaired partially or totally, leading to catastrophic consequences if they don't get K_2 from diet or vitamins. The body uses K_2 in enzymatic reactions of carboxylation to bind calcium, so if K_1 can't turn into K_2 the person will probably die decades earlier. K_2 is essential for enamel/bone remineralization (uptake of calcium), heart health, etc. Pill K_1 can be 20 times more bioavailable than spinach K_1 ► see reference 2, the body absorbs only 4% to 17% as much K_1 from spinach as from a tablet. MK4 is reportedly better for people with cancer than MK7, so get a formula that has at least K_1, MK4, MK7 to cover all benefits: BJC 2025;132(12):1141-7 & NC 2026;78(3):208-20. ☺☺

Most humans don't get the ideal 45+ µg K_2 from the diet or pills. The Japanese get about 230 µg/day K (74 µg K_2) from fermented soy natto, etc and have 3 times less heart disease compared to Americans. K_1 is cheaper, that's why they don't put K_1-K_2 mix in the multivitamins. The best Amazon K brands contain all 3 major Ks: K_1, MK4 and MK7 for best removal of calcium from arteries to reverse atherosclerosis and best longevity, cancer prevention. Among the brands with all 3 (K_1-MK4-MK7) forms, the cheapest (most K/$ and plenty of MK7) seems the one from Koncentrated company; this is made by a guy with a K_2 website who reversed his arterial calcification; the other brands that cost 10-40% less, offer only K_1 and MK4, without 500 µg MK7 and in much lower amount, even 20-50 times less; this one would last for 1-3 years if you take it rarely (a pill every 1-3 weeks); it has the most MK7 of all Amazon brands with 25 mg MK4, allowing you to take it every few days, many studies show MK7 works better than MK4 at decalcification of arteries and prevention of tooth/bone loss. Studies show to reverse calcification of organs, heart valves and arteries, one needs to use levels of vitamin K_2/K_1 much

higher than the RDA. Menaquinone-4 or MK4 (45 mg daily, 500 times the RDA) has been approved by Japan since 1995 for the prevention and treatment of osteoporosis ► Matur 1999;31(2):161-4. Some people say we need 500 µg K_1, 500 µg MK4 and 50 µg MK7 for calcification prevention, others say 10-30 times that is needed to reverse (or even prevent) calcification. B_{12} ideal amount is 100-400 times the RDA per many MDs and multivitamin makers, so why would K not be 100 times or more for decalcification? The reason many think we need 500 µg MK7 (or K_1 or MK4, so 5 times the RDA) daily is that only at 360 µg daily of MK7 they noticed a reduction of 61% in unMGP (marker of calcification) after 6 weeks, with the reduction being only 18% with 45 µg ► AJKD 2012;59(2):186-95. 360 µg MK7 cut ucMGP by 86% in 4 weeks ► BMCN 2017;18(1):191. A 12-week study showed ucMGP decreased 31% at 180 µg and 46% at 360 µg, 0% in placebo; the uncarboxylated osteocalcin was down 60% at 180 µg/day and 74% at 360 µg MK-7, 0% at placebo ► Ath 2012;225(2):397-402. K_1 is almost entirely converted into K_2 in the healthy body and similar lowering of ucMGP was noticed after 3 years of K_1 at 500 µg/day, with a drop from 485 pmol/L to 97 pmol/L, i.e. an 80% drop, higher than 61% drop found in the 6 week study with MK7, possibly because this was 3 years not 6 weeks and 500 µg K_1 (molar mass 451) is 2 times more molecules than 360 µg MK7 (molar mass 649). Lowering ucMGP was associated with lower CRP ► JN 2011;141(8):1529-34. ☺☺☺

Phytonadione (in parenthesis on vitamin K labels usually) is a man-made "vitamin K_1+isomers" that contains usually at least 75% of vitamin K_1. K_1 has 8 diastereoisomers, and only one of the 8 is the vitamin, being the only one found in nature: 2', 3'-Trans-7R, 11R-stereoisomer is K_1. Phylloquinone is the name used for the pure vitamin K_1 usually. Most multivitamins have this phytonadione written in parenthesis after vitamin K to signify it's not the natural form extracted from plants, but the same identical compound made by man and not separated from other stereoisomers. Being man-made is not an issue, many vitamins are made by man to replicate what is in plants when cheaper to do that. If it says menaquinone in parenthesis, then it's vitamin K_2, much better, as the body doesn't have to convert it to K_2. Those with highest blood ucMGP vitamin K marker had 2.7 times less heart disease compared to those with lowest blood vitamin K ► Matur 2014;77(2):137-41. Higher K_1 intake (626 µg versus 170 µg) meant 36% lower mortality from all causes, 46% lower cancer mortality, while those who increased K_1 or K_2 intake during the study had about 45% lower mortality than those who decreased or kept constant their intake of K_1 or K_2 ► JN 2014;144(5):743-50. Vitamin K_1/K_2 decreased the rat arterial calcium (Ca^{2+}) content by 37% in 6 weeks, only *at vitamin K of* 20 times *the normal dose* (100 µg/g food, instead of 5 µg/g food). Normal dose vitamin K did not decrease arterial Ca^{2+}, but let it build up ► BI 2007;109(7):2823-31, that's why today many MDs say you need at least 20 times the RDA to REVERSE calcification fast. K_2 worked better than K_1, enabling 2 rats out of 6 to get rid of all Ca^{2+}, compared to only 1 rat in the K_1 group. 180 µg of K_2 (MK7) for 3 years improved arterial

stiffness in healthy postmenopausal women ► TH 2015;113(5):1135-44. Mice without MGP died in 6-8 weeks as arteries ruptured, MGP is the Matrix Gla Protein that clears Ca^{2+} from arteries and soft tissue like muscles, heart valves. K is what activates MGP so it can bind Ca^{2+} and prevent it from depositing in arterial walls, valves, retina, brain ► Nat 1997;386(6620):78-81 ☺☺☺ Vitamin K_2 (K comes from Koagulation), absent from non-fermented vegan foods (natto is the only vegan food that has K_2) and rare in non-vegan ones (90% of K omnivores eat is K_1 from greens), is key to preventing atherosclerosis, cardiac death, teeth/bone health issues.

K_2 (MK4 or MK7) MORE EFFECTIVE SOMETIMES THAN K_1

K_1 is converted into the body into MK4 form of K_2. The great problem with K_1 versus K_2 studies is the inability to correct data to account for variability in absorption of K_1 from plants being very different from study to study (or even within the same study from quartile to quartile) and also to account for the difference in K_1 quartile µg being so low. Due to the fact 90% of the human intake of K is plant K_1, which comes from spinach and kale, etc (kale and spinach have 20 times less absorption than pure K1 in vitamin form), it is clear how in studies (done on omnivores) that compare K_1 effects < 170 vs > 630 see effects, while studies that compare K_1 at < 200 versus > 278, or < 71 vs > 124 see no effects. You need a lot more K_1 difference (broccoli, avocado, nuts, kale, spinach eating subpopulations) to see effects, this is why there seems to be a contradiction, where many K_1 supplement studies work as well as K_2, but this is often mostly due to disregarding bioavailability. Those with K_1 intake > 124 µg may eat more kale, which is poorly absorbed versus say avocado (K dissolved in fat, as it is in cheese and meat, more available), leading to absorbed K_1 from highest quartile being lower than absorbed K_1 from lowest quartile (if those people ate avocados, not kale). Even the absorption rate is very hard to standardize, as there are few studies about each food absorption. These 53 or 78 µg differences in dietary K_1 are sometimes equivalent to 3-4 µg in pill K_1 equivalent, so of course, they see NO DIFFERENCE, but see the difference in studies with K_1 pills or with high K_1 differences or where the K_1 difference was due to avocados/nuts not kale, since avocados/nuts have fat that speeds K_1 uptake. All studies with K_1 pills though show positive effects, so much of the K_1 "bad press" is possibly due to eating it without fat. Spinach K_1 is absorbed 3 times more if you add some fat (fat had 100,000 times less vitamin K to avoid changing the numbers) to the meal ► BJN 1996;76(2):223-9. Because natto has some fat, while greens don't, circulating K_2 concentrations after the consumption of 200 g of natto were about 10 times *higher* than those of K_1 after eating 400 g of spinach ► Haem 2000;30(6):298-307. Below are 7 studies on why K_2 is better than K_1:

1). The Rotterdam study found a 57% reduction in cardiac mortality for K_2 (menaquinone) above 32.7 µg/day compared to less than 21.6 µg/day and 0 reduction in cardiac mortality for K_1 intake difference for < 200 µg (1st quartile) versus > 278 µg (3rd quartile) (phytonadione or

phylloquinone on vitamin labels). K_2 above 32.7 µg/day also cut all-cause mortality by 26% compared to the below 21.6 µg/day group. ► JN 2004;134(11):3100-5. The paper explains K_1 was associated with higher total cholesterol (0.044 mmol · L^{-1} · 100 $µg_{-1}$) and HDL (0.016 mmol · L^{-1} · 100 $µg^{-1}$), K_2 intake was associated with lower total cholesterol (–0.025 mmol · L^{-1} · 10 $µg^{-1}$), and higher HDL (0.015 mmol · L^{-1} · 10 $µg^{-1}$). This makes K_2 better. ☺☺☺

2). K_1 was unrelated to prostate cancer incidence, but K_2 was related to a 63% drop in advanced prostate cancer and 35% drop in prostate cancer ► AJCN 2008;87(4):985-92. It's rather obvious why "K_1 had no effect", because the 4 quartiles have a minimal difference in plant K_1 from 1st quartile < 71 to 4th quartile 4 > 124 µg. This 53 µg difference becomes about 2-4 µg difference when we take into account some plant K_1 is 25 times less absorbed than pills K_1. At 2-4 µg vitamin equivalent, you can't really see a statistical difference, compared to studies using 100 µg or 500 µg K_1 as pill. On the other hand, the K_2 quartiles were <26 and > 47, meaning a 21 µg difference of much more absorbed K_2 from fatty foods, so of course, they see effects. If K_1 was mostly from fatty avocados or nuts (instead of greens and fat free veggies as true for most people), the difference between K_1 and K_2 would have been much smaller.☺☺☺

3). K_1 goes primarily to the liver, while K_2 goes to the other areas of the body, explaining why we see such a dramatic difference between K_1 and K_2 in some studies. MK4/MK9 attached to LDL (Low-Density Lipoprotein, going to peripheral organs easier) and TGRLP (TriacylGlycerol-Rich LipoProtein), while K_1 attached to TGRLP. MK4 was found in HDL even, not just LDL. MK9 half life in blood was 48 hours versus a few hours for MK4 or K_1. ► BBA 2002;1570(1):27-32.

4). A study of 16,057 women found for every extra 10 µg/day of MK7, MK8 or MK9 (K_2 forms) risk of heart disease decreases by 9%. K_1, on the other hand, had no effect on heart disease, possibly due to the issue mentioned above, too little difference in K_1 quartiles within a population that ate low K_1 absorption plants ► NMCD 2009;19(7):504-10.

5). K_2 is preferred by the teeth, bone, cartilage, vasculature, so the body takes plant K_1 to turn it into K_2. MK7 (soybean natto) has 20-25 times longer serum half life (4-6 days) than K_1, has 6 times the cofactor activity of K_1, accumulates at levels 7-8 higher in the blood after the same dosage. MK7 is as 6 times more bioavailable than K_1 ► BI 2007;109(8):3279-83. ☺☺☺

6). In a review of 7 studies, K_2 (MK4) was much more effective than K_1 at inhibiting osteoporosis and fractures. K_2 prevented vertebra fractures by 60%, hip fractures by 77%, and nonvertebral fractures by 81% ► AIM 2006;166(12):1256-61. ☺☺☺

7). High dietary menaquinone (K_2) intake is associated with reduced coronary calcification. High K_1 meant 17% more risk of calcification, high K_2 intake meant 20% less risk of calcification (MK4 form that humans/animals make from plant K_1) ► Ath 2009;203(2):489-93. A 40,087 person

study found a weak relationship between heart disease and K_1 (16-18% decrease in cardiac events for those eating more than 106 µg K_1 compared to those eating less than 106 µg), supporting the hypothesis K_2 is more effective at preventing heart disease. As with other studies with low K_1 difference among quartiles, given low K_1 absorption, the number of cardiac events was about the same for those getting 108-145 µg, 146-186 µg, 187-248 µg, > 249 µg K_1. We may need raise K_1 inter-quartile difference much more to notice consistently in all studies the drastic cardiac events reductions seen in other K_1 studies ► NMCD 2007;17(1):58-62.

VITAMIN K_1 (converts into K_2 in the body) BENEFITS:

In those using antihypertension medication, low serum K_1 was linked to 34% more calcification ► AJCN 2013;98(1):197-208. A 4 year study using 5 mg K_1 (RDAx50) daily led to a 10 fold increase in serum K_1 and a 55% reduction in clinical fractures (9 instead of 20) and 75% reduction in cancer incidence (3 instead of 12) ► PM 2008;5(10):e196.

4 studies showing the MK7 (way more potent than MK4 & K1) BENEFITS

It stays in blood 30 times longer than MK4. Longer forms of K_2 (MK7, MK8, MK9) are K_1 with some extra carbons, MK7 has 3 extra isoprene units, $-CH_2-CH = C(CH_3)-CH_2$, compared to MK4. K_1 has the same structure as the short form of K_2 (MK4), except for 3 double bonds in MK4. ☺☺☺

1). MK4 doesn't contribute to the vitamin K status as measured by serum vitamin K levels. MK7 significantly increases serum MK7 levels ► NJ 2012;12;11:93. ☺☺☺

2). MK7 has 3 extra isoprenic units, making it more fat-soluble than MK4 and K_1 and possibly easier to transport by chylomicrons from intestines to various organs. Chylomicrons are lipoproteins transporting lipids in the blood. K_1 is absorbed along with dietary fat from the small intestine and transported by chylomicrons in blood ► JN 1996;126(4 Suppl):1192S-6S.

3). Women with high serum MK7 had lower fractures than those with low serum MK7, the K_1 serum level was pretty constant and unaffected by intake of MK7 from natto soy food ► Ntr 2001;17(4):315-21. Serum MK-7/K_1 concentrations were 5.3/0.74 ng/mL in Japanese women in Tokyo, 1.2/0.72 in Japanese women in Hiroshima, and 0.37/0.5 in British women, with MK4 below the detection limit of 0.1. Several referenced studies in Table 1 show that Londonese with hip fractures have 8 times lower MK7 and 5 times lower K_1 in their blood compared to normal people, French with hip fractures 2 times lower MK7 and 1.7 times lower K1. K_1/K_2 deficiency damages bones and teeth, since K is critical to calcium metabolism. ☺☺☺

4). K_2 MK7 form has a 4-6 days blood half life compared to 4-12 hours for K_1 or 2-4 hours for MK4. This may be 1 reason why MK7 has a much stronger impact on cardiac mortality in some studies, as it offers 24-7 anti-calcification protection. It's no wonder that the Japanese have

much lower (some say 33%) heart disease rate than Americans as they eat the most MK7 from natto, getting same heart disease rate as locals when moving to US and no longer eating natto.

DIABETES AND VITAMIN K_1/K_2

For every 100 µg/day increase in K_1, diabetes risk fell 17%. Subjects who increased dietary K_1 during the follow-up had a 51% reduced risk of incident diabetes compared with subjects who decreased or did not change the amount of K_1 intake ► AJCN 2012;96(5):1113-8. Another study found similar associations between K_1 (19% lower risk for those eating 308 µg K1/day versus 100 µg/day) and K_2 (20% lower risk for 46 µg versus 16 µg, or about 7% lower risk for every 10 µg extra) increased intake and lower diabetes risk ► DC 2010;33(8):1699-705. ☺☺☺

MEMORY, ALZHEIMER AND VITAMIN K_1/K_2

Higher serum vitamin K concentration (log-transformed) was associated with better verbal episodic memory performances ► NA 2013;34(12):2777-83. Those with Alzheimer had lower blood vitamin K_1 (K_2 same), 25% lower if mild Alzheimer and 50% lower if severe Alzheimer. Bone mineral density was lower in mild Alzheimer, even lower in severe Alzheimer, implicating vitamin K even more ► APMR 2005;86(3):576-81. Those with Alzheimer had vitamin K intake 63 µg less than half of those without Alzheimer 139 µg ► JADA 2008;108(12):2095-9. This makes sense since calcified plaque in the brain can stop blood flow to the brain, depriving the brain of nutrients/glucose needed for normal function and β-amyloid clearing during sleep. Alzheimer develops at times due to lack of brain glucose.

VITAMIN K_2 AND RHEUMATOID ARTHRITIS

Vitamin K_2 lowers CRP (C reactive protein) from 1.7 to 0.5, which is a dramatic improvement; this is why K_2 is used to treat rheumatoid arthritis, osteoarthritis too ► MR 2013;23(5):1001-7. Similar drops of CRP and rheumatoid arthritis markers were found for MK7 (the study explains it's more available than MK4) ► EJP 2015;761:273-8.

STABILITY OF VITAMIN K

80% of K in oils exposed to light is lost within 48 hours, so K needs to be away from natural or artificial light ► JAFC 1992;40(10):1869-73. "K *degrades in only a few hours of exposure to light*." (see the last page of this pdf). See how to ideally store it away from light.

CALCIFICATION of Teeth/Bones/Arteries/Heart: the ucMGP MECHANISM inside the body

Before explaining the ucMGP mechanism, let's define the CAC SCORE (coronary artery calcium or CAC): calcium Ca from bones goes to soft tissue like skin, heart valves, arteries, retina, brain when K_1/K_2 deficient, leading to osteoporosis and stiff arteries (heart attack). The CT (computed

tomography) heart scan, costing $99-300, indicates the calcium score, how much Ca has deposited in the atherosclerotic plaque (this plaque stuff starts building in the womb even if mom has high cholesterol) in the arteries or heart valves. The best CAC score is 0, the worst is above 400, see the last picture at K.pdf for a chart of CAC increasing with age. There can still be plaque without Ca though. As explained by MD Dach, part of the treatment to stop calcification is higher D_3 and K_2 as MK7. CAC is a much better predictor of heart attack than blood lipids. The studies above suggest that those with a CAC score above 0 can take MK7 for maximum longevity/health and governments could require vitamin companies to include it. Even 4,000 years ago mummies had Ca in arteries. The inventor of the CAC score wrote a simple article about it. Some MDs estimate most people are K_2 deficient. If you want to read more, see IM 2015;14(1):34-9. A great paper on K_2 role in preventing calcification is AN 2012;3(2):166-73. ☺☺

Those (with stable vascular disease) with highest *uncarboxylated MGP* ucMGP (a marker for lowest vitamin K) had 89% higher (almost double) mortality and 88% higher cardiac mortality than those with the lowest ucMGP (best vitamin K status). ucMGP (uncarboxylated Matrix Gla Protein) is thus a marker for cardiac death risk and a few labs offer this test. The reason is that MGP is uncarboxylated and unable to chelate Ca^{2+}, as it only has one COOH (not two as carboxylated one) group, leading to calcification of arteries and heart valves ► Ath 2014;235(1):162-8. ucOsteocalcin (ucOc) is uncarboxylated and K carboxylates it, enabling it (cOc) to chelate Ca^{2+} (via the 2 COO^- groups) and mineralize tooth dentin, enamel and bones and prevent tooth/bone loss, osteoporosis. Vitamin D and A are key to this vitamin K action, hence they're needed too. K basically enables glutamate amino acid of the 17 Gla domain proteins (MGP and osteocalcin being two of them) to become gamma-carboxyglutamate (Gla), with 2 COO^- groups to bind Ca^{2+} as explained at Gla_domain and in a picture at K.pdf. MGP is mainly produced in vascular smooth muscle cells and chondrocytes (cartilage cells). High ucMGP is thus leading to high CAC score, as proven in this study ► EJCI 2010;40(4):344-9. The 17 known Gla proteins are blood coagulation factors II (prothrombin), VII, IX, and X, anticoagulant proteins C and S, factor X-targeting protein Z, osteocalcin or BGP (bone Gla protein), periostin, GRP (Gla rich protein), Matrix Gla Protein (MGP) preventing arterial Ca deposits, the cell growth regulating growth arrest specific gene 6 protein (Gas6), and the four transmembrane Gla proteins (TMGPs).☺☺☺

"K_2 acts in the body as a co-factor of 'vitamin K dependant carboxylase'. This enzyme, when enabled by its cofactor K_2, can alter the structure of proteins by the process of gamma-carboxylation. Two examples of proteins are osteocalcin, found in bones and teeth, and matrix GLA protein found in cardiovascular tissues. Both of these proteins require the fat-soluble vitamins A and D in their production. Carboxylation of osteocalcin by K_2 permits it to attract and retain Ca, which is good in bones. The reverse of this process happens in cardiovascular tissues because matrix GLA proteins allow Ca to settle in arteries when they're uncarboxylated but shed

Ca when they're carboxylated with sufficient K_2" ► MH 2015;84(3):276-80. Calcification is reversible via EDTA, tetracycline, nutraceuticals combo also ► Patho 2004;11(2):95-101; apatite (Ca phosphate) coated bacteria seem to be killed by this treatment; K probably takes Ca away from the area, so the nanobacteria can't coat itself, diminishing Ca buildup.☺☺☺

►► 12.4.11. VITAMIN B_{12} ◄◄ (need 0.2 mg/day if vegan, vegetarian or 45+)

If Hcy is > 5.2 (99.5% of humans), death risk rises, so 0.5 mg methyl-B_{12}, 10-20 mg methylated B_6 pyridoxal-5-phosphate form, 800 DFE units methylated B_9 MTHF form, methyl-tetrahydro folate, 0.5-2 g trimethylglycine (TMG) are used to bring Hcy down and prevent plaque/infarct. These methylated B_6, B_9, B_{12} forms are found in "methylated B complex", better bought from Walmart, much cooler storage/shipping than Amazon, to avoid B degradation. Hcy 20 = 10 times higher death risk vs Hcy 5, besides very poor cognitive function as Hcy induced vascular dementia can make you an 'Alzheimer patient'. Shrunk brain vessel diameter means less antioxidant delivery, repair, toxin/amyloid removal, start of Alzheimer (or 300+ neurodegenerative diseases) or brain cancer. Here is a horrible pic of what high Hcy leads to: no brains left, brain artery is 95% clogged, can't recall events of last day, hour or minutes, IQ drops 50 points. The current guidelines and lies of MDs that Hcy 7-10 is fine are causing endless deaths, suffering, dementia, cancers (lack of blood flow to organs, liver, pancreas, etc causes lack of antioxidants, nutrients, repair, toxin removal which allows cancer to start/grow). 99% of humans can't lower Hcy below 6 with methylated $B_{6,9,12}$ alone, we need 0.5-2 g TMG, the lowest possible TMG amount, max 1.5-2 g ideally, to avoid raising LDL/TC/TG, see 6% fat section on how to measure Hcy and 8 other cardiac markers from home. TMG or betaine is high in some foods, like goji berries, and need be avoided by pregnant women due to harm to fetus. If TMG fails to bring it to 5.4, try 1 g creatine on top for a year until you figure out another way using a safer (long-term) lower 0.5 g creatine dose. Vegans lack creatine in muscles more, so 1 g is fine after 50, if no kidney issues exist. Only 0.5-1% of humans have Hcy < 6. Everyone is SICK, but cheap TMG☺☺☺ won't make trillions for Big Pharma Palace Aristocrats. Their profits need SICKNESS. Conflict of interest. The devils sink the whole ship of humanity, themselves included, into the abyss of ignorance and short lives, instead of 4000 year lifespans.☺☺☺

The safest B_{12} form is methyl cobalamin (as this neurologist MD explains, to rebuild myelin sheath around axons for fast accurate nerve signal transmission (brain speed), *cyano*cobalamin is toxic) as in the Micro 0 inactive ingredients B-complex. NIH says lack of B_{12} can cause memory loss, irritability, depression, numbness, burning, needles, pins, tingling, stabbing pains or strained fingers/toes sensations (nerves from brain to feet are 6 ft long and lack of myelin insulation for axons causes pain, B_{12} makes myelin), heart palpitations, infertility, low sperm count, miscarriage, yellow eyes/skin, purple-pink-brown-nails (or just the tip of the nail) or

melanonychia as it is called, as shown in a 2007 and JAAD 2020 paper on reversing it with B12, a smooth/painful tongue, taste loss, vision loss, vision issues, pale skin, weight loss. Some feet, muscle/heart palpitation, tingling, twitches can also be caused by calcium overload, magnesium deficiency or electrolyte imbalance during fasting (if not taking electrolytes), while excess B5 or niacin form of B3 can cause yellow skin or eye. Tests can reveal if B_{12} is low. Metformin, alcohol, antacids, pernicious anemia, autoimmune diseases, digestive issues (colon surgery) reduce B_{12} uptake. Like B_1, B_2, B_6, B_9, B_{12} is sensitive to visible light, so store B_{12} away from light, water, heat. The NIH RDAs in µg are: 0-6 mo 0.4 (AI), 7-12 mo 0.5 (AI), 1-3 yrs 0.9, 4-8 1.2, 9-13 1.8, 14+ 2.4, pregnant 2.6, lactating 2.8. RDA is 4 in EU, not 2.4. B_{12} "RDA...might be inadequate... is primarily based on a 1958 (tiny) study conducted by Darby et al (34) in which approximately one-half of the subjects (4 of 7) with pernicious anemia achieved and maintained maximum erythropoiesis on long-term follow-up… with intramuscular (B_{12}) administration (not oral) ...1.4 µg/d" ► AJCN 2010;91(3):571-7. 2.4 µg is not sufficient however to keep homocysteine (Hcy) low. BMCP 2012; 12:85 found a *vegan* pregnant mom taking 2.5 µg, near RDA of 2.6 for pregnancy, developed severe deficiency in her kid after 5 months of breastfeeding, due to low transfer of B_{12} from her milk, since after birth, she stopped taking the multivitamin, causing her milk B_{12} level to fall. Low or very high B_{12} increase the risk of cancer, so it's best to not overdose.

As stand alone B_{12} (not B complex), the cheapest safest (free of toxic stuff) brands are:

1). methyl $10/g from Bulk Supplements, pure powder (lasts longer, not clear how long), 0 toxic fillers, lasts 6.8 years at 4 mg/day, 1.7 years for family of 4. Years 3+ less potency, as it starts degrade, but way > RDA. Need analytical balance to figure out how much is 1-4 mg, so very inconvenient, impractical for most people, unless you have a way to take small amounts without oxidizing it in air much or can make capsules with other vitamins, using a capping machine, etc.

2). hydroxy+adenosyl from Pure Encapsulations 90 capsules 2 mg (rice 130mg, cellulose capsule = 50mg, hypoallergenic, cellulose (wood) the only *1* inactive *ingredient*); lasts 1-2 years if you take mostly (75-90%) the cheaper (more neuron protecting) methyl B_{12} via Micro B-complex.

3). hydroxy+adenosyl+methyl from Igennus 333 µg of each natural form. 71$/g, but you don't have to worry about forgetting to take the other 2 natural forms if B complex has only hydroxy or methyl. The issue is mannitol (0.2-0.5g/pill, soft stool, dehydration if overeaten, 2.9g/100g cauliflower) inactive ingredient may cause dry eyes and brain damage via dehydration. Mannitol is produced via 1. hydrogenation of fructose with nickel catalyst (nickel allergies cause acne) 2. bacterial fermentation with USP ≤ 100 cfu/g for molds/yeasts, ≤ 1000 cfu/g for aerobic microbes, 3. contaminated seaweeds in China, the sea has got it "all", PCBs, heavy metals, etc).

Be aware some brands are fraudulent, they claim 10 mg inside, but have 0 mg, see the full table

here, the claim vs actual columns, stop the video to read and also check out the NOW Foods list. People against vitamins forget cows and livestock get tons of B_{12} in their feed when plants and soils are cobalt deficient. All those "organic cows" often (conventional even more often), since 1970s, get synthetic multivitamins and B_{12}. Were she to follow EU guidelines of 5, double, her child may have fared way better, especially if she didn't stop the pills during lactation. Were she to follow common sense from papers on B_{12} metabolic deficiency, which recommend 50 µg a day during pregnancy (especially if vegan), she probably would have had no issue, because her liver stores of B_{12} would have been enough for that breastfeeding period. Additionally, multivitamin B_{12} is not reacting with saliva when not in powder form or chewed, so it may be less absorbed, since saliva protects B_{12}. The B_{12} reacts with the pill constituents more, so it's better to take it as powder and let it react with saliva first, separate from multivitamin. The ULs are nonexistent, since no adverse effects were seen at even 1,000 µg for 5 years in healthy people (for diabetics, see below). As a vegan, I take around 500 µg/day in 3 forms (some multivitamin orally, methyl or adenosyl-hydroxyB_{12} capsule sublingually, all are oral, not sublingual brands), as explained in the next pages; most of my life I took just 2-4 µg, but as we get older we need more, plus I read a lot more about RDAs. I/many take 8-100% of a multivitamin pill or vitamin capsule (D_3, B_{12}, K_2, I, Se) daily, to avoid taking > UL. Since processing, sunlight can diminish food B_{12}, it's safer to take B_{12} pills if eating little meat or over age 50, to avoid blindness, coma, anemia, psychosis or short lifespan. B_{12} is the most complex vitamin, see B12.pdf. Many papers show very positive effects at higher doses, 250-1,000 µg, which are not harmful because out of 500 µg taken orally we only absorb 2-14 µg max. "Suboptimal B_{12} status (serum B_{12}<300pmol/L) is very common, occurring in 30%-60% of the [OMNIVORE, *vegans* maybe 85+% due to misinformation] population, in particular in pregnant women and in less-developed countries" ► AFNR 2018;83:215-79. Dr. Greger recommends min 50/day or 2,000 once/week taken on empty stomach as a liquid, chewable or sublingual (to bypass digestion, liver) for those with good absorption, 1,000 µg /day for age 65+. B_{12} lowers homocysteine Hcy; Hcy > 20 µM meant 4.5 times higher mortality vs < 9 µM. If you take 2000 µg, only 20 µg is absorbed, but if taking 2 µg, 1 µg is absorbed, so to avoid any damage to microbiome, kidney or colon with B_{12}, take B_{12} 3 times/day at 2 µg to absorb the 20 µg/week. That way GI tract deals with 20 µg of extra B_{12}, instead of 1980 µg. B_{12} may be good for the colon though, at least according to some studies.

B_{12} or cobalamin is present in 4 forms, 3 natural (foods and our bodies): methylcobalamin or MeCbl, Me-Cbl, CH_3-Cbl, methylB_{12} , CH_3B_{12} or CH_3-B_{12}, hydroxocobalamin or hydroxycobalamin or OHCbl, OH-Cbl, hydroxyB_{12}, OHB_{12}, OH-B_{12}, 5-deoxy-adenosylcobalamin or AdCbl, AdoCbl, Ad-B_{12} and 1 artificial (not in foods, unless fortified) CyaNoCobalamin or CNCbl, CN-Cbl, *cyano*B_{12}, CN-B_{12}, the one that releases toxic *cyanide* (CN^-) inside our bodies once absorbed and turned into what cells need: MeCbl, OHCbl, AdCbl, GSCbl (glutathionylcobalamin). *Cyan* means blue and

cobal (Cbl) refers to the ***Cobalt*** atom at its center, ***amin*** due to the 5 N amino ligands bound to the Cobalt center: see pic. The 6th ligand of cobalt is either OH, Me, Adenosyl or CN, determining the 4 types of oral B_{12}: 3 natural and one ***lethal*** man made, GS being an endogenous B_{12}. sp^3d^2 hybridization means 6 orbitals, 4 are the 4 nitrogens in a square and the 5th nitrogen is below, while the variable 6th ligand is above to form an octahedron. IJVNR 2008;78(4-5):195-203 found in fortified foods, in solution, CNCbl is unstable, may become pseudoB_{12} which hinders true B_{12} absorption. JCI 1982;70(4):889-98 found taking a multivitamin, dissolving it in water at body's 37°C for 2 hours led to a mixture where 20-90% of B_{12} reacted with the other vitamins/minerals to become pseudoB_{12}; this may happen with B_{12} from food too; perhaps the RDA/one meal is insufficient to achieve optimal B_{12} status in half the omnivore population even, as shown above. This is also why I always take separate B_{12} from powder capsules (these are easy to be placed under tongue to become sublingual) at several meals (at least 2 a day), at least once without multivitamins in a very simple meal (multivitamins are taken orally at the biggest meal when there are already a ton of nutrients and vitamins) or an empty stomach before meals with some cucumber or watermelon. This is needed to prevent any reaction of B_{12} with B_1, C, copper sulfate; these 3 mixed caused 66% B_{12} to become pseudo *at pH 7 and 15% at pH 2 (stomach pH is 2),* 40% in just 15 minutes in pure water pH 7, but *only* 7% with pig TC1 (*saliva protein*), *9%* with pig TC3 (*intrinsic factor*). However, 80% of CNCbl was gone in 45 min in the presence of pH 2 human gastric juice; so, the conversion *is lower at low pH and in the presence of B_{12} binding proteins* TC1 *and* TC3 *(see below) from saliva and stomach; they noticed* OH*Cbl is* converting even easier, with vitamin C alone (not food vitamin), after 30 minutes 21% at pH 1.8 and 89% at pH 4 (when we eat, our pH is not 2 always, as eating a lot lowers pH to 4-5 even for a while due to dilution*).* If this conversion to pseudo happens with CNCbl, it happens even easier with the other 3 from food, so to get the benefits of the 3, one can be careful and avoid multivitamins with CNCbl or avoid taking B_{12} from multivitamins only. This is why meat, milk often has pseudoB_{12} these days, since factory farming uses CNCbl as supplement often, which can lead to pseudoB_{12} forming, just as mixing B_{12} into animal feed led to pseudoB_{12} forming in the feed, as the paper explains, leading to half of omnivores having suboptimal B_{12} status (vegans even more?). This is a new phenomenon not present in decades prior to B_{12} fortification of animal feed (soils depleted of cobalt); this will mean the food B_{12} may sometimes hinder true B_{12} uptake and RDA needs be higher. The 3 food B_{12} forms are less stable, but they're also nontoxic and have many benefits; due to being less stable, they form pseudoB_{12} easier, so to get their benefits, greater care has to be taken to avoid pseudoB_{12} formation, which is easier from the 3 natural forms not bound to protein as in food. Thus swallowing tablets is a big no-no for B_{12}, let the tablet be chewed or capsule powder react with saliva haptocorrin first in the mouth and stomach. Haptocorrin is also called HC, R-protein, R-factor, TC1, TCN1, transcobalamin-1, 1st trans*port protein of Cbl* cobalamin, the main transport protein in serum too, with 80% of B_{12} in

serum bound to it and unable to go to tissues, (the other 20% bound to TC2, transcobalamin2, and the TC2-B_{12} complex is also called holotranscobalamin, being called by some (not everyone, since B_{12} deficiency can exist when holoTC is normal and total B_{12} is low) a "truer" indicator of cellular B_{12} status than the total serum B_{12}, so we hear about measuring "holotranscobalmin" not total B_{12}; TC2 allows serum B_{12} to go to tissues after enterocytes absorption). ☺☺☺

After B_{12} is separated from food protein, it binds to TC1 to avoid being destroyed by stomach acid, but for *vegans* taking pills, this TC1 binding happens much faster in the mouth and stomach (stomach also produces TC1), meaning that vegans who take separate B_{12} as powder orally can have a much better B_{12} status than many omnivores, because the multivitamin pills omnivores swallow don't react with TC1 early on; the paper above shows pseudoB_{12} is not only absorbed, but can diminish the activity of B_{12} dependent enzymes in the mouse liver (but rabbits fed B_{12} contaminated with pseudoB_{12} grew normally, and animals usually don't store pseudoB_{12} in tissues, even if they can store it in serum); pseudoB_{12} makes 75% of total B_{12} in the serum of those severely B_{12} deficient (those that got 10 times lower than normal total serum B_{12}), being eliminated slower; it is thus important to realize the paper found that TC1 lowers pseudoB_{12} formation in vitro (due to vitamin C, B_1 and copper in solution, not food) 9 fold and iron rich vitamins (meals probably too) also lower pseudoB_{12} formation in vitro 2-3 fold vs same multivitamin without iron, so take B_{12} with iron loaded lentils like I almost always do. *Though the paper authors state that vitamins from food are not easily available to react with oral B_{12}, so they can't do the B_{12} → pseudoB_{12} conversion multivitamins, B-complex vitamins (C and B_1 mixed often) can.* Vitamin pills extracted from food are not the same as food vitamins, they're more reactive and available, so they can still convert B_{12}; not knowing the level of C and copper in those "natural brands" can complicate things. *So vegans*, real long-term vegans who almost always take B_{12} separately since they're much more informed than short-term vegans in studies *that were "vegan for a few years", can have some "brain shrinking less" advantage, stemming from taking B_{12} separately, especially if they take it sublingually (totally bypassing stomach, liver, i.e. hold that pink powder from B_{12} capsule for 5-minutes (while you prepare the meal) under the* tongue right before a meal, don't swallow it, and you never have to worry about "multivitamins *or food* vitamins, minerals *interacting with B_{12}", making sure if any B_{12} is* swallowed, *it is* fully bound to TC1 and super-resistant to any reaction. *Yet, some studies found sublingual and oral lower* Hcy *by the same amount. It's unrealistic to expect that if you* take a B_{12} containing multivitamin (chewed or not), food and perhaps some extra B_{12}, that the B_{12} → pseudoB_{12} *conversion* would be identical to an in vitro solution of a vitamin in these studies, solution free from 50,000 other interfering compounds in the food; however, with 50,000 compounds, *conversion* may occur even more via mechanisms not discovered until a century later, so, *while* we wash our leafy greens, make our smoothie, we can take non-cyano-B_{12}

sublingually and be safest, takes 5-10 min to make your daily super smoothie, *so no food in the mouth until then*. Knowing about this possibility and the 3 B_{12} binding or transport proteins, TC1, TC2, TC3, is helpful in designing eterni foods ☺☺☺ and achieving the best B_{12} status with minimal side-effects. It may be unrealistic also because in animal studies, after being given multivitamins, livestock don't accumulate much pseudoB_{12}, although this "non-accumulation claim of the 1982 study" is uncertain, given that pseudoB_{12} was often confused with B_{12} in 1980s studies: Ntr 2016;8(12):767 *says B_{12} food/animal content was overestimated, since in earlier decades we didn't always* distinguish between B_{12} and pseudoB_{12}, explaining why half omnivores lack optimal serum B_{12}; it also clarifies the popular spirulina contains "127-244 µg per 100 g of dry weight" of B_{12}, (more than any food) 83% of which *is pseudoB_{12}*. Avoid spirulina, see why.

Toothpaste fortification with 100 µg/g B_{12} increased old people serum B_{12} by 54 pmol/L, (>300 is ideal) or 23%, equivalent to 7 µg/day ► ACER 2019;31(12):1817-25. *Vegans using 100 µg/g B_{12} toothpaste boosted serum B_{12} 81 pmol/L versus a 27 pmol drop in the placebo group, a 0.7 drop in* Hcy *vs a 2 point rise in placebo* ► AJCN 2017;105(3):618-25*; vegans who didn't take B_{12} had* Hcy *15, those taking B_{12} had* Hcy *50% lower; this underscores just how critical B_{12} is and how* clueless *German vegans were in this 2017 study even. If you're a vegan there is one nutrient you would know about at least, B_{12}, that you need a pill for it (and D_3 too, but B_{12} essential), since fortified foods can have nothing left due to oxidation, water, heat.* Omnivores often have the same dangerously high Hcy in other studies, due to no B_{12} too, this may shorten healthy and total lifespan by 20 years in some people; omnivores often think only "anti-vitamin" vegans have high Hcy, which may give them stroke any time. Last decades, the meat processing has depleted its B_{12} content more, soils got cobalt depletion, not all livestock get B_{12}, people no longer chew tablets, and very little get absorbed from a multivitamin at times, since they put 2-6 µg B_{12}, but 150,000 µg of vitamin C, 30,000 µg B_1 to react with B_{12}. Toothpaste is a form of sublingual absorption, just like fluoride from toothpaste and water is absorbed and causes thyroid problems in millions, replacing iodine. That is why what is in toothpaste needs to be very healthy (non-cyano B_{12} ideally), because it goes into the bloodstream immediately via the capillaries under the tongue. Eternis may eat a thick liquid (powder dissolved in water maybe), 2-3 times daily perhaps, with all stuff needed from saliva (or similar binding proteins to TC1, just better), without having to waste time chewing and wasting so much energy to digest food and have such low bioavailability, waste body resources eliminating unabsorbed nutrients, minerals by kidneys and colon. Instead of chewing, we can meditate and achieve bliss.

TC1 is the saliva glycoprotein (also secreted by the stomach) protecting B_{12} from stomach acid, until reaching duodenum where trypsin and chymotrypsin proteases cleave TC1-B_{12}, releasing B_{12} free so the ileum enterocytes can absorb it. The B_{12} is absorbed only 1-2% by passive diffusion without the intrinsic factor (also called IF, TC3, or TCN3, transcobalamin 3) *glycoprotein binding*

to B_{12} right after release of TC1, so out of 500 µg only 5-10 µg are absorbed. After B_{12} binds to TC3, TC3-B_{12} goes to ileum enterocytes where only about 2 µg B_{12} per meal can be absorbed, due to limited IF. TC1, TC2 *are in the blood too being more important and frequent in papers,* TC3 (IF) *only in the digestive system*. Epithelial ileum enterocytes (cells lining the small intestine) cleave TC3-B_{12} and the free B_{12} can bind to TC1 or TC2: the TC2-B_{12} complex, together with TC2-B_{12} from passive diffusion, goes to tissues that need B_{12}. The remaining B_{12} binds to TC1 again, for body storage in the liver. Once in the tissues, the B_{12} ligand (CN, OH, Me, Ad) is removed and we get free Cbl, which then becomes MeCbl or AdCbl depending on what the cell needs. Thus out of 500 µg we get to absorb only 7-12 µg, maybe 14 in some rare cases. That's why people without TC3 (IF) need high doses of B_{12}, because they rely on passive diffusion, which absorbs only 1-2%, versus TC3 (IF) which can absorb even 50%. For all these reasons, it is best to use multivitamins with low levels of B_{12}, so most B_{12} is taken separately as pure B_{12} powder sublingually as explained above or with light meals (*not too high in C or B_1, but rich in iron*) or on an empty stomach with water, chewed slightly so that TC1 can bind to B_{12}, it will bind easily since it's powder form which makes interaction with saliva fast, while food B_{12} is bound to protein. ☺☺☺

IM 2017;16(1):42-9 says "AdCbl is the predominant B_{12} form found in meats, at 68%, with the rest occurring as OHCbl and MeCbl. MeCbl is the predominant form in milk and eggs… (B_{12} in) fermented foods, algae, seaweed, spirulina, yeast, and mushrooms may not be bioavailable… (these B_{12} forms) are referred to as pseudoB_{12} corrinoids. They compete on blood transport proteins with (*AdCbl, OHCbl, MeCbl*) bioavailable B_{12} forms, thus further aggravating B_{12} deficiency.. *MeCbl, OHCbl, and/or AdCbl is* preferred instead of the use of CNCbl, owing to their superior bioavailability and safety… potential cyanide accumulation in human tissues" that's why vegans need take B_{12} and not rely on *vegan* food sources. Even some shellfish contains pseudoB_{12}, and sometimes the distinction between B_{12} and pseudoB_{12} is prone to error during analysis ► JAOACI 2018;101(5):1308-13. "In edible snails, abalone, and pond snails, however, both vitamin B_{12} and pseudoB_{12} (a minor fraction of total B_{12}) were observed" ► FS 2014;80:1065-71. Most *vegan* foods have ultra low B_{12}, except for dried green or purple laver (nori algae) with 30-134 µg real (not pseudo) B_{12}/100g (depends if toasted, seasoned, etc), "Dried shiitake mushroom fruiting bodies rarely contained the inactive (pseudoB_{12}) corrinoid" ► Ntr 2014;6(5):1861-73, meaning 4 g is enough for RDA; 100 µg is huge, since best soy yogurt got 18, sauerkraut 2-7, tempeh (fermented soy) 0.7-8, milk 0.35, eggs 1, dried shiitake mushroom 1.3-13 µg, other algae, mushrooms usually almost 0 real B_{12} or too much pseudo (83%), which is risky. The issue with *vegan* sources is you have to read 50 papers to see which foods (spirulina, etc) exactly have negligible pseudoB_{12} (mixed with real B_{12}) that interferes with normal B_{12} uptake; most vegans don't even eat those exotic seaweeds and mushrooms, being too expensive and loaded with heavy metals. *This is why natural "food based" vitamins, which cost 2-5 times more,*

are not always the super-ideal thing, because they got 8,000 compounds in them (allergens, lectins, thyroid disruptors, toxic alkaloids, kidney stone forming oxalate) that could interfere in ways unknown or poison, depending on what mushroom they used for vitamin B, D, etc; for B complex only, it's safer, as only water soluble compounds get to the extract of the plant used; yet, if they're more bound to other things, they may convert B_{12} to pseudo B_{12} less than the traditional vitamins; globally sourced ingredients without heavy metal testing poses other issues. It's not clear what the shelf life is for those, if not solid or opaque container, food vitamins have lower shelf life. Nutrition is far more complex than "food vitamins are better", future people who live to 900 may say "food (ours) is worst", since they invented eterni foods. MCF 2017;16:15 explains, industrially, B_{12} can be made by bacterial fermentation which yields MeCbl and AdCbl; *this then is treated with KCN to yield CNCbl, which is heat stable (the only heat stable B_{12}) and can be added to foods,* and has longest shelf-life; bacteria also produce CNCbl directly, which is cheaper than the 2 step process. ☺☺☺

B_{12} is the most important vitamin *vegans* and older adults need to supplement with via fortified foods or vitamins. Even nih.gov says 1.5-15% of people are deficient due to known and unknown causes, with 10-15% for those over 60 years old. Ntr 2013;5(12):5031-45 says up to 30% of those over 65 years can be deficient and 5-7% of young people. The funny thing about vitamins (or nutrients in general) is that deficiency is defined in several ways: serum deficiency or functional/metabolic deficiency (at the organ or cellular level, when serum B_{12} is OK); so papers report deficiency in wildly different figures. NR 2016;36(2):109-16 says "Metabolic B_{12} deficiency is *common*, being present in 10%-40% of the population; is frequently missed; is easily treated; and contributes importantly to cognitive decline and stroke in older people. Measuring serum B_{12} alone is not sufficient for diagnosis; it is necessary to measure holotranscobalamin (TC2-B_{12}) or functional markers of B_{12} adequacy such as methylmalonic acid or plasma total Hcy... *cyano*cobalamin (*cyano* B_{12}) is harmful ... in patients with renal impairment (methyl B_{12} is suggested by the author)." CCLM 2013;51(3):633-7 says "*high-dose cyano*cobalamin *leads to accumulation of cyanide in patients with* renal failure...(a GFR <50)... in patients *with renal impairment, methylcobalamin should be used instead cyano*cobalamin." NDT 1997;12(8):1622-8 explains that AdB_{12}, OHB_{12} and MeB_{12} react with cyanide to detoxify the body of it, during normal processes, when the main route of CN^- detoxification (*thiosulfate*, $Na_2S_2O_3 + CN^- \rightarrow$ thiocyanate SCN^- + sulfite Na_2SO_3) is less effective due to kidneys' incapacity (renal patients) to eliminate SCN^- (thus, the serum SCN^- increases). Smoking also increases CN^- levels, as well as some foods; that's why when people have CN^- poisoning, they receive hydroxo OHB_{12} in large quantities (with *thiosulfate* sometimes), since it binds CN^- fastest, eliminating CNB_{12} via urine. *In people with* diabetic nephropathy, a combination of 2.5 mg B_9 (which exceeds folate UL by 2.5 times), 25 mg B_6, 1 mg (1,000 µg) B_{12}, for 3 years, *led to more vascular events (even if Hcy went down 2.2*

instead of increasing in placebo group by 2.6) and poorer kidney function (GFR declined more 54% extra, 16.5 vs 10.7, the blood Glomerular Filtration Rate that decreases 0.4-1.2 mL/min a year after age 40), but that may be due to folate alone, not the **CN^-** *accumulation from* **CNB_{12}** *(they most likely used* **CNB_{12}***)* ► JAMA 2010;303(16):1603-9. This is similar to people taking statins that increase HDL (in those with low HDL) 70%, but increase mortality too; just because a biomarker goes up as in healthy people, doesn't mean everything else (the other 500 unknown biomarkers) is fine or improving. Hence, medicine focus on one biomarker alone often fails to decrease mortality, since we don't understand how the human biomachine works. In 3 years of 1 mg B_{12}, one ingests 365*3*(28/1355)=22.6 mg of cyanide, with an unknown level accumulating and destroying the kidneys, etc. ☺☺☺

Hence, this book argues against using cyanoB_{12}, since as we age, the cyanide may accumulate in healthy kidneys too, shortening our lifespan by 1-3 months; 3 months from this and that, soon becomes 30 years. It's odd, when methylB_{12} is almost as cheap as cyanoB_{12}, many still use cyano in pills (it used to be a big price difference, no more today). A paper claims that MeB_{12} blood half life is 6 days. OHB_{12} half life is allegedly longer than the other 3 forms: "OH-Cbl is used to treat B12 deficient patients because it has a longer half life due to its ability to bind serum proteins". Oddly, a textbook (Ctrl-F "half life" this pubmed) says OHB_{12} half life is only 3-20 hours, so it's unclear. You will find many papers, textbooks, or Wikipedia entries giving different answers, so you will need read 5000 papers to get an average, searching for the half life, we need some AI to search it on pubmed, as it gives papers that don't talk about it. Part of the reason big vitamin brands use cyano still sometimes (hundreds of medium and small brands replaced it with methyl in the last 40 years) is cyano is very stable and eliminated intact (with cyanide bound) into urine in healthy people and B_{12} is low in many multivitamins, 5-50 µg, not 100-1,000 and most of it goes into urine, with only 1% absorbed out of high doses, so actual cyanide accumulation can be way lower than 22.6 mg in 3 years (we may get way more cyanide accumulation from some common foods like flaxseeds, etc). It's yet to be seen in future large scale studies how safe is to take 1,000 *µg* B_{12} in any form over 20-70 years for people with normal B_{12} absorption (not those that need 1,000 *µg* to survive due to genetics, low intrinsic factor, low stomach acid), given that natural forms are more readily absorbed than cyano (*and that pill B_{12} is better absorbed than food, not being bound to protein*), to see if the benefits (ultra low Hcy, cardiac protection, brain shrinking slowing) for living to 150 outweigh any risks: only in recent decades, natural forms of B_{12} became cheap so only recently people (without B_{12} deficiency) started taking higher doses. In 75 years we may know the best intake level and combo of the 3 natural forms 100 times better than today as more data is gathered. Shellfish, liver, kidney, some algae (that's how fish get it) have high B_{12}. Laver Nori algae got 30-130 µg B_{12}/100g mollusks 99 *µg*, organ meats 30-90 *µg*, turkey giblets 28, bran cereals 28, multi-grain cereals 21 (or less), lamb kidney 79, lamb liver 90,

mackerel 19, red salmon 18 and many people ate those daily and lived to 100, so many ate 100-800 *µg* B_{12} (*800 very rare, if in an area where mollusks, organ meats were the main source of daily protein*) in the 3 natural food forms with no problems (very similar to taking natural B_{12} mixed with foods). 240 *µg* B_{12} is basically 100 times the RDA. Clams got B_{12} is needed for red blood cell formation. Cyano B_{12} is the most common and cheapest form in supplements and fortified foods, which the body takes and converts *to the active forms* MeB_{12} *and* AdB_{12}, *releasing cyanide in the process*. "forms of Vitamin B_{12} that are produced and activated in two separate cellular compartments: methylcobalamin in the cytosol and adenosylcobalamin in the mitochondria." ► Ntr 2013;5(12):5031-45. Vitamin companies may not include the methyl, hydroxy, adenosyl forms to keep prices lower. Some hypothesize the methyl and adenosyl are better than the cyano form, but others disagree. MNFR 2015;59(7):1364-72 explains that methyl and adenosyl seem no better than hydroxy; it also presents several papers for and against either hypothesis. Defects in cblC gene lead to inability to make methyl or adenosyl B_{12} from pills of cyano B_{12}, but patients show response to 1-2 mg of hydroxy B_{12}. Methionine synthase activity is induced by hydroxy and methyl and to a lower degree by cyano. Hydroxy stays longer in plasma and is lost less in urine than cyano. Others think hydroxy is better than the other 3. One researcher hypothesizes cyano and hydroxy are OK taken alone, and methyl is not OK alone but only in combination with adenosyl ► EJCN 2015;69(1):1-2. ☺☺☺

Cyano is man-made, the other 3 are natural and physiological with hydroxy the most common in foods. Outside of US, they use hydroxy (EU) or methyl (Asia) more, in the US cyano more. Cyano is turned into hydroxy in the body, then into active methyl and adenosyl. Hydroxy increased serum B_{12} concentrations 40-fold, whereas cyano increased them only 10-fold ☺☺☺ after 1 mg of intravenous B_{12}, but both lowered Hcy by 33%, so it seems hydroxy is better absorbed ► Metab 2005;54(10):1362-7. Another study found that Hcy lowering was very good and below 5 µM with hydroxy B_{12}, but only worked half the time with cyano B_{12}, so hydroxy B_{12} seems better absorbed, being a natural form the body got used to over millions of years, compared to man-made cyano B_{12}. Urine methylmalonic acid (MMA), was much lower with *hydroxy* (at detection limit) compared to *cyano* (at 10 times normal); MMA is high in urine when B_{12} deficiency exists (the deeper, the higher MMA levels), further showing that hydroxy is better absorbed, *the authors recommend* hydroxy *over cyano* ► JP 1998;132(1):121-4. Serum hydroxy was 3-6 times higher than cyano over 48 hours ► EJH 1964;1(1):5-15. Cells seem to absorb hydroxy better ► BI 1984;63(2):335-41. Cyano is the least ideal per many studies, since any cyanide release, no matter how small, induces extra stress on the body and hydroxy is better absorbed, lasts longer in the blood, while methyl and adenosyl are retained better than cyano too. Other papers propose methyl is better than cyano at curing different issues. MeB_{12} was better than cyano at improving mental performance, alertness, reducing oversleeping ► NPP 1996;15(5):456-64, so

always take B complex with MeB$_{12}$, not CN. MeB$_{12}$ with carnitine caused "cerebral mass growth, increased neocortical layers thickness, pyramidal neurons volume,... normal structure of neocortex" ► ZNPIISSK 1989;89(2):82-7. Choline is metabolized to carnitine, so similar effects may occur with choline, explaining why people who eat legumes (high in choline) live longer, since brain controls aging? IM 2017;16(1):42-9 found "AdCbl, was 67 times slower than the (ileum enterocyte lysosome) *reduction* of MeCbl *to cobalamin*... (the current theory is that usually, all B$_{12}$ forms get ligand removed to become free cobalamin, which is then turned into the form we need, among the 2 most needed: MeCbl or AdCbl; since MeCbl is split way faster than AdCbl or CNCbl, it works better, but there may other reasons we don't know yet, since these mechanisms are not entirely understood, just recently they discovered GSCbl is very important, and OHCbl is important too inside the body). Thus, AdCbl supplementation may result in a slower synthesis of intracellular AdCbl and MeCbl". MeB$_{12}$ (at RDA x 25000, or 60mg/day orally) seemed to work better than hydroxy (0 effect) at delaying progress of demyelination in multiple sclerosis ► IM 1994;33(2):82-6; this may be due to partially sublingual absorption allowing the MeB$_{12}$ to act on neurons much faster. Some think methyl is the best B$_{12}$ form. NP 2013:424651 explains MeB$_{12}$ is the *most* effective one in being uptaken by subcellular *organelles* of neurons, promoting injured nerve and axonal regeneration, improved nerve conduction & visual function, less pain & rheumatoid arthritis, diminished symptoms of Bell's palsy, Alzheimer, and sleep-wake rhythm disorder. IJPC 2019;23(2):167-75: MeB$_{12}$ is "the *most effective* (B$_{12}$) analog in permeation and in transportation of neurons in subcellular organelles".

Others think best is the methyl with adenosyl mix for people unable to convert methyl into adenosyl and vice-versa, others vow on hydroxy as the best. To remove cyano group from cyano B$_{12}$ and convert it to the other 3, it takes glutathione, a very valuable antioxidant in the cells as explained at JBC 2014;289(23):16487-97. A study found hydroxo is better absorbed than cyano ► Bl 1984;63(2):335-41. "Treatment with hydroxocobalamin, but not with *cyano*cobalamin and folic acid, resulted in rapid clinical and biochemical improvement" ► NEJM 1984;310(11):686-90. ☺☺☺ Another reason to avoid cyano B$_{12}$ (take triple B$_{12}$ or methyl with adenosyl combo) is that the methylation of Hcy to methionine requires methyl B$_{12}$ as a cofactor. As shown above, defects to cblC gene make synthesis of methyl/adenosyl from man made cyano impossible. Even in healthy people, the methionine synthase (an enzyme taking part in the methylation of Hcy) activity is much stronger with methyl than cyano B$_{12}$, as explained above. This methylation of Hcy, so important for good health, also depends on methyl-B$_9$ or 5-methyltetrahydrofolate, which is made by the MHTFR enzyme (see the B$_9$ section). When genetic mutations of the MHTFR gene lower MHTFR enzyme efficiency, it is even more vital to eat methyl not cyano. Most vegans/vegetarians eat plenty of folate (B$_9$) from vitamins, legumes, greens, fortified foods, so when Hcy is > 9, it's due to low B$_{12}$ usually, not to low B$_9$. ☺☺☺

Hcy (H-S-CH_2-CH_2-CH(NH_2)-COOH) + THF-CH_3 = Methionine (CH_3-S-CH_2-CH_2-CH(NH_2)-COOH) + THF-H *is a reaction whose final step is catalyzed by methionine synthase, which uses* B_{12} *as a cofactor. The methyl group goes to form methionine.* During this process, 5-methyltetrahydrofolate (5-MTHF or THF-CH_3) is converted to tetrahydrofolate (THF or THF-H), as the methyl from THF-CH_3 (biologically active B_9 or folate) is moved to B_{12}, and from methyl B_{12} to Hcy to give us methionine and keep Hcy below 9 in the blood. Basically, Hcy + methylB_{12} = B_{12} + methionine, 5-MTHF + B_{12} = THF + methylB_{12}; if we add the 2 equations B_{12} and methyl B_{12} vanish, as they're cofactors of the enzyme, but the 2 B_{12} equations explain better what occurs. Therefore, it may be best for everyone (not just those with some mutations) to stay away from cyano or "methyl without adenosyl or adenosyl without methyl" since the body needs both. Methyl B_{12} is used as cofactor by methionine synthase to convert Hcy to methionine by donating the methyl group (then methionine reacts with ATP to form S-adenosylmethionine, or SAM, which is used for methylation of neurotransmitters, myelin, DNA, phospholipids, etc); adenosyl B_{12} is cofactor for methylmalonyl CoA mutase that converts methylmalonyl CoA to succinyl CoA, with succinyl CoA being necessary for creating hemoglobin and for energy production from fats and proteins. Succinyl CoA is a key molecule in the citric acid or Krebs cycle (CoA stands for coenzyme A). Methylmalonic acid (MMA) is high in urine when B_{12} is low, as explained above in the MMA test paper, because there is no adenosyl B_{12} for this key reaction. The form matters, just like vitamin D_3 is far better than D_2. Since in food we find all 3 and in the human body we find all 3 (sometimes methyl goes into hydroxy in the body before going back into methyl), the safest for all people (who may lack certain enzyme dependent conversion capabilities) seems to be a mix of all 3, hydroxy, methyl, adenosyl or what some call the TRIPLE B_{12}. For just $11, in 2017 I bought on Amazon a B_{12} that has all 3 natural ones into one pill of 1 mg, ; since then I found much cheaper alternatives, as they doubled price; *The cheaper alternative to buy all 3* B_{12} *is to buy* 2 brands, use much less than both pills (many don't need more than 1 mg): *hydroxy & methyl+adenosyl* is more expensive Kal, 1 mg methyl + 1 mg adenosyl, 60 tablets. The cheapest route to get all 3 B_{12} is *methyl* & *hydroxy + adenosyl.* ☺☺☺

Since many pills have so much of the B_{12}, those who absorb it well (Hcy ≤ 8 is a *biomarker* of *sufficient* B_{12}) may not need to take it daily (multivitamins already have some) and only 10-30% of the pill/capsule, to *promote neuron repair*, arterial health. Many MDs recommend these 250-1,000 µg/day amounts (some multivitamins have even 500 µg (0.5 mg) as methyl, safer than cyano). 1,000 µg/day is recommended for seniors where B_{12} absorption is ultra poor and deficiency at up to 40% of population per one study. Dr. Greger recommends absorbing 4-7 µg (2-3 times the RDA) daily, i.e. take 250 µg daily. Most multivitamins have 2-20 µg, a few got 50-100 µg, so to get 250 µg we need a separate B_{12} supplement. The reason why they say *250* µg is OK, is because we only absorb about *7* µg maximum from it. NIH explains that absorption

decreases dramatically as dose becomes higher due to the limiting intrinsic factor, that's why there is no "upper limit" for B_{12} like for other vitamins. Certain people (1% or less) don't have the intrinsic factor necessary for proper absorption of dietary B_{12}, so in these cases, their B_{12} intake is increased about 800-1,000 times (depending on age) to 2,000 µg per day (later the amount becomes lower) as explained at ► CDSR 2005;(3):CD004655. High oral B_{12} doses were as effective as the old traditional intramuscular injection method. Most multivitamins provide those minimum B_{12} RDA amounts. Even fortified foods today can provide the minimum for some. People with incapacity to absorb vitamin B_{12} need to take higher doses, but those are very rare and only a doctor can tell for sure if one is B_{12} *deficient*. *Deficiency is found by*: *1*. high *methylmalonic* acid MMA in urine (classic test that is used to confirm *adenosyl* B_{12} is not doing the *methylmalonil CoA* transformation into succinyl CoA), *2*. high Hcy (because *methyl* B_{12} is not doing the *methyl*ation of Hcy), *3*. the least reliable method ► low serum Cbl (cobalamin) or B_{12}, because serum B_{12} can be high, yet cellular B_{12} low and Hcy or *MMA* high, *4*. low cellular B_{12} deficiency symptoms, present when serum B_{12}, Hcy, MMA are normal ► Bl 2005;105(3):978-85 ► "neurologic and cognitive dysfunction (unsteady gait, fatigue, impaired memory) often develop in the absence of hematologic changes... Cbl, MMA, and Hcy levels fluctuate with time and neither predict nor preclude the presence of Cbl-responsive (B_{12} pill) hematologic (arterial damage) or neurologic disorders". ☺☺☺ Some multivitamins are so hardly compressed that those with poor digestion may not be able to fully dissolve them (vitamin rarely found whole in feces), so chewing the vitamin with food in the mouth is a good idea. "Oral cobalamin is also less effectively absorbed after a meal than when fasted (1.8-7.5 vs 2.8-13.4 µg of a 500-µg dose)" ► Bl 2008;112(6):2214-21. This means out of 500 µg taken orally we only absorb 1.8-13.4 µg maximum. However, out of a 1-2 µg multivitamin tablet, we absorb usually half. The more B_{12} the pill has the lower the % absorbed. The limiting variable is the stomach intrinsic factor. Thus, if we take a given amount 3 times daily, we can absorb more than someone taking same (or higher) total B_{12} once; it's not about how much is taken, but absorbed, like with other vitamins. Usually mild deficiency is corrected rapidly orally, so one can take small amounts 3 times daily. Low intake of B_{12} can lead to very high Hcy and increased risk of cardiovascular disease, Alzheimer, early death, neurological problems, etc. B_{12} is the one vitamin all vegans are very aware of and supplement with via multivitamin or fortified foods. Even omnivores over 50 who take no multivitamins can become B_{12} deficient leading to heart/brain disease. ☺☺☺

FNB 2008;29(4):249-54 explains higher maternal plasma B_{12} were associated with improved *offspring* cognition, including attention and short-term memory. Methyl B_{12} helped the crushed optic nerve of rats to regenerate partially ► YKXB 2004;20(3):171-7. High doses of methyl B_{12} in rats helped nerves to regenerate after acrylamide neuropathy ► JNS 1994;122(2):140-3. It may regenerate even crushed sciatic nerves ► NYZ 1976;72(2):269-78. As the 3rd pic at 12.pdf shows,

compared to those with Hcy below 9 µM, mortality was 1.9 times higher for those with Hcy 9.0-14.9 µM (micromol/liter), 2.8 times higher for those with levels of 15.0-19.9 µM, 4.5 times higher for those with levels of 20.0 + µM ► NEJM 1997;337(4):230-6. A review of studies, totaling about 28,000 people, found that for every 5 µM increase in Hcy in the blood, ALL CAUSE MORTALITY goes up 33.6% ► SR 2017;7:4769. Another study found that for every 5 µM increase in Hcy in the blood, *ALL CAUSE MORTALITY* goes up 49%, with those having Hcy above 20 µM being 3.5 times more likely to die than those with Hcy below 9 µM ► AJCN 2001;74(1):130-6. Those with Hcy below 11 µM were 2.74 times less likely to die compared to those with Hcy above 11 µM ► JNHA 2008;12(10):685-9. "With a plasma Hcy level greater than 14 µM, *the risk of Alzheimer's disease nearly doubled*." ► NEJM 2002;346(7):476-83. ☺☺ Vitamins B_{12}-B_9-B_6 cut the natural aging brain shrinking in half. Those with Hcy above 13 taking vitamin B_{12} (0.5 mg/day, RDAx200), B_9 or folic (0.8 mg/day, RDAx2), B_6 (20mg/day RDAx12), for 24 months got brain shrinking (seen in MRI scans) 53% lower than those receiving placebo ► PO 2010;5(9):e12244. The 8 B vitamins are water soluble, excess goes into the urine. The same authors published a paper showing that the same B_{12}-B_9-B_6 amounts above led to 7 TIMES LESS *brain shrinking* in those gray matter regions specifically vulnerable to the Alzheimer process in people with Hcy > 11 µM ► PNAS 2013;110(23):9523-8. ☺☺☺

Vegans who don't take B_{12}, B_6, B_9 supplements (multivitamins) have higher Hcy than healthy and in some studies quite a bit higher than omnivores. B_6 is cofactor for many enzymes, including those that convert Hcy into cysteine. B_{12}/B_9 help covert Hcy to methionine. If SNPs affect one pathway (B_6 or $B_{9\text{-}12}$), the other one can degrade Hcy, which is toxic for the brain vasculature and leads to brain shrinkage. That's why B vitamin supplements have the levels of $B_{6\text{-}9\text{-}12}$ as in this study quite often, or even some multivitamins. Of course, longevity is not reflected via one marker, there are always exceptions, so one can live to 100 with a higher value for Hcy than someone living 75, as longevity is much more accurately predicted by a mix of 200 biomarkers. But we try to minimize our risks, and each diet has its own pluses and minuses, with B_{12} being low in *vegan*/vegetarian diets not taking B_{12} pills or a few algae being the main minus. B_{12} lowers Hcy, so some people who want to be all natural (trying to get B_{12} from *vegan* sources such as seaweed, nutritional yeast, etc) may end up deficient, especially as many papers say even omnivores are B_{12} deficient after 50 as absorption weakens in all aging people. 20 years ago there were very few *vegan* foods and even fewer fortified with B_{12}, so the Hcy in *vegans* who didn't take vitamins was quite high (higher by 40% in some cases than omnivores) as some of the old papers show. Today, due to the fortification of so many *vegan* foods with B_{12}, Hcy levels in *vegans* are lower, but not every *vegan* takes vitamins, B_{12} or B_6 or B_9, the 3 vitamins that lower Hcy ► Ntr 2016;8(12):767. At walkinlab.com and other places, anyone can check their Hcy as part of a blood test, for < $100, without doctor approval, just for long-term prevention, if Hcy is

high, it may well mean low vitamin B_6-B_9-B_{12} intake or absorption so using B vitamin pills or a multivitamin with higher B vitamins may help bring Hcy down, so next blood test shows a lower value. It takes 1 month to see Hcy normalize usually after taking B_{12} or B vitamins. ☺☺☺

Vegans who eat enough B_{12}, B_6, B_9 can get Hcy at 5 µM or 25% of the 20 µM level of highly B_{12} deficient persons and healthier than the 10 level of most omnivores. Lower Hcy meant lower depression (better BCulation, neurons communicate), they lowered Hcy by 4 µM using B vitamins ► AA 2011;40(6):702-5. A real mystery is this: let's say we have a group of 20 million people, who all have Hcy at 5-7, which is the very best. What is the optimal serum B_{12} level, urine MMA, serum TC2-B_{12} (holotranscobalamin) level for maximum achievable lifespan? BMCM 2020;18:307 studied 24,262 people, finding "High intake of vitamin B_{12} in the form of supplements was not associated with any adverse effect on mortality and therefore can be regarded as safe…"; the authors explain there is no proof of causation in other studies finding B_{12} high in sick people, only of *reverse causation*, the sickness caused high B_{12} due to inflammation (serum B_{12} is *high* in several diseases) or B_{12} rose because people tried to fix previously diagnosed diseases by taking B_{12}, or thin nerds (notice BMI was lower for this > 700 group, more health conscious fit thin healthy people drove the average BMI lower, perhaps some vegetarians, some vegans, some physical fitness omnivores who eat tons of B_{12} rich meat to "be muscular"?) or health freaks took B_{12} vitamins, all these groups (*vegan* or not) merged into the > 700 pmol group, when if you separate them you get a totally different picture: *B_{12} < 140 pmol/L meant 39% higher all cause mortality (64% higher cardiac mortality too)* of course (Hcy was 13 vs 8 for the reference group, MMA 272 vs 124), but B_{12} > 700 pmol/L (Hcy 7.3, MMA 122) meant no rise in total all cause mortality (only 45% higher cardiovascular mortality). 35% of reference group (300 < B_{12} < 700, the so called optimal B_{12} level) used B_{12} pills, vs only 17% for the high mortality one, 59% for the B_{12}> 700 one (>700 group contained some extreme enthusiasts who took 6,000 µg/day, while usually we define 1,000 as high if younger than 65). *This is a classic example of clueless omnivores being "against vitamins", like vegans are at times, and living shorter as a result. Few people know half omnivores have suboptimal B_{12}.* Most people got B_{12} way < 700, half got B_{12} < 300 even. The question would be why do we see in some studies, like this one, done on omnivores, higher total B_{12} meant 45% higher cardiac mortality (or in other studies even higher all cause mortality)? Was it B_{12} the cause or was reverse causation or was B_{12} a marker for *red meat intake (shown in 100s of studies to increase cardiac mortality a lot via atherosclerosis)*, which contains oxidized cholesterol, AGEs and TMAO generating *(due to omnivore microbiota, vegans generate far less TMAO)* carnitine (*3 times more in red meat vs* chicken), choline? B_{12} is mostly in meat, fish. I never read a really good study, where they didn't remove the big confounding factors above, how much they fried and oxidized that cholesterol, what cooking method was used (that can increase AGEs 5 times), what was their supplement

intake before the study began (since if Hcy, for a subgroup of the >700 group, was high, right before study began, that meant they already did damage their arteries, so then, it will show a little higher cardiac mortality, even if during the study Hcy was low), etc? To answer this decisively we need to do a large study in *vegans* who eat like me *(minimal cooking, ultra low fat and AGEs, just some legumes boiled in water)*, since we vegans don't eat cholesterol, far less AGEs (if like me), and generate far less TMAO. Med 2016; 95(31):e3485 found (74,494 people) no increase of even 1% in total mortality from B_{12}. ☺☺☺ Methyl B_{12} can cure infertility ► HK 1984;30(4):581-6. Many conditions are cured by higher doses of B_{12}, especially related to nerves, multiple sclerosis, canker sores. 1 g Creatine can lower Hcy too.

►► 12.4.12. VITAMIN C (helps you see) ◄◄

JN 2011;141(10):1847-54 found 25% of Americans *don't get even the minimum* RDA *for vitamin C* (ascorbic acid). The RDAs in mg: 0-6 mo 40 (AI), 7-12 mo 50 (AI), 1-3 yrs 15, 4-8 25, 9-13 45, 14-18 men 75 women 65, 19+ men 90 women 75, pregnant 85, lactating 120. The ULs (for pills+food) are: 0-12 mo unknown, 1-3 400, 4-8 650, 9-13 1200, 14-18 1800, 19+ 2000. I got 800+ mg/day from food alone in 2020; multivitamin brands have 40 to 200 mg. Oddly, for the healthy young, LPI recommends min 400 mg/day, for the sick old, way more. Double Nobelist Pauling took 3-15 g daily for decades reportedly, many mammals take equivalent of 10g/day, so 0.8g a day from food is low, even if RDAx9. 0.8g is < 2g UL, so it's safe. If you take vitamin C, take only 150-200 mg max per meal from vitamins AND food by taking a fifth, half or 4th of a capsule or a max 200 mg tablet, but don't overeat since it can form oxalate kidney stones as C converts to oxalate and is excreted. C helps the brain to stay healthy. If you buy in bulk powder form, it goes bad fast with air contact and moisture, light and in 2 months, after 60 repeated openings, it may have toxic compounds there too, so best is to buy capsules, tablets and eat what you can to achieve 200 mg per meal for saturating the blood next 8 hours, if sick or in need of immune system boost. High oxalate due to high C could in theory cause oxalate arthritis people get from not soaking grains and legumes. Always choose 0 inactive ingredients, even rice flour in vitamins is toxic, since it has bacillus cereus which can cause anaphylaxis; stearic or magnesium stearate raises triglycerides, dextrin, mannitol can cause dry eyes, titanium dioxide can cause oxidative stress, silica or silicon dioxide can cause silicosis if inhaled and not dissolved in a smoothie, saliva or water first, etc. The Bestvite 12$ 120 caps 1000 mg cheapest, safest because it has no extra additives, except 50 mg healthy desperately needed by malnourished Americans hesperidin polyphenol from oranges. It's also safer than 99% of vitamin C products with no extra additives, because it is the palmitate ester of vitamin C, which is as bioavailable, but is much more stable. However, if you eat carrots, or high oxalate foods, you need normal vitamin C, for faster prevention of kidney stones, so you can take powder from capsules with no extra ingredients, take a third of a capsule and dissolve it in a smoothie or glass of water to avoid throat damage.

Some people can get sick from too much C, 200 mg 3 times daily is far safer than 600 mg once or 300 mg four times; some took 3 g daily for decades, but that doesn't mean everyone would get same benefits and not get sick. Use your common sense, try stay well below 2 g daily, since 2g UL is based on years of research. Avoid croscarmellose, microcrystalline cellulose, MCC, and too many extra ingredients, some known to be very toxic yet added by some brands (1 brand, the most toxic on Amazon, has 9 extra ingredients, many very toxic, like TiO_2 which damages DNA). Vitamin C pH is 3.3 when dissolved in water, versus 5.5 pH for ascorbyl palmitate (palmitic acid ester of vitamin C), so if you take it as a capsule powder with a small meal of watermelon, carrot and 2 walnuts, you won't destroy your throat and vocal chords with the powder of pure ascorbic. Ascorbic is water soluble, but ascorbyl palmitate is far soluble, so only take it with 1 walnut or some other fat at a meal, which is fine for those eating 1 carrot at every meal with 2 g of fat (walnuts) to boost vitamin A to prevent dry eyes, since A in carrots needs fat to absorb 10 times better.

The ideal brands, like the black bottle Pure, more opaque than the white bottles, I use, besides Bestvite, don't have anything except vitamin C: the cheapest/g $16 Pure 680 mg 365 caps, $21 Encap 1000 mg 90 caps, $14 Clark 1000 mg 100 caps or 31$ for 454 g pure powder. Avoid Encap and Clark ideally, as white bottles don't prevent light as well as black, and powder oxidizes fast each time you open it. Powder is only useful for people who have machine to put it in capsules. The issue with vitamin C, etc you buy is that exposure to air, light, heat leads to the degradation into possibly toxic compounds. 4 toxic brands are Nutricost 12$ 240 caps 500 mg (rice flour deadly) or Piping 7$ 200 caps 500 mg has toxic croscarmellose, Nature's Bounty 11$ 200 tablets 500 mg (clear bottle green tint, oxidation), NOW Foods 15$ 250 tablets 500 mg, has toxic MCC. 500 mg is too much to take 4 times daily due to going over the UL (upper limit of 2000 mg from pills+food). Tablets have the advantage of easy swallow, without irritating the stomach with the capsule or irritate throat if you eat the powder only, since the pure C form is corrosive, acidic, unlike the ester form from Bestvite. However, no tablet exists that has vitamin C only. The aqueous humor of the eye (which prevents dry/red eyes) has 20 times higher vitamin C level than serum, no wonder high food C prevents AMD & eye issues; C and glutathione inside the humor prevent its swelling, increased eye pressure, and glaucoma (80 million people got it, 5% of glaucoma patients go blind, C helps us to see); C, low 'AGEs, cyanogenic foods, mercury' give healthy eyes & glutathione level. High C, Bs detoxify heavy metals which lower glutathione level.

Too much C can cause some health issues in some people, so do research before going crazy with anything above 1 g daily, or half the USA UL. "Prophylactic prevention of infection requires dietary vitamin C intakes that provide at least adequate, if not saturating plasma levels (i.e., 100-200 mg/day)" 200 mg is RDAx3 ► Ntr 2017;9(11):1211. Studies show each meal we eat with 200 mg, we saturate plasma, so C can fight free radicals, clear blood heavy metals; 8 hours later,

it may decrease a lot, so another 200 mg from food brings C back up: C is essential for the immune system, fighting flu, colds, COVID19, protein synthesis, *dry eyes, cornea, skin, joints, vessels, ligaments health,* lowering body oxidative stress, so adults can plan to get 200 mg C every 4 hours from food and/or caps, even the lightest 100 cal meal before going to bed, to keep body repair in best shape during sleep (same for polyphenols). Some *vegans* don't calculate clearly protein quality, so the C is even more critical to keeping those heart muscles young and living to 100 or, some century, 900. Flu/cold symptoms in the 3 g/day group decreased 85% vs controls: JMPT 1999;22(8):530-3. C helped fight severe COVID19, shortening hospital stay: AJCR 2020; 21:e925521. Immune mechanisms of C, D, Se preventing COVID19 are here. The issue with most people is too low, not too much; not even 0.01% go beyond UL usually. 60 mg is the RDA vitamins use. People who didn't eat fruits or veggies with C for a long time died from scurvy; in 1932 they discovered vitamin C. Those getting 200-1200 mg from food live longer & always *have better eye health*. C is easily available, unlike B_{12}, K_2 or D_3 absent in most fruits and veggies. Studies show *food vitamin C gives MUCH better results than pill vitamin C*. Cooking can destroy most food C: those who eat only cooked foods, dry heat foods, fish may get low C status. ☺☺☺

The richest food sources (common produce we buy at every store, not dried or processed foods with toxic AGEs) are in order of *mg/100* g: green hot chili pepper 242, yellow sweet bell pepper 183, gold kiwi 161, fresh thyme 160 (careful, it may cause abortion), orange sweet pepper possibly 150, red chili pepper 144, parsley 133, red sweet pepper 128, kale 120, *green* kiwi 93 *(the standard hairy skin kiwi, available year round)*, broccoli 89, green cauliflower 88, brussels sprouts 85, green sweet pepper 80, normal green kiwi 71, papaya 62, strawberry 59, purple *cabbage* 57, orange & lemon 53, pineapple 48, white cauliflower 48, jalapeno pepper 44, green cabbage & cantaloupe 37, napa cabbage 36, grapefruit 31, lime 29, mango & spinach 28, cilantro 27, raspberry 26. Medium/Low C sources: blackberry 21, green leaf lettuce 18, zucchini 17, tomato 13, grape 11, blueberry 10, banana 9, watermelon 8, onion 7, asparagus & carrot 6, ginger/apple/beet 5, iceberg lettuce 3, walnut 1. For other foods, search mg on USDA. In mg C/calorie the cheapest common produce order is: yellow sweet pepper ► 6.78, red bell pepper 4.13, green cauliflower 2.83, broccoli 2.62, kale 2.40, cauliflower 1.84, purple *cabbage* & strawberry 1.84, cabbage 1.46, orange 1.13, zucchini 1.06, pineapple 0.96, grapefruit 0.74, blackberry 0.49. Yellow bell *pepper got* 9 times more C/calorie *than* "*high*" vitamin C citrus *grapefruit*. *Purple cauliflower* has about 50% more vitamin C than white cauliflower, so *2.76* mg/cal, if same cal; purple cabbage has about 50% more vitamin C/g than green cabbage. ☺☺☺

1,000 mg C lowered blood levels of lead by 81% within one week, while 200 mg had no effect. ► JACN 1999;18(2):166-70. Those with a geometric mean of 39.8 µM serum C had 10-50 times lower serum lead (0.7-1 µg/dL vs 7.2-56) compared to those with a geometric mean of 21.0 µM serum C ► EHP 2006;114(3):350-4. In a study of 7,071 people, men in the lowest (<28.4 µM)

compared with the highest (>/=73.8 µM) serum vitamin C quartile had a 57% higher mortality risk, while women < 39 µM had 46% higher mortality than women with C > 85 µM ► AJCN 2000;72(1):139-45. A 4 year study of 19,496 people showed a 20 µmol/L increase in plasma vitamin C was associated with a 20% decline in all-cause mortality ► Lan 2001;357(9257):657-63. Vitamin C ≤28 µM was univariately associated with a two-fold higher risk of mortality in renal transplant patients compared to patients > 28 µM ► Ntr 2017;9(6):568. Topical vitamin C "inhibits NFkB, which is responsible for the activation of a number of pro-inflammatory cytokines such as TNF-alfa, IL1, IL6 and IL8" ► IDOJ 2013;4(2):143-6; those cytokines can cause acne; that's why companies sell topical "vitamin C serums" to remove acne/sunspots or promote collagen synthesis, but you can buy vitamin C powder for a few dollars and make serum for 20 times less money by dissolving it in water (see paper above, store it away from light, use vitamin E and zinc to increase dermis absorption up to 20 times, etc, also see B_3 section on acne). Topical *vitamin C is "directly and specifically activating* collagen gene regulation both by increasing the transcription rate and stabilizing *procollagen messenger RNA, thus genetically signaling* collagen synthesis…"; the 3 drops of vitamin C serum (+ zinc, tyrosine) on face 3 month study "provided objective and subjective improvement in photodamaged facial skin" (patient answers showed it 84% better than placebo, photos showed vitamin C 58% better than placebo) ► AOHNS 1999; 125(10):1091-8. Collagen is the *most* common protein in the human body (33% of body protein), being part of the makeup of many organs, heart, blood vessels, cartilage, bones, teeth, hair, skin (75%), nails, tendons. Collagenase enzyme remodels collagen, contains zinc, so topical zinc helps too, that's why zinc is added to cosmetics and is so important for the heart, bones, teeth, hair, nails, all connective tissues, organs. Take C to boost immunity.☺☺☺

►► 12.4.13. VITAMIN E ◄◄ (buy d-α-tocopherol, not dl-α-tocopherol)

JN 2011;141(10):1847-54 found 60% of Americans *don't get even the* 22 IU RDA *for vitamin E* [R, R, R - α-tocopherol (most common isomer in milk)], even after accounting for the E some get from multivitamins (30 IU = RDA used by some vitamin companies). Without vitamins, the % goes to *91% of* Americans *being deficient* (get about half of the minimum). Vitamin E tablets can lose 50% of E in 5 hours (read next 3 pages), so then the *national* malnutrition *may be far more severe*. Vitamin E thins the blood, so for the 60% of humanity with non-O blood type (especially A+ blood of 33% of humans, the thickest blood types of all (hence they need to eat only 3 g of seed oils max, eat lots of garlic/proteases/ginger/cloves/ω3/water that thin the blood, move around each 45 min to shake the blood and prevent pooling that forms clots, eat a low fat vegan diet to live longer, since fat thickens the blood and causes strokes), vitamin E helps a LOT more to extend lifespan than for others, since A+ blood types are prone to ischemic (thrombotic) strokes, caused by clots (thick blood tends to clot more easily), not to hemorrhagic strokes. Likewise, ginger, garlic, onion and other natural blood thinners benefit A+ blood types more

than the rest. Not all vitamin E studies have the same conclusion, because they don't account for hydration (hydration prevents clots as blood thins) or for blood types: A+ benefit far more. Do you see why the confusion as to why one vitamin works or not? They forgot the 100000 confounding factors. The RDAs in mg of natural E, RRR d-α-tocopherol (double if synthetic E, racemic dl-α-tocopherol): 0-6 mo 4 (AI), 7-12 mo 5 (AI), 1-3 yrs 6, 4-8 7, 9-13 11, 14+ 15, lactating 19. As NIH explains, 15 mg means 22.4 IU of natural E and 33.3 IU of synthetic E. The ULs (for pills, either dl or d) in mg are: 1-3 200, 4-8 300, 9-13 600, 14-18 800, 19+ 1000 mg or 1490 IU of natural E. Many get 7 mg from food alone; multivitamin brands have 10-30 mg, 10-15 usually. 50-150 IU pills have been linked to only positive/neutral outcomes in many studies. So, perhaps, to get only 50-150 IU, buy the dry form (search Amazon for "dry form vitamin E" (free of silica, calcium silicate, present in 80% of vitamin formulations of all types) and open cap and put only half or a third of it in your smoothie, save cap and use next day, cover cap in a dark area or keep in a drawer in a little bottle cap to recall to take next day. Swanson has 250 caps and only 400 IU, but caps are clear (a slight green tint) and bottle is clear, (versus white bottles or this 90 softgels sunflower bottle, avoid sunflower oil in vitamins, as that oil can cause allergies) so in 10 days, you may lose half the vitamin E, as explained below, especially if it sits weeks exposed to bright light at the warehouse or home. Kirkland product designers got some "rat IQ folks"☺☺☺, their vitamin E is in 100% clear bottles, meaning it can degrade faster than any brand, since tablets exposed to light lost half vitamin E in 5 hours, meaning the softgels lose it even faster as softgels are more see thru. Spring Valley, Solgar, Member's Mark, Mason, Solaray, NatureWise, Puritan yellow or blue tint, Piping, Sundown, Nature Bounty, other brands' bottles are so clear that you can't know what toxins are in the pills, so avoid them, too many ultra low IQ folks start vitamin companies and in the future all vitamins are in the eterni powders meaning they're useless, we need to bankrupt them by proper inspection of bottles and fines of 1 billion dollars for anything that is found to be below 98% of listed label. How can soybean oil, with 70% polyunsaturated fats, be in such clear bottles? ☺☺☺, it causes strokes and heart attacks if oil is oxidized. Skeptics will say that that vitamin E is always 100% and I'm paranoid or too stringent, but New York state found "80 percent of the pills officials tested did not contain the key plant ingredient listed on the label" (these were from the main USA stores). Why do you think Amazon chooses E in such dark bottle, and Swanson chooses such clear bottle with a slight green tint? Even Amazon doesn't know what they're doing, that dark bottle needs to be 100% opaque like Webber. The ☺ abysmal IQ☺☺ of people buying Nature's Bounty (common brand in thousands of CVS, RiteAid, etc stores) vitamin E oil in clear or 100% opaque bottles is even deeper, because each time you open the bottle, you oxidize the rest of the bottle with fresh oxygen/ light. Can you believe all this is sold all over, like edible oil in clear bottles? The sale of vitamins in a big oil bottle without separation in pills ought to be illegal as it promotes oil oxidation. Choose totally opaque bottles, white, purple, black, etc and not bottles thru which you can see the softgels if looking in bright

light. To prevent loss during warehouse storage outside the cardboard box, opacity is key. The USA and worldwide ☺abysmal IQ☺, in terms of vitamin/food packaging is shocking. Even the white bottles with oils/vitamin E are known to be less ideal, since at Whole Foods all flax oil is in pitch black plastic containers, 100% opaque, to prevent oxidation and you squeeze that Barleans bottle so only a tiny amount comes via the 0.1 mm hole. Federal law ought to require them to make the label opaque, cover the whole bottle, so that if white cheaper plastic is used, it doesn't oxidize the vegetable oils or vitamins. Some other forms of vitamin E are sold too: gamma tocopherol kills nitrogen free radicals better than alpha. However, most E sold by NOW has some of these tocotrienols, tocopherols, as do nuts.

We had no tests of safety and arterial plaque buildup effects from oxidized vitamins. Swanson didn't do any tests on E stability after 1 month of warehouse light, so it's odd how they ship even ω3 oils in clear bottles with some green tint. Look at Micro Ingredients 24$ silverish looking inside non aluminized 50% only opaque packing of vitamins, it's a deception on Amazon, making people believe it is opaque. You can return it. I ordered them but it's not opaque, but good enough for hands and etc. Was hoping it would be opaque. Heat is a big factor, so USA, the "leader of the 'free' world" has Amazon storage temp for vitamins way above acceptable during hot months in hot states. On Amazon and in all stores, one can't find, among 100s of brands even 1 truly opaque, except the pitch black bottle brands. So much for our "amazing tech" (to kill others/torture mostly, not to keep Americans healthy). Too bad Micro brand sells 1000 IU, which is way too much. But what you can do, which I do, is to buy this, since it's same price as 200 IU for 240 caps, and use the rest on your hands to help your skin as with age we need some extra boost and only eat a 5th of a softgel. That way you KNOW it's vitamin E, not degraded E that may be competing with real E and poison YOU. The big question is if you buy it in warm months, did it sit too long in Amazon warehouse? In cold months, due to fast turnover, as Amazon keeps only what sells within 1-2 months, it's not an issue. Once the Immortalist Party wins, we will ban the sale of any vitamin in non 100% opaque packs or bottles, since Eterni Food Inc will bring true change: if it's as cheap as a bottle and protects all supplements from light known to degrade all pills faster, why let so much light in? Block it all. UV does the most damage, so plastic blocks the UV, but even visible light can over time speed up degradation since 400 nm visible is pretty high energy light, just 1 nm above 399 nm UV. That's why ω3 and other oils are stored in very dark brown bottles, not light green bottles like Swanson, so always choose brands that have 100% opaque bottles, ideally darker colors opaque, not white. Flax oil is kept in very opaque all black (not see thru like Amazon E) bottles for the same reason. You want to have some E left there by the time you eat it if you forgot it in sunlight. Transfer E in your home made aluminized bottles upon receipt, tighten any vitamin bag, so that air can't affect the softgels. Why is Jarrow Formula E in such dark bottle? Jarrow guys know 8th grade chemistry, unlike most

Swanson like bottle (see it) vitamin companies started from the garage of some Bible lover.

Swanson and most USA companies have a ☺☺☺comical 4th grader website, with no science papers to show their potency studies in the presence of light, with no Certificates of Analysis, nothing, indicative of the age of 1st century Christianity that rules "Stone Age America" ☺☺☺ and 100000 vitamin companies of mom and dad garage started "aristocratic kulaks", where nobody knows what is inside, being a business owner trumps having truly amazing high tech products and technologies. Hey, how about having 100000 car companies, instead of Tesla producing same number of cars, what will be the price and quality and research jobs? It will be much poorer, with fake ingredients even, like with Windows, 100000 fewer programmers per operating system if you got 100000 Windows versions. E tablets lost 50% of E in 5 hours, so perhaps, a lot of our "profit capitalism" supplements don't have even 20% of E after consumer places it in natural light areas. Other companies have 100% clear bottles, not even a green tint, if YOU can believe that. Why not try immortality capitalism, given that we can make all bottles opaque by central decision? The Swanson greenish clear bottle of 250 caps is like 500 caps of 200 IU if you use half each time, a good deal, lasts 1 year or two, the only ingredient is the antibacterial calcium laureate and gelatin (the cap you trash), laureate known to cause a lot fewer issues than magnesium stearate that people talk about for 30 years, partly due to the fact lauric acid is $CH_3(CH_2)_{10}$-COOH, or C_{12}, while stearic is C_{18}, $CH_3(CH_2)_{16}COOH$, the type of fatty acid C_{14}-C_{24}, that when free or bound to Mg can destroy beta cells that produce insulin and cause diabetes. Always opt for brands with least useless inactive ingredients or none at all, that, unlike Swanson, have truly OPAQUE bottles. When companies add stearic or stearate, it's to help avoid the machine that makes caps from stopping, it's not for our own health, to avoid clumping and other silly reasons. Most people take too much E, 400-1000 IU, but 200 IU is enough, unless you have a really bad day and need some antioxidant boost. Overdosing is not a good idea and olive oil in softgels has a lot of calories and oxidizes fast, while calcium laureate in dry form can't oxidize, it's already saturated and far more stable than the unsaturated fatty acids in olive oil that make more than 70% of fats. AREDs ocular vitamins for eyes contain vitamin E at 400 IU.

The dl-tocopherol in NatureMade USP contains the less natural ratio our bodies are not used to, and is too see thru, not opaque. Some studies show that dl-alpha-tocopherol leads to more strokes than d. Thus, always buy E (200 IU or 400) that is ***d-alpha-tocopherol.***☺☺☺ A brand many rush to buy with no oxidizing oils and somewhat opaque bottle and just natural d-alpha vitamin E alone (some glycerin) 300 caps 400 IU/24$ is Horbaach. Another strange brand for d-alpha, not dl-alpha, is Amazon, but that one has soybean oil and it not very opaque, while Webber for 300 caps 400 IU d-alpha/30$ and flaxseed oil is truly opaque (much healthier due to ω3 and pitch black way darker bottle than Horbaach, Amazon, Solgar and all "dark brown" see thru brands). A reputable company is NOW Foods, who does 19000 tests on their vitamins every

month, *and sells* 200 IU 100 caps/8$ softgel d-alpha-tocopherol (olive oil that oxidizes and that doesn't allow you to reuse next day for 100 IU, like Dry form) NOW bottle says 134 mg because 1 IU=0.67 mg [1/1.49=0.67] of natural or D-E, so 200*0.67=134 (13.4g d-E for $10, so *1.3g*/$). *1 mg d-E*=1.49 IU. Tocopherol is easier to absorb and benefit from than tocopheryl acetate or other esters of tocopherol. NatureMade says 180 mg for 400 IU, because 1 IU = 0.45 mg [1/(2.22)=0.45] mg of synthetic or dl-E, so 400*0.45=180. *1 mg dl-E*=2.22 IU. Easy to recall, 49=7*7, 2.22 is all 2s, 2 &s, 27=3*3*3, 3 3s, recall the 3 mnemonic for proteins and fats or Independence Declaration signed on 7-2, July 2nd. *Studies that had negative effects could have used the synthetic* racemic *dl-E, not* natural *d-E*. NOW Foods also sells 250 softgels (olive oil) of 400 IU d-E, i.e. 67 g of d-E for 19$ (*3.6g*/$), (can use it topically too, it helps skin healing if ever needed, gets rid of warts, etc) while Nature Made has only 27 g d-E + 27 g of l-E for 18$ in the 300 softgel version. *Nature Made sells less d-E and the l-E might do damage inside the body, like B_{12} analogs do, but reducing uptake of the d-E we got used to and inhibiting functions*. Not all pills are the same, that *l-E may cause more LDL rise seen in some vitamin E studies*. E has been used for 50+ years to treat or ameliorate dozens of skin conditions, including acne ► IDOJ 2016;7(4):311-5. E, which is supplied to the skin surface through the sebum outflow, "prevents irritating lipid peroxidation of sebum, damaged by bacterial growth, which may be responsible for the inflammatory aspects of acne" ► Cut 1981;28(1):41-2. Those with much lower serum E had much worse acne ► COT 2014;33 (2):99-102. Those with acne had 8.5% lower serum E, 19.5% lower vitamin A than those without acne ► CED 2006;31(3):430-4. Another idea is that taking 100 IU twice a day is healthier than taking 200 IU at once, same with any vitamin,☺☺☺ as too much can cause problems, like extra calcium deposits as plaque, etc, extra C can cause issues, etc. Thus, for tocotrienols plus d-alpha tocopherol, 200 IU is also better, NOW Foods has it. d-α-tocotrienol possesses 40-60 times higher antioxidant activity against lipid peroxidation than d-α *toco*pherol ► FRBM 1991;10(5):263-75. The NOW vitamin E advanced has only 10 mg tocotrienols, versus 50 mg tocotrienol mix plus 20 IU that could be taken every 4 days, besides the vitamin E daily intake from a 200 IU regular tocopherol mix (100 softgels for 8$) or the 400 IU flaxseed oil vitamin E. The number one killer worldwide is atherosclerosis and the # 1 cause of it is lipid oxidation, so tocotrienols help. The 400 IU needs to have fat to be absorbed The fat in the pill is not enough to facilitate the best absorption of the fat soluble vitamin E. E causes bleeding type of stroke, so keep doses low, the E toxicity is detailed here.

At 23 I placed the liquid E softgel content on 2 warts (daily) I had for years and they disappeared in about 2 weeks (E kills the wart virus we get from touching objects virus carriers touched). People also use celandine for warts/papilloma. People with certain disorders, conditions need more vitamin E. A few studies below show intake of 30-50 IU in multivitamins is much better than the 5-15 IU many people end up getting. Some of the studies below have most people take

in 10 IU or less, which is 45% of RDA. Other studies suggest those getting 50-100 IU fare much better (probably 70 IU might be best for the largest number of people, hard to tell), hence some people take 50 -100 IU supplements (or 200 IU every few days). However, 150-400 IU/day or higher seems to be where adverse side effects start to occur in some people and there are dozens of studies showing how 400+ IU have mixed results, helping only some people and harming others. Studies didn't evaluate if they used oxidized soybean oil as inactive ingredient, bottle color, d-alpha or dl-alpha, and many other variables, PhDs are too "low IQ" to bother with. If you eat a lot of oxidized E and oil, with 95% of E gone, no effect will exist, you will obviously damage everything with oxidized E. You read these studies and what is the most shocking thing is how little attention, if any in any study, they pay to the nature of vitamin E storage, packing, bottle color, light opacity, temperature of storage at home, at the store, etc. No wonder the study results are ALL OVER the place. If only 5% of E is left in a pill, what is there to see? The evidence seems clear that 30 IU have dramatically positive effects because many people are eating so little vitamin E. A review covering 0.25 million people found no higher mortality from vitamin E at levels above 100 times RDA even ► CAS 2011;4(2):158-70; there is a lot of paranoia among people to take even something like 0.5-1.5 times the RDA. However, overdosing on vitamin E (400-2,000 IU) may bring higher mortality as seen in some studies, which allegeldly correctly established correlation was causation. This higher mortality may be because, as AB 312(2):217-23 found, arterial plaque sometimes has 600 times more vitamin E in it than normal artery tissue, so when overdosing, the vitamin E that was not used to fight free radicals may join the plaque. ATVB 1995;15(10):1616-24 found the same vitamin E concentration in plaque and arteries, so it may depend on the diet, AGEs, oxidative stress, genetics. Tocotrienols (a vitamin E form, most vitamin E is α-tocopherol, tri-en-ols have 3 extra double bonds, hence tri-en) lowered LDL 42% from 179 to 104 in diabetics with high cholesterol ► Ath 2005;182(2):367-74. A nih.gov...tocotrienol+LDL search shows other studies found cholesterol lowering effects, while others no effects ► AJCN 2002;76 (6):1237-43. Everyone sells tocotrienols at higher price as they're harder to extract. The latest hypothesis is that tocotrienols + tocopherol mix is better than d-alpha-tocopherol alone.

Serum and cerebrospinal fluid *vitamin E* levels are low in Alzheimer patients ► Antiox 2017;6(3) :45. There was a 36% reduction in the rate of cognitive decline among 2,889 persons (ages 65-102) in the highest quintile of total vitamin E intake compared with those in the lowest quintile ► ARN 2002;59(7):1125-32. ☺☺☺ In a study of 87,245 women, those with a median intake of 208 IU (just 8 IU from diet) had 34% less heart disease than those not taking E and getting just 2-3 IU from food; taking only multivitamins (15-30 IU) led to a 22% drop in heart disease incidence, while those using E pills (100-1,000 IU) had 59% reduction in heart events. Women who took E pills for more than 2 years had 41% lower risk of heart disease, while short-term taking had a

negligible effect. Overall mortality was 13% lower for E pill users ► NEJM 1993;328(20):1444-9. This study shows in Table 1 just how little E most people get from the food, even if not *vegans*. A study of 5,133 Finnish people showed those taking the most *vitamin* E (3 quartiles) had 32% lower cardiac mortality for men and *65% lower cardiac mortality for women* ► AJE 1994;139(12):1180-9. A randomized controlled study of 40,000 women followed for 10 years found 600 IU every other day led to a *24%* drop *in cardiac mortality and* 49*% from in cardiac mortality for women* above 65 ► JAMA 2005;294(1):56-65. 50 mg (75 IU) vitamin E led to a 41% drop in prostate cancer mortality ► JNCI 1998;90(6):440-6. Women who used more than 36 IU vitamin E, aged 55-59, had 84% less colon cancer (about 6 times less) than those using < 6 IU, while for all ages, the drop was of 68% (about 3 times less) ► CR 1993;53(18):4230-7. In many of these free papers most people seem to take from diet vitamin E well below the RDA, yet we don't hear much about vitamin E deficiency. ☺☺☺

STABILITY of Vitamin E

E is very *sensitive to* light, 50% of vitamin E in tablets is lost in 5 hours of exposure to natural sunlight, so store it away from light, water, heat ► BJPT 2013;4(5):176-80. E degradation was big if mixtures were prepared in EVA bags, but was largely prevented if PN mixtures were compounded and stored in multi-layered bags ► CN 2000;19(5):339-42.

14 VITAMINS/MINERALS where RDA seems fine for Longevity

Below are 14 nutrients with a less debated optimal RDA. Those who lack a diverse diet (80% of people) fail to get the RDA for some of these 14, leading to issues. A healthy vitamin helps.

►► 12.4.14. VITAMIN B_1 Thiamine (the long COVID brain fog reversal pill) ◄◄

1 minute video shows the shocking effect of vitamin B_1: this is because B_1 increases the oxygen uptake, thereby reversing dementia (see studies below & this video) and many brain and motor functions. B_1 is a cofactor for 2 enzymes involved in energy production (citric acid cycle):

1. pyruvate dehydrogenase (PDH) B_1 is cofactor for the 1st step before the citric acid cycle:

$HCH_2(C{=}O)COOH$ (pyruvate) + CoA-SH + NAD^+ = $HCH_2(C{=}O)$-S-CoA (acetyl-CoA) + NADH + H^+ + CO_2

This reaction is done in 3 steps by 3 enzymes of the pyruvate dehydrogenase complex PDC, the first of which is E1 or PDH that has B_1 as cofactor. The other 2 enzymes of PDC are E2 or dihydrolipoyl transacetylase and E3 or dihydrolipoyl dehydrogenase. The PDC table shows the cofactor for each, and the paragraph after the table explains how B_1 helps.

2. α-ketoglutarate dehydrogenase (α-KGDH) B_1 is a cofactor for step 4 of the citric acid cycle:

$HOOC\text{-}CH_2CH_2(C{=}O)COOH$ (α-KG) + CoA-SH + NAD^+ = $HOOC(CH_2)CH_2(C{=}O)\text{-}S\text{-}CoA$ (succinyl-CoA) + NADH + H^+ + CO_2

α-KG is α-ketoglutarate or acetate merged with pyruvate via CH_3 group. You see the two reactions are identical, except instead of an orange H hydrogen of pyruvate in the first one, we have $HOOC(CH_2)$ (acetate) added. CoA is actually CoA-SH chemically. Both are decarboxylation steps. This second reaction is done in 3 steps by 3 enzymes of the α-ketoglutarate dehydrogenase complex KGDC, the first of which is E1o or α-KGDH, that has B_1 as cofactor. See Wikipedia, thiamine is listed as cofactor in the table on the right for the 1st of 3 enzymes of the α-ketoglutarate dehydrogenase complex. Glycolysis turns 1 glucose into 2 pyruvate units, generating cell energy in the form of 2 ATPs, 2 NADHs. Then, acetyl-CoA, via the reactions of the diagram of Krebs cycle and the electron transport chain, produces 12 ATPs and uses up oxygen we inhale to make CO_2 we exhale. By supporting these reactions, B_1 helps the body generate energy (ATP) aerobically, using oxygen and reducing lactate buildup. It's possible that like with many other vitamins, some SNPs will cause poor B_1 uptake by the brain so benfotiamine may save many from death via beriberi (nerve damage dry beriberi: numbness, paralysis, weakness, confusion or the heart damage wet beriberi: swelling, rapid pulse, congestive heart failure, coma, death, short breath). Lack of B_1 caused beriberi also leads to peripheral neuropathy and wasting, impaired sensory, motor, and reflex functions.☺☺☺ Lack of B_1 causes at times acute Wernicke's encephalopathy (confusion, uncoordinated walking, eye abnormalities (rapid movement of eyes, random called nystagmus) which needs to be treated before it becomes Korsakoff syndrome (forget events of last 5 minutes and since disease started). Seniors have much poorer absorption of protein and many vitamins, due to aging, so it's critical to measure vitamin status, if pain, numbness, high pulse exist, since beriberi is often confused with B_{12} or hypertension, aging or 100s of other conditions. Even 30 year olds with odd diets, illnesses or pills, can get damage to the gut living that prevents absorption of any vital vitamin, nutrient or mineral, so checking everything once a decade can add 20 years to lifespan. You can't wait until 55-75 to discover everything is totally destroyed, you need to be proactive, because death starts with birth: fetuses get 12 times aorta plaque if mom has high cholesterol. After 18, aging speeds up and at 30, it's already in high gear and you need be way more careful. A long life is not from genes, but from choices and effort made early on, since age 5. Parents need to teach kids to avoid risk and playing superman/macho guy, as the price for that is often living 30 years shorter.

Like B_2, B_6, B_9, B_{12}, B_1 (thiamin) is sensitive to visible light, so store it away from light, water, heat. Its C_{12} structure is here. The RDAs in mg: 0-6 mo 0.2 (AI), 7-12 mo 0.3 (AI), 1-3 yr 0.5, 4-8 0.6, 9-13 0.9, 14-18 1.0 female 1.2 male, 19+ 1.1 female 1.2 male, 1.4 pregnant/lactating. MDs often use 500-4500 mg, so 417-3750 times the RDA to cure certain conditions, because there is no UL (upper limit), since body excretes excess in urine; no adverse effects were noted at even 50

mg/day. I get 2.6 mg from food alone; vitamins have 1 to 100 mg. B_1 is yellow-orange, so any B complex or multivitamin will turn the urine (right after) yellow-orange, since B_1 is in excess. Some studies found that 98% of heart failure patients enrolled were low in B_1. An MD used 1500-1800 mg thiamine chloride for various conditions and obtained wild benefits. An MD explains the benefits of 600 mg benfotiamine (833 days/0.6g, 74$) and her nervedoctors.com shows people in unbearable neuropathy pain being cured with Nuphoria, Nerve D (read ingredients and then get them yourself if you can find a cheaper Amazon combo that has the key ones, like lipoic, carnitine, B complex, bromelain, etc), IR light that speeds up nerve healing 4 fold. You can buy correct supplements (most can be bought as powders) from Amazon, the 7 key nutrients for nerve repair, to regenerate your peripheral nerves and even the brain: 0.6 g R-alpha lipoic acid, 0.3-0.6 g benfotiamine (fat soluble, eat with fat e.g. 1 walnut), 80 mg P5P B6, 1-3 mg methyl B12, 0.4 mg 5-MTHF B9, 1 g L-citrulline (= 0.3-22 lb of watermelon red flesh depending on citrulline level, the most underrated supplement that would help billions who got atherosclerosis, sticky blood, hypertension), 1-3 g acetyl-L-carnitine. Hand or feet pain can also be due to high pyridoxine B6 (which accumulates and harms nerves, unlike P5P B_6 that supposedly doesn't accumulate in nerves to damage them), low Mg, inflammation (vanishes with fasting sometimes or simply removing repetitive strain injury or cold exposure, poor circulation), etc.

There are 6 main types of thiamine cation $C_{12}H_{17}N_4OS^+$ with properties shown in a 25 min video:

1). Thiamine mononitrate TN in animal feed, fortified food: $Thiamine^+$ NO_3^-
2). Thiamine hydrochloride TC in 98% of vitamins: $Thiamine^+$ Cl^- • HCl, $ThiamineHCl_2$
3). Benfotiamine TB 4 times more bioavailable than TC: $Thiamine\text{-}(OPO(OH)_2)(C_6H_5C(=O)\text{-})$
4). Fursultiamine TTFD Thiamine Tetrahydrofurfuryl Disulfide: $Thiamine\text{-}(SCH_2(\text{-}CH\text{-}O\text{-}(CH_2)_3)(=O)$
5). Allithiamine TAD Thiamine Allyl Disulfide in garlic: $Thiamine\text{-}(S\text{-}CH_2\text{-}CH{=}CH_2)(=O)$
6). Prosultiamine TPD Thiamine Propyl Disulfide in garlic: $Thiamine\text{-}(S\text{-}CH_2\text{-}CH_2\text{-}CH_3)(=O)$

Only 3 companies sell TTFD on Amazon vs 75 for TB & 900 for TC. TB and TTFD were made in Japan as fat soluble versions to help cross the blood brain barrier, so the neurons produce energy and heal. TB is used for neuropathy to regenerate damaged nerves, and can help the retina too in retinopathy, glaucoma prevention, etc. TN/TC don't cross the blood-brain barrier, while TB/TTFD & TAD/TPD do. TPD is dihydroTAD, with 2 extra H, the allyl becomes propyl. Fresh garlic contains TAD/TPD, a fat-soluble form of B_1 that's more effective than B_1. In 1951, Japan discovered 2 new forms of B_1 in nature, in garlic, the TAD/TPD, and Japan tried to make analogues that are more stable and easier to absorb by the brain, so they invented TB/TTFD. To create a very nonpolar (unlike the polar TN/TC) TB Japan added a nonpolar phenyl ring to cross the blood brain barrier via phosphate and benzoyl, so TB is S-benzoylthiamine O-monophosphate or $Thiamine\text{-}(OPO(OH)_2)(C_6H_5\text{-}C(=O)\text{-})$. TTFD is a synthetic derivative of TAD,

created to be even more stable and bioavailable, delivering high levels of active B_1 to the body. TTFD is TAD plus $-CH_2-CH_2-O-$ to turn allyl into a CH linked to a tetrahydrofuran ($-CH-O-CH_2-CH_2-CH_2-$) ring, THF from organic chemistry, hence the name tetrahydrofurfuryl in TTFD. Both TAD and TTFD are known for their superior energy metabolism, fatigue-fighting properties compared to TN/TC. TB seems more effective against dementia, blood sugar lowering in diabetics, and nerve pain/health (neuropathy), tingling, numbness, retina, central nervous system, while TTFD more useful for chronic fatigue, fibromyalgia, long COVID, brain fog, mental vitality/energy, happiness, alertness (ventral tegmental area and the locus coeruleus), motivation, wakefulness (dopamine). Some may be so alert with TTFD, they become hyper, get insomnia, so start low and try TB first. The idea is TB does stuff than TN/TC can't, inside the brain and nerves. TB is 50 times cheaper than TTFD per gram, since it's available as powder, so nobody buys TTFD usually.

B_1 lowers blood glucose when taken at 150-300 mg/day, so be careful with high doses because you may die due to low blood sugar. When sugar is too low, you have no energy and can enter coma, so start small until issues you have are fixed. Seniors eating more B_1/B_6 were 26% less likely to die over 8 years, survivors had higher serum B_6/B_9, higher B_3 intakes ► CN 2012;31(2):191-8; this makes sense since B_6-B_9 lower Hcy, B_3 raises the NAD^+ that declines with age. In animal models, B_1 "deficiency exacerbates plaque formation, promotes phosphorylation of tau and impairs memory... treatment of mouse models of Alzheimer with the thiamine derivative benfotiamine (cheapest is Amazon) diminishes plaques, decreases phosphorylation of tau and reverses memory deficits." ► MCN 2013;55:17-25. "Oral benfotiamine is safe (12 months, 0.3g morning, 0.3g evening, 34 folks vs 36 placebo) and potentially efficacious in improving cognitive outcomes among persons with MCI and mild AD.... the 161-fold increase serum thiamine was more robust than predicted... In animals, even mild thiamine deficiency leads to increases in AGE... Increased AGE are common in diabetes, which predisposes to the development of AD... Benfotiamine significantly reduced increases in AGE (neuron killer, AD/MCI brain/serum have higher AGEs)... Thiamine can act as an antioxidant and may act directly in cholinergic transmission,... as an allosteric regulator of many proteins. Benfotiamine and thiamin may act as Nrf2 activators, which would help the brain deal with many oxidative insults... benfotiamine, thiamine could be acting on endothelial cells as has been demonstrated in studies of diabetes" ► JAD 2020;78(3):989-1010.☺☺☺ Diab 2007;50(10):2164-70 found diabetics had higher sVCAM-1 and 4 times lower plasma B_1 ► "64.1 (healthy controls) nmol/l, type 1 diabetes 15.3,... type 2 diabetes 16.3. Renal clearance of thiamine was increased 24-fold in type 1 diabetic patients and 16-fold in type 2 diabetic patients." Low B_1 is linked to high soluble vascular cell adhesion molecule-1 (sVCAM-1), a marker of atherosclerosis (chemotactic factor, mediating the adherence/migration of leukocytes, including monocytes/macrophages, to inflamed endothelial sites, turning them into foam cells; sVCAM-1 influences blood-brain barrier regulation, raises

cerebral vascular resistance and cognitive decline in the elderly). The lower the plasma B_1, the higher the atherosclerosis sVCAM-1 marker as Fig. 3 shows. To live long we need zero plaque and healthy arteries, meaning high B_1. CTA and MRI see only large vessels down to 0.5 mm in diameter, so 80% of the vessels are not seen, capillaries diameters reach 0.005 mm. MDs are ignorant of plaque in capillaries, so B_1 helps. A new experimental (not in clinics yet) technique allows us to see capillaries and detect vascular or other issues 20 years early.

300 mg "benfotiamine … over 24 months (59 subjects) has no significant effects upon peripheral nerve function or soluble markers of inflammation in patients with type 1 diabetes…. Peroneal F-wave persistence and amplitude in addition to tibial nerve F-wave persistence and heart-rate response to standing were significantly reduced in the benfotiamine group, which may indicate a slight deterioration of nerve function." ► DC 2012;35(5):1095-7. "Benfotiamine (300 mg, 18 months) significantly improved the cognitive abilities of mild to moderate AD patients" ► NB 2016;32(6):591-6. B_1 deficiency can cause low stomach acid, digestive issues, as proteins rot undigested and load toxins in the blood that damage the brain, especially in A+ blood types that have lower stomach acid than the rest. Without stomach acid we become malnourished, as proteins are not properly split into peptides and amino acids, we die as collagen (arteries are made of it) is not made properly. B_1 is used to remove lead from cows ► VHT 1995;37(3):230-2, sheep (72% increase in lead excretion, 842% increase in lead excretion if B_1 was mixed with EDTA) ► TL 1991;59(1-3):153-9, mice ► Bio 2010;23(2):247-53. Humans with higher than avg levels of blood lead, had lower than avg serum B_1, possibly because the sulfur in B_1 binds to the lead (and Cd, Hg) and is eliminated ► AISS 2013;49(1):65-72. ☺ TTFD improved autism symptoms and led to increase of heavy metal (linked to autism/dementia) release in the urine ► NEL 2002;23(4):303-8. TTFD 100mg/day for 12 weeks was successful in Alzheimer patients ► MBD 1996;11(1):89-94. B_1 increases survival by protecting from Pb, Hg, Cd oxidative stress.

►► 12.4.15. VITAMIN B_2 Riboflavin as in Ribose (RNA) & FAD/$FADH_2$ ◄◄

Lack of B_2 can cause migraine, headache, baldness, birth defects (heart for infants), infertility, anemia, cataracts, skin disorders, mouth/throat soreness/edema/lesions (esp. mouth corner), swollen/cracked lips, red/itchy eyes, liver/neuron degeneration. B_2 (riboflavin) structure contains 3 hexagons (3*6=18 flavin structure☺☺) bound like anthracene, formula is $C_{17}H_{20}N_4O_6$, molar mass is 376.37. FAD (flavin adenine dinucleotide) is a well known coenzyme (cofactor for 100s of enzymes called flavoproteins) that is B_2 plus 2 phosphates, a ribose and adenine, while FMN (another cofactor) is B_2-5-phosphate. 90% of dietary B_2 is in the active FAD and FMN forms, which are not the vitamin forms, unless you get methylated vitamins with FMN. B_2 is thus cofactor for 100s of reactions catalyzed by FAD/FMN enabling enzymes (dehydrogenases, oxidases, reductases) to make ATP (e.g. citric cycle, electron transport chain, chemiosmosis),

metabolize fats/amino acids, scavenge free radicals (glutathione reductase). Beta oxidation or FAt oxiDation, easy recall, has FAD involved in its first step (FAD + R-CH_2-CH_2-CO-S-CoA = $FADH_2$ + R-CH=CH-CO-S-CoA) as cofactor of acyl-CoA dehydrogenase, which as the name explains, removes 2 H from fatty acids in the first step of beta oxidation process of generating acetyl-CoA from adipose tissue or fats we eat, so that acetyl-CoA enters the citric cycle and oxidative phosphorylation to make another 12 ATP. Carb (glycolysis), protein, fat metabolism produce stuff that makes ATP via phosphorylation, which is consists of electron transport chain reactions and chemiosmosis. FAD is the cofactor for succinate dehydrogenase of step 6 of the citric acid cycle: HOOC-CH_2CH_2-COOH (succinate) + FAD = HOOC-CH=CH-COOH (fumarate) + $FADH_2$

Like B_1 has a hexagon, B_2 (and B_9) contains 2 hexagons with 2 C replaced by 2 N, sort of similar to the pyridine of B_3/B_6 (where only 1 C is replaced by N). The RDAs in mg: 0-6 mo 0.3 (AI), 7-12 mo 0.4 (AI), 1-3 yr 0.5, 4-8 0.6, 9-13 0.9, 14-18 1.0 female 1.3 male, 19+ 1.1 female 1.3 male, 1.4 pregnant, 1.6 lactating. Most get 1-1.2 from food alone; vitamin brands have 1.3 to 30 mg. There are no ULs, so MDs use even 400 mg/day (330 times the RDA) for 3 months to reduce migraine headaches: “proportion of patients who improved by at least 50%, i.e. "responders," was 15% for placebo and 59% for riboflavin” ► Neu 1998;50(2):466-70. “riboflavin (200-400mg/day)... well-tolerated, effective, and low-cost prophylactic treatment in children and adolescents suffering from migraine.” ► JHP 2009;10(5):361-5. “B_2 400 mg/day for 3 months .. had significant effect on days, duration, frequency, and pain score of migraine attacks… B_2 is an important factor in oxidative metabolism that can improve energy metabolism in the brain..” ► NN 2022;25 (9):1801-12. Basically, when fasting, we get this forehead headache as brain is low on glucose; during migraines, caused by open eyes and fast curves in a car for kids, the brain over computes spatial balance etc and runs out of glucose, as it does during exposure to microwaves from WiFi, cell phones etc, when it gets confused and runs out of energy. B_2 makes more energy from fat, preventing this headache caused by low brain glucose, ATP etc. Most headaches of forehead type are due to low brain glucose, so one needs to eat. B_2 lowers brain oxidative stress, which is a driver for migraines, besides poor blood brain barrier defense for toxic nutrients after a meal. B_2 is required for cellular respiration and good brain health. “maximal amount of riboflavin that can be absorbed from a single dose was 27 mg” ► AJCN 1996;63(1):54-66, excess going to urine. Thus, all headache sufferers can take the 400 mg above in 13 empty stomach doses of 30 mg, one each hour, as it peaks in serum in 1-2 hours, to absorb 13x more, let us know if it works. Weigh 30 mg with a scale, get Bulk Supplements B2 powder, 20 times cheaper than pills, keep it air tight in the fridge, in the bag, move 50g in a tiny opaque bottle to use daily. Same for all B vitamins, take the same total split in 2-9 portions to get higher IQ, longer life, by keeping serum Bs much higher for 16 hours instead of only 2 hours of a day. Besides, your kidneys/liver will be so much happier, dealing with so much less Bs (or other pills split in 2-3

doses 5-8 hrs apart) at one time, or any other vitamin you take a fifth of a capsule 5 times a day.

WiFi, cellular, GPS, Bluetooth, cell towers, EMF open VGCCs (voltage gated calcium channels) in the presynaptic neuron, causing glutamate release (Glu makes neurons fire, the brain excited, active, so all neurons fire at once, jam/pain happens), which activates NDMA receptors in the postsynaptic neuron, causing calcium entry into the neuron, which then starts the calcium/calmodulin dependent activation of nNOS neuronal nitric oxide synthase, and iNOS inducible nitric oxide synthase pathway (repetitive EMF exposure causes permanent upregulation of iNOS which destroys our brain), both of which produce NO, which reacts with superoxide O_2^- to produce peroxynitrite N=O + O_2^- ⇌ O=N-O-O$^-$, which kills mitochondria (by inhibiting oxidative phosphorylation complexes I, II, and IV/cytochrome c oxidase), then neurons. As neurons have no energy (mitochondria are fewer as some die) and neurons are excited and forced to work and fire randomly, pain occurs, as with starvation or fasting, these neurons can then die if it continues, there is no ATP, no energy for all of them to fire at once, the whole head feels a headache as when fasting and running out of glucose suddenly, causing dementia, Parkinson, brain diseases, memory loss, etc as seen in insects and mammals too. The 3-9% of population (actually "A survey in Taiwan in 2007 showed that the prevalence rate was 13.3%" ► EH 2018;17:5) that gets the most severe (head explodes feeling, severe vertigo, loss of balance, hard to walk or stand) headaches after just 10 minutes near a cell tower or after using cell phones, laptop WiFi, etc may need multivitamins with higher $B_{1,2,3,5,7,9}$ reported to soothe headaches. The mechanism of this headache is unknown, some claim it's the blood brain barrier leakage or merely the EM field of the microwaves affecting the vestibular (balance) system of the ear, the tiny hairs position via electric field orientation, which causes the horrible vertigo headache. In urban areas the power density rises from 0.02 mW/m^2 on quiet residential streets to 40-90 mW/m^2 on busy roads, making headaches the norm on bad streets. GHz towers are proven to cause shorter life (they are even used by militaries, like in the Maduro capture, causing vertigo), meaning all near cell towers live shorter lives, getting cancer, diabetes, atherosclerosis more as the free radicals of EMF destroy every cell. Move away from cell towers (avoid houses near one), campaign for LiFi, 100x fewer cell towers. Taking $B_{1\text{-}12}$ is key as cities become concentration camps with RF torture weapons disguised as 5G towers. Just because we don't get a headache, doesn't mean our bodies are not damaged: foods rich in oxidized cholesterol can be tasty, but you can drop dead in 3 years. 74% of those with EHS experience it near cell towers, 36% near cell phones, 29% near cordless phones ► IJHEH 2004;207(2):141-50. "number and severity of migraine headaches were correlated significantly with an increased use of mobile phones during day and Wi-Fi per week" ► EP 2016;8(12):3445-9. The MDs destroy billions of brains (causing neurological disorders that never existed and multi organ failure) by prescribing headache man made pills to people who simply need to stop being lazy, turn off house WiFi, wire every

computer, and use phones only once a month in emergency, always off. Connect to the human quantum field, not the crap on phones. If you got a headache, don't move in cars after meals, take a small break, walk gently, use the safe Bs our bodies got used thru 400 species over billions of years, not toxins of last 40 years we reject. These MDs put billions of patients on pills, when the cause is different, far easier to remove via diet, routine, EMF. Corruption has no limits, we pay some MDs 80 times the federal minimum wage, that's why we need ETs, NPs, NDs, MDs.

The body takes riboflavin in cheap vitamins and converts it to riboflavin-5-phosphate or FMN, the biologically active form present in pricier methylated multivitamin or B complex brands that contain the "active forms" requiring no enzymatic steps in the liver. The issue some have is their body lacks the enzymes to convert basic cheap B vitamins into the active forms: P5P B_6 not pyridoxine, L-5-methyltetrahydrofolate B_9 not folic acid, D-Biotin B_7 not biotin, natural forms of B_{12} found in food (methylB_{12}, adenosylB_{12}, hydroxyB_{12}) not man made lethal cyanocobalamin. If liver is tired, sick or genes off, you can get sick from deficiency. The activated B complex usually cause no issues, unless you take mostly activated B_9, instead of some normal B_9 from a multivitamin, to give body freedom of choice of how much active B_9 to make. Keep B_9, activated or folic acid, under 1000 DFE from B complex+multivitamin+fortified food. Activated B_9 is the only one causing issues, such as anxiety, insomnia, nausea, so find a B complex with normal B_9 in that case, which may or may not have other Bs in activated forms. A 15+% drop in B_2 intake from 1.41 mg/day to < 1.20 mg/day was linked to 2.4 times more offspring heart birth defects in moms who didn't take vitamins during periconception (3 months before and after conception) ► EJN 2008;47(7):357-65. Mothers with higher B_2 levels in their blood gave birth to longer infants; the longer infants had higher B_2 at birth ► EJCN 1999;53(1):27-38. *28.8%* of pregnant women with B_2 deficiency got preeclampsia; *only 7.8%* of pregnant women without B_2 deficiency got preeclampsia ► OG 2000;96(1):38-44. "Maternal intake of n-3 (ω3) fatty acids plus arachidonic acid and of B_2 were associated positively with fetal growth. A negative relation was observed between linoleic acid (ω6) intake and fetal growth" ► JADA 1997;97(8):867-70. B_2 is the most light sensitive B vitamin; multivitamins "should always be stored in containers protected from air and light" ► BJOC 2014;10:1999-2012. Aqueous solutions (smoothies, beverages) of B_2 are less stable than tablets. Milk (in glass or plastic polyethylene containers) lost 75% of B_2 in *1* hour *of exposure* to direct sunlight (page 432) ► JFP 1990;53(5):430-40, so many "health beverages" sitting in partial sunlight may have none after 1-2 *days*. Thus, many companies selling clear vitamin bottles and clear caps may sell useless B complex, with deadly compounds that compete with the real Bs from food, leading to deficiencies and shorter lifespan. Carton *vegan* milks containers retain vitamins A, B_2, D better, but light still penetrates. Tablets are more stable. Did *study authors know or calculate* if milk *was* exposed to *light* when *estimating* B_2 *intake*? ☺☺

►► 12.4.16. VITAMIN B_3 nicotinamide of NAD^+/NADH/$NADP^+$/NADPH) ◄◄

B_3 is niacin (nicotinic acid vitamin) or pyridine-3-carboxilic acid or nicotinamide (most common vitamin form), a NAD^+ precursor. NAD of Krebs cycle (how we produce energy) is nicotinamide dinucleotide, NAD, so B_3 plus 2 phosphates, 2 ribose and adenine. Pyridine is benzene where CH is replaced by N. B_6 is also pyridine based, but with 4 groups. The RDAs in mg: 0-6 mo 2 (AI), 7-12 mo 4 (AI), 1-3 yrs 6, 4-8 8, 9-13 12, men 14+ 16, women 14+ 14 pregnant 18, lactating 17. The ULs (pills only) are: 1-3 10, 4-8 15, 9-13 20, 14-18 30, 19+ 35. Niacin is nicotinic acid or NA, while nicotinamide (niacinamide on vitamin labels) is the amide of nicotinic acid or NAM, with $(C=O)NH_2$ instead of (C=O)OH of nicotinic. Both are forms of B_3. The 2 are the most common forms of B_3 in vitamins, though niacinamide is far more popular, due to no skin redness. A slowly released (20 times slower), less common, 3rd niacin multivitamin form is the ester of NA and *inositol (6 OH groups), a natural compound our body makes*, that is called obviously inositol hexanicotinate (IHN): this is called "no flush niacin" on vitamin labels, has some pros and cons vs NAM. Unlike NA or extended release NA, IHN doesn't lower blood lipids, the main reason some take NA: lowering LDL, ApoB, Lp(a). For some people with claudication, IHN or NA may be better mixed with NAM than NAM alone, to achieve max lifespan, but we don't know the ratios, read 900 papers first. In the EU, IHN is prescribed for poor peripheral circulation in legs or fingers. I use only NAM to be safe. Pill NA lowers LDL, raises HDL, but all cause mortality is the same. For people with cancer though, NA may extend lifespan more than NAM per some studies.

The US UL is 35 for both NAM + NA. The EU UL for NA is 10 (NA causes flushing at 50 mg, rash at 30, tingling *at* 15 in the unhealthy). The EU UL for NAM is 900. The UK UL for NA is 17, UK UL for NAM is 500. That's why many multivitamins have NAM > the 35 US UL ► NR 2017;75(6):471-90. Stay below UL or 50, because pill NA at 200 mg can *cause* diabetes, blindness and other issues as explained below. Most get 17 mg from food; no ULs for food intake exist. Multivitamin or B-complex brands have 10-100 mg. NAM can cause issues at a mere 100 mg, besides potentially increasing the risk of high homocysteine (which causes infarcts, dementia), high fight/flight hormones, Parkinson. Catecholamines remained elevated for hours after a 100 mg NAM, so common in 5,000 US multivitamin/B complex pills. The NAD^+ rises without B_3 by eating purple, blue, red (video) produce high in flavonoid polyphenols (see list of highest polyphenol foods) that prevent the formation of the lethal AGEs, see list of anthocyanidins/flavonoids that protect NAD^+ levels, prevent oxidative damage. NAM is a 3 step precursor of the important NAD^+ *which gets depleted during* stress *and aging, only* NAM*, among 12 vitamins, helped stem cells to survive, so* NAM *is "used in many organoid culture systems"* ► SCR 2018;11(6):1347-56. NAM has much fewer adverse effects (*need way more to get similar effects*) than NA (30-50 mg NA nicotinic can cause rashes, red skin *due to vasodilation*). If B_3 pill has 50 mg, try take 25-50%/day, so intake is < 15 if NA, < 35 *if* NAM. 99.9% multivitamins, B-complex, etc have NAM for safety. Lack of B_3 leads to pellagra, other diseases. Many take 8-100% of a B complex, vitamin capsule

(multi, B_{12}, K_2, I, Se, Zn), to avoid taking > UL.

Nicotinamide mononucleotide (NMN) reversed aging in old mice (33$/40g), giving them energy *and improving many markers*, their "60 yr old human equivalent cells" becoming like those of a "30 yr old human" ► scidaily or Sci 2017;355(6331):1312-7; the supplementary page 26 suggests all NAD^+ precursors have similar effects to NMN. However, all oral NMN and NR were proven to be converted in the gut into NA which turns into NAD^+, so there is no point to pay 70$ on NMN or NR, when you can get the same NAD^+ rise with a 3$/month methylated multivitamin or B-complex that has the cheap NAM or NA. Lots of companies make big $$$ selling NMN and NR, but it's all a big scam preying on people's lack of info. Indeed, 100s of papers, show that 200 mg of the ultra cheap NAM can increase NAD^+, so it's not clear how much the 50 mg NAM in vitamins raise NAD^+. 2.72 mg NMN has the same B_3 in 1 mg NAM. However, SR 2022;12:14442 says NMN at 250 mg is safe, since even at 1250 mg for 4 weeks it was OK, so short term, 3 months maybe, 250 mg is safe, while long term it is not known, it all depends if you notice vision being affected, since NA affects vision at 250 mg leading to temporary blindness, so if you see less, stop immediately. Start small at 50 mg, double it every quarter if OK, until you reach 200, measure A1C to keep it below 4.9%. Old reports of flushing due to NAM may have been caused by impurities of NA per some studies. NAM 200+ mg taken daily for years can cause liver damage, so kindly avoid taking 200 mg for vanity ('better skin tone'). Any NAM or NA above 100 mg needs MD monitoring of kidney, liver, stomach ulcers, etc to prevent internal bleeding, bruises, permanent damage. NA causes far more liver damage (yellow skin, jaundice is a sign of it) than NAM, so with NA, you need to be ultra careful before taking 50+mg daily for years. NA use raises diabetes risk by 34%, with 1 extra person out of 43 getting diabetes in 5 years ► Hrt 2015;102(3):198-203. Parkinson may develop way faster if you take too much (50-150 mg) NA or even NAM: "MNA (methylnicotinamide) has been found to destroy several subunits of cerebral complex 1... it is hypothesized that niacin is a causal substance in the development of Parkinson's" ► EHPM 2005;10(1):3-8. Imagine what happens if taking 500 mg NAM pills sold everywhere. Could these sky high NAM pills, 10-15 times above UL, be the reason why many develop Parkinson, diabetes in USA? JOAR 2022;37:267-78 claims doses of 375, 750, 1500 mg/ kg /day for 3 months were safe in rats and that NMN single doses in humans don't elevate blood NAM as high doses of NAM do. Perhaps, that extra ribose-PO_4 makes NMN safer: NMN is NAM plus ribose-phosphate PO_4. Mice ocular function has improved versus controls. NAD^+ is essential for the citric acid cycle, which provides cells with energy to survive. As we age, NAD^+ declines, so the synthesis of alpha-ketoglutarate, AKG, from isocitrate and glutamate slows. AKG synthesis and conversion into the succinylCoA both require NAD^+. To provide energy, we need AKG when NAD^+ is low, hence AKG given to mice meant less grey hair and inflammation, 5-10% extra lifespan, higher energy during "second half of life" ► CM 2020;32(3):447-56.e6. It's possible

NAD^+ boosters (NAM, NR) may achieve same results or better than AKG supplements in humans, not mice only. The AKG supplements human half life is 5 minutes and may be a waste of money. AKG is irritating for the throat. AKG gives insomnia if taken before bed, just like iodine, B vitamins, mitochondria boosters (CoQ10, PQQ). When cells starve for energy, they can die. NMN without PO_4 is NR nicotinamide riboside, another NAD^+ precursor some believe in ► Ntr 2020;12(6):1616. NR & NMN are way more expensive than NAM. NA boosts NAD, but only at very dangerous levels of 100 mg. There are a few other substances that worked in mice, which one day, via synergistic effect, may boost anti-aging effect 5 times in humans. One gene change in worms increased lifespan 25% each, but with both genes changed lifespan increased 500%. Likewise, 1 chemical may raise lifespan by 20%, but with 9 compounds by 400%. This synergy for good or bad compounds is common. NR is useless in many studies, so some doctors say it's best to not waste money on it, as mice studies are not human studies. Only 3 out of the most sold NMN Amazon brands matched the label mg, even if most had certificates of analysis. In mice, too much NMN can cause nerve degeneration, so the same may happen in humans.

NMN, NA, NR, IHN, NAM are precursors for nicotinamide dinucleotide (it has 2 nucleotides) NAD^+, a key enzyme found in all living cells that declines up to 65% from age 30 to 70, just like CoQ10 and 900+ other important molecules decline as we age. NA, etc can have many side effects too, like homocysteine rising, so skim thru 50 papers before deciding how much NMN, NR, NAM to take in a multivitamin, since NA is less safe. NMN and NR, two popular NAD+ boosters, cost 50 times more than NA and NAM, and inside the liver NR, NMN are turned into NA and NAM, so it makes little sense to take the 50 times more expensive pills. A 2021 study shows how complex the interactions are, how useless it may be to take NR and NMN (they degrade to NAM in the liver before being absorbed in one hypothesis), vs NAM, how NMNH and NRH_2 hydrogenated reduced forms seemed to be more stable and more effective, NMNH twice more than NMN at NAD boosting. So many precursors, so much research to determine which amount is below UL and leads to longest lifespan, decades of 40,000 papers on this topic may be needed to have a better answer. NAD^+ formula has 2 nucleotides: NMN & riboadenosine monophosphate *(another nucleotide made of phosphate, ribose (a sugar) + adenine (1 of the 4 DNA bases))*. DNA is DeoxyriboNucleic acid, a polymer made of nucleotides, while RNA is RiboNucleic Acid. Deoxyribose means ribose lacks OH group (hydroxyl group or oxygen) in the 2 position. NAD^+ is essential to producing energy in the cellular power plants, mitochondria, no wonder old mice given NAD^+ precursor NMN became so energetic (found in tiny amounts in broccoli, cabbage, avocado, tomato, edamame, cucumber, one would need NAM or NMN etc to really boost NAD+ when it declines with age). Nicotine is similar to nicotinic acid (same pyridine ring with a group in position 3). We reduced disease mortality by 500 times in some cases, why can't we reduce adult aging speed 20 times? In 1937 Conrad Elvehjem discovered vitamin B_3.

This led to curing pellagra. An 11+% drop in vitamin B_3 (niacin) intake from 15.1 mg/day to < 13.5 mg/day was linked to 2.0 times more offspring heart birth defects in moms who did not take vitamins during periconception (3 months before and after conception) ► EJN 2008;47(7):357-65. Moms who gave birth to babies with heart defects ate more saturated fat, less B_2 also. However, high niacin doses used to lower cholesterol levels (*250-2,000 mg vs B vitamins with 20 mg*) were associated with lab animal birth defects, with possible consequences for infant development during pregnancy ► Goodman & Gilman's Ph Basis of Ther. ISBN 0071422803. 200+ mg NA (niacin, not NAM niacinamide) doses can lead to *reversible blindness* that disappears as niacin intake ceases ► Retin 2003;23(6 Suppl):500-10. Nobody takes high doses of NA, unless MD gives it to lower LDL. It's much better to lower LDL by going vegan. All B vitamins are water soluble, excess is eliminated via urine, but taking $B_{3,6,9,12}$ vitamins > UL or >> RDA has adverse effects. While NA can be bad, NAM can prevent glaucoma. They gave ascending doses of 1-3 g NAM and noticed improvements, like in this 1.5-3 g study.

► ► 12.4.17. VITAMIN B_5 or Coenzyme A (CoA) precursor ◄ ◄

Pantothenic acid, HO-CH_2-$C(CH_3)_2$-CH(OH)-C(=O)-NH-$(CH_2)_2$-C(=O)OH, $C_9H_{17}NO_5$ (3*3=9) or B_5 is 1 of the 8 B vitamins essential for health. It has 3 C-OH like B_6 and 2 C=O bonds, 5 oxygens, B5, like penta or pantothe. B_5 becomes part of Coenzyme A (in CoA, -C(=O)NH-$(CH_2)_2$-SH replaces the B_5 -C(=O)OH, and adenine-ribosephosphate-$(O\text{-}P(=O)_2)_2$-O-CH_2 replaces the B_5 HO-CH_2) of the vitamin B1, etc CoA reactions, as seen from the CoA structure, a part of acyl carrier protein ACP. The B_5 active form is pantetheine, while pantethine (sold online) is the stable dimer of pantetheine. 1 kg costs 40$, some take 1-2 g daily for 3 months/years to get rid of acne, since B_5 boosts the immune system which is half dead in many people, so the arteries, brain and all organs are better able to get immune cells to remove plaque, amyloid, waste, microbes, toxins. Amazon sells 100 caps of 0.5g (zero extra ingredients) for $6.8 to try doses of 0.5 g for a week, then 1 g if acne not out, then 1.5, 2.0, 2.5, 3.0 g if acne not out, etc, and see if it works and if acne returns after stopping using it, may need take 0.5 g for 5 years to rebuild immune system in many ways, better sleep, nutrients, exercise, etc to be able to no longer take it daily. For me, only higher doses worked, not 0.5 g to start healing scars and stop sebum overproduction. Forehead pimples are $1 trillion worth of lab tests free gift of sorts, measuring 500,000 immune system biomarkers that tell you what vitamins or foods aid or impair the immune system. Take advantage of it, since when acne vanishes, the immunity usually is far stronger. Acne is often weak immunity or deficiency in amino acids, hormones, etc. B_5 helps produce CoA, which breaks down fats and oils (beta oxidation), including sebum in the skin (sebum if the food acne microbes feed on), so B_5 starves the bacteria of their food, ending acne. B_5 helps produce energy from carbs, fats, proteins via the citric acid, beta oxidation, etc processes explained in the B2 section first paragraph. It helps immune cells to produce antibodies (the 5 classes of

immunoglobulins: IgA, IgD, IgE, IgG, and IgM) to fight microbes, etc, to make acetylcholine, epinephrine (adrenaline), testosterone, cortisol, serotonin, melatonin and dopamine. When we're low in B_5, our body can't break down excess sebum and the skin pores become saturated with sebum which lead to pimples as the P. acnes bacteria on everyone's face have more food (oils) to grow and cause pores to clog. Thus, B_5 has been used successfully to treat acne breakouts. Pimples are not a joke, they're a sign the same thing can happen to the arterial wall (see below how white blood cells eat fatty LDL to become foam cells that form plaque), because plaque often starts as an arterial pimple, as shown in the acne section, due to similar P. acne bacteria (P. acnes was found in arterial plaque). So, 50-300 mg B_5 may also prevent stroke, infarct, vascular dementia caused by arterial pimples (guy died at 58, his artery looked like acne, see pic) commonly called plaque. The NIH B5 short page explains more about what B5 does. 900 mg/day of pantethine, a precursor of B_5, for 4 months lowered LDL by 20%, TG by 33%, raised HDL by 8% ► Review 2005, but this refers to sick people with LDL > 130 mg/dl, TG > 150 mg/dL. In healthier people, with LDL/TG 60-90, LDL/TG may fall only 1-3%. LDL fell 11% after 600 mg pantethine and rose 3% in placebo in 16 weeks ► VHRM 2014;10:89-100, in people with LDL 180, not a healthier 90. B_5 itself didn't do that per NIH (Ref. 1 that may reference a study done with stearate that blocks absorption of plain B_5, or etc), though I doubt large studies exist to confirm B_5 fails to lower LDL. The AIs/RDAs in mg: 0-6 mo 1.7 (AI), 7-12 mo 1.8 (AI), 1-3 yrs 2 (AI), 4-8 3 (AI), 9-13 4 (AI), 14+ 5, pregnant 6, lactating 7. Many get 8-10 mg from food alone; multivitamins have 5 to 50 mg, B-complex 10-100 mg. There is no UL, excess goes into urine, adverse effects (mild diarrhea) seen at 10g/day. Other side effects at < 10g/day levels are in this NIH article and include *jaundice* (yellow skin and yellow white of eyes).

JDD 2012;11(3): 366-74 found children can be cured of atopic dermatitis with the alcohol B_5 form (5% D-panthenol ointment), indicating a role in healing skin and cornea surface diseases. This alcohol B_5 has a role in wound healing, so it is added to eyedrops post LASIK surgery, such as Hylo eyedrops. Youtube has adults who got rid of dermatitis too with plain B_5 pills. DT 2014;4(1):93-101 found 12 weeks of 2,200 mg/day led to a dramatic drop in pimples in a tiny study of 40 people; this may mean fewer ocular styes too and less dry eyes. Start slow, at 50 mg/day and don't exceed 500 mg/day for a year at least, since many lost 30% of their hair when taking 5g/day for 1 month, as the B_5 1 star reviews, the youtubes show. The youtube comments of Amazon videos on B_5 curing acne explain it works for many at only 200 mg, so you don't need 2200 mg or 5000 mg. Let the body adjust, monitor carefully. B_5 doesn't work for everyone, but for many, it will do wonders at 400-5000 mg for months/years and then never return. It helps to read the acne section as that one explains many other methods to get rid of acne, since sometimes you need to eliminate the dairy (this is what causes the worst acne, according to 100s of youtubes that deal with "how I got rid of acne", because US dairy has many growth

hormones banned in the EU), gluten, soda, sugary foods or foods that you're allergic to. For 1700 B_5 papers, have a look the PubMed, but don't freak out, the Vioxx drug that made CEO aristocrats more billions for Palaces, and that killed 38,000 Americans, got more papers on PubMed than B_5 that can't make them rich. Capitalism 101 and one on one: what works is what makes Demons Rich. For example BMJ 1952;1(4759):643-4 found that kids with grey hair had their hair return to normal color by injection of B_5 and people with paralyzed intestine were cured in the same way. This shows B_5 might be curing a lot of undiagnosed issues relating to far more than acne. Acetyl-CoA is the acetylation enzyme cofactor that makes acetylcholine and maintains the parasympathetic tone. FI 2018;9:365 found that B_5 reduced bacterial growth in mice infected with tuberculosis: "studies reported that ...B_5 can promote the expression of inflammatory cytokines in epithelial cells" (skin cells), so they hypothesized B_5 enhances the macrophages killing of tuberculosis. B_5 boosts the immune function. Macrophage activation to kill P. acnes is another reason why B_5 prevents the P. acnes pimples, arterial plaque (pimples of the endothelium). LSA 2023;6(12):e202302200 found pantethine has anti cancer effects (like the vitamin A that cured with 10$ what 50000 didn't), but it's too cheap to make billionaires richer, so all we hear is $300,000 chemotherapy, not using simple mixes of vitamins/nutrients that would be 100 times safer. Pantethine and B_5 are in foods, can't be patented for big $, so they don't research B_5. Avoid antibiotics when possible, since they can wreck our gut lining, creating leaky gut, allowing toxins to enter the blood and damage not just the face, but the inside of our arteries by the pimples of the arteries also known as plaque. The US dairy has high levels of antibiotics, so avoid dairy and taking antibiotics unless you risk dying. Many people report on youtube, and I noticed it too, after taking some antibiotics for one issue like tick bite that can kill, acne erupts as soon as antibiotics (doxycycline) are stopped, due to the destruction of the microbiome homeostasis which takes months to return.

FNR 2018;62:10... 49 person observational study (useless, not a double blind randomized interventional 20 year study), which is as useful as trash because vitamin intake was calculated based on poor memory recall of foods eaten by folks with cognitive impairment, do you recall what you ate each of last 60 days to the gram level?) found B_5, provitamin A, vitamin A, B_6 etc intake were linked to Alzheimer plaque,☺☺☺ but it could be coincidence or reverse causation (sickness caused food intake, etc). Most studies found the exact opposite, low serum and low diet Bs, B_5, A, C, E, B_6 are linked to dementia. We always have to question in any study if the B complex was taken with stearate or other absorption blockers or confounding factors, for any study, be it "lycopene in food works, in pill form it doesn't" and other "genius conclusions" taken without any real analysis of all types of pills. B_5 "is significantly decreased in multiple brain regions in... Alzheimer's... Huntington's", Parkinson's ► Metab 2021;11(9):569. "cerebral vitamin B_5 deficiency may well cause neurodegeneration and dementia" ► BBRC 2020;527(3):676-81. If

you got pimples, try 50-500 mg B_5/day for 1 month, to see if they vanish; stop if skin or eyes get yellow or any side effect explained by NIH. The arterial wall/outer skin on forehead are similar skin like tissue: plaque can start with a pimple. B_5 was used to reverse anorexia, weight loss, lethargy, incontinence and hypochromic anemia ► JAGS 1973;21(2):88-91. B_5 is key to hair keratinocyte proliferation, skin fibroblast collagen integrity ► JPS 2011;115(2):230-4. This includes blood vessels collagen, since arteries are inner skin issue, so B_5 prevents plaque.

JCH 2022;24(7):945-54 observational epidemiological study (far less useful in drawing correct conclusions than interventional) measured the serum B_5 and found those with hypertension with higher plasma B_5 were more likely to die, though it could be reverse causation: sickness caused the B_5 to spike, since B_5 is involved in wound healing and many body processes and is known to rise in certain common diagnosed or undiagnosed diseases, just like Cu/MnSOD, GPx rise when sick. B_5 supports T cells in fighting wounds, plaque bacteria, invader viruses, so aging/sickness can spike B_5 in of itself. These studies indicate that perhaps if these people had taken B_5 pills, they would have lived longer as their bodies desperately tried to make more B_5 to fight that which killed them: the body uses B_5 to fight aging and disease. Vanin 1 is the enzyme ☺☺☺ that breaks pantethine into B_5 and cysteamine, the Vanin 1 activity is detailed here. To control runaway inflammation due to disease, the body can break pantethine into B_5 and cysteamine, to try control inflammation via cysteamine, so higher plasma B_5 can be a marker of serious disease, not a cause of disease. For example, HL 2022:56:91-5 found in COPD, serum B_5 and Vanin 1 vitamin B_5 synthesis enzyme are high and correlated to the level of free radicals/inflammation. B_5 is made when trouble appears. To live to 150, RDA for B_5 may need to be higher. Cysteamine is a signaling, antioxidant, anti-inflammatory chemical that tells macrophages and other immune cells to slow down, dials down the release of proinflammatory cytokines and chemokines (TNF-α, IL-18, CCL2). In mice, cysteamine intake reverses arterial plaque created by macrophages. B_5 helps regulate fat production in the body, including LDL. B_5 precursor pantethine lowered LDL by 10-20% in studies above, while B_5 allegedly did not. Perhaps, the pantethine conversion to CoA is much faster than the B_5 conversion to CoA, so intracellular CoA levels rise faster, causing a faster breakdown of LDL, triglycerides. Pantethine also inhibits the enzymes (HMGCR (enzyme targeted by statin drugs) and acetyl-CoA carboxylase) that create VLDL (the mix of LDL and triglycerides) in the liver. Pantethine breaks down into cysteamine that lowers LDL. Pantethine is also called the biologically active B_5. Thus, pantethine (20$ for 300 mg tablets 90 tablets (odd brand uses stearic) start with half tablet to get used to it) will probably work better than B_5 for acne. B_5 and pantethine are light sensitive, decompose faster in gel form, so solid form is safer 17$/90 caps (free of stearic acid, stearate). Search Amazon. When immune cells go wild, they create plaque or attack self causing autoimmune diseases, friend is seen as foe. High B_5 intake was linked to lower hs-CRP, which

means less arterial plaque and longer life ► NMCD 2017;27(9):806-16. B_5 boosts red blood cells production (CoA turns into succinyl CoA, then heme, the essential component of erythrocyte hemoglobin for oxygen transport) ► STM 2023;15(685):eabn5135. CoA also is key to sex hormone synthesis, so in B_5 deficient rats, sperm motility and testosterone were lower ► JVMS 2009;71(11):1427-32 or PDF. High B_5 and pantethine pills may cause bleeding in some.

PLAQUE FORMATION (the number one killer worldwide, see pic) delayed by B_5

Hyperglycemia, high blood pressure, oxidative stress damage the endothelium (lining of arteries), making it permeable and leaky, easy to penetrate by oxidized LDL oxLDL. High immune activation causes monocytes (*the largest white blood cells, that diferentiate into* macrophages *or dendritic cells*) to attach to the arterial intima (via a gap in endothelial cells layer) where oxidized LDL got into, then, in the intima, the monocytes differentiate into macrophages that eat oxidized LDL (oxLDL), becoming foam cells (also called lipid (LDL) laden macrophages) that form early plaques. LDL is oxidized by oxidative stress, so eat antioxidants, lower LDL to 60, to avoid plaque (3.5 min plaque formation video). Macrophages recognize oxLDL via CD36, LOX-1 *scavenger* receptors (not normal LDL receptors), causing macrophages to '*eat*' (scavenge like they eat bacteria) oxLDL non-stop, to become big foam cells as this 85 sec video shows. Dendritic cells present plaque antigens to T cells, which activate more immune cells, fueling plaque growth. Th1 and Th17 T cells then infiltrate the plaque, releasing cytokines (IFN-γ, TNF-α), which inhibit the plaque-stabilizing functions of smooth muscle cells. Constant immune activation prevents dead foam cell clearance (foam cells release this oxLDL when they die which becomes fatty streaks of plaque, which grows the necrotic core of cellular debris and oxLDL lipids, increasing plaque volume and instability (soft plaque can form clots when it breaks, killing us). COVID19 forms clots which start plaque formation, so long COVID destroys us. See a short clip on macrophages.

►► 12.4.18. VITAMIN B_6 (only pyridoxal-5'-phosphate P5P form of B_6 is safe) ◄◄

Like B_1, B_2, B_9, B_{12}, B_6 is sensitive to visible light, so store it away from light, water, heat. The AIs & RDAs in mg are: 0-6 mo 0.1 (AI), 7-12 mo 0.3 (AI), 1-3 yrs 0.5, 4-8 0.6, 9-13 1.0, 14+ 1.3, 51+ men 1.7 women 1.5, pregnant 1.9, lactating 2.0. The USA ULs (for food+pills) are: 0-1 unknown, 1-3 30, 4-8 40, 9-13 60, 14-18 80, 19+ 100. However, Australia requires vitamins with more than 10 mg to have a warning label on them (since some people with 7 times the blood B6 level developed neuropathy in legs), due to cases of neuropathy (at 24 mg or 40 mg daily) and near paralysis of legs in people who took high levels of B_6. UK UL is 10 mg. B_6 link to neuropathy is detailed in AN 2021;12(5)1911-29. B_6 can accumulate in tissues, and strip neurons of myelin (protective cover), destroying them when taken in ultra common 24-100 mg amounts. High B_6 or B_{12} can also cause cystic acne. The ability of B_6 to accumulate depends on diet, DNA and other factors. Wikipedia explains more. Several researchers have written about many cases of

pyridoxine form of B6 toxicity at even 120 mg levels. Pyridoxine can attack the trigeminal ganglia, responsible for producing tears and lipids for the meibomian glands, so a high intake of the toxic pyridoxine form of B_6 could cause even dry eyes and all kinds of issues related to the trigeminal ganglia (face). Many papers claim cheap vitamins (Utah Nutricost) with pyridoxine cause neuropathy, while those with the P5P active form pyridoxal-5'-phosphate (Wikipedia on P5P) (NatureBell has it) are far less likely to cause neuropathy: "Pyridoxine is converted into its active form, pyridoxal phosphate. High levels of pyridoxine are thought to inhibit pyridoxal-phosphate-dependent enzyme… this means that *… [high,* 24-100 mg pyridoxine*] B6 …* [blocks the creation of P5P B_6, leads to B_6 deficiency, high inflammation, stroke risk, high hs-CRP/plaque*] is associated with the development of a painful sensory neuropathy… The toxicity of vitamin B_6 is* not only dose determined, but related to the vitamer in which it is taken… pyridoxine should be replaced by pyridoxal or P5P" in vitamins. You may *save 5$ on multivitamin by buying the Utah one*, but you may die (from stroke…, heart disease from high homocysteine Hcy), like the 120 shot dead by Utah Mormons. Some people lack the enzyme to convert pyridoxine into the active P5P form, so it makes sense to require P5P only in pills, given that pyridoxine can be toxic at even 20 mg. The scary thing is that pyridoxine may be harmful even at the 2 mg found in most cheap formulations, since not all may convert to P5P and pyridine (and pyridoxine, a pyridine derivative) is a neurotoxin. Too little research with carbon tracing was done to assess where this pyridoxine goes if not converted to P5P B_6. Pyridoxine will also shrink brain more vs P5P since the actual P5P made from it is lower. A 1985 paper explains toxicity of various B_6 vitamers. Sort of like B_3 niacin causes flashes, but B_3 nicotinamide doesn't, niacin causes blindness, but nicotinamide doesn't at 200 mg. The B_6 was tested in thousands of people and now a class action lawsuit is ongoing, due to sky high blood B_6. In the EU, the 2023 UL is 12 mg, much lower than 100 in the USA. In 2000, the EU UL was 30 mg. B_6 is the only B vitamin where US limits are different than Australia. B_3 has a slight difference too US vs EU. Being cautious is wiser. You don't want to damage your nerves. "pyridoxine induced cell death in a concentration-dependent fashion and inhibited P5P-dependent enzymes.. pyridoxine competitively inhibits … P5P causing the symptoms of vitamin B_6 toxicity to mimic the symptoms of vitamin B_6 deficiency." ► NIH B6. Pyridoxine HCl in cheap vitamins can exceed the liver's ability to convert it into P5P B_6, causing an accumulation of unconverted pyridoxine in nerves and tissues, which can damage sensory neurons in the dorsal root ganglion, resulting in numbness, tingling, and ataxia (lack of muscle coordination affecting gait, speech, eye movement, and swallowing due to dysfunction of the cerebellum or its pathways). High dose (20+ mg) Pyridoxine is a neurotoxin, mimicking a B_6 deficiency, because it binds to nerve receptors, interferes with the metabolism of P5P (the active B_6), leading to dysfunctional GABA signaling in peripheral nerves. P5P is already active, skips the liver conversion by enzymes, doesn't cause damage as it doesn't inhibit P5P generating enzymes, but actually provides P5P directly. Pyridoxine accumulates because the body can't use it, it

needs to convert it to P5P first, but the liver can only convert a little daily, so pyridoxine will damage the nerves as the blood carries pyridoxine to the nerves to bind to the P5P nerve receptors (due to almost similar structure), blocking the function of P5P made in the liver before P5P gets to the nerves from the liver. By taking over all nerve receptors, no P5P gets to help the nerves to regenerate and repair and the nerves gradually die, causing peripheral neuropathy and all kinds of damage to the nerves and brain we don't even know about today. So stop buying pyridoxine containing vitamins that have more than 2 mg pyridoxine as the liver can only convert a little, and to be safest, avoid any pyridoxine, since with age, liver fails, so take P5P only. This is exactly the same way caffeine destroys billions of people: mothers drink it and caffeine that looks like adenosine chemically, binds to the fetus adenosine receptors, slows neuron migration and causes low IQ, heart defects and all kinds of birth defects, low birth weight, short lived baby. So, stop drinking coffee and take the correct form of anything, R not L for alpha lipoic, etc. This is like spirulina, chlorella, etc have fake analog B_{12}, that bind to the B_{12} gut receptors and damage our nerves, since the real B_{12} can't be absorbed. Always avoid fake B_{12} foods. Endless companies, NOW Foods, etc sell B50, B100 with 100 mg pyridoxine that will destroy millions of people, causing billions in brain damage, neuropathy drugs (that have side effects, causing more brain damage and other diseases, shorter life) given by clueless MDs who have no idea the customer ate 100 mg pyridoxine for 5 years until last year. Decentralization means the private sector can inflict genocide by lost productivity and lifespan years and clueless MDs add to the injury by prescribing pills without eliminating the cause, pyridoxine. Now, perhaps you might understand why we need 11 companies, so every vitamin is safe. ☺☺☺

I get 4-5 mg from food alone; multivitamin brands have 2 to 30 mg. Given this, it may be wise to use a B-complex or multivitamin that has max 10 mg B_6, not 50-100 like many B-complex brands in USA sold as B50 or B100 by NOW Foods, Nutricost and 100s of others (B50 = 50 mg of each of the 8 B vitamins). 9000+ studies show B_6 (not sure which form they used in each study) heals the brain, so do take 10 mg/day. 0.8 mg folic acid B_9 (1.335 mg DFE, or > the 1.0 UL), 20 mg B_6, 0.5 mg B_{12} achieved 2 things: 1. it shrank the brain 50% vs placebo: PLOSO 2010;5(9):12244 2. it shrank grey matter brain areas vulnerable to dementia 7 TIMES LESS in people with Hcy > 11 µM (most Americans) ► PNAS 2013;110(23):9523-8. Bronson has 2 mg toxic pyridoxine B6/capsule, bad MgStearate, 0.015 mg toxic cyano-B12. NatureBell has 10 mg safe P5P B6/capsule, but bad MgStearate, 0.5 mg methyl-B_{12}. Sapling has 5 mg P5P B_6 and 0.1 mg natural methyl-B_{12}, but contains black pepper which blocks the liver detoxification enzymes from clearing bad compounds (same mechanism that allows toxins in, allows turmeric curcumin in, at 20x higher absorption). So before you start using black pepper as spice, think again… Kirkland organic multivitamin contains toxic pyridoxine found in vegan foods. In vegan foods B_6 is less bioavailable: pyridoxine and pyridoxine-5'-phosphate, often in a glycosylated form; in animal

foods B_6 is P5P and pyridoxamine 5'-phosphate. Vegans thus need to be careful to not develop B_6 deficiency, as that would increase homocysteine. Before you get fanatical about "organic food vitamins", recall most have toxic pyridoxine in them. God has given us millions of poisons in plants/animals to make us develop eterni foods. Most multivitamin and mainstream B complex brands, at Walmart, GNC, CVS, RiteAid, Target, etc, even Daily Vits by NOW contain 2 mg potentially (even at low doses) neurotoxic pyridoxine B_6, explaining perhaps why some have issues. Even the most expensive multivitamin from NOW Foods has pyridoxine B_6 mixed with P5P B_6. So, to avoid pyridoxine, use Micro Ingredients multivitamin and B complex (1 capsule each to prevent B_9 above UL intake, 0 inactive ingredients, healthiest B forms), as it is the best brand, no inactive ingredients (stearic, mg stearate) that block nutrient absorption.

This shows some companies know about B_6 dangers, unlike most health food stores and others who include 50 mg of each vitamin B or even 100 mg per pill. Measure B_6 blood level and see if you're very high or not, to see if any neuropathy (manifests as pain, tingling, etc) is caused by B_6 vitamins. NatureBell seems better, as you get way more B_1-B_2 than sapling. AJCN 2008;87 (5):1446-54 found that at 2 mg/day intake of B_6 many people have low vitamin B_6 in their blood, so some researchers suggest a dose of 3-5 mg a day for adults, others even more. B_6 is pyridoxine,☺☺☺ B_3+3 or 4,5-$(CH_2OH)_2$-3-(OH)-2-(CH_3)-pyridine 4,5-Bis (hydroxymethyl)-2-methyl pyridin-3-ol. Pyridoxine is pyridine (C_5H_5N benzene with 1 CH replaced by N) with 4 groups: OH, CH_3, two CH_2OH, which are like 3 OH groups and 3 "methyl" groups (2 without H), 3+3. Cells 2018; 7(7):84 shows B_6 key role in 140+ cellular reactions, the 3 common forms: 1. pyridoxine (oxi hydroxy, alcohol), 2. pyridoxal (CH=O replaces 4-CH_2OH, al for aldehyde), 3. pyridoxamine (-CH_2-NH_2 replaces 4-CH_2OH) and the 3 phosphate forms of these 3 where -CH_2-P=$O(OH)_2$ replaces 5-CH_2OH). The bioactive form is the P5P pyridoxal phosphate. Mnemonic: B_6 got a 6 (3+3) sided pyridine ring (pyrolysis, pyr means fire in Greek, pyridine is very flammable, it catches fire reacting with oxygen, like B_6 helps metabolism, synthesis of fats, proteins, etc which depends on oxygen), like B_3; B_6 has 3 extra groups (B_3 only 1) or B_6=B_3 + 3. 6=3+3. 3 is the smallest # allowing a cyclic chemical (all polygons and geometric forms in math/chemistry can be made from triangles, trigonometry), 3 is basis of all geometry, 3+3=6, the most stable cyclic compounds are hexagons, B_3+3, 3 mnemonic of amino acids Ala C_3, 3 mnemonic of key fats allyl, C_3. B_2, B_9 have 3 hexagons, B_{12} 4, B_1 only 1. B_6 lowers Hcy, aids neurotransmitter synthesis, gluconeogenesis.☺☺

See vitamin B_{12} section B_6-B_9-B_{12} studies on lowering brain shrinking and Hcy levels. Since *lower Hcy means less vascular disease (endothelial injury)* it's no surprise that those with >1.33 mg/day B_6 intake had 49% less heart disease than those with <0.79 mg/day ► Stroke 2010;41(6): 1285-9. B_6-B_9-B_{12} lower Hcy levels and reduce the risk of stroke, heart attack, atherosclerosis. Stroke 2009;40(4):1365-72 found that 1 mg B_{12}, 50 mg B_6 and 2.5 mg B_9 together for 5 years led to a 25% drop in stroke risk, because B_6 *helps* convert homocysteine to cysteine and B_9/B_{12}

convert Hcy to methionine, improving brain vascular health. B_6 prevents AGE formation in vitro; B_6 is similar in structure to polyphenols (that prevent AGE formation) doing the same via its 3 OH groups ► PO 2013;8(9):e72128; thus, it is no surprise that studies found that people with higher B_6 blood levels had lower cancer rates and better memory. OG 2000;95(4):519-24 found Hcy > 18 meant 3-6.4 times more miscarriages (> 18 mean low folate); perhaps fetus endothelial injury and fetus brain damage by maternal AGE intake happen too, so pregnant moms with higher B_6 (not just Hcy < 6-7) may birth *higher IQ babies, with healthier brains*. Most females got Hcy > 8. IJGO 2007;96(1):43-4 found that taking 80 mg B_6 a day diminished PMS symptoms. OG 1991;78(1):33-6 found that 30 mg B_6 daily diminished nausea during pregnancy. The ACOG says that for pregnancy nausea/vomiting "B_6 is a safe, OTC treatment that may be tried first. Doxylamine, a medication found in OTC sleep aids, may be added if B_6 alone doesn't relieve symptoms" (B_6 + doxylamine relieved vomiting/nausea by 70%). JOG 2006;26(8):749-51 found no side effects were noted at even 130 mg a day (range was 50 to 500, 130 is mean), which is over 50x the RDA and > the UL even. Holistic people don't use doxylamine, but ginger or acupressure, acustimulation, acupuncture ► CDSR 2010;(9):CD007575. About half of pregnant women experience nausea, vomiting at least once *during first months of pregnancy,* with only 25% not experiencing nausea or vomiting. 15 g of *saturated fat* increases morning sickness risk by *5.4 times*: Epi 1998;9(6):636-40 ► "odds ratio = 5.4 for each 15 g/day increase (equivalent to one *quarter-pound cheeseburger*)". Morning sickness is not present almost at all in many *vegan* populations (while very present in omnivore ones), as the pathogens from animal products don't trigger the vomiting ► 4 min video. Part of the cause may have to do with the body rejecting foods that may harm the fetus (viruses, bacteria), based on eons of knowledge.

►► 12.4.19. VITAMIN B_7 ◄◄

B_7 or biotin is sensitive to UV light, store away from windows. Avoid taking biotin as a pill 3-14 days before biotin sensitive blood tests. B_7 in high doses of 2-30 mg could cause acne in some, so if breakouts happen, get vitamins with lower B_7, B_6 and B_{12} the 3 known to trigger it. When deficient, B_7 causes brittle nails, hypotonia, *conjunctivitis*,☺☺☺ skin infections, hair loss all over the body, lethargy, paresthesias, depression. B_7 is a cofactor *for acetyl*-CoA carboxylase *1 & 2, propionyl*-CoA carboxylase, *methylcrotonyl*-CoA carboxylase, *pyruvate* carboxylase involved in the metabolism of amino acids, fatty acids, glucose. B_7 helps signal cells, modify histone, regulate genes by changing transcription factor behavior. B_7 was used for decades, especially in children, to cause complete hair regrowth (plus help white hair get colorful again) at doses *333 times higher than today's RDA*, meaning 10 mg/day, not 0.03. JAAD 2018;79(6):E121-4 Table 1 shows studies that yielded unbelievable results (kids and adults stopping hair loss or achieving complete hair regrowth) after just 1 year of 1-30 mg/day (80% of case reports used 10 mg/day). It's worth trying for 1 year to see if anything improves with eyes, skin or nails; skin quality is

critical, it's a marker for qualities of arteries, vascular problems stemming from lack of elasticity, lack of regeneration, leading to strokes, heart attack, since collagen is 35% of our body protein. Many MDs believe it helps with skin, nails, hair and all this would also help dry eye sufferers, since cornea is skin, its wetness and eyelid skin condition will make us more/less prone to styes and acne, irritation and abrasion, inflammation and redness. It's about inner health. Nutricost sells 240 caps/15$. Nutricost has only rice flour as extra ingredient in some vitamins, while others have silicon dioxide (lung issues if inhaled) or coconut oil (raises LDL). Try for 1 year, 1 cap/day, and see if hair thickens, nails become less brittle, skin improves, blood pressure drops (better vascular skin tone on arteries) or dry eye disappears, skin improves, cornea redness diminishes. The AIs in µg are: 0-12 mo 7, 1-3 years 8, 4-8 12, 9-13 20, 14-18 25, 18+ 30, pregnant 30, lactating 35.☺☺☺ The AI changed from 300 µg to 30 in 2016 and vitamin companies had until 2018 to update their labels. There is no UL for B_7, as there was no toxicity observed at 500 times the AI, but B_7 interferes with lab tests and could lead to misdiagnose of diseases, so stop taking it before some medical tests. Food intake is hard to establish as USDA databases lack the B_7 level. Most multivitamin or B-complex pills got 30-300 µg, 30 and 75 two I used. JN 2009;139 (1):154-7 found half the pregnant women had 3-hydroxyisovaleric acid, meaning B_7 deficiency existed ► Multivitamins "reduced the combined incidence of *cleft palate (birth defect, opening in the mouth roof) and limb* shortening 7 TIMES". Transport of B_7 across the human placenta is slow. B_7 deficiency causes cleft lip (opening in the lip), cleft palate and impairs skeletal long bone growth in mice. B_7 deficiency is *highly* teratogenic (birth defect causing) in mice at levels where no symptoms show in pregnant mice. In humans and animals, avidin in raw egg whites binds biotin *and leads to deficiency.* The rates of cleft palate and *limb* hypoplasia *(deformed or short limbs, hands, feet, jaw)* approached 100% at egg white concentrations > 5%. Alcohol inhibits B_7 absorption, so drinking moms have more birth defects, as explained here. People with some cancers may need to avoid B_7 intake, as B_7 can help cancer cells grow ► MC 2026;86(5):901.

► ► 12.4.20. VITAMIN B_9 (folic acid is toxic form, 5-MTHF is safe, natural) ◄ ◄

Like B_1, B_2, B_6, B_{12}, B_9 is sensitive to visible light, so store it away from light, water, heat. Autistic toddlers (with cerebral folate deficiency) who take leucovorin or folinic acid (folic acid with NH turned into N-C=O, pteridine ring having 2 double bonds instead of 4 in folic acid), start talking after 3 years of silence. It's called folate because foliage is green and greens contain B_9; just like B_2, it contains 3 hexagons, 2 of them with 2 C replaced by 2 N. The RDAs in µg DFE (1 µg DFE = 1 µg food B_9 = 0.5 µg pill B_9 (empty stomach) = 0.6 µg pill B_9 (taken with meals);☺☺☺ DFE = dietary folate equivalent): 0-6 mo 65 (AI), 7-12 mo 80 (AI), 1-3 yrs 150, 4-8 200, 9-13 300, 14+ 400, pregnant 600, lactating 500. The ULs (for pills + fortified foods) in µg pill B_9: 1-3 300, 4-8 400, 9-13 600, 14-18 800, 19+ 1000. The 19+ UL is 1000 µg folic acid or 1667 µg DFE, stay below UL to avoid health issues. Mnemonic is simple DFE is like deaf, the kids don't speak, as if they don't hear, as

if they're deaf. Bedwetting kids get cured by taking B_6, sort of like folinic acid: brains need $B_{6/9}$. There's no UL for food B_9. I get 1500 µg/day from food; multivitamins have 200-550 µg, 400-550 the ones I used. Spinach B_9 was 30% bioavailable versus pill B_9 ► AJCN 2004 ;80(4):911-8; the paper says studies found food B_9 can be only 10% bioavailable. Some people lack enzymes to convert folic/folate to 5-MTHF that the body absorbs, and uses, so for those, a brand with 5-MTHF, 480 caps/40$, like MicroIngredients will be life saving, as it lacks inactive ingredients like magnesium stearate which lowers B9 bioavailability 2-9 fold. 5-MTHF form of B_9, if taken in high amounts (1.7 mg DFE), can cause heart palpitations, irregular heart beat, an increase in heart rate, sleep disturbances in some. Cur 2025;17(2):e79374 says "adverse effects of maternal (folic acid B_9, unnatural, not in foods, only in cheap pills) intake above the UL, including low psychomotor scores, autism, decreased verbal memory, language delay, reduced embryonic size, and insulin resistance… Very few adverse effects of excess natural folate with 5-MTHF supplementation have been documented, and for this reason, they don't apply to concerns such as the accumulation of unmetabolized folic acid (UMFA) in the blood. UMFA … associated with … cognitive impairment, cleft lip, and autism… Excessive folic acid intake… linked to … autism, developmental delays… insulin resistance in fetuses… (UMFA) cause issues such as DNA damage, leading to an increased risk of cancer and digestive complications… high levels of folic acid, especially above the recommended limit… decrease the activity of natural killer (NK) cells…. This… can make it harder for the body to fight off cancer. Excess folic acid… connected to heart disease, autism, and birth defects like cleft lip". "if a new mother has a very high level of folate right after giving birth – more than four times what is considered adequate – the risk that her child will develop an autism spectrum disorder doubles… very high B_{12} (is) tripling the risk (of) autism. If both ($B_{9/12}$) are extremely high, the risk (rises)… 17.6 times". Folic from pills + fortified foods above UL causes "pregnancy loss (&)… fertility" loss ► Ntr 2022;14 (13):2715. Folic (≥60.3 nmol/L) or B12 (≥536.8 pmol/L) meant 2.5x higher autism risk.

See vitamin B_{12} section (much info on B_9 there) above for the B_6-B_9-B_{12} studies on lowering *brain shrinking with age, endothelial injury,* homocysteine (Hcy) *levels*. Since lower Hcy means less heart disease it's no surprise that those with > 536 µg/day B_9 intake had 38% less heart disease than those with < 272 µg/day ► Stroke 2010;41(6):1285-9. The biologically active form of folate is 5-methyltetrahydrofolate, or 5-MTHF, so sometimes some pricier vitamins have this form aimed at people with certain SNPs (pronounced snips), single nucleotide polymorphisms, that diminish the conversion of food folate into 5-MHTF needed for homocysteine methylation in the presence of B_{12} (explained in the B_{12} section).☺☺☺ However, some people experience insomnia or anxiety from 5-MTHF, so discontinue if so. However, many greens, berries, etc have 5-MHTF already. Homocysteine methylation is fundamental for proper health, as Hcy > 20 can mean 4.5 higher mortality than Hcy < 9. The enzyme that makes 5-MHTF from folate we eat or get from

vitamins is methelenetetrahydro folate reductase, or MTHFR. The normal gene for the production of MTHFR enzyme is MTHFR C677C/A1298A, where C is cytosine, A adenine (two of the base pair components of nucleotides, which have phosphate, a sugar and a base pair). Sometimes, mutations lead to the C being replaced by T or A by C so we get MTHFR C677T or MTHFR T677T, which is also written as homozygous MTHFR T677C. When 1 C is replaced by T, or 1 A by C, it's not a big deal, but when 2 Cs/ or As are replaced, the enzyme activity is inhibited by up to 70%, leading to lower production of methionine from Hcy, and higher risk of mortality, heart disease, Alzheimer if one doesn't take B_9 as 5-MHTF instead of normal B_9. Since the methylation of Hcy to methionine needs methylcobalamin B_{12}, the *cyano*cobalamin B_{12} in most vitamins is not always up to the task, because it's not converting efficiently into methyl B_{12}. That's why it's best to avoid cyano, see the B_{12} section which explains many reasons why triple B_{12} is the best. For more on MHTFR C677T/A1298C (homozygous, 1 mutation), T677T/C1298C (heterozygous, 2 mutations) from the normal C677C/A1298A, see this article. Some estimated 30% of Americans have 1+ mutations, that is a LOT of people. ☺☺☺

Taking multivitamins with B_9 for 3 months before conception led to 2 times fewer birth defects ► BDRACMT 2009;85(4):260-8. 35% of U.S. adults and 28% of children aged 1 to 13 years use supplements containing folic acid. Taking multivitamins with B_9 led to a decrease of 9.6% in blood Hcy levels. High Hcy destroys endothelial cells, so B_9 prevents abnormal vasculature (in fetus too), atherosclerosis, cardiovascular disease ► JN 2000;130(12):3090-6. Choline, B_{12}, betaine also lower Hcy, like B_9. In some studies B_9 and B_{12} lowered Hcy by 36%. Hcy being high is a risk factor for dementia and Alzheimer. Since many women get only 200 µg of B_9 from food, getting 400 µg from a pill 6 months before conception and during pregnancy is essential for minimizing neural tube birth defects. Since 1998, when the mandatory B_9 fortification program took effect in the US, neural tube birth defects rates have declined by 30%. Pregnant women taking multivitamins with B_9 *3 months* before conception had a *24% reduction in* congenital heart defects of babies*, while those starting* to take multivitamins after the first month of pregnancy did not get these benefits ► AJE 2000;151(9):878-84. A US study of 525,488 people aged 50 to 71 found that those B_9 intakes of 900 µg/day or higher had a 30% lower risk of colorectal cancer than those with intakes less than 200 µg/day ► AJCN 2011;94(4):1053-62. Moms with *higher* B_9 levels gave birth to offspring with *higher* cognitive function, as fetus brain vascular health improved, probably new *capillaries* fed new neurons as brain increased 50,000 fold in size better, as Hcy was low ► JN 2010;140(5):1014-22. ☺☺☺

►► 12.4.21. IRON | $_{26}Fe^{56}$ ◄◄

Women menstruate, so they're far more likely to be deficient, especially if pregnant. The NIH RDAs in mg are: 0-6 mo 0.27 (AI), 7-12 mo 11, 1-3 yrs 7, 4-8 10, 9-13 8, 14+ 11, 19-50 men 8

women 18, 51+ pregnant 27, lactating 9. The ULs (for pills + foods) in mg: 0-18 yrs 40, 19+ yrs 45. I get 32 mg/day from food alone; multivitamin brands have 8-21 mg. The NIH link explains that *vegans/* vegetarians need 180% RDA (if using food as source alone), 14.4 mg food iron for *vegan* men, 32.4 mg food iron for *vegan* women, 48.6 mg *vegan* pregnancy, because *vegan* iron is less bioavailable. Video shows symptoms of iron deficiency. In 2025, omnivore centenarians got 9% higher serum iron and 16% lower ferritin (iron storage): ferritin was 149 in centenarians (vs 177 in those dead), which means their ferritin was probably 70-100 at age 50, since ferritin rises with age, while serum iron falls with age. Anemic centenarians had ferritin 139, while the normal centenarians had it 101. For vegans, we don't know. During pregnancy, women take iron as pills, so the level needed can be calculated depending on each vegan diet (divide vegan iron by 1.8, then subtract that from 27, to get amount needed from pill). Since vegan moms eat more iron from foods than omnivore ones, the amount in pills Fe needed is about the same, if C intake is high and phytate not too high (soaked legumes). Vegans who soak legumes and avoid cereals may eat less phytate (that lowers mineral uptake) than omnivores eating cereals or out. Since 80% raw *vegans* eat way more vitamin C than vegans, the Fe required is probably less, as C boosts Fe absorption, as long as Ca, Mn and Zn are not high. "2 mg (phytate) inhibited (iron) absorption by 18%, 25 mg by 64%, 250 mg by 82%… ascorbic acid *(vitamin C) significantly counteracted the inhibition*" ► AJCN 1989; 49(1):140-4. "tea leaves concentrated at *396* mg/275 mL serve *polyphenols reduced (iron) absorption (from bread) by 91%*, while the same tea diluted to 99 mg/275 mL by 82% (*20-50mg by 50-70%*)" ► Ntr 2013;5(8):3184-211 ► "*coffee* (tea or anything with polyphenols will be similar) 1 hr following a meal or simultaneously with a meal both inhibited iron absorption by 44%, while coffee consumption 1 hr prior to food had no effect… *50 mg* ascorbic acid increasing absorption by 61% from a hamburger meal and *164%* from a pizza meal… iron absorption from bread rolls containing as much as 250 mg phytate was improved with the addition of *50 mg ascorbic acid*… 100 mg of ascorbic acid added to a meal of rice and soup could not (fully) counteract the inhibitory effect of tea… (iron absorption increased *35*%) in a self-selected five-day diet study (*247* mg/day ascorbic acid vs. *51* mg/day).. 164 mg ascorbic acid in fruit with a breakfast cereal containing 272 mg phytate as a daily breakfast meal improved iron status". I eat *500-1000* mg/day vit C (usually 600), at 500 mg phytate, polyphenols effects on iron are canceled, but remain valid for Mn. NIH says *vegan* RDA for iron is almost double since *vegans* eat more polyphenols. Even omnivores can eat 1.4 g phytate daily, more than many vegans. Vegans eat more Fe, but absorb less, so *vegan* ferritin levels are lower. Too much iron (Fe:Zn ratio 2:1) lowers the levels of Zn causing issues ► JN 1986;116(6):927-35, but most people don't take more than 8 mg for males or 27 mg for pregnancy. Vegan MD, top of class at Stanford and Harvard, says ferritin needs to be 30-80 ideally. ☺☺☺

Maternal iron levels have a huge impact on the birth weight, health and IQ of their kids, and iron

deficiency in the first 2 years of life (not just during womb period) can dramatically lower IQ, quality of brain development, telepathy ability. *A temporary iron deficiency in infancy can lead to* IQ 13 points lower *later on* ► Ar 2007;57(6A):426-30. As the coffee section explains, polyphenols in purple produce, coffee can cause low IQ. Coffee is deadly during pregnancy, causing miscarriage, low IQ, heart defects, endless issues due to caffeine. Even things like spices (peppermint), turmeric (Cur 2019;11(1):e3858), etc, anything on the high polyphenol list needs to be used with care and vitamin C, meaning, extra iron taken during pregnancy if eating those to protect self from gestational diabetes induced by high iron. Vitamin C cancels the polyphenol iron lowering, so always eat healthy berries with high vitamin C veggies and extra iron to be safe. JNS 2008;28(47):12176-82 explains that total brain volume doubles during the first year of life (increases by 100% in 1st year and another 15% in 2nd year) and reaches 80–90% of adult volume by age two, the womb and first 2 years of life are the most critical and any deficiency in this period has dramatic consequences that often are irreversible for the rest of one's life. Iron deficiency at age 1-24 months does irreversible damage and *even if iron levels are corrected, those kids will have lower IQ, lower motor function,* more repeated grades, anxiety, depression, social and attention problems 10 years later than those who did not have deficiency early on ► Ped 2000;105(4):E51. A study of 110 girls aged 12-15 showed *that* those who were iron deficient had IQ 11 points lower, *see Table 4* ► Ane 2013:819136. "Infants who did not receive supplemental iron had longer looking times on a visual recognition memory task... infants with iron-deficiency anemia received lower motor test scores, averaging 6 to 17 points lower... Virtually every case-controlled study that examined social-emotional behavior found differences in iron-deficient anemic infants (e.g., more wary, hesitant, solemn, unhappy, kept closer to their mothers)... studies reported improvements, sometimes dramatic, in mental and/or motor test scores after iron therapy... higher levels of irritability in infants whose mothers were iron deficient. At 5 years, each 10 g/L increment in Hb at 9 months was associated with a 1.75 point-higher IQ score... iron-deficient anemic group tested lower in IQ, psycho-educational abilities, visual motor integration, and language abilities. Formerly anemic kids had IQ 6 points lower years later. Hb less than 105 g/L at 9 months (anemia) predicts lower IQ at 7 years old" ► NR 2006;64(5 Pt 2):S34-91.☺☺☺ "Lower levels of neonatal hemoglobin and serum iron (in pregnant mothers) were related to higher levels of negative emotionality and to lower levels of alertness and soothability (in their children)." ► DP 2005;46(2):141-53. Compared with children with cord ferritin in the 2 median quartiles, those in the lowest quartile scored lower on every test and had significantly worse language ability, fine-motor skills, tractability; they were also 4.8-fold more likely to score poorly in fine-motor skills, 2.7-fold more likely to have poor tractability than those in the median quartiles. ► JP 2002;140(2):165-70. To properly compare study conclusions, we need to know what their quartiles, the ferritin ranges are, since each study uses different ranges. Giving breastfed newborns iron pills resulted in higher motor development and visual

acuity at 12 months ► JP 2003;143(5):582-6. *Iron deficiency in infancy is related to mental retardation at age 10* ► AJCN 1999;69(1):115-9. Vegans don't have a higher incidence of iron deficiency in some studies, but in others they do have ferritin < 12 more often.

BMCM 2012 10:119 found that the more meat (heme iron) iron people ate and the higher the body reserves of iron (as measured by ferritin blood concentration), the more Type 2 diabetes people got. On the contrary, dietary intake of *vegan* non-heme iron, or iron from supplements did not correlate with Type 2 diabetes risk. Given this data, I'm surprised some companies, like Impossible Foods, are creating *vegan* burgers with *vegan* heme iron for taste, when several studies have implicated heme iron and heme itself in several diseases, including cancer. Non-heme iron was not related to blood ferritin levels, but heme iron was. Another study found the same diabetes ferritin connection ► DC 2006;29(8):1878-83. Too much iron causes cancer ► CS 2009;100(1):9-16. Too much copper and iron cause cancer ► AE 2004;14(3):195-201. Lowering iron lowers cancer rates ► JNCI 2008;100(14):996-1002. Too much iron may speed up Alzheimer ► JCMM 2008;12(5a):1548-50. Vegans were found in NE 1993;12(1):28-36 to have 3 times less Alzheimer than omnivores, maybe the heme iron causes ferritin levels to climb faster, damaging the brain. ☺☺☺ The iron and heme-iron links to IQ are complex and within certain brackets there is a lot of variability: "Chinese Children who performed the best on IQ tests exhibited low iron levels (compared to the others in the sample, not to anemic children) concurrent with high hemoglobin (iron bound to heme) levels, whereas the group who performed the worst exhibited high iron but low hemoglobin levels." Other studies also found the higher the Hb the higher the IQ, so it's Hb that counts more in some ► PI 2012;54(5):669-75. However, a study found that "Higher hemoglobin levels were associated with higher IQ in the children who carried the wild-type allele DRD2 (dopamine D2 receptor that is hypothesized to regulate the effect of iron and lead on cognition), but in children homozygous for the variant allele, an increase of 1 g/dL hemoglobin was associated with a decrease in 1.82 points of IQ" ► EHP 2011;119(1):144-9.

IRON ABSORPTION IN VEGANS AND OMNIVORES

Research found that when ferritin is only 12 ppb in the blood, people are iron deficient. When ferritin is above 50 ppb, people start increasing their risk of getting diabetes and cancer, especially when above 150 ppb. Normally, a value between 12 and 300 is thought of as normal for men (12-150 for women), but some studies found that even above 50 problems start to appear. Vegans have ferritin levels around 72, way above the 12 deficiency level, compared to omnivores levels of 125, which have a higher incidence of cancer and diabetes. AJCN 1994; 59(s): 1233S-7S mentions hemoglobin concentrations are the same in vegetarians and omnivores; ferritin levels in *vegans* and omnivores are at ► EJCN 1999;53(3):189-94. A study of 50 vegetarian and 24 omnivore females found much lower ferritin level for *vegans*, even if they ate

slightly more iron ► 25 ppb for vegetarians vs 45 ppb for omnivores ► AJCN 1999;70(3):353-8 ► 18% of vegetarians, 13% of omnivores had ferritin < 12 ppb because these vegans did not take multivitamins, which would have gotten their ferritin to 50-100 really fast. After taking iron containing multivitamin my ferritin was 115 in 2017. In 1999, the iron awareness among *vegans* was lower, as Internet was just starting. In 1994 serum ferritin concentrations were significantly lower in male vegetarians 37 ppb vs omnivores 105, in female vegetarians 14 vs omnivores 34; 42% of vegetarian vs 39% of omnivore females had ferritin < 12 ppb (the warning level) ► EJCN 1994;48(8):538-46; more of the vegetarian males had ferritin < 12 ppb than omnivores. ☺☺☺

Vegans got more iron in the diet, but ferritin level was lower (about half the level of omnivores in this study, explaining why they got lower cancer and diabetes perhaps). Nobody knows exactly if lower ferritin is bad, as long as it doesn't become very low, because too much iron causes cancer as the papers above explain and in some studies higher iron meant lower IQ (as long as it was not heme-bound iron, since the higher the heme iron in the blood, the higher the IQ in some studies). Heme iron in blood is not necessarily related to dietary heme iron of course. In another study above those with a gene had lower IQ when heme iron was higher in serum. The relationship is not very uniform, but low ferritin might mean issues in some people at least; on the other hand, high ferritin increases diabetes risk, which lowers cognitive performance. Human biochemistry is ultra complex. ☺☺☺ Those eating a lot of phytic acid rich foods (even if they're omnivores) and polyphenols, further chelate iron preventing its uptake. Too much milk, tea, coffee, eggs, calcium antacids, calcium, magnesium, zinc or unfermented soy can diminish iron uptake too. Even so, *vegans* are as likely as omnivores to get iron anemia (they eat more iron than omnivores per some studies, yet have lower serum ferritin levels), possibly because *vegans* eat far more vitamin C, fermented soy, citric acid, lactic, malic acid and other organic acids which increase absorption of iron and the fact these days, even more than 10-25 years ago, a lot of packaged food has iron added to it, cereals, breads, pasta especially. Most people take a blood test every 10-20 years at least, if not 5, and it tells them if their iron levels are low. There are so many factors at play, that it is hard to know how well one absorbs iron or anything really. That's why people do a blood test once in a while, especially if there seems to be a problem or they're pregnant, etc. It might be free every year to do it on some insurances, not sure. Iron deficiency can lower IQ, brain performance (telepathy too) a lot. A quarter of babies are thought to be iron deficient. It's not clear what the serum ferritin levels mean at times, when they're lower, but within the acceptable range. It's a known fact that iron from meat is associated with cancer, but the causation is hard to prove, it may be due to other carcinogenics in meat.☺☺☺

►► 12.4.22. IODINE $_{53}I^{127}$ *(mornings, as it causes insomnia if taken evenings)* ◄◄

Use 150 µg iodiDe, I^-, ionic, from KI, not 150 µg iodiNe or I from kelp, KI absorbs 2 times better,

kelp often causes allergies. If using kelp form in vitamins, you may need 300 µg. The RDAs in µg: 0-6 mo 110 (AI), 7-12 mo 130 (AI), 1-8 yrs 90, 9-13 120, 14+ 150, pregnant 220, lactating 290. The US ULs (for pills+food) are: 0-1 yrs unknown 1-3 200, 4-8 300, 9-13 600, 14-18 900, 19+ 1100. The US adult UL is 1100 µg, EU 600 µg, Japan 3,000 µg. Iodide 20 mg/kg or iodate IV injection can give retina damage, blindness. Even 100µg/kg can cause issues, like atherosclerosis in groups not used to high I (Japan has evolved genes due to eating high I). Kids and pregnant women need to eat multivitamins with I, to help IQ and also selenium which helps the body reduce the oxidative stress from extra I via the GPx enzyme that needs glutamine, glycine and cysteine (N-acetyl cysteine) to make glutathione. Even if these limits exist, NIH is OK with 6,000 µg doses under physician guidance to treat fibrocystic breast disease ► AMR 2008;13(2):116-27. Common signs of deficiency are nail vertical ridges, feeling cold all the time (hands and feet especially). However, vertical ridges on a nail can be caused by low protein during fasting on mostly water or low iron, zinc, magnesium, B vitamins, etc. However, if taking higher 0.5-1mg doses of iodine, taking 100-200 µg of Se is important for the conversion of T4 into T3 and reducing thyroid oxidative stress coming from high I levels. Fluoride, chloride, bromide interfere with I^- absorption because they behave chemically the same way due to similar electronic structure, same group in the periodic table ► PR 2004;53(Suppl1):S81-90. Dr. Flechas believes higher I is good for IQ. Some breads, many sodas have bromide or brominated vegetable oil BVO (patented as a *flame retardant,* banned *in food in* EU in 2008, UK in 1970, India 1990, Japan 20120, but present in 10% of US sodas since 1920s, banned in USA only starting in August 2025 after 10 decades of complaints from activists and being labeled as GRAS, *generally recognized as safe,* in 1950s) and bromide goes into the brain leading to strange behavior, blocking the uptake of iodine. In Oct 2023, California banned BVO and FDA proposed a national ban. The shocking thing is that for 100 years, the US government allowed ☺filif cow IQ☺ aristocrats to take natural oil and brominate it, which anyone with the least level of chemistry education, maybe 10th grade, would find it genocidal, since pesticides and other toxins are chlorinated versions of common organic structures and bromine is not found in most compounds of the human body, being a natural group 7 competitor for I sites in the body. In a culture of profit trumps health, anything goes into the food of the workers. The parasitic rich don't drink coke, they usually drink freshly made juices or other stuff slave chefs make for them. It's shocking how easy it is for companies to add anything without extensive studies proving safety.

US bread and milk used to have I^- too, now bread has bromide sometimes (used to kill termites). Kelp I is popular, but it contains *arsenic, lead, cadmium, pesticides, PCBs from ocean, radioactive impurities, mercury.* Kelp has allergy causing proteins, peptides, compounds in weak or normal immune systems JAP 2023;35:339-52, causing hives or anaphylaxis after laminaria kelp tents they insert into vagina during abortion. Thus, *potassium I^-, KI, is far safer than kelp, 20x cheaper.*

During nuclear war or power plant melt down, they use KI, *since it's easy to get 65 mg to prevent uptake of radioactive* I *(that causes thyroid gland cancer), while with kelp,* you need eat sometimes 100 g of kelp, which would be unhealthy for allergic people. Transporting 100 g for many people is 1000 times harder too, than tiny 100 mg pills. KI lasts 'forever' almost, kelp expires. Thus, millions of people, me included, now only use multivitamins with I^-, KI, and no kelp, to avoid hives, pimples, etc. It takes often 250-500 mg kelp in that multivitamin (half the weight sometimes) to reach 150 or 225 µg for pregnant ladies: *lots of proteins to cause allergy, hives, pimples*. The heavy metals are not the big issue, as we get those from all foods (since we eat pounds of those foods, we get far more heavy metals than from a little pill), but the specific *proteins*: allergy and pimples are bad, since acne happens on the inside too, meaning arteries leading to atherosclerotic plaque (acne of the arteries). If taking I supplements, better limit intake to 5-10% of a 10 mg capsule roughly, or 500-1000 µg. Even 300 µg may be high, for people with acne or ocular styes (seen only with 20x mirror, on the edge of eyelid), since it may cause flare ups. Vegans are at much lower risk of hyperthyroidism, so you can take more than the 150-300 mcg many take, given Japanese vegans often take 3000 mcg. Terry sells 90 caps (no stearate, just cellulose/silica) of 12.5 mg Iodine, 97% as iodide, KI/NaI in equal amounts of 6.06 mg and 3% as kelp, so much better than kelp. Take 10% of this or 5% and see what the labs come at, or if dry eyes become wet. So, if we want to see effect of higher I on biomarkers, acne, cognition, hair loss, oxidative stress, fluoride/bromide detox, eye function, immunity buy 120 10 mg capsules (cellulose inactive ingredient). MH 2020;144:109860 says I may prevent flu and Covid: "the Japanese, known for their high iodine intake, have a very low number of COVID-19 deaths compared to other countries (iodine helps the innate immune system) (JPBS 2025: iodine mouthwash prevents Covid spread in dental offices), especially in 33% of people worldwide who're deficient and 60% who're suboptimal. 3 papers (1914, 2011, 2014) show iodine benefits for respiratory (RSV, etc) infections. Most 150 µg KI brands have magnesium stearate that can block absorption 50-90%, so 225 mcg KI (cellulose) from Pure (120 caps/20$) is your only Amazon choice free of stearate, just take 50% or 67% of a 225 mcg cap if you want to take 112 or 150 mcg KI/day you may get in a multivitamin. The cheapest higher dose type with least extra ingredients is 34$ 120 caps of 10 mg I each, lasting 10 years if you use 1 capsule a month, i.e. 333 mcg/day. Since pure iodine tablets or caps, sold as 12.5 mg can be corrosive to the throat, etc, they're best avoided if you worry about tissue injury, as they're not pure KI, but I_2 + KI. One that is best avoided, is 300 caps 1 mg 30$ (has no safe KI, but unsafe bladderwrack (wrecks your bladder) to aid joint, gut health, but it can cause bladder inflammation (cystitis) and kidney toxicity if you're allergic to it, or if the supplement is sourced from polluted waters and contains toxic heavy metals like arsenic, so it's best to avoid this form of iodine sold by Life Extension, since pure KI is much safer), 7 times cheaper than Pure/g. You can add this to a multivitamin or take it when taking blood tests and have to avoid multivitamin for a week to prevent biotin

interference with blood tests. The Thyroid Support 10$ for 180 caps of 230 mcg KI, 200 mcg Se, 11 mg Zn, 1.2 g tyrosine, 200 mcg B9 DFE is free of stearate and could work for some who take low B9/Se and need to bump KI, due to low KI in their multivitamin (40-80 mcg), but due to tyrosine, you may need do blood tests and get MD to OK the high tyrosine. The 65 mg caps (200) will cost 100x < normal 0.2-0.3 mg caps, last 35 years at 1 mg/day (*only good as family of 6+ size to avoid rotting of rice flour, mold*) but you have to stay below FDA 1.1 mg upper limit, you need take 1.5% of a cap/day, or 1 mg max, 1 cap every 60 days is hard to live with, 1 cap/10 days is easier to handle. For safety, 10 mg is better, it allows you to use about 5% easily and gradually increase. You can also make caps with 99.98% pure USP KI mixed with some filler (sugar, flour, turmeric, some healthy spice) and other vitamins, minerals you want added, using a size 0 cap maker (manual or automatic), calculate exactly, so max 10*1.31=13.1 mg KI (39+127/ 127=1.31) max will go to 10 vegan capsules, (1000/16$) to get close to UL, but still leave a 0.1 mg for dietary iodine. ☺☺☺

When a vegan diet is high in goitrogens from kale, cruciferous, the thyroid can become mildly sluggish. A classic, subtle symptom of low thyroid activity is a localized accumulation of fluid and mucopolysaccharides (a gel-like substance) inside tissue joints, known as mucinous edema. This creates internal pressure and structural pain in the knees when moving. Taking 1 mg I stops the raw kale iodine uptake block. It fully fuels our thyroid, optimizes metabolic fluid balance, clears the stagnant, pressurized fluid out of our knee capsules. Eating many legumes/grains/foods packed with phytates, which block uptake of Zn, Se, Cu, Mn, reduces SOD and cross-link collagen synthesis to repair joint wear and tear. 1 mg I interacts with systemic mineral distribution pathways, while curcumin acts as a direct antioxidant shield, protecting a mineral-starved cartilage from undergoing oxidative breakdown during movement. I can help prevent a digital mucous cyst, a fluid-filled (thick, jelly-like synovial fluid) sac that forms near the fingernail joint. A low I baseline triggers cyst formation through thyroid driven joint swelling. Low I means no capacity to manage systemic fluid/electrolyte balance. This creates a mucinous edema (sluggish fluid accumulation) inside finger joint capsules (or even knees), including the tiny distal interphalangeal (DIP) joint of a finger. Due to a sedentary life, the fluid within that tiny finger joint (or knees) can become stagnant and pressurized. Over time, this pressure forces the weak part of the joint capsule to herniate or leak outward under the skin, forming a visible bump or cyst that diminishes once the electrolyte, calcium and iodine imbalances are corrected.

Vegans get less I from food and eat more I inhibitors, multivitamin brands have 75-225 µg, so *vegans* need take more I from pills. Since I eat no iodized salt or any salt, and no dairy, fish or seaweed *(too many heavy metals)*, my iodine intake from food is very low, maybe 10 µg so I tried to get 150+ µg from vitamins daily for many years (it's 150-325 µg from some iodine kelp capsule, still figuring out how much is optimal for my genome, will try 650-975 kelp or maybe KI

500 µg too to see effects). US average is 216, excluding iodized salt (another 45 µg for many). USDA tables don't list iodine, D, B_7, so I could not add them to my food table; *kelp I is 50-60% bioavailable, vs 96% for* potassium iodide *(KI)*, so those using vitamins with kelp may need 300 µg to absorb same I as vitamins with 150 µg KI, if their diet is low in iodine. I intake is to be increased slowly, for the thyroid to get used to it, never go way above what our body was used to for decades, as it can do more damage than good. Some *vegans* eat more goitrogenic foods which slow I uptake, so they may need to eat even more pill I than regular vegans. *Exactly as dietary thiocyanates in cruciferous veggies or* flaxseeds *can interfere with I uptake* if overeaten*, some medicine or vitamin inactive ingredients could pose some issues in certain genomes/guts.* Povidone-$(I_3)^-$ complex is familiar to many, so (cros)povidone may interfere with I absorption in some genomes *(see pic,* one povidone unit is about 222 molar mass *vs* 127 for I^- and 381 for I_3^-, but many monomer units are free), since it is 5-75 mg in tablets weighing up to 1.5 g, vs 0.15 mg for I RDA. I^- could react with some free radicals at "rates 12- to 500-fold higher than ascorbate (vitamin C) and glutathione" (PNAS 2008;105(19):6954-8); the I containing products of that reaction could recombine with I^- and/or bind to units of pyrolidone (that did not cross link) in crospovidone and be eliminated before reaching the serum and then thyroid, leading to mental retardation or 20 points lower IQ in offspring due to iodine deficiency of pregnant moms; while this sounds far fetched, since povidone is the I_3^- complex, not I^- or other diet I forms, we can never know what goes on without studies; in our stomach though, and digestive tract, tons of compounds would compete with I derivatives to bind to crospovidone; it may be best to not chew I multivitamin with crospovidone containing tablets (see B_{12} section) at the same time; USP states adding iodine to crospovidone and then starch leads to no typical blue color, since I is bound to crospovidone and can't form the starch-I blue complex; Handbook of Pharma excipients (945 pages) indicates povidone forms adducts with various compounds and crospovidone is a disintegrant used at a level of 2-5% of tablet; this shows how complicated the issue of pill additives is. We need studies that examine serum, urine, stool I compounds after eating crospovidone with I^- supplement or foods; I could not find such safety studies online. Lack of I leads to IQ 13.5 points lower sometimes and in rare cases to severe brain deficits or even mental retardation (meaning IQ lower by 70 points). ONLY 15% of Australian pregnant women had enough I (> 150 µg/L in urine) ► Ntr 2010;26(10):963-8. *We're* not even talking about the "anti vitamin" subgroup of *vegans* (hopefully 1% or less of *vegans*) ("nature knows best how to poison people"), *it's* far worse *there if no strawberries, sea weeds, algae consumed weekly*. A third of humanity is thought to be I deficient at least. Many people are I deficient (especially those avoiding salt, due to hypertension, including iodized salt or multivitamins), and kids in I deficient communities whose pregnant moms don't get multivitamin with I and who don't get I themselves can have an IQ score 12 points lower than the rest ► APJCN 2005;14(1):32-42.

The American IQ scores went up 15 points after the introduction of Iodized salt in 1924. "A meta-analysis of 18 studies found a 13.5 point difference in IQ between I sufficient and I deficient children (Bleichrodt and Born, 1994)" ► FHN 2013;7:97. What is interesting is that the I levels in urine of pregnant women seems to be on a decline, as found in this 2004 study, where half the Boston pregnant women were low in I ► Thyr 2004;14(4):327-8. Pregnant women need 250 µg I I daily, according to the WHO, yet many prenatal vitamins, don't even have I or only 25-150 µg and sometimes from poorer absorbed kelp compounds, compared to the best absorbed potassium I^-, KI. If they don't eat seaweed or iodized salt at home (99% of commercial salt added to foods, cans, etc is not iodized), many of those women will be deficient in I due to not reading carefully the vitamin label and give birth to kids with IQ lower than it would have been otherwise. Iodized salt contains 45 µg iodine/gram only, I can be lost in open containers exposed to humidity (salt shaker), and people with hypertension (a third of humanity) can't eat more than 1 g of salt ideally, few people even cook at home. However, the American Thyroid Association says that people who got used to low I and move into a high I area or diet can develop thyroid problems. The body seems to adapt at times to low amounts of iodine. Baldness can be caused by low iodine, see the hair loss section. See other iodine benefits (google each claim to get the latest research that may disagree: google AI has NIH references). Make it a habit to google any claim in any youtube, since some ideas are off, especially of naturopaths. ☺☺☺

In a study of 1,229 people with goiter in 1920s, 4% of those using iodized salt had a recurrence of it, while 55% of those refusing iodized salt had goiter recurrence because back then iodized salt was the main way to supplement ► JAMA 1937;108(11):860-4 first free page. The concentration of urine I was 85 µg/L in diabetics and 119 in healthy people in a study of 266 persons, meaning lower I is linked to diabetes, which makes sense since the metabolic rate is stimulated by I and metabolic syndrome leads to obesity and diabetes. They also found CRP, C reactive protein, a marker of inflammation and disease in the body, was higher in people with low urine I ► ECED 2012;120(10):618-22. JCEM 2004;89(7):3421-4, has a list of I content of various breads, milks, infant formulas, etc. The table shows some breads have *388* times (23.3 µg/gram or 587 µg per slice) more I than others (0.06 µg/gram) on a µg/g basis and this is not listed on the ingredients list on breads, some infant formulas (57 µg/5 oz) got almost 4 times more I than others. They tested 20 breads and the average amount of 10 µg per bread slice. One baby *milk formula brand had 7 times more I than listed*. All 18 brands of cow milk had at least 88 µg I per 250 ml (1 cup), ranging from 88–168 µg. Values for infant formulas ranged from 16.2–56.8 µg I per 5 oz serving, which was often far higher than labeled. Milk and bread/cereals/bakery products used to have more I on average in the past, because they used more iodine-containing feed supplements and iodophor sanitizing agents in the dairy industry, as well as *more iodate (IO_3) dough conditioners, and erythrosine, an iodine-containing food dye*. Today, most I in dairy comes from adding I to

feed and disinfecting cow breasts with I. Vegan milks have also started adding I, to match the level in cow milk, just as they added B_{12}, D_3, A. Iodate (IO_3) dough conditioners went out of use for *most bread brands*, while bromate (BrO_3) conditioners (2B carcinogen) went in use. While many nations banned $KBrO_3$, the US didn't ► KBrO3. Brominated vegetable oils in sodas, $KBrO_3$ in breads lead to competitive inhibition of I in the body, contributing to thyroid issues. From 1974 to 1994, I in urine declined 50% in US from 320 µg/L to 145 µg/L, and *7 times more pregnant women* had very low I in urine ► JCEM 1998;83(10):3401-8. Since 1994 it stabilized.

Even adults, infants and kids who're low in I will suffer from poorer mental performance per some studies. Women are 9 times more likely to develop hypothyroidism than men due to estrogen, and pregnancy is a period when women get very low I without supplements and can develop hypothyroidism with thyroid becoming 47% larger ► JCEM 1997;82(9):2840-3. Thyroid glands, ovaries produce most thyroid I hormones. One of the best lists of I in normal foods is the pdf at JFCA 1995;8(2):171-217. This shows that navy and other beans have more I than most meats and dairy. JFCA 2005;18(6):461-71 shows one bread had 6 times more I than red meat (6µg/100g), leafy veggies (24µg/100g) 4 times and nuts (22µg/100g) 3.7 times more; canned veggies (120µg/100g, almost the daily needs) *have 18 times more I than poultry and 25 times more than fresh veggies, due to iodized salt*. Veggies (5µg/100g) are easy to eat in large amounts, but poultry is not. Nightshade veggies (13µg/100g) got more than *vegan* meats (11µg/100g). Vegan I rich foods include certain seaweeds. Too much I is bad, so one can't overeat seaweeds every week. The Japanese outlive Americans and they eat the most I in the world, 7-20 times more than the average American (1,000-3,000 µg/day), so it is very strange, but populations seem to adapt to higher levels since conception and get sick only when suddenly move to a much lower or much higher dose. For a summary of I content of different seaweeds, see TR 2011;4:14, which found ☺☺☺ kombu has 2353 µg/g iodine, while nori has 16, wakame 40 µg/g. Kelp flakes got 8,000 µg/g, so one only needs 19 mg of kelp flakes to reach the 150 RDA. The brands used in a study determine the values they get, since JFDA 2004;22(2):189-96 found "iodine content surveyed for nori was 29.3–45.8 mg/kg, for wakame 93.9–185.1 mg/kg, and for kombu 241–4,921 mg/kg. Kombu has the highest average I content 2,523.5 mg/kg, followed by wakame (139.7 mg/kg) and nori (36.9 mg/kg)." Many *vegans* who eat no iodized salt though get too little I (plants have less I than animal origin foods), if they don't supplement with seaweeds (spirulina, kelp, etc) or multivitamins that have iodine. The problem with kelp/seaweeds is that they have high arsenic, fakeB_{12} that competes with real B_{12} absorption (can cause B_{12} deficiency) but given the small amount eaten it may not be an issue, since arsenic is everywhere these days.

I^- move into cells via the sodium iodide symporter (NIS, from Natrium I^- Symporter), a membrane ion pump or protein that transports I^- across the basolateral membrane into thyroid epithelial cells and into other cells where NIS is located (breast, ovaries, eyes, etc).

Triiodothyronine or 3,5,3''-triiodothyronine (T3) and its prohormone, thyroxine, 3,5,3',5'-tetraiodothyronine, (T4) or iodoT3 (an aromatic H is replaced by iodine), are tyrosine-based thyroid hormones (produced by the thyroid gland) that regulate metabolism. If you forget the name, always recall it's like the nonessential amino acid it contains: tyrosine, except the S becomes X and is like thyroid gland where the hormones are produced. Lower T3/T4 means longer life, meaning vegan diet of lower metabolism prolongs life, since it causes less DNA replication and fewer DNA mistakes introduced. T4 turns into T3 when an enzyme takes an I and replaces it with hydrogen. T3 and T4 have a very simple chemical structure, being essentially the tyrosine (4-hydroxyphenylalanine) nonessential amino acid with the hydrogen of the OH group replaced with 4-hydroxyphenyl and 3 or 4 hydrogens replaced with iodines. T3 name comes from 3 I atoms, T4 from 4 I atoms, T4 being T3 with a hydrogen replaced by an I atom. See their formulas side by side at hormones. Hyperthyroidism means too much T3 and T4 circulate, hypo means too little of them circulate which leads to the thyroid getting bigger as it tries to produce more T3 and T4 (goiter). T3 level in the blood plasma is about 2.5% that of T4. T3 and T4 are made by the release of Thyroid-stimulating hormone, TSH, a glycoprotein produced in the pituitary gland. The hypothalamus produces thyrotropin-releasing hormone (TRH) which stimulates the pituitary gland to produce TSH. In blood, T3 half life is 1 day, T4 is 7 days. 90% of I is excreted into the urine, a tiny amount goes to feces and the other 10% is recirculated and retaken by the thyroid. That's why urinary I is used as an indication of I intake. A small 30% drop in mom's T3-T4 serum levels even in the beginning of pregnancy alters the fetus neuronal migration. When deficiency is big, miscarriage, stillbirth or mental retardation (IQ about 50 instead of say 120) can occur. ► End 2004;145(9):4037-47. Myelination of neurons, which is key to higher faster thinking and higher IQ, depends on the T3 hormone ► IJDN 2006;24(7):445-53. Multiple sclerosis happens due to demyelination. Low I may be a risk factor in developing multiple sclerosis as the ability to remyelinate neurons is impaired. Demyelination slows down messages sent along axons and causes the axon to deteriorate, and neurons to deteriorate too. I is 65% of the molar mass of T4 and 59% of T3. I is found in the thyroid (15-20 mg), and possibly (estimates vary) another 10-50 mg in breasts, eyes, gastric mucosa, fetal thymus, cerebrospinal fluid and choroid plexus, arterial walls, the cervix, and salivary glands. Animals also accumulate I mostly in thyroid, as seen in the pictures at ARTPB 1964;41:24-32. ☺☺☺

Perchlorate has 30 times higher affinity for NIS ion pump compared to iodine, thiocyanate 15 times higher affinity. Because of that, they can interfere with I uptake. Nitrate is another ion with an affinity for NIS. Some studies suggest higher risks of goiter in areas with high nitrate concentrations (even if I intake is normal) ► JTR 2011:934104. This is why it's so hard to know the ideal level of I since it depends on one's diet and how many inhibitors exist. However, most goitrogens in cruciferous veggies, etc don't cause clinical symptoms unless there is I deficiency ►

ER 2009;30(4):376-408. In 1917, Marine and Kimball showed that thyroid gland enlargement (goiter) is caused by I deficiency and can be avoided with I supplements, leading to iodized salt in the US in 1920s and a 15 IQ point rise afterwards for everyone. Iodine, in group 7 of chemical elements called halogens, means violet in Greek (named purple by the famous guy who discovered PV=NRT gas law, and that water is made of 2 hydrogens and one oxygen, due to the fact it looks metallic grey-purple and sublimes easily into a violet☺☺☺ gas) and it's the nutrient with the highest possible drop in IQ (70-100 points) when deficiency exists, i.e. genius parents give birth to retarded children because mother ate foods that blocked I uptake during pregnancy and I was low in the first year of life too. I is also the heaviest element commonly needed by living organisms, and the second-heaviest known to be used by bacteria after tungsten. All the other nutrients when low lead to maximum 15 points drops in IQ. I was found in the thyroid in 1895. Imagine how many diseases today are, unknown to doctors, possibly caused by synergistic deficiencies (synergistic toxicity too or a mix of deficiency and toxicity), i.e. low I coupled with low zinc, low iron, low DHA, etc and we think "this guy just got diabetes or disease x" or whatever, but without machine learning and real data we will never DISCOVER these amazing & beautiful ☺☺☺ relationships between the onset of "chronic disease or aging" and nutrition or toxic ingredients or even "neutral ones". Presumably, if one ate bread with 587 µg I per slice all his life, getting more than 1100 NIH upper limit and getting his system used to that and he suddenly at age 30 changes bread brand to one that has 400 times less iodine, his system might go into a deep shock (because I drops by 10 times) and trigger the onset of a serious illness and it will be discovered only 5 years later after damage was REALLY DEEP. Goiter often happens when one is exposed to a sudden rise or drop in iodine. Same for other diseases? Unfortunately, there is no FDA requirement yet to list mg of trace minerals, heavy metals in foods. This is the consequence of our lack of eterni foods that monitor 50,000 biomarkers and all nutrient intake.

ANM 2003;47(5):183-5 is a tiny study (good studies have thousands of people or hundreds of thousands, this one had 81 people, 15 vegans, 31 lacto- and lacto-ovovegetarians and 35 omnivores) that shows that vegans are far more likely to have I deficiency than meat eaters. Granted, meat eaters are far more likely to have phytonutrient, antioxidants, flavonoids, polyphenols, potassium, magnesium deficiency which leads to living shorter by 5-10 years on average compared to vegans. But it's important to know these things so as to maximize the benefits and create the healthiest vegan diet transition if you're moving into veganism or thinking about it. However, the 97,000 people study Ntr 2013;5(11):4642-52 found that vegan diet is better than vegetarian and meat one for preventing hypothyroidism and this makes us question the use of urine I content as a marker for hypothyroidism risk too. This 97,000 people study brings more doubt regarding the so-called "iodine deficiency" limit of 100 ppm. Interestingly, most vegan-vegetarian IQ studies in America showed these guys have higher IQ

than meat eaters, indicating that perhaps health-conscious families may care about a lot of things that determine IQ score, not necessarily that *vegan* diet raises IQ in of itself. A 2011 Boston study with 141 subjects (78 vegetarians, 63 *vegans*) found that *vegans* have urinary I concentration of 78.5 µg/liter, much lower than vegetarians at 147.0 µg/liter ► JCEM 2011; 96(8):E1303-7. This is because many vegans don't check vitamin labels for iodine mcg. ☺☺☺

IODINE AND LONGEVITY (Highest TSH, lowest T3, T4 = longest life)

Familial longevity is associated with decreased thyroid function (or hypothyroidism, i.e. high TSH, low T3/4). The lower the thyroid activity the longer the lifespan: the longest living people have highest TSH and lower T3/T4 ► JCEM 2010;95(11):4979-84. Greater longevity is associated with higher TSH and lower levels of T3/T4 thyroid hormones ► SR 2015;5:11525. Diiodomethane at a concentration of 10 µg/ml increased the median lifespan of the fruit fly, Drosophila melanogaster, by 29.3%. Decreased flight activity was associated with increased longevity when the flies were reared and maintained on diiodomethane. Thus, the fitness fanatics who eat 200 g protein and exercise 1-3 hrs/day may shrink lifespan by 5-15 years. It's the self-correcting mechanism of the universe: evil self-destructs, the human species' goal is to move beyond today's infernal sports and endless sporting goods stores and to the Eterni Tone, Eterni Music and Eterni Diet that enables 4000 year lifespan, to kindness not martial arts or resistance training". The effects of iodine, iodoform and hydroiodic acid on longevity were also examined. ► Geron 1978;24(2):104-10. In a 4 year study of 599 people aged 85, higher thyrotropin, lower free thyroxine were associated with lower mortality ► JAMA 2004;292(21):2591-9. ☺☺☺

►► 12.4.23. CALCIUM $_{20}Ca^{40}$ ◄◄

Low Ca can cause leg muscle cramps, "pins and needles", numbness, tingling since Ca plays a key role in muscle contraction. The RDAs in mg are: 0-6 mo 200 (AI), 7-12 mo 260 (AI), 1-3 yrs 700, 4-8 1000, 9-18 1300, 19-50 1000, 51-70 men 1000 women 1200, 71+ 1200. The ULs (pills+food) are: 0-6 mo 1000 7-12 mo 1500, 1-8 yrs 2500, 9-18 600, 14-18 3000, 19-50 2500, 51+ 2000. I get 900 mg from food alone, multivitamin brands have 100-400 mg, 100 two I used for years; Ca pills 1000 mg/day during pregnancy reduced hypertension, preterm birth, low birth weight and preeclampsia, all of which affect IQ and health of the baby; for those with very low Ca intake, supplements were over 1 g. The WHO recommends 1.5 g to 2 g Ca daily for pregnant women with low dietary Ca intake. Absorbable Ca biological need for adults is 250-300 mg. All *vegan* milks have Ca added to match cow milk levels, even Tropicana, juices have Ca added. Absorbed levels are from JN 2005;135:2379-82, AJCN 1994;59:1238S-41S, AJCN 2000;71:1166-9. If you do the math from the data below, spinach Ca is only 5.1% bioavailable, milk Ca 32%, orange juice 36% (Tropicana, fortified), kale 41%, broccoli 52%, cabbage 63%.

The Top 17 Vegan Sources of Absorbable Calcium (Ca)/100g of food (the first 8 have more absorbable calcium than cow milk) are presented below, with links to the total calcium:

1). FIRM TOFU (tofu has Ca added; one cup of tofu has > all CA daily needs) ► absorbed Ca 212 (total Ca 683). Soft Tofu has less. However, that sulfate form of Ca can cause issues.

2). CHIA SEEDS ► TOTAL CA 631, absorbed Ca unknown 3). FLAXSEEDS ► TOTAL CA 255, absorbed Ca unknown 4). Fortified orange juice ► absorbed Ca 36% (total Ca varies 100-200 mg/100g see list of juices and their calcium here) or old data 201 mg or 36% (natural orange juice only 11 mg). Vegan juices often get 200-300 mg Ca added, to outdo cow milk.

5). Turnip greens ► absorbed Ca 71 (total Ca 137), see all turnip types, drink the steaming water after 1 minute in a pressure cooker if you want absorbed Ca way > 71; raw turnip total Ca is 190

6). Almonds ► absorbed Ca 56 (total Ca 254). 7). Cooked Collard greens ► absorbed Ca 55 (total Ca 141); there is no data on collard greens for absorbed Ca; raw collards total Ca is 145

8). Raw Kale ► absorbed Ca 55 (total Ca 135). AJCN 1990;51(4):656-7 explains milk Ca is 32% absorbed, versus 41% for kale. Cooked and Drained Kale total Ca 150 ► absorbed Ca 42 (total Ca 72 if water discarded); steamed absorbed Ca will be > raw kale if water is consumed

9). Cooked and Drained Chinese cabbage ► *absorbed* Ca 50 (total Ca 93); total Ca is 105 for raw, if steamed with pressure cooker and steaming water consumed, *absorbed* Ca is > 50) ☺☺☺

10). Cooked and drained Mustard greens ► absorbed Ca 43 (total Ca 74); raw mustard greens total Ca is 103, so steamed mustard greens with water consumed will have > 43 absorbed Ca)

11). Typical fortified Soymilk w/ Ca carbonate ► absorbed Ca 38 (total Ca 123) (plus other *vegan* milks with added Ca). Cow's milk (human milk may be comparable, but not sure) (non-*vegan*, for comparison only) ► absorbed Ca 43 (total Ca 120). ☺☺☺

12). Fortified Soymilk w/ tricalcium phosphate ► absorbed Ca 30 (total Ca 123) many *vegan* milks have total Ca 250-300. 13). Cooked Cabbage ► absorbed Ca 30 (total Ca 48)

14). Cooked and Drained Broccoli ► absorbed Ca 21 (total Ca 40); raw broccoli total Ca is 47

15). White beans ► absorbed Ca 15 (total Ca 90) 16). Pinto beans ► absorbed Ca 8 (total Ca 46)

17). Cooked Spinach ► absorbed Ca 7 (total Ca 136); oxalate in spinach binds Ca forming kidney stones. For more on the kidney stones made of Ca & oxalate, see the oxalate kidney section.

►► 12.4.24. Magnesium & Legs, Glycinate = Best Form | $_{12}Mg^{24}$ |◄◄

Because Mg is crucial for 300 enzymes, ATP/GABA synthesis (GABA helps kids etc relax so they

don't *bedwet* (low B_6 = low Mg, take B_6), discharge semen in sleep, get misdiagnosed with autism), muscle relaxation, contraction, low Mg leads to 50+ symptoms for both adults and kids:

1). twitches (legs, eyelids, etc, Mg glycinate/threonate help calm neuropathy, insomnia, stiff muscles, leg tingling, toe/calf/body cramp/spasm, arrhythmia (heart muscle spasm), tension in the shoulder, neck, and upper back area, or any part of the chest, breast, ribs, temples, legs, toes, causing involuntary toe curls that wake you up in the morning, dry eyes (muscles involved in tear reflex and meibomian gland lipid excretion reflex stop working), rare bowel movements as muscles can't relax to let stool move in the colon towards the anus during the day, night or even during trying to defecate (hence people take 500 mg total Mg MgO pills daily (4% absorbs, no risk of overdose) to turn rock hard constipated stool into 'peanut butter almost' (normal) soft stool that comes out effortlessly (no strain) 20 times faster, 30 sec bath trip, not 10 min). A single mineral has such far reaching and varied effects, unlike any other nutrient or vitamin, one pill MgO before bed and stool comes out effortless when waking up (at night, we're not moving, so best time to take it is before bed to help stool move during sleep; slow moving feces mean high toxin dump into the blood, acne, rashes, systemic inflammation). Eat plenty of lentils and other high fiber foods too, and you'll never be constipated again. Hard stool and leg cramps after high K meals (legumes, etc) is a strong potential indicator that you're Mg deficient, and cramps won't vanish until Mg intake with high K meals rises a lot to replenish body reserves over 1-20 weeks. Many "experts" online scare people from taking Mg over 400 mg which is comical☺☺☺. These are people without personal or clinical experience of such patients. When you're severely depleted, due to having used 10,000-25,000 IU D_3 for 12 months, you need more like 1 g Mg oxide and 1 g Mg as glycinate so 5 g of Mg glycinate (the nerve calming form, not taurate or malate, those are energetic, exciting the nerves), just like when B_{12}, D_3, A deficient, they give you mega doses, way above the upper limit. You don't have to believe me, try it, leg cramps/hard stool won't vanish until you ramp up Mg a LOT if you're so low, it takes 5 months to replenish body Mg reserves to the point where you're fine with just 400 mg Mg as 2 g Mg glycinate. If the stool is still hard due to microbiome, a pill of Mg oxide too, 500 mg Mg: 4% absorbed and traps moisture in the colon. Hypercalcemia caused by 5000-30,000 IU D_3 causes harder stool as D_3 uses up Mg and then Mg is no longer in the stool to keep it soft and watery, so lower vitamin D intake if stool is hard or take up more Mg. D_3 uses Mg, so the stool hardens (water is pulled from colon, as Mg is no longer in the colon to keep the water), barely moves, constipation emerges.

Eating large amounts of legumes means serum potassium (K) and Mg rise dramatically, while sodium (Na) remains very low if you never add salt or salty foods. Thus, the body initiates a mechanism to keep blood K constant (lower excess K that entered via digestion): because it can't instantly remove high K and Mg thru the urine (takes hours, even though it does that), it temporarily drives excess serum K into cells while pulling Na out of cells, causing a localized shift

in the Na-K ratio that alters the electrical charge across lower limb muscle membranes, making the nerves hyper sensitive and causing the muscles to involuntary lock up, so you have to walk a little to unlock them. After large meals with carbs, besides flushing K/Mg in urine to lower serum K, the body releases insulin which clears nutrients (we ate) from the blood, pushing them into cells. Insulin forces both K & Mg to move into the liver and glycogen stores, temporarily depleting the circulating Mg available to resting leg muscles, so hours after a meal the Mg is low and cramps occur. All these 3 (Na, urine K/Mg, insulin Mg) mechanisms contribute to cramps. Eating 2+ lb of cooked lentils/day can cause leg cramps (excruciating muscle tightening), if daily Na is < 0.6 g, so add 0.3 g salt and 0.2-4 g Mg (because high K causes urine to expel K and urine flushes Mg out too, so Mg moves from high to low in the serum, 3-5 hours after a high K meal) to each huge meal of lentils to avoid this electrical charge change. If you don't drink water, processing high levels of *K, Mg, lentil fiber* requires pulling water away from legs to redirect it into the GI tract to aid absorption. This mild, localized leg dehydration concentrates the remaining leg electrolytes, further changes the membrane electrical charge. A fast K rise (hyperkalemia) outside of cells causes subthreshold depolarization -.75 mV (resting electrical charge -0.95 (4 mmol/L in blood and outside cell, 140 mmol/L inside cell) mV shifts closer (-0.75) to its -0.55 firing threshold), which makes nerves and muscle fibers highly hyperexcitable and prone to locking into spasms. Because the baseline charge -.75 sits so close to the -.55 trigger point, the slightest physical movement (during sleep or when waking up), twitch, or minor neural signal can cross the threshold and cause the muscle to fire, to lock or spasm. The inactivation of Na channels (the sustained lock of calf muscles) happens due to the inability of muscle cells to reset after firing an electric signal, due to high K outside the cell (serum from eating), so voltage remains -0.75 instead of -0.95: the muscle relaxation switch fails, so the contraction/relaxation rhythm ends, the muscle fibers lock into a sustained, painful cramp. Feet and calves are highly susceptible to K level changes due to hydrostatic pressure and gravity. Blood and K pools in the legs (when standing, chair sitting or even sleeping due to feet being farthest way from heart), and then digestion requires leg intracellular water to be removed, further raising K level, meaning K level rises fastest in feet, then calves, causing cramps. You sit at a desk 30 min, then suddenly move away from the desk: this move causes a toe/calf cramp.

This rise in K, Mg can cause heart rate changes or arrhythmias (heart muscle spasms or lock) ► THIJ 2006;33(1):40-7. High K can lead to fatal cardiac arrest ► CREM 2012:458049; bad kidneys can cause fatal infarct due to kidneys unable to flush K ► Med 2021;57(8):810, JETEM;5(3):V1-3. "half of ER visits… (hyperkalemia) result in mortality" ► CPCEM 2025;10(1):24-7. High K (from high Mg foods) can cause heart block, seizures ► CR 2023;15(7):e41473. Palpitations don't mean plaque or heart attack, just eating caffeine/nicotine, too much K without Na, being low in Mg or K, anemia, hormone fluctuations, stress or AFib (disease). Exercise causes electrolyte imbalance,

dehydration too, leading to muscle, heart spasms. High K, Mg can cause flaccid paralysis: can't move out of bed for a week ► JCHIMP 2015;5(3):10.3402. Carrots have 70 mg Na/100g vs 1 mg for most produce, so they can be used to raise Na slightly, though exercise needs more Na. The lack of Mg, plus poor neck posture pressing on the occipital nerves, can cause sudden pain in temple, skull and forehead areas as those muscles can't reset, relax and contract nonstop (like in leg lock), causing a lack of blood flow to the area. Not only that, but the massive intake of K causes the kidney to work overtime to remove K, which flushes Mg out too, causing low Mg. This low Mg becomes even lower if you take high vitamin D, causing a total systemic lack of Mg in the muscles of your temples/forehead/skull/knee/hands/joints/legs (pulsing pain (if sky high K) or burning pain for skull), calves (cramps), anus (pulsing pain), eyelid (twitch, not pain), so each time some eat a high K meal, some experience a series of leg etc pains thinking it's the "they're sick or attacked". Pain of joints is different, that's related to lack of synovial fluid movement. To avoid any low Mg pains simply eat more Mg with high K meals, maybe 2 pills of 500 mg MgO and 600-900 mg Mg as malate and glycinate, since remaking body Mg reserves takes some huge Mg doses: you will see, the leg cramps won't vanish unless you eat 1-2 g of Mg daily with the high K meals on high K days, when you're severely Mg depleted. If K is high, blood dilates so much, you get the annoying pulsing throbbing pain that is felt with each heartbeat for months even, it's a well known phenomenon. It can be annoying, as sleep quality becomes "lowest", you can't get any real deep sleep... If so, you're in urgent need of 3 times a day Mg malate/glycinate and glycine to calm excited nerves. High stress raises cortisol, which then causes more Mg loss via urine, requiring more daily Mg intake. Fasting ➡ Low Insulin ➡ Kidney Na Resorption Pumps Turn Off, aldosterone hormone no longer holds Na in the blood, glucagon promotes diuretic flush, glycogen is burned in a fast and releases a lot of water that takes out Na, K, Mg (each glycogen is bound to 4 waters) ➡ Kidney Flushes Na, & Mg with it ➡ Low Mg ➡ eyelid twitch. High K meal ➡ Kidney Flushes K, & Mg with it ➡ Low Mg ➡ Leg/toe cramps or (pulsing) pain in any body area. Always take Mg and salt when fasting. ☺☺☺

2). bedwetting, nocturnal sperm emissions, also happen due to low Mg causing random spasms of the nerves. The sperm liquid component production rises, so then emission happens easily when a large K meal causes a dip in Mg, triggering muscle spasms, and hyper excitability. Bedwetting can be caused by cesarean birth. Key Bacteroides/Bifidobacterium strains, that are depleted long-term in cesarean infants, possess the pdxJ gene that encodes the enzyme the gut needs to make P5P, active B6. Instead of making B6 easily, cesarean guts are colonized by hospital surface microflora (Enterococcus, Klebsiella, etc) which can't make B vitamins. This makes these babies more likely to have all the other low Mg symptoms as adults, as B6 is needed for Mg uptake. Endless babies went to an MD, got B_6 pills and then stopped bedwetting next day. The gut microbiome regulates the health of the gut lining. A C-section-derived

microbiome creates a state of chronic, low-grade mucosal inflammation that impairs the passive and active nutrient transporters in jejunum and ileum, so Mg absorption is compromised. Kids eat unsoaked cereals, bakeries, burgers, tacos, legumes, soy, beans rich in phytate that traps all minerals, including Mg, causing even more symptoms that MDs misdiagnose as ADHD, autism or etc, all related to hyperexcitability of the nerves that can't relax. Lack of Mg leaves the brain exhausted and unable to produce GABA, plunging kids into an abnormally deep sleep coma at night. Meanwhile, a Mg-starved bladder sat in a permanent state of subthreshold depolarization (hair-trigger sensitivity). When the bladder filled at night, the brain couldn't wake up, the over-excited bladder spasmed, and involuntary bedwetting occurred until MD gives B_6 pills enable Mg to enter cells, so GABA can be made (without GABA kids can't relax and they're misdiagnosed as ADHD), sleep architecture can normalize, bedwetting can stop the next day.

Mg deficiency induced Involuntary sperm emissions (similar mechanism to bedwetting):

The nervous system hyperexcitability caused by low Mg changes how the body stores, releases sperm. It creates the illusion of overproduction of sperm via: 1. The Prostatic Muscle "Squeeze". Sperm and seminal fluid are stored in prostate and seminal vesicles which act like secure storage tanks because Mg keeps their smooth muscle walls perfectly relaxed. With low Mg, prostatic muscles become hyper-irritable and undergo micro-spasms. Even a tiny amount of natural fluid buildup causes the hyper-excitable muscles to clamp down. The storage tanks are constantly twitching and squeezing, making them prone to leaking or overflowing at night. 2. Hyper-Excitable Nervous System Over-Secretion: While low Mg doesn't alter sperm production, nerve hyperexcitability can cause pelvic secretory glands (Cowper's gland + prostate) to overproduce the fluid portion of semen. Our autonomic nerves control these fluid secretions. When the nerves lack their Mg, they send constant, uninhibited signals to these glands, causing them to pump out excessive fluid. This fills our pelvic storage zone much faster than normal, combining with a full bladder to trigger involuntary sperm ejection. Avoid heavy meals and a full bladder if you want these to stop and eat your Mg before bed. Spies can use gadgets to cause nerve spasms causing sperm discharge, arrhythmias, fast pulse and all the stuff in this Mg section.

3). hypertension as Mg is key to low blood pressure, glaucoma (patients have low Mg in tears),

4). higher blood viscosity, which generates strokes/infarcts (glaucoma, retinopathy, blindness can emerge too as viscous blood raises blood pressure, ocular pressure), plaque (LDL down 11% with 300 mg $MgSO_4$, Table 6, JCP 2020;76(3):321-8, even when serum Mg is the same, because tissue Mg is different). Lowest Mg group had "highest proportions of CVD (cardiovascular disease) incidence (36.89%), use of lipid-lowering drugs (60.28%)" ► JHPN 2025;44:275, 11 times higher risk of cardiac mortality, 6 times higher risk of all cause mortality in the crude model (seen in Fig 3 too). Ntr 2021;13(5):1411 has 139 references and a long discussion of the recent

decades of findings regarding the benefits of Mg intake.

5). diabetes (300 mg $MgSO_4$ causes A1C drop from 7.6 to 6.6, Table 6), obesity (BMI dropped 25% via 300 mg MgSO4 or 60 mg Mg)

6). yellow or translucent teeth that are no longer white: take 5000-20000 IU D3 and 1-3 mg K2 to keep teeth naturally white or reverse the yellowish to the white of age 18, plus Boron too, as it helps; Mg acts as an enamel stabilizer, supporting the crystal structure of the enamel during its remineralization (whitening) repair process).

7). vascular dementia or Alzheimer due to lack of blood flow to brain regions or low brain glucose in diabetes, low ATP (neuron fuel). Mg threonate and glycinate aid the brain, with glycinate helping us fall asleep better or calm down (reduce anxiety). Threonate is believed, by the present scientific consensus, to improve working memory, learning ability, short and long-term memory (absorbs a little better/faster than glycinate Neur 2010;65(2):165-77, but is 4x more expensive), Mg oxide is used to soften stools as a laxative, Mg malate for energy. Mg prevents neuron death, depression: nih.gov/books/NBK507265. Since brain Mg levels raise with body Mg level, any Mg pill aids the brain too, even if it takes slower for oxide, etc. "MgO absorbs at 4%", repeated by 800+ youtube MDs, is based on a misinterpreted study as explained below.

Why does Mg raise blood pressure, causing clots, strokes and infarcts via a more viscous blood?

For most people who die of heart disease born of hypertension, Mg and K are low, Na and Ca very high, especially Na. Na/Ca raise pressure, K/Mg lower it. Mg/K are everyone's friend, except people with hypotension. Mg^{2+} helps the RBCs repel each other so that the blood doesn't turn viscous due to stacks of RBCs tightly bound that impede fast blood flow. Mg lowers fibrinogen and other clotting factors that make RBCs aggregate into clot-prone viscous blood, so low Mg makes blood thicker. Mg inhibits the influx of Ca into vascular smooth muscle cells. When Mg is low, Ca enters these cells, leading to increased vascular tone, vasoconstriction, hypertension. Narrower vessels increase shear-related resistance to blood flow, making blood viscous. Low Mg lowers NO bioavailability, a key molecule that relaxes blood vessels and improves flow. Low Mg triggers release of inflammatory cytokines, increases oxidative stress, thereby damaging the endothelium, raises fibrinogen (the clot protein released to fix damage to arteries), which increases viscosity. Low Mg causes diabetes, metabolic syndrome, insulin resistance, increased capillary permeability and higher hematocrit (% RBCs in blood by volume), raising viscosity. Los Mg is often accompanied by low K that will further raise blood pressure, causing arterial damage and more fibrinogen to thicken the blood. RBC membranes exhibit reduced negative charge (lower zeta potential) under low Mg conditions due to the disruption of membrane stability, leading to an alteration in the arrangement of surface glycoproteins and an

increased exposure of hidden positive charges. Magnesium helps maintain the structural integrity and flexibility of the RBC membrane, often by acting as a cofactor for enzymes and bridging anionic sites within the membrane. Low Mg impacts membrane-associated proteins and phospholipids, specifically affecting band 3 protein, which is critical for membrane flexibility. RBC surface negativity is largely due to sialic acid residues on surface glycoproteins. With low Mg the steric hindrance (physical arrangement) of these structures changes, causing the cell to lose some of its effective negative surface charge. The resulting changes in protein conformation can lead to increased interaction with positively charged serum proteins, reducing the net RBC negative charge. Low Mg inhibits the Na+/K+ pump, leading to altered intracellular ion concentration. This disruption can cause ionic imbalances that reduce the overall electrostatic charge on the RBC membrane surface, causing RBCs to bundle together and become less flexible, less able to pass through small capillaries, contributing to viscosity, premature cell aging/destruction. This is common in sickle cell anemia, where low Mg levels aggravate cell stiffness and promote vascular occlusion.

Mg, "the most common intracellular divalent cation, participates in around 300 enzymatic processes, including the metabolism of lipoprotein lipase (LPL), HMG-CoA reductase, and lecithin-cholesterol acyl transferase (LCAT)… 1% of the body's magnesium is found in circulation (0.3% in plasma/serum), while the majority...is found in the bony tissue (60%) and intracellular (40%) space.. LCAT that decreases LDL and TG levels and increases HDL levels, is activated by magnesium" ► CIMB 2023;45(4):3146-67, sections 5-6 of the paper explains Mg with statins works way better in preventing statin side effects and in lowering LDL, etc. LPL, LCAT lower TG, LDL, raise HDL. The evidence show that the serum Mg value is rather useless; we need the 7 tests to properrly evaluate what happens inside: urine, feces, serum, RBC, hair, nail, saliva. Low Mg can make you believe you have a heart attack, when it's merely a lack of the ability to regulate heart rhythm, causing irregular heart pulse or chest wall muscle spasms or eye twitch, eyelid twitch, pain or spasm (sudden pain, contraction of a muscle group, lasting for minutes, painful, unlike a 1 second painless eyelid twitch) across the brow or eye area or any muscles of the face or skull, body, causing people to think they got "a brain disease or heart disease", when it's plain old soil depletion of Mg that makes food intake much lower than our daily needs. If you had a recent punctal plug that narrowed the puncta drain, eyedrops will be stuck longer in one eye, and since many eyedrops lack K, Mg, Ca, they create electrolyte imbalance that makes eyelid Mg deficiency even more severe causing eyelid twitches in that eye. Thus, until Mg deficiency is solved, you need change the eyedrop brand perhaps.

Other people panic or even think "cops or spies are attacking them", but it's a much simple explanation that almost nobody suspects: low Mg, and far easier to fix than any of these people would suspect: 4$ a month worth of Mg malate. If you have insomnia, avoid malate, as it will

make night sleep worse. Malate can cause poor night sleep even for people without insomnia, if you got a hyperactive brain or over excited nervous system (stress, etc) or excited sympathetic system (instead of parasympathetic), so in those cases we need Mg glycinate (not malate) to sleep better. Avoid excitatory amino acids, like glutamine, that cancel out the effects of glycine, or glycinate, otherwise, you'll sleep only 4 hours a night instead of 8 required for good brain detox and that chronic sleep deficiency will completely destroy your body, as sleep is the body repair time. You can't live to 120 with 4 hour sleep.☺☺☺ Muscle tightness, aching, or cramping can occur in the jaw, temples, or around the eyes, headaches can happen too, causing temple/brow area pain, due to electrolyte imbalance, dehydration, low Mg. Mg deficiency can even cause the arteries of the heart to tighten suddenly, resulting in a feeling of crushing pain in the chest that may radiate to the jaw or arm, but that's not a blood clot (as an aspirin to "dissolve it" doesn't make it go away), it's you needing to buy Mg right away. Any pain in any body area (say left arm/shoulder/knee/leg) can be caused by other things, as simple as a draft in your bed area on the left side or cold winter month where electric heater is on the right side and blanket fails to keep left side as warm as right side (7 degree cooler, causing "arthritis like pain" due to poor circulation, etc). Not all musculoskeletal pain is related to Mg, sometimes pain vanished once they got the left side warmer by better insulation of heat loss during sleep or placing another small electric heater on the left side too. However, if toes curl it's almost always Mg, as that is not a "cold draft" type of pain, too much or too little Mg. If you soak lentils and change water only once or twice or don't reach 150°F during soaking, you leave there some phytates that bind the Mg, so you develop in 1 decade 9 diseases that are misdiagnoses in reality, since Mg looks fine in serum, serum Mg is 1% of body Mg. Thus, we spend worldwide 300 billion possibly treating Mg deficiency of 3$/month fix potential with "fantasy diseases" 200$ a month pill regimens. Why? Because all grains and legumes humans eat, except for hard core vegans eating only ultra soaked lentils (least phytates of legumes), have phytates that bind Mg and cause endless health problems. The Food industry needs to Soak All Legumes, grains First to remove antinutrients or be fined 20 trillion.☺ Americans lose 10-20 years of life due to phytates that bind Zn, Mg, the key minerals for life, ATP, DNA repair, energy production, cell repair, causing diabetes epidemic, infertility, as we saw people without Zn die at 25. Too much Mg can cause a Ca-Mg electrolyte imbalance too, like taking 900 mg or something crazy, so then you'll get the same eyelid twitches from low Mg, as Ca contracts, while Mg relaxes the muscles. However, when taking high D3 during a cold or flu, like 20-100K/day, you need more Mg, MK7, K, so taking 1 g Mg and 3-5 g K is a must then, as you need drink more water to flush toxins out and that depletes your K, Mg more, besides D3, and we need to lower blood pressure via K, Mg.

Many Mg brands got 2-10x less than the label, see clip and the NOW list. The glycinate is so powerful, 2 g (400 mg elemental Mg) makes you fall asleep during the day and wake up 8 hours

later, even when you initially wanted to just rest for 10 minutes during the day. This table shows how little Mg is actually in each popular compound. Reports indicate threonate may help feet cramps and tingling to vanish during fasting, etc, in a better way than glycinate or other forms, in severe Mg depletion: these cramps happen due to neurons not getting enough Mg, so give Mg to the brain, so brain gives it to the neuron to give it to the axon going from brain to the toes, and people can get Mg faster via fat soluble forms: malate, glycinate, threonate. Mg Threonate is sold as Magtein (patent of AIDP and Tsinghua University) or as generic threonate from China (same as 3-5 times pricier Magtein, this is the cheapest on Amazon) that is put in caps in USA, which is way cheaper, since China doesn't enforce patent laws. US can't compete with China in threonate. Some Amazon companies are scams, their label says "2000 mg Mg threonate, 400 mg Mg from glycinate (meaning 2.8 g glycinate), 100 mg theanine, 100 mg PS" per 2 capsules, so 5000 mg/2 capsules, but is only 1.46 in reality when measured. MgO is best bought with 0 other ingredients, like Bulk Supplement 90g MgO (54 g of Mg)/15$ 1 year supply if half a cap/day, discard capsule and dissolve in water first. Mg glycinate may be released too fast into the blood, causing leg tingling, cramps due to electrolyte imbalance, but glycinate is way superior to malate and oxide in relieving tingling, etc.☺☺ Avoid stearic or stearate inactive ingredients. Malate is much easier to absorb (than the same price MgO) and 17-35 times cheaper than threonate, 3-4 times cheaper than glycinate, so it's popular today when nobody soaks legumes, grains, leading to mineral deficiencies via phytates in grains, legumes, burgers, tacos, bakeries binding Mg, Fe, Ca, Zn causing an epidemic of back, leg, facial, skull, temple, breast pain, fatigue (low Fe), diabetes/infertility (low Zn).☺☺☺ This often leads to misdiagnosis. Soak stuff well and see it vanish. It's not fibromyalgia, just plain old Mg deficiency. Before you think foreign agents harass you, try a Mg pill 4$/month, to save the anxiety trouble.

The scariest thing is that the regular blood (1% of body Mg is in the blood) or even red blood cell test for Mg may look normal and the MD may misdiagnose this Mg deficiency for some other condition, causing the prescription of drugs that do organ damage and as the patient moves to new towns with new MDs, his organ damage causes more false diagnoses, organ damage, more pills, soon he's on 900$ of 30 pills/month, all started by a misdiagnosis that 4$/month would have fixed if the system was real, not a criminal enterprise to make aristocrats rich and drain the nation of trillions. Not to mention surgery often is suggested for damage done by misdiagnosis, so then the bills become half a million for the insurance. Hospitals are elated, "the MD brings in 50 million a year by screwing all up instead of prescribing lifestyle/nutrition changes decades earlier". In a real system, the 7 tests (blood, saliva, RBC, urine, nail, hair, feces) are done so cheaply for the essential nutrients to get a real picture, before any prescription or diagnosis, by the ND who sees all people before any MD does. Nutrients are friends we adapted to for millions of years, while synthetic pills are new, causing severe reactions or death as with Vioxx.

MDs can be semi drunk, tired, unethical, greedy, trying to make commission: this is a conflict of interest with the ideal of double checking and making sure nutrition is fine first, by not spending 0.5 trillion/yr for MD pay☺, but creating 4 classes of doctors, 3 above MDs in pay and authority, all paid by the same $0.5 trillion by an ethical pay scale for all jobs.☺☺ In 1950s, MDs told us smoking a pack a day is fine, because they did so, like many say alcohol is fine. Sadly, Americans alone waste 1.4 trillion/year on junk that harms them, and if we want to have 10 times more doctors, we need to create a new culture of life extension, health and longevity, because you can't pay all doctors 45K if we get 10 times more doctors, so they do way more tests, research and real stuff instead of pathetic rushed "see 30 patients daily" stuff. The small vampire aristocrats, whose IQ rivals that of chimps☺☺☺, buy bulk supplement/bottles from China (81$/500g or for 1500g in big amounts), a label, resell it to Americans at 2-10 times the price for a whopping 100-900% profit off slaves in China and USPS, calling for privatization of everything and criticizing poor Chinese slaves fooled by the top 0.01% families of China who own 56% of wealth under fake communism (feudalism). These guys want to turn USA into a gangland, where all cheat all, no national unity, everything private and "Bible of Rape, Genocide, Cannibalism based". This is called "capitalism" that never innovates a better method to purify it to 99.99%, leaving it 98% junk. This parasitic capitalism is why USA is so backwards, with 11 companies only, we get 90 times more R&D and make it all in USA. With centralized gentle eterni tone education (same online classes for all, 1 schooling system for all US, same courses, no more 50000 schools), we get 100 times more chemists and physicists working on 1 minute synthesis, instead of 50 days and 20 day shipping from china, with purity 99.99999% vs 98% in China.☺☺☺

Mg needs to be taken with 12-16 oz of water, so that it can't damage the intestinal wall if taken on an empty stomach. It's ideal to first drink a glass of water 30 minutes before taking this dissolved magnesium in 16 ounces of water. Many vitamins, minerals can reduce magnesium. See the amazing video of magnesium removing calcified joints. NIH states 48% of Americans are deficient in Mg, but the aristocratic TV rooster IQ filif programs brainwash us to buy deadly sugar rich foods, products and drugs. Mg deficiency leads to brain shrinking and lower IQ, due to the inability for neurons to connect dendrites with axons between neurons, IQ = more connected brains. Those with confirmed blood analysis low Mg could take 0.5 to 2 g MgGly (only if Mg deficient, otherwise, high Mg can cause death, atrial fibrillation, difficult breathing, muscle twitches that are common on low magnesium also). Synaptophysin protein is a marker of neuron connections and Mg boosts this protein. Greater Mg increases memory function. Soils no longer contain the same level of Mg of 100 or 50 years ago, so dietary intake can be lower and serum Mg is not the red blood cell level of Mg (a different test), which more exactly reflects Mg status. High sugar intake lowers Mg absorption, impairing brain health, causing anxiety and insomnia. This 48% doesn't take into account that tissue level of Mg is not reflected in the blood

level of Mg they base the 48% on. For many vitamins, tissue levels can be way lower when blood seems OK. It's well known nails or hair provide a way better estimate☺☺☺ of tissue levels of certain nutrients. Our understaffed NIH only provides 10th grade articles for "health professionals" ignoring the complexity of each nutrient, just a 10 page worksheet instead of 5000 pages as an option for those who don't want only the 10 page summary, ideally with a 100 page summary of the most critical info for those wanting more, but not 5000. NIH website is a testament of a Jewish fanaticism culture of 0 IQ that pervades the Republican, Democratic parties, where 2% of Congress have a STEM degree. The same Jewish "experts" who pose as atheist gentiles, brainwash US that "circumcision is good for you", so 80% do it vs 0.1% in many nations. Immortalists demand officials have a STEM college degree, economics MBA optional.

The Mg RDAs in mg are: 0-6 mo 30 (AI), 7-12 mo 75 (AI), 1-3 yrs 80, 4-8 130, 9-13 240, 14-18 men 410 women 360, 19-30 men 400 women 310, 31+ men 420 women 320, pregnant 360, lactating 320. The ULs (pills only) are: 0-12 unknown, 1-3 yrs 65, 4-8 110, 9+ 350. No UL for foods exists. I get 700+ mg from food alone, multivitamin brands have 40-150 mg, 40 and 100 two I used for years. I get 170% RDA, like most healthy vegans, but you need to soak grains, donuts-cookies-pastries-pizza (they never do soak the grains in these, avoid at all costs), restaurant foods (never soak legumes), protein powders (avoid, they never soak the legumes), bread wheat (avoid bread), cereals wheat (avoid cereals), legumes before eating them since phytic acid can block Mg (and 25 other key minerals) absorption by 50% and destroy your body completely. Those grains and legumes also have purines that cause uric acid, gout, trypsin inhibitors that cause low protein absorption, lectins that cause leaky gut and endless diseases from that, etc. The food industry is a criminal enterprise to enrich bastard aristocrats who ruin the whole planet. This is a nutrient omnivores need to pay attention to. Those with low magnesium (or too high Mg or electrolyte imbalance, like too little Ca, Na, K) will get muscle or even eyelid muscle twitches in any body area (heels, feet, legs, you name it), leg (feet mostly) cramps (when muscles are in pain for 10-300 seconds), leg/hand tingling or numbness, heart palpitations or irregular pulse, enhanced muscle loss (sarcopenia), due to inability of the brain to reach the muscles and cause muscles to work, weak balance, weaker motor skills, falls (fractures from frequent falls) (when older, also due to lack of potassium, B_{12} and D_3 and 1.6-2 g protein per kg weight), joint pain (joints are mostly collagen, and magnesium regulates collagen interaction with cells, so knee pain can be due to low magnesium, though joint pain can be caused by arthritis or low glycine intake. Low K/Ca also can cause muscle cramps, so do a blood test to see. Arterial clogs (detailed here) can also cause cramps, tingling, needle pains, etc so check plaque, do a leg ultrasound score, before you think it's magnesium or perhaps a lack of calcium or potassium or even too high magnesium. A newly proven natural extract lowers MMP3 by 46%, reducing knee pain significantly. All MMPs are inflammatory enzymes involved in tissue repair, extracellular matrix

recycling, etc that can go in overdrive destroying healthy tissues (knee joints, cornea, MGs), causing pain or dry eyes (MMP9), asthma. If you did everything, minerals, vitamins, shoes, warmth, IR, try 30% acetyl-11-keto-β-boswellic acid extract (that blocks 5-lipoxygenase enzyme or 5-LO) ► ART 2008;10(4):R85 has the graphs. 5-LO catalyzes the two-step conversion of ARA ω6 into pro-inflammatory leukotrienes, which are critical mediators in asthma, arthritis, cardiovascular diseases, cancer. Leukotrienes lead to higher histamine, which fuels the emergence of dry eyes for example. The only thing is this ayurvedic medicine study is funded by an Indian entity linked to sales of this, so perhaps, read 50 other papers to make sure it's legit and try all the other well known ways to reduce inflammation, covered in the list of nutrients (boron, glycine, omega 3, etc). 5-LO is a common target by many Pharma companies aiming to reduce inflammation in many diseases. Google it to find many other similar natural compounds that are more tolerated by our body, useful in stopping the inflammatory cascades that lead to joint tissue loss and subsequent pain. Please visit the Eternal Clothing Inc section for more on shoes to avoid leg or foot pain.☺☺☺

It is easy to confuse magnesium deficiency with sleeping on a short 75 inch twin bed, while being 75+ inch tall. *Always buy twin XL, which is 80", instead of twin 75", if you're 75+ inches tall.* If you failed to buy that, use Amazon boxes etc to at the top of the bed, place pillow 4" outside the bed, pillow resting on a box wrapped in soft clothes, to get 4" extra for your feet. If feet hang off the bed forced to point downward (plantar flexion) for 4-8 hrs, it shortens the calf muscles, causing calf cramps. If the *bed edge presses against heel tendons* (Achilles tendon or the plantar fascia), it can lead to irritation and inflammation, worsening symptoms of Achilles tendinitis or plantar fasciitis. These odd bed positions hinder blood flow to feet, *increasing the risk of feet/toe cramps, toe nail fungus and recovery from any toe nail injury etc. So, you need to use the box method if a short bed. Knee pain can be due to poor circulation, arthritis or low collagen production, so* a red-IR 660-850-940 nm cap (used to regrow hair) can be used to heal knees *or heels, toes, since not all knee/toe/heel pain is due to low magnesium, just wash feet well before use. It's better to use a dedicated device, so you don't infect eyes via forehead on cap, with feet bacteria, fungal strains etc, so* buy a cheap mat for 15-70$ for thighs, knees (use when in bed, leg straight), calves or feet. *See more on* light 660-850 cytochrome oxidase mitochondria healing here. Glycine causes uric acid in joints to disappear, so not all feet cramps are due to low magnesium, some are due to a high purine diet that causes uric acid to deposit in the joints, hence the soaking of all grains, legumes is essential, besides avoiding meats, seafood that are high in purines. Legumes and grains have a lot of phytic acid which blocks magnesium absorption from legumes, so you end up being highly deficient and complaining about joint pain due to eating restaurant or canned foods or home made food without soaking (3 water changes) first. It's key to lose body fat via fasting, because 15-95 lb of body fat can cause systemic

inflammation of joints which seems like arthritis. Besides, 50 lb of fat cause pressure on all joints. Jesus allegedly fasted 40 days in the desert, with mere water alone. If he did that, his whole brain was destroyed by the lack of electrolytes and no wonder he became so insane, claiming he's God and providing no proof such as moving mountains, bringing World Peace, etc. He even claimed that the horrific Old Testament is legit and remains valid (see the 1 page full of such Jesus quotes a few paragraphs into the 80 page Bible crap quotes section), which is illogical, if you love all. Leg etc attacks can come from spy agencies or militaries too, since neurons and muscles can fire due to lasers and electrical fields, devices too. Not everything is a deficiency, though your torturers certainly would love to brainwash you that this is so.☺☺☺

Since glycinate is 3-4 times pricier than malate, many people choose malate to prevent toe curling or other signs of Mg deficiency, especially since glycinate can decompose fast and give a fishy smell if not stored in a dark and ultra cold place in warehouses of the hot Amazon cities, etc. Mg glycinate is only 30$/kg in bulk: Amazon rating 3.6 stars, a red flag, never buy any food or pill with rating below 4.4 stars, before reading the 1 star reviews to see if real issues exist, beyond "pack color" or "didn't like texture" "doesn't dissolve in water" (it can't, since solubility is 2 mg/L, you need way more water) trivial complaints, which for low sales (& reviews) products can bring rating down fast. Bulk Supplements Mg, etc powders are dubious, ultra cheap from China, so they contain heavy metals, lead at times. Glycinate becomes ammonia rich after a while (making people sick), as glycine decomposes, so trash it if it smell strong of ammonia or buy from a reputable company like Nutricost 28.4g Mg/19$ (4 times cheaper than magnesium threonate) or just use MgO. Horbaach Mg is only 25 g/18$, with 240g fillers to get from 25*(208.45 MW of Mg GlycinateDihydrate/24.3 (MW Mg))= 214 g to 454 g in a bottle, so do multiply the servings by the Mg g × (208.5/24.3) to see if unreported fillers exist, choose 0 fillers brands. They add flavors and citric to hide the smell and taste of glycinate. Mg malate provides more energy via Krebs cycle, so it can be used too, and you will see ratio of Mg to Mg malate differ a lot on labels, as some use MgMalate & hydrates, or Mg_{2M}alate & hydrates, each with its own low-moderate or high solubility, Vitamatic seems cheaper, 0 extra ingredients. Bulk Supplements is usually the cheapest, but the lowest quality for fast degrading items like glycinate, glycine: a deceptive company, as they say Mg glycinate on first pic, but second pic (of the back of the package) says "glycinate and oxide". MgO prevents colon cancer, diverticulitis, IBS, hard stool, polyps, hemorrhoids, bleeding because it takes hard stool and makes it soft. 440 MgO 3x/week shrank arterial plaque, reversing heart disease "At 6 months, cIMT was significantly decreased in the Mg group (0.84 ► 0.76 mm)… in the placebo group, cIMT (rose 0.73 ► 0.79)" ► EN 2013;69(5):309-16. cIMT = 0.80 means 2.5x higher risk of infarct, 1.0 mm 3.5x more infarcts vs 0.477. This is due to Mg preventing calcification of soft reversible plaque. Mg pulls calcium away from arteries, like K2 does. For decades, MR 2001;14(4):257-62 study of

16 people, concluded that MgO is the worst form, due to only 4% being excreted in the urine and this idea became the dogma (standard google, etc AI answer too) for years. One can see from this incident and 500 others like it, how many of our nutritional dogmas and all AI answers are false based on prevailing dogmas, you need to google the "show me the study that led to the idea that x is true, sample size, study design" and find out, recall the history of medicine. All AIs are are databases of premade answers based on current human dogmas, the google AI, ChatGPT, etc are very stupid, their answers very robotic, they seem smart due to the fact they have a memory trillion billion times higher than a normal human. However, MgO is the best form of Mg in a way, as it is absorbed slowly, being less likely to cause tingling, cramps, etc and most able to loosen hard stools common in vegans who eat chia seeds or who get good bacteria destroyed by doxycycline or other antibiotics due to a tick bite, which can cause harder stool. Sucrosomial Mg was shown to be absorbed better than glycinate ► ERMPS 2018;22(6):1843-51 as this video explains too. The only form that crosses the blood-brain barrier easily is Mg threonate (MW 294.5 vs 24.3 for Mg, 83 mg Mg in 1g threonate, 603 mg Mg in 1g MgO, 13 times cheaper, but threonate OH groups may prevent baldness/oxidative stress, independent of Mg) and possibly the best and safest form for anyone who has eyelid twitch, tingling or cramping in toes or feet (though some can be caused by bad shoes). Red light 660 + 850 nm, or warm bath instantly removes almost any leg or joint pain, without the horrible brain destruction Tylenol does (Tylenol or acetaminophen, paracetamol is linked to 18% higher risk of dementia).

►► 12.4.25. ZINC | $_{30}Zn^{65}$ |◄◄

The RDAs in mg are: 0-6 mo 2 (AI), 7 mo-3 yrs 3, 4-8 yrs 5, 9-13 8, 14-18 men 11 women 9, 19+ men 11 women 8, pregnant 11, lactating 12. The ULs (pills+food) are: 0-6 mo 4 7-12 mo 5, 1-3 yrs 7, 4-8 12, 9-13 23, 14-18 34, 19+ 40. I get 13 mg from food alone, multivitamin brands have 2-15 mg, 15 and 11 two I used for years. Some take 20 mg Zn separately (avoid Nutricost, 240 caps as it contains MgStearate which blocks absorption) since multivitamin has 10 mg Zn too usually, and the average diet has 10 mg (1 mg if soils depleted), so 40 total, though too much can suppress the immune system, so watch what goes on. Some advise against Zn picolinate, because picolinic acid increases urine Zn 8 fold in rats, meaning, picolinate is so stable, that it simply deposits in human hair, urine, red blood cells, etc and doesn't go where it's needed. So, try Zn glycinate (zero extra ingredients). Since most eat phytic acid that blocks 30-70% of minerals uptake, the extra Zn is OK, since all bivalent cations compete with Zn for absorption too and polyphenol rich vegan diets block even more Zn. The AREDS eye vitamins got 80 mg Zn, 20 mg Zn as zinc glycinate has its own advantages, glycine for GSH. I noticed my eye floaters become more visible than I lower my Zn, sleep hours or hyaluronic acid intake, so Zn is key to collagen production, floaters being abnormal oxidized collagen fibers that didn't repair. Once Zn, hyaluronic rise, floaters diminish. However, measuring about 20 mg of Zn glycinate is no easy

task, you need some tiny q-tip without the cotton to take the tip of it and measure it in a small mg scale to see visually how much 21 mg of pure Zn is (70 mg glycinate). Be careful to not overeat it and take it with a separate meal from Mg Glycinate, which can block Zn uptake. If you take copper 1 mg from multivitamin, you may not develop copper deficiency, though Cu^{2+}, Zn^{2+}, Ca^{2+}, Mg^{2+}, Fe^{2+} all compete for absorption in the gut, so once you take high Zn you may develop grey hair due to copper deficiency and impair immune function by 40%, so do a copper test to make sure it's not dangerously low *if you get grey hair suddenly, feel tired or get flu/cold too fast or* remain sick with running nose for 25 days instead of 4 before. High Zn also suppresses immunity on its own (read the AI overview of google), so it can be deadly if no copper, it can cause iron (Fe), Ca, Mg deficiencies too, via competition for gut absorption.☺☺☺ ► " Zn deficiency is the most ubiquitous micronutrient deficiency problem in world crops" ► EGN 2009;31(5):537-48; "In 1990, a survey of 190 representative soils from around the world indicated that about 49% of them were Zn deficient… maps for Zn-deficient soils and prevalence of Zn deficiency in humans are remarkably similar" ► AN 2012;3(6):783-9, the paper shows the leg abnormalities of phytate rich soy feed given to chicks and the low Zn effect on pigs (similar to humans, remaining short, dying sooner); tofu and other soy foods have less phytate due to processing (chicks get it unprocessed with all phytate), but generally soaking legumes is a great way to reduce phytate 10 fold. JSFA 2013;93(10):2362-71 found vegetarians eat about 1 mg less Zn/day than omnivores and have serum 0.93 µmol/L or 6.0 µg/dL (8% lower in *vegans* vs omnivores, so blood test says 70 instead of 76 µg/dL) lower, so vitamins help. "Soil Zn was positively associated with serum Zn" ► Ntr 2019;11(2):221. NIH explains some *vegans* and vegetarians may need 50% more than RDA for Zn (80% extra for Fe), because of eating more phytates, polyphenols that inhibit Zn absorption, plus *vegan* Zn is less absorbable. PillZn is absorbed 50-61% ► FHN 2013;7:97. Low zinc causes acne, so read the acne section too.

MH 2006;66(1):169-72: "40.6 ppm Zn in normal aorta vs. 23.2 ppm Zn in atherosclerotic aorta ..19.4 ppm Zn in atherosclerotic *aneurysm* aorta… (raising Zn) from 95 to 177 microg/dl resulted in objective improvement in 12 of 16 of ..(angina) patients… Zn prevents oxidation of LDL.. and consequently stops the main mechanism of atherogenesis… We hypothesize that higher… LDL… resulting from … 300 mg of Zn/day is caused by a release of LDL from *cardiovascular* tissues (plaque *that causes* angina), beneficially flushing it (LDL) into the serum where it is readily observed, thus decreasing arteriosclerosis, increasing circulation, terminating angina pectoris… removal of LDL might be attributable to action of Zn^{2+} on ICAM inhibition… high-dose Zn should be considered as basic in the strategy of prophylaxis and therapy of the atherosclerosis process to terminate angina (stenosis)… and restore youthful cardiac function."

JAMA 1980;244(17):1960-1 showed huge doses (178 mg/day in the form of 440 mg Zn sulfate) for 5 weeks to 12 adults lowered HDL from 40 to 30 (25%). In NM 2015;12:26, a review of studies

(14,515+ unhealthy people) taking 39 mg/day, total cholesterol fell 17 points (vs only 1 in healthy people), HDL rose 6 points (mg/dL) (fell 3 points in healthy), LDL fell 11 points (up 1 point in healthy), triglycerides fell 18 (3 in healthy). Even 50 mg pills are not a good idea long term. AJCN 1995;61(3 Suppl):621S-4S explains when Zn is too high SOD is low, LDL is higher, HDL lower, due to copper deficiency. JN 1985;115(2):159-66 found in rats, Zn is fine when high, if copper is also high in the diet, as long as 5:1 ratio exists. Oysters got 182 mg/100 g, so it's best to not overeat daily if pregnant, to avoid iron, copper depletion of fetus. 40% of people worldwide are Zn deficient; it is a vital nutrient for the brain, people who were deficient died at 25, became short and mentally retarded. "The risk of mortality was reduced by 27% in subjects 55–81 y of age who received Zn daily" ► AN 2013;4(2):176-90.☺☺☺ Zn pills/foods lower blood glucose and pressure, AGEs formation, LDL cholesterol and total cholesterol, decrease lipid peroxidation and oxidative stress, improve eye sight and diminish age related vision loss, shorten the duration of the common cold, increase the height/weight of babies, increase the cognitive performance (IQ probably too) of people and animals and sometimes can even cure hair loss and acne. Zn deficiency is linked to depression, Alzheimer and many disorders of the brain, not just hair loss, infection, diarrhea, weak immune system, acne, heart disease and diabetes. Zn is needed by 2,000+ transcription factors and 300+ enzymes in the body, is a part of some neurons, having a critical role in DNA synthesis and repair. IJP 2010;20(1):53-7 shows infant formulas have Zn/copper too. 10% of human proteins bind to Zn. Breastmilk Zn is higher than blood Zn, because Zn is essential to the fetus ► section 3.3 of Ntr 2018;10(2):199. The concentration of cellular Zn is .2-.3 mmol, ATP is .5-10 mmol depending on cell. 10% of genome is believed to encode Zn proteins. Zn is used as a cofactor in proteins much more frequently than most vitamins ► AN 2013;4(1):82-91. For a very cheap Zn deficiency test, see below. ☺☺

►►► ZINC ABSORPTION – picolinate seems OK, glycinate too (cheapest picolinate is NOW Foods 120 caps/50 mg, 3 pack/ 27$, lasts 2 yrs - cheapest, half capsule enough, UL = 40) ►►►

50 mg Zn/day for 4 weeks led to a significant rise in human hair, urine, erythrocyte (red blood cell) Zn only for Zn picolinate $Zn(C_5H_4N\text{-}COO)_2$, with no rise for placebo, Zn citrate, Zn gluconate. This may mean picolinate is much better absorbed ► AA 1987;21(1-2):223-8, which makes sense because the body produces pyridine-2-carboxilic acid (picolinic acid) in the kynurenine pathway (the metabolic pathway leading to the synthesis of *nicotinamide* adenine dinucleotide NAD^+ via the degradation of the amino acid tryptophan; *nicotinamide* (a form of vitamin B_3) is the amide of pyridine-3-carboxilic acid which also called niacin, nicotinic acid or vitamin B_3) and uses picolinic acid to transport several minerals, making picolinate easy to recognize and absorb by the body. Rats deficient in tryptophan had poor Zn absorption, as picolinic acid could not be made readily. Supplementing with tryptophan immediately boosted Zn absorption. Picolinic acid is the meta isomer (COOH in position 3 or meta, instead of 2 or ortho) of vitamin B_3. "The

concentration of picolinic acid in human milk was 308 microM (µM), the concentration in one brand of processed cow's milk was 20 microM (µM), but picolinic acid was undetectable in a second brand of cow's milk and in four different infant formulas." ► PR 1980;14(7):876-80. As explained in Life Chemistry Reports 1982;1:57-67 by Dr. Evans (with the USDA Human Nutrition Research Center) they discovered that people with the (sometimes lethal) Acrodermatitis Enteropathica AE autosomal recessive disease (a disorder of poor Zn absorption) are fine if they drink human milk or take Zn supplements (a third of Zn needed if using picolinate versus sulfate in humans to relieve AE symptoms); vitamin B_6 enhances Zn absorption and almost triples the duration of Zn retention by the body at higher levels, as it is a co-factor for one or more enzymes in the kynurenine pathway that produces picolinic acid; B_6 also has the same pyridine ring like B_3 (and picolinic acid) with the pyridine nitrogen possible binding to Zn as it does in picolinate. Scientists figured human milk, unlike cow milk, facilitates the absorption of Zn via its picolinic acid content. Zn is key to brain development in infancy, so no wonder breastfed kids are smarter, the longer they're breastfed, since unlike infant formula, human milk has picolinic acid. Zn is part of some neurons. NR 1980;38(4):148-50 found that administration of picolinic acid with Zn relieved people of AE (poor production of picolinic acid from tryptophan due to enzyme deficiency) disease symptoms. As the 1982 pdf above explains, Evans found picolinic acid in pancreatic extract and that picolinic acid is a good chelator of several metals, including copper, iron, manganese, magnesium, calcium; his research team found the kidney Zn concentration and Zn absorption in rats supplemented with picolinic acid was much higher than in the rats without picolinic, and the rats grew bigger (just like humans with Zn grow taller) ► PSEBM 1980;165(3):457-61. Rat babies using Zn picolinate had much higher liver and kidney Zn levels than rat pups using Zn acetate ► JN 1980;110(10):2121-4. There is some debate about long-term intake of Zn, since after reserves are replenished, 50 mg Zn/day (333% RDA) as picolinate may be too high and could, per some studies, help form the core of kidney stones. Low salt healthy vegans eating no added salt are traditionally at lowest risk of kidney stones. ☺

Zn glycinate $Zn(NH_2\text{-}CH_2\text{-}COO)_2$ was 43% more bioavailable (present in serum) than Zn gluconate at 15 mg doses ► IJVNR 2007;77(4):243-8.☺☺☺ Glycinate and gluconate "forms (60 mg Zn/day) were compared in a 6-week intervention in young adult women. Plasma Zn... increased in all subjects given Zn glycinate (N = 10), while no significant change was seen overall for Zn gluconate or placebo (N = 10 each). Erythrocyte superoxide dismutase activity, a marker for Zn-induced copper deficiency, was unchanged in all 3 groups" ► BTER 2015;168(1):11-4. Humans "with serum Zn ≤60 µg/dL failed to attain adequate concentrations of serum Zn (≥70 µg/dL), despite supplementation with 30 mg Zn/d for 3 mo" (gluconate) ► AJCN 2016;103(3):942-51; 30 mg Zn/day increased serum Zn slightly (but not enough, not 10), 5 mg/d did not (7 mg/d didn't either in a study mentioned in the paper). Compared with Zn sulfate, $ZnSO_4$, 80 mg Zn/kg as

glycinate significantly decreased the late stage embryo and 1 day old chick mortality ► BTER 2018;181(2):323-30. Organic Zn, such as picolinate, citrate, gluconate seems less blocked by $FeSO_4$ from absorption than inorganic (Zn oxide ZnO, $ZnSO_4$) Zn. "(*inorganic iron*) Fe/Zn ratio of 2:1 and 3:1 substantially inhibited (inorganic) Zn uptake… No effect on (inorganic) Zn absorption was observed, however, when heme iron was ingested... (with organic Zn, inorganic) iron did not significantly affect Zn absorption; competitive interaction of Zn and iron was strongest with nonheme ($FeSO_4$) iron and *inorganic* Zn" ► AJCN 1981;34(4):475-82. This may be why some people taking Walmart, etc vitamins with ZnO, $FeSO_4$ get poor Zn absorption; many vitamins have ZnO, ferrous (Fe, iron) fumarate, so fumarate may interfere less with ZnO than sulfate. Perhaps organic Zn is safer because it will interfere less with other metals, such as copper. Most studies done on copper deficiency, adverse effects caused by Zn used *inorganic Zn*. Thus, pricier vitamins use organic chelates of metals, not inorganic salts. ☺☺

JN 2014;144(2):132-6 found that, when administered intravenously with isotope labeling,► "absorption of Zn from Zn citrate was 61.3%... Zn gluconate with 60.9%... Zn oxide (ZnO) at 49.9%… The presence of food results in lower Zn absorption values ranging from 10 to 25%" Ntr 2005;135(5):1102-5 found 10-11% absorption when Zn oxide/sulfate fortified corn tortillas were eaten with beans and milk, since unsoaked beans contain phytic acid that binds to all minerals in the diet, so eating canned/restaurant unsoaked grain/legume foods is a sure way to get grey hair, collapsed immune function via low copper/zinc. ☺☺☺ FCT 2016;90:76-83 found ZnO nanoparticles (too expensive for most vitamins, but you never know if micron sized ZnO, not nanometer size), cause kidney issues (liver toxic in other 2017 studies), due to low absorption and more kidney work to eliminate it, so try multivitamins with amino acid chelate Zn (Zn AAC) instead of ZnO. Avoiding ZnO seems better, even if cheapest vitamins use it. High dietary calcium reduces Zn absorption and balance. Zn absorption (from a meal with 7.3 mg Zn) halved when a 0.6 g calcium pill was given with the meal. Inclusion of 7.8 mg Zn as part of a calcium pill offset the detrimental effect of calcium on Zn absorption from the food ► AJCN 1997;65(6):1803-9. "Glutathione peroxidase (detox enzyme) activity of lambs supplemented with organic Zn was significantly higher than inorganic and control groups" ► BTER 2019;189(1):75-84.

Hypothesis: given that it took a third of Zn as picolinate to achieve the same AE relief effects of Zn as sulfate, that picolinate urine, hair and erythrocyte increased only after picolinate not gluconate or citrate, that Zn gluconate is slightly better absorbed than Zn sulfate and oxide, it seems reasonable to hypothesize that picolinate is the best form of Zn as it's the natural one the body is most used to absorb and retain. While gluconate is cheaper, when one takes into account you may need twice to achieve same effects, picolinate is cheaper and safer as we don't take too much Zn and less toxic excipients in the pills (rice flour has arsenic at 10 times the level of wheat flour, many additives in some brands are not healthy). Very few studies compare
